THE geese and ducks are acting funny this year. It looks as though they intended giving this region "the go-by." Very few of either have made their appearance. Some flocks of geese have been seen and heard in their flight southward, and they are reported as fairly numerous at a few points on the Platte. None have been seen in this vicinity for over a week. The party that killed so many last year about a hundred miles west of this city have been ready to go for several days, but they get to call from the farmer with whom they quartered before. Indeed, they hear from other sources that the geese have not come there. It is feared the great amount of shooting at that point last year has had the effect to turn the geese to other lines.

Twice this fall the ducks have appeared here in goodly numbers, but in both cases they were off and gone almost as quick as you could say "Jack Robinson." Let me illustrate. On Thursday afternoon Mr. Webster and I visited quite a number of the best ponds, and saw only five ducks. The next morning they landed up everywhere. Mr. W. drove out in the afternoon with a wild horse, taking his wife with him, and bagged twenty-four. One day later the birds had taken their departure, and in a long drive in quest of them I got "skunked" for the first time in Nebraska. Three of us were out yesterday and picked up only two, one a mallard, the other a bluewing. Where are they anyhow? Prairie chickens have "flocked," and chicken shooting has practically been over for twenty days or more. Quail are unusually abundant, but for the present the season is too dense to allow satisfactory results in that direction.

BURN H. POLK.

LINCOLN, Nebraska, Oct. 27.

KILLING A DEER WITH SHOVELS.—Mr. John T. Daly, Jr., writes us the particulars of the killing of a deer near Buzzard Roost, in Twig county, one day last week, under very singular circumstances. Mr. Daly is foreman of "Gang No. 2" on the Erie and Missouri river, and is Georgia Railroad. On Tuesday last week Mr. Daly had his gang at work on the railroad. A party of hunters from about Jeffersonville were deer hunting the same day in what is known as Parver's Swamp. The dogs started a deer, which left the swamp and took its course toward the railroad. Mr. Daly discovered the deer, and decided it was coming directly toward his gang. He told the negroes to get back in the bushes, and told them to kill the deer with their shovels if the same near enough, and the dogs were within thirty feet of a mile away. The deer came right down the ditch, and the first negro it came to struck at it with his shovel, breaking both of its hind legs. One of the hunters was near enough to bear the deer cry when it was caught by the railroad gang. He came up and claimed the deer according to the laws of hunting, as he stated. Mr. Daly gave up the game after a promise that he and his gang should have a share, but up to last accounts the Jeffersonville hunters had not divided.—*Herkensville (Ga.) News.*

NEAL DOW'S BEAR STORY.—The Hon. Neal Dow, who has been traveling in the wilds of Northwestern Maine, writes to the Post and Telegraph and night and bright moonlight, but the moon was often obscured by clouds. It was in a little opening in the thick forest, where the moonlight could reach the ground. I was startled by the creaking and breaking of bushes and branches. An immense tree without top was lying on the ground. I sat on it and waited. Presently I saw a huge black object slowly approaching; it was a bear. I opened my knife and stuck it into the tree trunk and waited, the bear was within thirty feet of me, and as he sat down on his haunches and sniffed the air for prey the moon was left uncovered by a cloud. Both barrels of my gun made one report. I seized my great knife and waited for the onset; but the huge beast did not move. He continued to sit with head drooping to the ground. Hastily reloading my gun I approached him and waited for the end. Presently he fell over on his side and breathed his last.

MAINE GAME WARDENS' DILEMMA.—Game from Maine does appear in the Herkensville market, says the *Herald* of that city, notwithstanding the law and the refusal of the transportation companies to forward it. A trunk full of partridges, forwarded from Maine as baggage, has been seen in the market. Also a flour barrel, marked "potatoes," showed partridges when opened, each bird nicely wrapped in paper. But a letter, just received, says that the wardens are on the alert, and the seizure of packages of game at the railway stations and elsewhere will be most daily occurrence. The railway officials and officers of express companies are also ready to line up to those determined to enforce the game laws. An amusing dilemma was dropped into by the game wardens themselves at a station on the upper Maine Central the other day. The superintendent of that road, as soon as the position of the new law was laid before him, issued orders to all his station agents not to receive game to be forwarded out of the State. The warden would not prohibit the forwarding of one moose, two caribou or three deer by one train. In a season, but the orders of Sup't. Tucker were peremptory. No one of his station agents could possibly know how many deer a person had forwarded from another station, and the superintendent decided to take no risk. Besides, it is claimed that he is warmly in favor of enforcing the game laws. The game wardens had seized several carcasses of deer. And they desired to present them in court, at a station a number of miles farther down the track, as tangible evidence against the poachers who had broken the law. They presented the deer at the Maine Central railway station to be forwarded. The agent would not receive them. The superintendent was telegraphed, but the order came back to obey former orders. A further explanation was telegraphed, but the superintendent replied that he was obeying the law from principle, and they could not go over the road. Hence the deer did not appear on our market day. Game wardens McLean of Mattawamkeag, and Davis of Winn, in that State, have lately returned from a successful hunt after deer shooters in the vicinity of Eagle Lake. On the woods road to Brandy Pond they met a party with several deer which had evidently been shot after being driven into the water by dogs. They seized six deer, five of which were of unusual size. Of the deer taken, all but one had been shot in the back of the head, showing conclusively that they had been killed while in the water. Some of the wounds were down to the bone. They have lately returned from the person shooting had taken in a canoe and shot downward at near range. The parties from whom the deer were taken had bounds with them, but denied that they had used them in hunting deer. They made considerable loud talk, declaring that they would shoot before the deer should be taken from them, but they did not execute their threats upon the wardens, and the game was taken to Mattawamkeag. The poachers will have to appear in court.

DUCKS AND NETS.—Eutaw, Ala., Oct. 23.—*Editor Forest and Stream:* I noticed in your paper last winter or this spring something about wild ducks being caught or taken by pot-hunters in quantities about Norfolk, Virginia. I have got the paper, and now write to ask if you can refer me to any one with whom I can correspond, to ascertain the kind of nets and how used. From now until February or March we have in Greene county, Ala., millions of ducks, an abundance for the true sportsman and pot-hunter, too. All members of our sporting club are not expert shots, and can do better shooting at game in a net than they can on the wing. Partridges, quails and turkeys are not so plentiful with this season than usual. Some of our young Nimrods are having a fine time just about now.—BLACKSTONE. [THE FOREST AND STREAM is published in the interest of sportsmen, and we can conceive of no possible reason why it should be expected to give aid to would-be duck netters. Our correspondent might be better engaged in encouraging wing shooting than in showing his friends how to scoop in the fowl.]

QUAIL SHOOTING IN THE CITY.—Lockport, N. Y., Nov. 2.—Yesterday Mr. George H. Moody, residing on Pine street, heard quail calling in a vacant lot in front of his residence. Taking his gun and going across the street, he found and put up a bevy of about a dozen and succeeded in bagging two of them. George is a good shot in his score in the club shooting will show, and his ducks are more plentiful than in the past. Five birds (the result would probably have been the same) I have been through the same lot not less than half a dozen times within the past month and have not seen or heard of any quail being seen in or near the city, and that this bevy should come in on the first day of the open season is a little queer. Frank Conover and John Freer bagged twenty quail yesterday north of the city. In last issue, "Owl Kapping at the Door" the type made me say "pigeon owl;" it should have read pigmy owl.—J. L. D.

THE RESULT OF ONE PELLET.—Fort Lyon, Col., Oct. 28.—I find that taxidermy enables me now and then to account for the results of a shot that puzzled me at the time. A few days ago I shot a Western red-tailed buzzard hawk (*Buteo borealis calurus*) measuring fifty-two inches in extent and weighing four and three-quarter pounds. I fired just as she had raised her wing to fly, and with no idea of killing, yet she dropped stone dead. As I did not believe such a large bird could be killed with No. 6 at the distance this was unless hit in the eye, I could not understand it. Skinning showed that five shot had struck in the side and had penetrated to the bone. The bird had a single pellet had entered a corner of the eye and gone into the brain, not breaking the eye-ball and leaving no external mark.—T.

TEN YEARS.—Gen. Langhorne Wister, of Germantown, a few days ago returned from a visit to Minnesota. He says that during a journey of hundreds of miles across the plains the only sign of life he saw were three antelope, where ten years ago large game was abundant, and during a day's ride through a great forest in Minnesota he saw no game, a few squirrels being the only indication of animal life. Since the introduction of repeating rifles large game in the far West has been greatly diminished, and the time is apparently not far distant when it will be extinguished on the plains.—*Germantown Telegraph.*

ALBINO GROUSE.—Mason City, Ia.—On the 15th of August I went out for a half day's shooting at prairie chickens, and while in the act of shooting my eighth bird I saw a pure white chicken fly up at one side, in company with six or eight others, which were all of the natural color. I followed it and flushed it a second time, and failed to get a shot.—C. F. V.

ABSENT A "FLICKERING."—Guymard, November.—*Editor Forest and Stream:* I am extremely sorry to see you lend your valuable column in yours of the 1st inst. to such a disagreeable and disgusting description as given by "Lagrange Sport-man" to your readers about his mean pot-hunting experience, for "filthy lucre" at that, by murdering our noble woodcock by electric light in Louisiana. I am sorry there are no laws in that State to prevent such slaughter. It is a pity the rifle ball he writes about did not stop him forever from poaching. How can game prosper with such fellows around? It's bad enough to see such things happen, but you certainly ought not to publish them as a disgust to all true sportsmen.—CROXTON.—[Two ifs.—If our correspondent knew anything about a canebrake his complaint would not have been in behalf of the woodcock, but of the mule team. If game birds were as plenty as the folks who can give an editor points on what he ought and ought not to do, the shooting would be good all over this country.]

NON-RESIDENTS IN NEW JERSEY.—New York, Nov. 2, 1888.—*Editor Forest and Stream:* I noticed in the *Evening Post* of Oct. 31, the following insertion: "The Game Association of New Jersey this year will pay particular attention to the enforcement of the law against shooting by non-residents. In Bergen county non-residents are warned not to appear with dog and gun." Although a resident of Bergen County, I have a fellow feeling for sportsmen in general, and I heartily concur with the advice given outsiders by the Game Association of New Jersey not to appear with dog and gun. As the natives of said county have for the past two months, Sunday included, been shooting at everything wearing feathers, would not a good example home prove more of a protection to our game than warning our neighbors not to shoot upon our premises?—G. W. D.

A BROOKLYN BEAR BAGGER.—Edward H. Litchfield, the son of the millionaire president of the Brooklyn Improvement Company, is a mighty hunter. Recently he has been shooting bears in the wild country of the Little Medicine River, near Fort Sherman. The Des Moines *Register* speaks of him as "bagging" thirteen bears on a twelve days' hunt this month—blue grizzlies and four black bears, three of them in one morning, and before breakfast. The bears are caught in steel traps weighted with logs that make a broad trail across the country and enable the hunter to come up with and fight the wounded and enraged beasts. The sport which is said to be full of peril, has nevertheless become tame to Mr. Litchfield, who is represented as coveting next an encounter with panthers.—*Tribune.*

MAINE GAME NOTES.—Rangeley, Nov. 1.—Black and sheldrake ducks have been very plenty this fall around our lakes, and large numbers have been shot. Partridges are very plenty. Two gentlemen, with Mr. Henry Fuller, of Phillips, as guide, bagged in two days, near Kennebec Lake, thirty-three partridges. Quite a number of hunters have gone back into the forest around Seven Ponds after deer, caribou and moose. Deer are very plenty, and so are caribou. Moose are not so abundant as they have been; still there are some left yet, and the game law says you can kill them until Jan. 1. The fall thus far has been all the KENNEBEC could ask for, and the trappers have improved it.—KENNEBEC.

LONG ISLAND WILDFOWL.—Two years ago the Suffolk County Board of Supervisors passed a resolution prohibiting the shooting of wildfowl from boats or batteries in the waters of Northport Bay. A petition has now been sent to the Board asking that the resolution be annulled. The residents of the locality claim in defense of the resolution that inside gunning had frightened the birds so badly that they would not come in and feed. One hundred and seventeen residents signed the remonstrance against the repeal of the resolution and eighty-one the petition for its repeal.

FLORIDA HUNTING GROUNDS.—Zalaha, Sumpter County, Fla.—Many of the old hunting grounds of Florida have been broken up by the great number of roads arising continually. For large game, deer and turkey, fishing for bass, etc., I would recommend the Peetula Creek, emptying into Lake Harris, Sumpter county; it heads about forty miles south, in what is known as Green Swamp. Deer and turkeys, bears and some wildcats, wolves, tigers, etc., are found there. Shall be pleased to give further information.—E. R. LAWS.

PERILOUS DUCK SHOOTING.—Last week we recorded the experience of a Maine man who was nearly drowned while on a duck shoot. News of a sadder calamity comes from Erie, Pa., Nov. 2. Fred C. Kelsey, news agent, Giles Russell and John W. Eyster, mail agents on the Philadelphia and Erie Railway, and Charles Brown, a well-to-do young man, were drowned in Erie Bay while duck hunting. Eyster and Kelsey have families.

ST. LAWRENCE AND JEFFERSON WARDEN.—*Editor Forest and Stream:* Mr. Griffin was first appointed, but declined, and Mr. P. R. Leonard, of Ogdensburg, N. Y., was appointed instead, and is now the warden for St. Lawrence and Jefferson counties, and is doing splendid and efficient work.—E. F. B.

THE FIRST FLIGHT OF GESE THAT PASSED OVER BOSTON this year were announced to the congregation of the West Church in a sermon preached Sunday, Sept. 23, by the Rev. Dr. Bartol.

A CONNECTICUT "COON TREE."—A party of four went out coon hunting at West Hartland, Conn., a few nights since, and killed eight "coons in one tree."—DORRIN.

PENNSYLVANIA DEER.—The Pennsylvania deer law provides that the open season shall be from Oct. 1 to Dec. 16.

The Virginia City (Nev.) *Enterprise* gives a description of a Putee fowl.—A favorite dish is a stew of duck, fish, turtle potatoes, and pineuts. Sometimes, when two or three families join in a feast, a camp kettle holding a dozen gallons is placed on the fire. Into this are thrown promiscuously all that the men, women and children have succeeded in gathering. Ducks, minnows by the score, ground squirrels entire—except that the hair had been singed off—wild rose berries, grassnuts, pinenuts, and the like all boil and bubble together in a rich mess—meat, soup, and bread all in one.—

Sea and River Fishing.

ANGLING RESORTS—We shall be glad to have for publications of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The latest of open seasons, printed in our issue of Aug. 16, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

POACHING IN PENNSYLVANIA.

THE illegal capture of fish in the State of Pennsylvania has assumed such proportions as to have aroused public feeling to a wholesome pitch of indignation. The gill nets, fish baskets, weirs, etc., that infest the Delaware, Juniata and Susquehanna rivers have increased in numbers during the last year, and in some cases these obstructions extend entirely across the rivers. The Anglers' Association of Eastern Pennsylvania has taken up this matter and begun a vigorous crusade against the poachers. It is stated that three hundred of these so-called fish baskets can be found in the Delaware River between Treuton and Port Jervis. These are permanent structures, made by driving piles in the river and by a system of lathe crates or "baskets." Every fish that goes down stream, big or little, is killed by being caught on this grate and kept out of water.

After the equinoctial storms these structures are nearly submerged, and can only be removed with great difficulty. The larger fish are appropriated by these wholesale fishermen—hundreds of pounds of every haul—while the small fry, including millions of young bass and shad that become caught in the woodwork, are scooped up by the shovelful and fed to the hogs. Acting upon information derived from various sources, the Anglers' Association recently drew up a formal protest against these abuses, and addressed a communication to the Fish Commissioners of the State. A letter was received from Benjamin L. Hewitt, of Hollidaysburg, who has been most energetic in denouncing the fishing laws. Mr. Hewitt says that the operation of these engines of mischief is a plain violation of the law, yet the Commissioners look to the local authorities to suppress them. The wardens on the Susquehanna and Juniata, Mr. Hewitt wrote, have destroyed between two hundred and three hundred basket dams between Harrisburg and the Maryland line. No idea can be had of the difficulty either in obtaining proper legislation for the fishing interests or in securing thoroughly reliable men to undertake the job of destroying the dams. The wardens have been fired upon repeatedly. A raid is to be organized at once on the Susquehanna and Juniata rivers.

TUNNY FISHING IN THE MEDITERRANEAN.

THE tunny is one of the great sea travelers. It winds its way not singly, but in flocks upon legions, which follow the coast, forming a continuous line of migration one day and far away the next. The German Sea, the coasts of Guinea, those of the Antilles, the waters of Brazil, of Chile, and of China, are but a few of the places they frequent. In the Mediterranean they are as numerous now as in the days of Polybus, who first described them.

The tunnies need warm waters in which to spawn. Numbers stay during the winter in the eastern parts of the Mediterranean, where they deposit their ova, at depths ranging between 80 and 130 fathoms. They leave the coast in May, become numerous near Sicily and Southern Italy, and return in autumn slowly to reach their winter quarters once again.

Pliny, in his book, asserts that Alexander's fleet met with huge numbers of them which prevented the advance of his galleys, and which nothing could frighten away until they had passed by.

They are of the mackerel family, like the bluefish, but are commonly three or four feet in length, and often a five-footer is caught. A curious fact is the finidity of this large fish. He is easily caught, and when first engaged in the fatal meshes of the tunny net, hardly tries to regain his freedom.

They prefer rocky bottoms, a fact well shown by the following: The Spaniards had a long while a monopoly of the tunny fishing, and seven huge fisheries were scattered around the coasts near Gibraltar. All this wealth was lost in one day; a fearful earthquake overthrew the town of Lisbon, thousands of inhabitants met with death below its ruins, the earth seemed to quake all over Spain, huge masses of sand and gravel were torn away from the coast of Africa, and instead of the rocky deep bottoms previously existing, a shallower sandy level was formed, and the tunnies forever disappeared. They frequented the rocky coasts of Morocco, near Tetuan and Salé, and the fisheries were transferred to Italy, Sicily and Sardinia.

The nets used in the Mediterranean are bag-like in shape, but huge in size. The Italians call them *fouari*, and begin in April to construct the enormous trap in which they are caught. The nets are weighted with large anchors and iron bars. The men place the whole thing in some deep, rocky channel, between two islands—as a rule the whole passage is carefully closed by the nets—then a small opening is left in the middle called the "door," which leads into a first chamber. From this they are frightened into another passage which leads into another enormous pocket called *camera di morte*, literally the death chamber. A door, also of netting, is closed and the first one opens again, more fish arrive; they find their way into the death chamber, the door of which again opens. When the death chamber is full, the whole thing is raised by a number of boats forming a circle, and the massacre begins, as they are speared and thrown in the boats.

Here let me give a little of my own experience. On a splendid summer day, early in the morning, I left the shore in a little sailboat, laden rigged, with two Italian boatmen. The sun had just risen, gorgeous with purple and scarlet rays from the bosom of the deep, scattering over the waters a rain of diamonds and gold sparks; the sky had already assumed that soft light blue, cloudless and beautiful, so peculiar to Italian heavens. The waves rose about us, a little crest of foam crowning the shining emerald water. Rapidly we sailed on, the warm wind lifting us along further and further from the black rocky cliffs, and the white, bright look-

ing village at their foot. In an hour or so, we had neared a little clump of islands, and suddenly tacking around one of them, we saw the little fishing fleet. Strange-looking craft, to an American eye, but picturesque in the extreme. The brown-colored sails had been furled down, but the gorgeous colors of the hulls, all painted with different hues, made a wonderful scene against the black rocks, the green water, and the azure heaven.

Nearer we got to them, and songs are heard, slow, and in time with the movements of the fishermen, who are slowly raising the huge bag. We are just in time. We get near one of the boats, and I watch as deeply interested and anxious as when a "silver doctor" killed my first salmon. Faster and faster the net rises, and the men are congratulating themselves upon a big haul. The death chamber is nearly at the surface, and before the water is boiling. They have raised the death chamber at last, and now we see the monsters rolling and tossing and striking the boats, which have formed a narrower circle around the bag. The net is still more raised, until only a foot or so of water is over the meshes, and hundreds of the big fishes are leaping wildly about in a vain endeavor to escape, but the circle gradually narrows around them, and the carnage begins.

Armed with long spears the fishermen strike the fish. Thirty or forty men are at work, the water boils and redens, and the huge detritus of the deep are lifted into the boats; a scene of wild excitement, of shouting and of thumping of the half dead fish in the boats. The men yell, and laugh, they shriek and swear, and still the work goes on, and the water has become purple in hue. A few big fish are dying in the net, and are taken out, and a scene of massacre is ended, which I shall never forget, but which made me feel sad that day when coming home, as I thought of the hundreds of noble fish, slain without a chance to escape. It seemed afterward to be murder, under that beautiful blue sky, which so high proclaimed peace to all, and good will toward men. G. V. S.

New York.

CASTING AGAINST THE WIND.

UNDER the heading of "Some Wrinkles from Abroad," Mr. R. B. Maiston thus writes in the London *Fishing Gazette*:

"F. R. C. S." in his interesting notes on "Trout Fishing," refers to the difficulty I have often alluded to in the way of getting a line out against the wind with a whippy rod. Mr. Reuben Wood spent an afternoon with me on purpose to show what a split-cane rod can do in his hands, and among other things he taught me how to make a 6-ounce limber split-cane rod send a line right into the teeth of a strong breeze. We were casting from a punt (in the hope of getting one of my black bass to rise), and I confess I was astonished to see how Mr. Wood could send the fly nearly twenty yards against the wind. "In casting against the wind, and I could just as soon cast it as against it," he said, "you must lift your line from the water so that it extends behind you at about an angle of 45°, and then bring your rod down sharply right on to the water, and straight against the wind; this makes the line cut through it, and extend out straight on to the water. The secret is to keep the line well up behind, and then continue the forward impetus sharply until the top touches, or nearly touches, the water." After watching Mr. Wood some time I had a try, and found that by following his directions I was successful in making this most useful cast. I question whether an ordinary hardwood rod would stand the sharp stroke required, nor would a long cast be possible with a light line, but in a breeze there is always a good ripple on the water, and light tackle is not so necessary. I have often, when fishing up-stream against a strong wind, found it almost impossible, even with a stiff rod, to get much line out, and even then the light gut cast often blows back over the reel line before touching the water, and I consider Mr. Wood's wrinkle a very good one.

In the same paper "F. R. C. S." says: "I find that I have omitted to say anything on casting against wind. Fishing with the wind blowing down-stream is always more or less unsatisfactory. You whip off your fly, and you strain your rod. If the wind is not continual, advantage must be taken of the intervals between the gusts; but a stiff rod will often enable the angler to force his fly forward where a whippy one is absolutely powerless. When a wind is blowing straight across the stream from the opposite bank, if it is not too strong, then playing them, but these slight difficulties, with a little practice, are soon overcome. I think that when a person uses the sarcastic expression "punt pole" for the stiff rod, it simply shows that the only stiff rods he has tried have been made stiff by increased thickness and consequent weight in the upper part. These are what I have expressly warned my readers against when I remarked that on no account should the rod be top-heavy. Stiff rods can be made of the American glued cane, or of the cheaper solid cane, quite free from this defect; and in conclusion I can only say that I think I have given you my favorite rod to any angling friend but that he has expressed a wish to have one like it, especially when he has seen the long straight casts I could make with it to the other side of a wide bit of stream.

In a foot note following this the editor says: "There is a style of casting against the wind which was taught us by Mr. Reuben Wood when over here. With a six-ounce "whippy" split cane rod we saw him time after time send his line straight into the teeth of the wind for fifteen or twenty rods. This would seem to imply that casting against the wind is not well understood on the other side of the water. On many American lakes it is necessary to cast against the wind in order to take trout from the "spring holes" where they lie in summer, and which cannot be ap-

proached from the shore, especially in the Adirondacks, where fishing is mostly done from boats. The practice is common here, and an angler who cannot handle his line against the wind is not considered a good caster.

MY FIRST ADIRONDACK TRIP.

A BOYHOOD REMINISCENCE.

(Continued.)

We were much disappointed at the course of the river. We came to an old log-lut, and Fred called my attention to it by some remark and towed on, and after going about a mile we came to another old hut looking exactly like the first. I asked Fred if he understood this; he said he did not, but would bet that it was the same old house. We got out of our boat, and sure enough it was. The river came to it at first, and then turned; after going a mile it came back about fifty yards below, so that we could have saved a mile if we had only known. It was dark when we arrived at Union Falls, and we were wet through and very tired, having come over fifty miles. We were told that we could find a place to stay over night there or we would not have undertaken to come. You can imagine our surprise to find only two houses in the place. We stopped at the first one, and told them that we wanted to stay over night, but the man of the house said he would not keep any one. "It was played out." We asked him what he meant, and he told us it meant we could not stay; he told us that Mr. Duncan had a big house opposite, and that he thought we could stay there, and we went and saw Mr. Duncan. He said he did not know, but he thought it would be "inconvenient." We told him we did not want him to go to any trouble, all we wanted was to get dry, and we would be satisfied with some bread and milk. He said his mother was not feeling well, and thought it would be "inconvenient" for him to go in and see, and soon came out saying it was "inconvenient." I then got mad and told him a decent man would not turn a dog from his door under such circumstances, and told him if he would let us come in and get dry we would go and sleep in the law-mow. Again he went in the house to consult, but one of his hired men said it was no go, his mother and sisters would object, and he would not dare let us in if he wanted to. When the man again said it was "inconvenient" I felt like knocking him down. We coaxed and pleaded with him, told him we would give him his price for staying, but it was no use. At last he told us there was a mill about a quarter of a mile below kept by an old man. The man built it for a mill, put it in good order, but there was no grain within twenty-five miles of it. What Croft wanted to build a mill there for is a mystery, but build it he did, and waited for twenty-five years for people to come and grow grain so that the mill could run. They never came, and the mill is "idly waiting," as it will continue for years to come. We bid Duncan good night, told him what we thought of him, and proceeded to the mill, where we found a party staying with Mr. Croft gathering hay. They had come twenty-five miles to gather it on shares. Hay in this region is rather scarce. We stated our case to Mr. Croft, told him our health was in danger if we had to sleep out-doors, being so wet, and had not got half through when he told us to come in and welcome, and he would do his best for us. He was a "white man." We soon were drying ourselves at his fire, and did justice to his supper. He lived in the mill, and was assisted in by reading a book of "Biblical Arabic" he found a good listener in Croft, and when speaking of the Egyptian pyramids Croft had the nerve to dispute him on their height, and soon proved that he was right by some of his books. About ten o'clock we retired in an out-barn and slept well. The next morning we left him 84, which was more money than he had seen in a month, and our axe and my pipe, which were forgotten, and felt the need of often on our way out.

About the next morning we started from Union Falls without shedding a tear at parting. We had a few rapids to run, but we got over them easily, but about four miles below we came to Beardley's rapids, and we run them at first all right, Fred did the rowing, or rather the steering, and let the stern of the boat down first so he could have more control of the oars. It was very exciting work. Sometimes we would go at the rate of ten or fifteen miles an hour, and did not know how soon we were getting on a rock. After going about three miles the river altered its run in a straight line. It was easy to look at, but to go over it was a job, for the water would splash up three or four feet in some places. At the entrance of these rough rapids was what is called the "gorge," or "shell-rock." This gorge was not over fifteen feet wide, and the water boiled going through it; the rocks on each side were about forty feet high, making it a beautiful but awful spot. We got out of our boat and looked at it long and well, and concluded as we wanted to get back home we would "take water," but not by going through that place. We consulted the map and found there was a road laid down about half a mile to the right, and thought it best to find this road and then carry our things down it until we could get on still water. We hunted for that road for two hours, and got so disgusted because we could not find it that we made up our minds to go through the gorge. We started back about fifty yards, let our boat in the current, and in less time than I can write it, we were one mile down, and all right! We could not hear each other speak, no matter how loud we talked; we shut our teeth, and I really think I tried to remember, "Now I lay me down to sleep." We were in the stern of the boat, and while we were going over a rock about two feet below the surface the water would jump up in my face and make me shiver. The boat was nearly half full of water, and both were wet through when we got down. We came to the road where it crossed the river, and saw two men watching us approach. I asked one for a "chev," he asked me where I came from, and where I was going, and said, after informing him: "Here, young man, you deserve a plug; I will give it to you." We gave it to him, and he followed the river into Tit's Pond, which is a mile and a half long, with poor scenery, and after passing through it, came to such rough rapids that it was thought best to carry four miles and strike the north branch of the Saranac. The water spread out and was so rocky that we knew the boat would break if we attempted to go down, not that we were afraid to shoot these rapids, but we thought "discretion the better part of valor," so we put our things on our backs and started off. This four-mile carry seems to me to have ten miles of it, for I could not see the hills, and the hills were all over. We stopped and cooked dinner when about half-way over, and never did dinner taste better. At last we arrived at the Forks, and put the boat in, and were soon gliding down the river. There were more rapids, but not bad ones, and we soon arrived at the little town of Redford, and here shot

- 98. DRAB.—Edward Armstrong, Gnosmont, England, liver and white bitch, Feb. 3, 1882, Bang II.—Jane.

THE KENNEL HOSPITAL.

IV.—THE SYMPTOMS OF DISEASE.

To detect disease requires us to appreciate the meaning of the signs or symptoms by which it is made evident. The owner of a dog, if he take more than a casual interest in his companion, ought in many cases to be able to notice signs of some departure from health many years earlier than would a professional man, strange to the animal. He should notice a change, although he might not correctly estimate its import.

A dog in health has certain habits and manners, likes and dislikes, wants and dislikes, which are exhibited daily, if not hourly. Any change in these is not necessarily a sign of disease, but it may be, and therefore should not be overlooked. By itself it may be of little moment, but considered in connection with some other sign, developed later, it may be of the very greatest importance. It may lead to a morbid tendency to tear things, and their doing so is no sign of disease. Adult dogs developing a similar tendency is a change of habit suggestive of some departure from health; it may be merely a sign of some nervous condition, or it may be a preliminary symptom of dangerous illness, such as rabies, which may arise when ill shun observation, and separate themselves from their fellows. A cow or a sheep in a field, standing away from the rest of the herd or flock is significant of something wrong; so also is a dog in kennel that keeps itself separate from the others. A dog in a house shuns observation by hiding in corners or under articles of furniture; this or any other departure from his usual habits should be treated as a sign of some bodily ailment.

The attitudes and movements of dogs are also important signs of health or disease. The manner in which he stands, sits, or lies down, is sometimes absolutely indicative of certain diseases, and at all times of importance in directing attention to his condition. A dog who stands with his head raised and nose protruding is suggestive of some affection of the throat; while one which stands with his back arched is indicative of abdominal pain. Some dogs habitually lie on their stomachs, with forelegs stretched out and hind legs raised above the ground. Such a position is, however, always met with in painful conditions of the stomach; and when seen as a changed attitude should be noted as a symptom of disease. The movements of dogs rendered in all kinds of diseases. They are also significant of their departure from health. A dog who refuses to come down stairs, or does so with difficulty, we suspect rheumatic affection of the muscles of the shoulders. When he refuses to go up stairs, to jump on his bench or a chair, or when he jumps up and down on his hind legs, and something wrong with the back or hind legs. It may be rheumatic, it may be approaching paralysis, or merely some injury.

A dog avoids all movements when his chest is sore from affections of the lung, when he is weak and exhausted, or when some febrile disease has attacked him. Erratic movements are seen in cases of blindness and disease of brain; defective movements in paralysis; convulsive movements in cases of poisoning; in cases of insanity, and in some cases of rabies. Abnormal movements of parts are seen in cases of St. Vitus's dance, affecting the head, the limbs, or even the whole body. Scratching is a movement indicative of irritation of the skin, and this may be due to various causes. Picking or scratching the ears is seen in diseases of these organs, and this is evidenced by pawing the mouth. Pawing the mouth is also seen in two very different conditions—when a bone or other intruding substance has stuck in the teeth, the other in cases of rabies, when the animal scratches the throat with tongue and cheeks, causing the dog annoyance. Barking, howling, crying, and growling are all at times signs of disease, though seldom more than indications of pain or discomfort.

Every material substance has certain physical properties by which it is made known to us through one or more of "the five gateways of knowledge"—the eyes, ears, nose, touch or taste. The animal body possesses an well organized definite proportions, and the relative positions and locations of the limbs, in cases of dropsy, in wasting diseases, and many other conditions too obvious to need specifying. The color of parts is altered to excessive redness in inflammation, it is blanched in certain conditions, and it is highly colored in some diseases—yellow, for instance, in certain states of the liver. Changes in color are not very noticeable on a skin covered with dark hair, but they are easily seen on the skin inside the arms and legs. They are equally clear in the ears, lining of the ears and on the membrane of the nose, lips, and eyelids. The alterations of dusky in parts are important symptoms in enabling us to determine the contents of any natural cavity or dissolved swelling, whether the contents are air, water, or solid matters. The odor of the liver and skin are signs which can seldom escape notice. The breath may have an offensive odor as the result of diseased teeth or of diseased stomach. The temperature of parts varies but little; that variation, however, is sufficient to indicate the extent of any disease. Increased temperature of a part is evidence of inflammatory changes, and accompanies sprains and other injuries. Decreased temperature is not often met with; it is dependent upon a want of circulation, and always accompanied by some other signs, such as the loss of baring health. Although the skin and extremities of an animal may vary a few degrees in temperature, the blood preserves a uniform heat, which is practically the same throughout, or rather within the body. This standard is maintained by the existence of heat by a process which is necessary for a few minutes in any of the natural openings of the body, is of the greatest value as a sign of disease. The standard temperature of dogs is about 102 degrees, and any rise over one degree is evidence of some disease, and a decrease below 101 degrees is accompanied by a rise of temperature. Distemper is a fever, and we have this in the thermometer as a means of determining in the earliest stages whether the appearance of external symptoms is due to common cold or to the specific poison of distemper.

The vital functions of animals, such as digestion, respiration, circulation, etc., each give evidence of their action by appreciable external signs. By changes in these we detect the existence of many diseases, and it is our duty to study the knowledge of the anatomy and physiology of the animal, and by an understanding of the morbid changes accompanying disease, that we are enabled to decide what organ is affected, to what extent, and in what way. Some of the signs are, however, so general that it is necessary to say something of their significance. The general wants of the system give rise to two sensations—hunger and thirst—the gratification of which is a necessary and natural condition. These sensations may, however, be increased or decreased, or become morbid, and become symptoms of disease. A voracious appetite is often dependent not upon insufficiency of food, but upon inability of

the digestive organs to utilize what is eaten, as is seen in cases of dogs suffering from intestinal worms. Loss of appetite accompanies the disease of the bowels, but it is not necessarily one of the most common signs of general disturbances. Loss of appetite is in nearly every case a good thing for the animal under the circumstances, as if he continued to eat, the food would not be digested, and further complications would result. Excessive thirst is usually a sign of irritation of the stomach; but it may also exist as an accompaniment of some drain on the system, such as is caused by violent action of the liver or bowels.

The circulatory system gives physical evidence of its action by the beating of the heart, and by the flow of blood through the vessels which we feel under our fingers when we take the pulse. The best place to feel the pulse of a dog is at the femoral artery, which runs in the middle of the thigh. The pulse of a dog numbers from 90 to over 100 beats in a minute. Its frequency is not a symptom upon which much reliance can be placed as was pointed out long since by Blaine. It fluctuates to a great extent, the feel of the artery under the finger is not as in man, and sometimes a variation in the rapidity of the heart gives rise to sounds which are best heard on the left side just behind the elbow.

The respiratory system gives evidence of its action by a steady rhythmic movement of the flanks and sides during expiration and inspiration. As air enters and leaves the lungs certain sounds are caused which can be heard by applying the ear to the chest. These sounds vary in disease, but the variation requires considerable technical skill to appreciate, and we, however, may notice the movements of the chest and flank. Continuous increased respiratory movements are seen in inflammation of the lungs, but they are seen also in many other conditions. Panting is readily induced by pain or excitement, and is not so indicative of chest affections as it is in larger animals. As a rule expiration and inspiration go on without any apparent sounds. When, however, any irritation of air passages exists with sneezing and coughing, a rattling sound is heard during inspiration, and a hoarse and lead. Coughing is a symptom of irritation of the throat, when short and sharp; of the larger air passages and windpipe when more prolonged, as in what is called hoarse coughing, or when the larynx is inflamed and swollen, as caused by disease of the lungs. The digestive system gives evidence of its action by the way in which food is taken into the system, and there deprived of its nutritive materials. While the ingesta in portions are passed regularly through the bowels, it is not necessarily a sign of health. Vomiting is evidence of irritation, and is not necessarily of disease. Continuous vomiting is indicative of disease, which may be due to some irritant in the stomach, to disease of the organ itself, or even to disease of the intestines. Vomiting may be caused by irritation of the stomach, or it is not uncommon thing to hear of a dog coughing until he is sick. The action of the bowels may be excessive—diarrhoea; it may be defective—constipation. Want of action in the bowels may arise from mechanical obstruction by hardened excrement, or by foreign substances, such as bones, muds and earth, or it may be due to want of nervous power.

The excretory organs may become diseased, and then we have either increased or decreased flow of urine. This state of the system should be noted up to. The action of the urinary must important, as somewhat similar symptoms are induced by morbid conditions of very different parts, e.g., of the kidney, the bladder, and the canals leading from them.

There are many other signs of disease, but I must mention, i.e., dryness of the nose. The condition of the nose is as indicative of health or disease as is the tongue in the human subject. In all febrile diseases the nose becomes dry, and in nearly all serious disturbances a state of dryness of the nose is a very common sign. Symptoms of disease have mentioned are to every one sign, but they are indications only to those able to interpret them. Their recognition, however, is the first step toward understanding them.—*From the Royal College of Veterinary Surgeons, in Land and Water.*

- HORNELL SPANIEL CLUB.—Mr. J. Otis Fellows, proprietor of the Hornell Spaniel Club, has sold one-half interest in his kennel to Mr. Geo. Leavitt, Jr., Boston, Mass. The club has a membership of 25, and is now making up the spaniels, and the club will depart from England soon a dog by the celebrated Obote of Nellie. It is the intention of the club to keep up their reputation, and, if possible, to add to it.

KENNEL NOTES.

- NOTICE TO CORRESPONDENTS.**
- Kennel notes are inserted free of charge. To insure publication of notes correspondents MUST GIVE the following particulars of each animal:
- 1. Color.
 - 2. Name.
 - 3. Name and residence of owner.
 - 4. Age.
 - 5. Sex.
 - 6. Name and residence of buyer or seller.
 - 7. Size, with his sire and dam.
 - 8. Date of birth, or breeding or of first sale.
 - 9. Name and residence of stud or breeder.
 - 10. Owner of dam.
 - 11. Names must be printed written.
 - 12. Communication on one side of paper only, and signed with written name.
- NAMES CLAIMED.
- See instructions at head of this column.*
- Waverly.** By Mr. G. E. Osborne, Steeple, Ct., for black and liver and white dog, which was sold by Dan Oak (Osborne—Bargate) out of Sly (Ladlie, Jr.—Nellie).
- Manrose.** By Mr. C. E. Osborne, Steeple, Ct., for black and tan dog, which was sold by Dan Oak (Osborne—Bargate) out of Gypsy (Sheep—Collie).
- Lady Gay.** By Mr. J. W. Hopkins, North Trafton, Ct., for white, black and tan bitch, which was sold by Dan Oak (Osborne—Bargate) out of Beauty out of Beauty (Bargate—Lacy).
- Flash.** By Mr. F. P. Farley, Westboro, Mass., for black and white dog, which was sold by Dan Oak (Osborne—Bargate) out of Nellie out of Altha (Brush II.—Guro).
- Lacelia.** By Mr. Forrest W. Forbes, Westboro, Mass., for liver, white or fawn bitch, which was sold by Dan Oak (Osborne—Bargate) out of Nellie out of Cate (Siam—Flora).
- Larrie and Lenore.** By Mr. Fred W. Koenig, Simons, Ont., for black and white dog, which was sold by Dan Oak (Osborne—Bargate) out of his Lizzie.
- Lella, Louisa, Lottie, Liss, Lora and Liza.** By Mr. Fred W. Bothwell, Simons, Ont., for black and white dog, which was sold by Dan Oak (Osborne—Bargate) out of his Lizzie.
- Wallnut Jack and Wallnut Bob.** By Mr. Archibald Gordon, Middlebury, Vt., for liver and white dog, which was sold by Dan Oak (Osborne—Bargate) out of Nellie out of Nellie (Hornell Dairy—Vic).
- Wallnut Maude and Wallnut Blanche.** By Mr. Archibald Gordon, Middlebury, Vt., for black spaniel bitches, which were sold by Dan Oak (Osborne—Bargate) out of Nellie out of Nellie (Hornell Dairy—Vic).
- WHELPES.
- See instructions at head of this column.*

who paddle, living apart, than does now. This could be accomplished by correspondence and occasional visits to those not too far off. Some kinds of work in the forenoon, but then in a matter of weeks.

Who-tenets of the published canvases have been up to us, and to us one thinking of taking it in his hands, but then in a matter of weeks. Who-tenets of the published canvases have been up to us, and to us one thinking of taking it in his hands, but then in a matter of weeks.

WATER-TIGHT COMPARTMENTS.

The question of airtight compartments is one that has attracted much attention among canoeists late, but certainly no more than it warrants, seeing that in our craft, as in that of a great extent the safety of boat and crew. The principal plan proposed is to use several cases, either one in each end, fitted to the boat, or a number of small cases, each of a certain size, situated up. These are heavy, they take up more room than can well be spared, and being stowed where they cannot be readily examined, are liable to be broken, thus being useless, and, as damage to them is not to be discovered until too late. The most economical plan, so far as weight and room are concerned, is that followed in theory for a canoe of oak, and in fact, by the makers of the "Forest and Stream" canoe, by a little more careful proportion and fitting of parts to make them absolutely airtight. The surfaces of the hull and the covers are covered with a thin layer of lead, and the joints carefully leaded in thick white lead oil-tight compound while on the wooden tables, stuck very closely, white-leaded and finished with short iron filings and a coat of varnish, and then with canvas and, as an additional precaution, before being the deck a piece of muslin, well painted, stretched over the edge and tacked to the canvas, and the joints of the deck and the hull are covered with a cap or a cap, as usually built, but would retain water-tight, the only danger, in practice very slight, being that of a hole in the skin or deck. Of course, any openings in the hull or bulkhead would be dangerous.

MATTHEW BELDEN.

THE CHART LOCKER.

We publish this week a letter from an old canoeist on the collection of information concerning canoeists, and would call the attention of canoeists to the importance of the information required. Most of the local publishers are either interesting to the canoeist, or they are not interested at all. It is necessary for canoeists in writing should endeavor to give either an entertaining account of the canoeist or simply to state the main peculiarities of the water as played in the canoe. The "Forest and Stream" of the "Chart Locker" weekly collector in the future to give just such information regarding American canoeists, publishing at the same time inquiries for canoeists concerning their localities, and notes in answer to them as we shall receive, and also such general information as may be sent by canoeists. The labor of writing up one's own locality is not a heavy one, and can be done by corresponding information concerning many other localities.

Besides the above, it is a great help in canoeing to know the location of canoeists by the name of their canoe, and to give information by letter, or personally to visiting canoeists. All who wish to do this are requested to send their address to Forest and Stream, and we will endeavor to give information. Canoeists mapping out cruises, on applying to FOREST AND STREAM, will be furnished with the address of other canoeists along the route, from whom, by correspondence, the most complete information can be obtained than is possible with any printed guide. Such a publication as the "Canoe Club" suggested in the prospectus of the American Canoe Association, even if carried out, would soon be out of date, owing to the constant changes and additions required, but a living guide, such as the columns of FOREST AND STREAM, fresh every week and containing the most complete information, and if properly supported by canoeists, be of the greatest value to them.

WATERPROOF FABRICS.

Formerly some preparation of India rubber or gutta percha was generally employed for rendering textile fabrics waterproof, but since that time many other and cheaper materials have been pressed into this service. Some of the processes are thus described in the *Boat-builder's Process*. The process makes use of alum and sugar of lead. It is applicable to cordage and fabrics as well as to wood, leather and paper. It takes the following form: Alum is dissolved in water, each 20 parts, bicarbonate of potassium and Glauber's salt, each 12 parts, and pours over this mixture 3000 parts of soft water, all by weight. The alum and bicarbonate of potassium are dissolved in 2 parts of olive soap, and then mixed with both solutions. The articles are left in this solution until thoroughly saturated, allowed to drain, dried, and ironed with a hot iron.

For linen, leather, and wool, a heavy solution of paraffine, or for cotton or paper some solution of 2 parts, and resin, 6 parts. Impregnation with this preparation is done in the same manner as above. When the articles are dried, they are treated with a solution of saltpetre, and alumina in ten times its weight of water, and a soap bath of the following composition: One part of light colored resin and one part of erythrol-stearic soap, and soda ash, in the ratio of 1 part of water to 1 part of soap. The soap is dissolved in the first half part of table salt, and is subsequently dissolved along with one part of white cedar soap in thirty parts of soft water. It should be applied with a brush and then rinsed off.

According to *Mechanics*, paraffine is excellent for waterproofing hempen hose, and can be used in the following manner: It is tightly stretched and heated over a hot plate of iron, and then rubbed as evenly as possible with a piece of parchment. It is then pressed with a hot iron or heated with a steam iron. The paraffine is then melted. Instead of using a piece of parchment, the paraffine may be cast in a mold, and used in the same manner. The paraffine may be cast in a mold, and used in the same manner. The paraffine may be cast in a mold, and used in the same manner.

WINTER CAMP-FIRES.

ACTING on the suggestion in a late number of FOREST AND STREAM, a meeting of canoeists was held at the residence of Mr. J. M. Jones, No. 501 Madison avenue, to organize a series of meetings through the winter. There were present Messrs. Jones, Hoffman, Williams, Clark, and others. Mr. Jones was elected chairman, Mr. Hoffman, secretary, and Mr. Clark, treasurer. The committee withdrew, and during their absence a question of a winter camp-fire was finally adopted. On their return they submitted the following resolutions:

Resolved: An informal meeting of canoeists having been held at 501 Madison avenue, and

Resolved: It having been decided to hold periodical meetings of a social nature during the winter for the discussion of all questions pertaining to canoeing,

Resolved: That these meetings be known as "Winter Camp-Fires,"

Resolved: That the meeting be held on the first of each month, and that a secretary and a treasurer be elected to keep the records and collect dues.

Resolved: That at each meeting a pre-arranged subject will be discussed.

Resolved: That the meetings be held at intervals of about twenty days, the dates to be fixed in advance for the season by the committee. It is also recommended that dues, at the rate of fifty cents per member for the season, be imposed to cover the necessary expenses.

The report of the committee was read and accepted, after which an informal discussion of a meeting place, outline of proposed work, a local meet, and the camp of 1889, at the residence of Mr. J. M. Jones, No. 501 Madison avenue, was held.

and other subjects followed. The committee were empowered to procure a meeting room, fix the date of first and following meetings, and to select an executive committee, and to select a secretary for the first meeting. At this meeting, to be held about the middle of this month, a permanent chairman and secretary will be elected. The committee will also be empowered to select a secretary for the first meeting. The committee will also be empowered to select a secretary for the first meeting.

The circular will be sent out in a day or so to canoeists and boaters, and will be accompanied by a copy of the prospectus, and by a copy of the circular. The committee will also be empowered to select a secretary for the first meeting.

CLUB SIGNALS. Editor *Forest and Stream*: I trust that the secretary of the various canoe clubs in the country will act on your suggestion in issue of 11th inst., and send you a set of their club signals. I have long frequently written to the editor of the *Forest and Stream*, and have been disappointed in not receiving a reply. I have long frequently written to the editor of the *Forest and Stream*, and have been disappointed in not receiving a reply.

LAKE GEORGE C. SIGNAL.—The Lake George C. C. have adopted for sailing signal a red-pointed star, to be displayed at peak of mainmast or in last lower corner of foremast, and the burgee of the British flag, to be displayed at the top of the foremast, with exception of the lower. Our club was organized in the fall of 1887, and it would seem as though they should have priority in those colors. They are now used by the Forest and Stream Club, and by the Toronto Canoe Club.

TORONTO CANOE CLUB.—The Toronto Canoe Club wound up the season by a cruise around the island on Saturday afternoon. The weather was beautiful. A gentle steady breeze blew from the west, and the water was very calm. The club was composed of several sailboats were out.

T. N. B.—There is no place in New York where large hamboes can be had unless imported to order, but they may occasionally be found on China ships, where they are sometimes damaged.

Yachting

HE IS ON A CRUISE.

Editor *Forest and Stream*: Having learned that your nautical editor will be absent this week on a cruise in the *Forest and Stream*, I am greatly gratified to be able to make a few remarks. I am greatly gratified to be able to make a few remarks. I am greatly gratified to be able to make a few remarks.

There were three regattas. We will admit that two of the three were won by the cutter, and such a howl as was made over it. What frankly we say, we do not think that the cutter did it. We do not think that the cutter did it.

I protest against this fulsome praise of cutters and ridicule of every other model, and of the labor of effort to magnify the one and depreciate the performance of the other. One swallow does not make a summer, nor two, and two cutters do not make a season. I do not think that the cutter did it. I do not think that the cutter did it.

While all this is going on deck, there is a delightful state of things below. Everything clattering to leeward, and to be in a windward berth is to perform the flying trapeze act. The skylight must be kept open, and the water must be kept out. The water must be kept out. The water must be kept out.

smoothed over, and the same again in this last one where the cutter was beaten. I claim fair play, and protest against this attempt to influence the jury by the use of the words "fair play" and "fair representation." Fair play, say I, and a fair representation of the facts, and every craft shall have its own bottom. Cutters, though, having none must I suppose be dejected.

My proposition is this, and it is fair, to give voters credit for all the various processes, and to give credit to the cutter for its own credit. If they beat our boats, all right, we will give them due credit, and if we beat them we want the fact honestly admitted, and not have it hid in some obscure corner, or in some obscure corner, or in some obscure corner.

CONCERNING OPEN BOATS.

Editor *Forest and Stream*: As you have seen it is not editorially my letter published to the effect that the liberty of regaling it is as to not fully agree with all you say. As to Vixen's sailing around the Lily R. in circles, to use similar language, it is not editorially my letter published to the effect that the liberty of regaling it is as to not fully agree with all you say.

As to the Oriva's being six times as large as the Lily R., that is a question you would do well to carefully consider. The following figures will show that the Oriva is not six times as large as the Lily R. The Oriva is not six times as large as the Lily R.

In that race, an open boat, the *Nettie Thorp*, her loadline being 1100 lbs., was defeated by the *Lily R.*, but by the same loadline the *Nettie Thorp* was defeated by the *Lily R.*, but by the same loadline the *Nettie Thorp* was defeated by the *Lily R.*

As to making a valid defense of traps, I do not consider either the *Sophia* or *Mystery* to be in point, both being cabin boats, to the best of my recollection, and of course the *Lily R.* is a cabin boat, and of course the *Lily R.* is a cabin boat, and of course the *Lily R.* is a cabin boat.

By Mr. Gardlan's figures Oriva is, roundly speaking, twice as long and three times as deep as Lily R. It will hold one match-box in length, and one match-box in width, and one match-box in height. It will hold one match-box in length, and one match-box in width, and one match-box in height.

There is no analogy under such circumstances. The *Petra* was fit and ready to go anywhere for any length of time. The *Petra* is fit and ready to go anywhere for any length of time. The *Petra* is fit and ready to go anywhere for any length of time.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF Horses, Cattle, Sheep, Dogs, Hogs & Poultry. For Twenty Years Humphreys' Veterinary Specifics have been used by Veterinarians, Stock-breeders, Horse R. B., Trainers, Hippodromes Managers and others with perfect success.

- LIST OF SPECIFICS.**
- A. A. Cures Fevers and Inflammation, Milk Fever, Sanna, Malignity, Hog Cholera, 75c.

BRAIDED FISHING LINES.

The great superiority of a properly braided line over a twisted or laid line, has increased the demand for braided lines enormously. This demand has induced a number of manufacturers, entirely unacquainted with the requirements of anglers, to put on the market a quantity of perfectly worthless goods. Many of these lines are undersized and short of marked length; nearly all of them are made of poor material and on old-fashioned machines. Anglers will please take notice that all of our best braided lines—cotton, linen, raw silk, boiled silk, oiled silk, enamel, and polished waterproof tapers—are labeled with our full firm name and trade mark, except the enamel fly lines on cards, which bear only our trade mark and the name of the Empire City Erad Co., whose agents we are.

Orders received from persons residing in cities in which the dealers keep a full line of our goods in stock will not be filled at any price.

ABBEEY & IMBRIE,

Manufacturers of every description of
Fine Fishing Tackle,
48 & 50 MAIDEN LANE, NEW YORK.

JAS. F. MARSTERS,

55 Court Street, Brooklyn.
MANUFACTURER AND DEALER OF

Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., \$1.00; 120ft., \$1.25; 180ft., \$1.50; 240ft., \$2.00; 300ft., \$2.50; 400ft., \$3.25; 600ft., \$2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., \$1.00; nickel plated, 10 cts. extra. Metal Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., \$1.00.

Sprout, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Abernethy, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; double, 25 cts. per doz.; treble, 50 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts.; Double Twisted Leaders, 3 length, 5 cts.; 4 length, 10 cts.; treble, 10 cts. Trout Flies, 50 cts. per doz. Black Bass Flies, \$1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, \$1.25 to \$5.00. Trout and Black Bass Fly Rods, 10ft. long, \$1.50 to \$10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

ANGLING TALKS:

BEING THE

Winter Talks on Summer Pastimes

Contributed to the FOREST AND STREAM

By **GEORGE DAWSON.**

CONTENTS:

- Simple Wise Men, About some Distinguished Anglers of our Time,
- About Bass, About Salmon Fishing,
- About Grayling, Salmon and Sea Trout Haunts and Habits,
- A Memory, Several Relevant Topics,
- Reminiscences, Angling Mishaps,
- Odds and Ends.

Extract from the Preface:

"The 'Talks' attracted wide attention at the time of their publication in the angling columns of the FOREST AND STREAM, and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable. These 'Talks' are brimful of manly, wholesome sentiment; there is in them all a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he performs sturdily the author's entreaty: 'The effect is magical, like that of the mimic players in Xenophon's *Symposium*; he who reads, if he be an angler, must go a fishing; and if he be not, straightway then must he become one.'"

Limp Cloth, 78 Pages, sent postpaid on receipt of price, 50 Cents.
Forest and Stream Pub. Co., 39 Park Row, N. Y.

KYNOCH'S Patent "Perfect" Brass Shells,

MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and clatter, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectively crimped with tool (as represented in cuts) and straighten out, to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO.,

SOLE AMERICAN AGENTS
101 & 103 Duane Street, - New York.
WILLIAM READ & SONS, Boston, Mass. Agent for New England & A

UPTHEGROVE & McLELLAN, VALPARAISO, IND. HOBABIRD SHOOTING SUITS

Of Waterproofed Duck, Irish Fustian and Corduroy. Unequaled in Convenience, Style, or Workmanship. WRITE FOR CIRCULAR.

THIS is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

Danz' New Pat. Decoy Duck

This is a double folding decoy, consisting of two metal profiles precisely alike, hinged to either side of a flat wooden float. One of these acts as a keel to hold the decoy upright, but if it gets tipped over, as both sides are alike, no harm results. We also make to order the double decoy with different profiles on opposite sides of the float; say a mallard on one side and canvas back on the other. So you have two dozen ducks for the price of one dozen.

Sportsmen who have tried this pronounce it "The Decoy of the future." Its excellence is so apparent, we now make no other styles. A large variety always on hand, including Mallard, Teal, Red Head, Canvas Back, Blue Bill, etc.

PRICE LIST.

- Ducks, either style, with cord and anchor, complete, per doz., \$12 00
- Geese, for stubble shooting, " " " 13 00
- Geese, combined for land or water shooting, " " " 21 00

Fifteen per cent. discount where our goods are not on sale.

For Circulars and Terms to Dealers, address

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, NOVEMBER 15, 1883.

VOL. XXI.—No. 16.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C. London, England. Subscription agents for Great Britain—Messrs. Benson Low, Marston, Searle and Bivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 35 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

CONGRESS AND THE LARGE GAME.

DURING the coming winter legislation of interest to sportsmen may be looked for at Washington. The interests of the Yellowstone National Park will, we are confident, be cared for by Senator G. G. Vest, whose fidelity to the trusts committed to him by the public has been already proved. The act protecting this beautiful region, which during the past summer has been visited by many of our readers, will, if its provisions are enforced, do much for the wild creatures who make their homes among its rocky fastnesses, and while perhaps not in all respects perfect, will serve for the present. We look forward to a time, however, when the public feeling shall be so strong on this subject that a law having a far wider scope shall be enacted in behalf of the National Park.

There is another phase of the Park question which will probably be discussed this winter. This is the project of enlarging its boundaries. We have given reasons, based upon an intimate knowledge of the country, and confirmed by the opinions of others equally well informed, why this should be done, and done without delay, and we have no doubt that these reasons will commend themselves to those Senators and Congressmen who may give themselves the trouble to look into the question a little.

Of course there will be others who will obstinately oppose any measure for the protection of this National pleasure ground, who will through sheer stupidity and inability to comprehend the higher needs of the people, urge, as did a certain distinguished (sic) Senator last year, that the appropriations for the Park shall be cut off, and the region thrown open to settlers. Against such dull ignorance it is in vain to do battle; such men cannot be convinced. We may, however, reasonably hope that a majority of the Federal Legis-

lature will be intelligent enough to realize that the increase in the Park's area is a matter of importance, and one that demands prompt action.

The large game of our Territories is diminishing each year with greater rapidity—a necessary result, perhaps, of the settling up of the country. That it must be exterminated is a conclusion which is inevitable, though something might be done to retard the work of destruction which is now going on, if Congress would only take hold of the matter in earnest. There can be no doubt of the right of the Government to legislate for the protection of wild game in regions where it is the owner of the soil. On the ground of the public policy and *ratione soli* (because it is the possessor of the land) it has this right—a double authority. It is a right, moreover, which it has already assumed, and one which other governments have also exercised in the past. It is true that in regard to some species of our wild game, such legislation would come too late to be effective, but there are other species now rapidly diminishing in numbers, whose tenure of existence might be lengthened by a wise general law for the protection of game. Such a law might be passed for all the Territories.

The buffalo are practically exterminated, and it is too late to hope to save them; but the elk, the antelope and the mule deer remain, and in some localities are still sufficiently abundant to tempt the cupidity of the skin hunter. The opening of railroads in every direction throughout the West makes it now an easy matter for the merest tyro to reach a good hunting ground, and men from the East and from England run out West, have a week or two in the mountains, and return, counting their elk, antelope and deer by dozens or scores. Besides what they kill, the number that they wound and that go off with broken legs or balls through the body, too far back to be at once fatal, is very great. Less than three months ago we had occasion to remain for some days in the mountains, near an English hunting party, and we found almost every day in riding through the hills carcasses of dead elk. From some of the bulls the heads with antlers had been removed, but the cows were usually untouched by the butcher's knife—were not even bled. They had been shot down wantonly, and for no purpose.

The game laws of the Territories as they stand at present are inoperative. There seems to be behind them no strong public sentiment calling for their enforcement. A Federal law, backed by the power and resources of the Federal Government, would change all this. Naturally, the introduction of such a bill would be greeted by a howl from demagogues and politicians for "economy." These Solons would recommend a penny-wise pound-foolish course of hoarding up money, when the Nation's treasures are overflowing with the revenues, for which it is unable to find a use. The press of to-day is greatly exercised because the Treasury is obliged to pay off the National debt faster than seems wise, and the bonds deposited by the national banks to secure circulation are being called in. The expenditure of a few hundreds of thousands of dollars to enforce the game laws on the Government lands in the West would be an act of wisdom which past experience does not encourage us to hope for.

If we feel strongly on this subject it is because we have seen with our own eyes how great is the change which has taken place within the past fifteen years. We have seen how rapidly the western country is settling up, how rapidly the game is being destroyed even in most favorable localities; and from the past we can judge of the future. Years ago, before the horrible slaughter began, which resulted in the extinction of the bison over almost the whole West, we advocated the protection of this species, and since then we have not ceased to call for similar measures in behalf of our other game.

This subject is one which interests the people at large far more deeply than is supposed by the average Congressman, who seems too often to be rather pachydermatous on any subject where dollars or political preferment are not concerned.

"AMERICAN KENNEL REGISTER."—The November number of the *American Kennel Register* contains the pedigrees of no less than ninety-four dogs of all breeds. It has also a complete set of the show awards at London, Louisville, and the various agricultural fairs, together with a special report of the London show. It is announced that the first volume will close with the December issue so as to make each volume a yearly one. Owners will see how desirable it is to get in as many entries as possible before the close of the present volume, in order to get the benefit of having their dogs included in the index. They will oblige by sending their entries in as speedily as possible.

WOODCOCK NOTES.

LAST Saturday the weather was mild and muggy, with occasional showers of rain, a capital day to go shooting. Sunday was almost the same, but was a little brighter. That night the weather cleared, and the woodcock, we venture to say, started for the South. Monday was clear and cold with frost, and during the morning snow squalls and a piercing wind. The woodcock shooting, which during October and the first ten days of November, was unusually good in New York and New England, may now be considered over for this season, though a few old stragglers may perhaps be met with for a month yet. During the fall we have heard of some very good bags of these birds, one of the most notable of which was made by two Massachusetts sportsmen, who secured forty-two in one day. Those who go into the brush from this time until the season closes must content themselves with killing the ruffed grouse and the quail, and these, if we are not mistaken, will be found more abundant this year than for many seasons past.

On Tuesday last, Nov. 13, a woodcock was discovered on the roof of a building in Duane street, in this city. It was seen from an office window, and for some time stood in one place without moving, being apparently cold. The tail of Monday's storm was still passing over the city. The gentleman who discovered it at length sent a porter on to the roof to try to catch it, but the bird declined to become a captive and flew off. We have more than once seen these birds in the uptown streets during the summer and in September, and have been told by a gentleman that years ago he used occasionally to shoot them on the old Houston street graveyard.

RED-LETTER DAYS.—They come in October and November. The sportsman who finds game abundant knows nothing of the "melancholy days" sung by the poets. Now and then a field tramp ends in disappointment and a touch of disgust, but there is compensation in reading of the happier experiences of others; that is one reason why the accounts contributed to the FOREST AND STREAM are so acceptable to its thousands of readers. We have heard from the sportsmen who had hard luck, and from the veterans who praise the times of their youth to decry the present state of things; now it is in order to know of the RED-LETTER DAYS, when the birds were flushed in the corn, the wild duck's fight cut short, and the deer hung up before the tent. Tell us of the time when you had "good luck."

HARVARD has a rifle and gun club. Princeton has something of the kind, and so has the University of Pennsylvania. Why can we not see a series of inter-collegiate rifle, or clay-pigeon matches? When students graduate, they put away a ball (unless they join the professionals), boating, football, and other like amusements; but the collegian who learns to use the gun or rifle has acquired something that will last through his lifetime. The recreation of shooting is one that will not interfere with the dignity of any station in life.

LIEUT. FRED'K SCHWATKA has promised us a series of papers relating to his recent explorations in Alaska. We also have on hand for immediate publication a valuable series of chapters descriptive of "Life Among the Blackfeet." They are by one of our old contributors, "Ap-pe-kun-ny."

BEAST, BIRD AND FISH have seasons which nature has set apart for their vacation; men theirs, which are not fixed by any unalterable law. Which should be most respected?

SHOOTING AT A MARK is sometimes profitable. One Connecticut marksman, who has attended eight shooting matches this season, shows \$200 as the profit.

THERE IS A VAST DISTINCTION between a "sporting man" and a sportsman, and between a "sporting" paper and a sportsman's paper.

THE OWL QUARRIELED with the hawk because he took in the daytime what the owl would have taken in the night.

IF EVERY SPORTSMAN would be a game protector, game would be well protected.

CORRESPONDENTS ARE RESPECTFULLY REQUESTED to write on one side of the paper only.

NO MEASUREMENT JUGGLERY THIS TIME.

THE New York Y. C. at the beginning of the season unanimously adopted sail area and length for the competitive measurement of yachts. The rule was formulated by a committee of experts. The committee included Mr. A. Cary Smith, a yacht designer with greater experience and a wider range of general knowledge than any American in the profession. It also included Mr. J. Frederick Tams, an expert yachtsman, thoroughly conversant with all that appertains to the sport in every bearing, and vice-president of one of the largest shipbuilding establishments in America. It also included Mr. C. Smith Lee, equally an expert and familiar with yachting affairs at home and abroad. It also included Messrs. Anson Phelps Stokes and Chas. Warren Lippitt, yacht owners and practical yacht sailers. This committee, after full and thorough investigation, with a full knowledge of the design of modern cutters and a full knowledge of the probability of a challenge from abroad for the America Cup, decided to recommend a rule which should show no prejudice to any type and which should permit the equitable classing of British and American yachts in the event of an international contest next season. This rule the New York Y. C. unanimously ratified after mature consideration, with a full knowledge of its workings in every respect, with a full knowledge of the design of modern cutters, and with a full knowledge of the probability of a challenge for the America Cup under that rule.

The recent fall races have brought about the conviction that the America Cup will be lost next season and that this emblem of precedence in yachting is to be transferred again to British shores through the instrumentality of a cutter.

If under this impression any attempt is set on foot to alter a measurement rule adopted with a full presentment of the responsibilities it entailed, that movement will be such barefaced chicanery and sharp practice that, with the public, we will not hesitate to pronounce such an attempt as infamous.

We do not for a moment suppose or even hint in the remotest manner that the New York Yacht Club as a body is capable of stooping so low as to seek the retention of the Cup by foul means if unable to hold that trophy under rules of its own deliberate creation. But recently some prominent members of the club have appeared in print with the suggestion that dabbling and cooking the rule be again undertaken, with a view of outclassing the cutter and prejudicing her chances in advance by jugglery which would be met with a storm of indignation at home as well as abroad. If such a proposition has been made by the persons in question through oversight of its real portent and consequences, we trust they will see fit to counteract in the future the suspicious of contemplated foul play they have unwittingly raised in their anxiety for the safety of the Cup. If their proposition has been made in earnest, in full recognition of all it implies, we pronounce their endeavors the most outrageous perfidy and shameless attempt at sharp practice ever sought to be perpetrated in the annals of sporting history.

Owing to the one-sided prejudice incorporated in the conditions of the challenge, the America Cup is even now in bad repute. If foreign yachtsmen have the courage to shoulder the handicap these conditions impose, the probability of a challenge hangs only by a slender thread.

If, in addition, the foreign yachtsman discovers grounds for suspicion that the Cup is to be held at all hazards, even to the artificial garbling of a measurement rule deliberately adopted after long research, and definitely accepted by the New York Y. C. as equitable in the event of an international challenge, the possibility of a trial between the two types is swept away forever at a stroke, and the possession of the Cup, so far from remaining a proud symbol of supremacy, will degenerate into a token of reproach, evidence of the cowardice and unsportsmanlike character of the club which meets every advance for fair competition by the most reckless and impudent subterfuge, disgraceful to all having any connection with the custody of the Cup.

History in the past unfortunately supplies to foreign yachtsmen grounds for well-founded suspicion that the America Cup is to be retained by measurement concoctions, should its tenure seem doubtful in a fight fair to both parties.

Upon the New York Y. C. devolves the duty of pronouncing in its official capacity against the outrageous propositions recently advanced by some of its members.

It is true that no person in his individual capacity can legally compromise a club of which he is but one member, but it is equally certain that when a prominent yacht owner openly declares in the public press, "that it is more than probable that a change will be made in the present rule," that the club is morally compromised to the extent of the influence that person carries.

No British yachtsman will be fool enough to take his chances upon an avowed intention to juggle him out of the fruits of his visit by measurement contortions, devised with swindling intent in the eleventh hour.

As six months preparatory notice is required by the conditions, we submit that, if the New York Y. C. is not desirous of shirking an international match, its intentions on the measurement question be officially reaffirmed to prevent that suspicion of foul play, however groundless it may in reality be, which the recent expressions in print of some of the club's members are certain to arouse in foreign sporting circles.

What the New York Y. C. may choose to do after the ex-

pected international match, is foreign to the object of this writing. Having accepted a rule, already identical with the rules generally prevailing throughout the country, and in full consciousness of all the rule carries with it, an effort to escape a just accounting, induced by fear of defeat, would be such barefaced sharp practice that there is not even the ghost of a probability that the New York Y. C. can be induced to tamper with its present measurement rule, however much single persons may compromise the club's fair name by unauthorized announcements of impending bad faith.

For the sake of promptly setting suspicions abroad at rest, it is the plain duty of the New York Y. C. to take official cognizance of the expressions of some of its leading members which threaten to end all prospects of an international match and to sacrifice the good fame of American yachtsmen as a whole through the hasty recklessness of their implications.

The Sportsman Tourist.

OCTOBER.

OCTOBER'S here! Let us away. While autumn colors, bright and gay. Adorn the woodlands fair! With dog and gun we'll range afar. Leave all our troubles where they are. And seek relief from care.

On sunny slope, where matted vine Among the birches loves to twine And wander o'er the ground. The woodcock hides with folded wing. And springing upward makes a ring His startling, whistling sound.

And, where more sheltered groves appear, Of chestnut, oak and maple, near Some quiet, sunny vale, The wary grouse, of pinion's troug, Disturbed, affrighted, darts along. As swift as summer gale.

Or, where again sweet briars grow, And fields the yellow stubble show. That bore the golden grain, Bob White resorts, his mellow note Resounding from his mottled throat. A clear and sweet refrain.

And, yet once more, where meadows bare, With pool and streamlet here and there Diversified, lie brown, The dainty snipe in zig-zag flight, When hunted, hastes away from sight. And, distant, settles down.

'Mid scenes like these the sportsman's days Shall pass in pleasure, while he pays His vows at Nature's shrine. The ripened glory of the year, October, queen of months, is here!

Oh, queen, our heart's are thine!

OCTOBER, 1883.

C. T. D.

OUR FIRST AND LAST CRUISE.

TWELVE months ago four of us, ignorant enough to think that we knew all about sailing, went for a cruise. A 6-ton sloop rig, open cockpit "punkin seed" had fallen to our lot, and we determined to take advantage of its being Saturday to try her. Business kept us at our offices till 4 o'clock P. M., and then down to the wharf we went. Everything was soon in readiness. The moorings were cast off, also our coats, slippers and socks. Our captain knew the most, or rather the less little, about navigation and seamanship, for any photographer could write on his thumb nail all that he knew on the subject. The breeze was fair, but only in direction, not in force, for there was none; by this I mean if there had been any wind would have been called a fair wind. I have, however, rightly named it, for it was indeed "fair" for such a crew. The mainsheet is hauled aboard, as is usual, I believe, with such men, who not seeing the canvas belly out, do their best to make it. The yacht is found to be unmanageable at once, and her nose points back to her moorings. In our dilemma some kindly-disposed sailors on the neighboring craft seeing with their keen eyes that either they must aid a handicap or receive a "dig in the ribs" were quick to render us assistance. Filling in their chain plates, prefer the former course, and with a most dexterous whirl of a heaving line—which, by the way, our second mate (all were officers) endeavored to catch with his nose—took a turn round that said officer's leg, but before he went overboard our two senior officials had him secure, also the line. A few minutes' towing was indulged in, and the yacht passed, from schooner to barge till clear of the shipping, in perfect safety.

Quite enjoyable were the quiet laziness, the tobacco and the yarns that evening. No wind to disturb one's anxiety. The jibes of the main boom were frequent, but quite harmless. The steering, although a *sine qua non*, was also a secure office for many reasons—such as the absence of wind, of any sailing orders, or any compass; the yacht, however, endeavored to make up for the lack of the latter instrument by turning round and round, as if on a pivot, and desirous of acquainting us with the different points of the compass. The darkness which crept on apace, did not disconcert, but rather brightened us up, for it brought to our view the light at Point Abino and made us anxious to reach it, the exploit forever to stamp us as great seamen. Then our noble craft, as if tired of balking so long, made up her mind to go, and soon we reached Point Abino, having been some seven hours out from Buffalo. Here we put in a night, in company with some brother yachtsmen from our city, and in order not to overlook ourselves we refused to go to bed.

On Sunday morning began our voyage home. No thought of caution pervaded our minds, for having voyaged there so safely, why not in safety return, and I think had not a sudden squall buried us half under water we would have been of that opinion still. But now real work commences, now common sense and true bravery comes to the fore, and I do not doubt it did, but I either did not take the trouble to see or I have forgotten. I do not know, however, there was a general scramble, a awful shaking of canvas, and some convulsive spluttering. I have a vivid recollection of seeing

a fearful *debris* of ropes bathing both in and out of the yacht and our noble captain pulling and hauling at their executives which seemed to me to be the most obstinate cordage that was ever belayed on a pin. Something must have given way to his strength, however, for I suddenly felt myself enveloped in what felt like a mammoth fish cloth, and on burrowing my way out I missed the sail aloft.

We were now set to work balling, and during this occupation explanations were exchanged, and each of us had his tale to tell. On counting the missing, we found one coat, three stockings and five boots, the remainder of our victuals and sundry small articles had been washed overboard. The sea, which had previously been playing up and down our bows like a kitten, had now, in so short a time, grown like a lion, which came leaping and leaping at our stern, trying to keep pace with the wind, and both doing their level best. The squall was but a herald of the gale. From which quarter we knew not, neither did we trouble to find out, supposing it was from the same direction as, before, and being ignorant of the fact that the yacht had run right up into the wind, and thus had not only saved us from capsizing entirely, but made us lose our bearings. All canvas was stowed as well as our knowledge and circumstances allowed; ropes, however, being left to themselves, as we could find no end to any of them, and if we could, it would have occupied a colony of Davenport brothers some time to have disintegrated them; 10,000 fish worms in a can never could perform more intricate and acrobatic problems than these wet ropes did. Never mind, we felt happier, because the boat went steadier, yet the seas as they followed looked just as if they wanted to come in to us. Now and then a big swell would rise up like a giant with his mouth open, and his white teeth jutting going to take a bite out of our counter, and then things getting better of it, would tumble and roll under and around us, then carry us on its back with lightning speed, and in leaving give us a shove that seemed to send us astern. Bravely did our skipper hold his tiller amidships, and right before the increasing gale we went, but no welcome Buffalo spires, nor elevators, could we see ahead. This puzzled us. All day we scoured the sea, but found only a tiny portion of the water Erie looked like the Atlantic, and then, compelled to take those many involuntary dips, I was astonished to find the water was not brackish. Afternoon came, so did lunger, Evening came, so did sleepiness, but the stern command to cry "watch" every five minutes, kept us employed. All this got very monotonous till a big, strong, heavy, wet wave came climbing over the stern, and seemingly was not content then, but it must needs swallow me and me like a frightened dog looking for a hole to escape, either through the lockers or down the centerboard box. More hailing kept out the sleep, which this visitor expelled.

I don't like to say how many hours there were in the thought that followed; if I said there were 330 I shouldn't be believed, but yet I fancy this number must be short of the mark; at any rate, we had plenty of time to think over everything done, left undone, thought of doing, wished we had and wished we had not done, sins of commission and omission, relatives, friends and employers, obituary notices, epitaphs, coroner's inquests and many other cogitations, extending over a space of four times twenty-five years.

Amid the awful gloom that 11 o'clock on a stormy September night brings generally we spied a light dead ahead. Oh! I have seen several lights in my day, but none like this one. Edison could not hold out his brilliant light, his glare lit up our homes, and photographed our people's anxious and sad countenances. Its glare was a prophet, telling us how soon we should be with them. Its glare was a telescope, through which we could discern a safe harbor. Its glare told ribs, for it fulfilled nothing of the kind. We bore down on it and found it represented a huge, heavy propeller trying to hold its own against the tempest, and apparently quite disinterested about us. We shouted, "Take us aboard!" (How quickly the unlearned will show their ignorance when the opportunity arrives.) We heard, indistinctly, a reply containing the words, "dark"—"sea on"—but as we were just passed, more distinctly and a kinder voice saying, "Steer S. W. by S., and make for —" here the speaker's voice was lost in the howl of a larger zephyr than common, and increased distance. It might have been a great cry, but since we had our compass, "Take us aboard!" If we had, it was no. Our adventures just as well have asked us to swim ashore, or to go home and to bed for all the good it was to us; so, as we scudded along we waxed wrothly at the steamer's indumantry for not chasing and capturing us, but then after a while we concluded that perhaps, since we carried no light, the steamer had never seen us at all, and that being the case how was this feat to be performed. We did think that we saw an attempt made by it to come round and thus show her will, and we were more content.

What a noise the wind can make when it likes. The gully-gods of a variety theater could not equal it, even if the curtain failed to rise half an hour after time. It was perhaps a good thing, too, for although very sleepy, I will defy any one to take a nap in it.

At 6 o'clock it began to get a little lighter, and we could make out one corner of what was still better, the dark outlines of land. Our hopes revived. Land is dear to the greenhorn sailor, whether a lee shore or not, it does not matter. We were fast nearing some land and we should be safe. We never dreamt of "bars," "breakers," or "under-tow," yet, strange to say, we were told afterward that we must have crossed a "bar" with only two feet of water on it, which bears N. by W. for two miles from Long Point. I suppose a big sea carried us over, and on our next heading direct for Iverson Island, a promontory of Long Point. Had we touched that but nothing could have saved us. With a steady hand our captain jerked bow on to the beach, and with two or three spasmodic jerks the yacht stuck fast, the chasing waves piled in and we piled out, and as if shod with ten-leagued boots, strode ashore. The yacht swamped, but being of light draft, had been carried well up on to the beach, far above ordinary high water mark, which fact alone enabled us to escape the strong undertow.

One would imagine that with our safe landing on terra firma our troubles or at least our dangers were ended, but not so; they were but in their infancy. I must confess, however, that as we turned on the beach to gaze upon our late ark, partly submerged as she was, there was plenty of room for sentiment in us, poor empty things, having eaten nothing since six the morning before, and then only a hasty mouthful, just twenty-four hours back, and having had no sleep since we turned out of our beds in Bates on the Saturday night, now forty-eight hours behind. Although sentimentalism was entertained it was not long nursed, for we were on an unknown shore. We thought this must be either the State of New York or Pennsylvania, and were

just as confident of it as if there was no other land in existence; but we thought it a very wild, woody part, and as we walked along we heard the wampers and divers other ripples which came out to meet and inspect us. Naked feet, though, if I don't forget, are not just the things for a walking force through the mud. We turned up the nose for a mile and came to a marsh. We turned and traveled across for half a mile and came to a marsh. We walked down a mile and a half and were stopped by a marsh. Then we concluded that we were on an island. There was no dwelling, no human being. A cowbell told a tale of animal life, and the crow of a rooster a volume on foathery animation. How they ever got there, and when they should ever get away, would have been a grand theme for consideration had we been less busy with our animals. However, quiet moments of subsequent consideration have brought me to the conclusion that it was either a case of animal transportation for life, or that they, like ourselves, had been the cruel sport of the waves and wind, which latter opinion seemed the most feasible, since one of the prisoners gave the same name as Wm. Defoe did in his famous history, only he left out the Robinson.

We looked about and saw marsh everywhere, but one of us discovered, quietly nestling among the reeds, a roof, which seemed to indicate the existence of a house beneath it, only a mile or so distant. A shower of joy at once broke loose in the words, "Thou art so near, and yet so far." A family consultation resolved itself into a family compact, and ended in trying the solidity of the bog, for foot it we must, and the whole interval between us and the coveted dwelling was filled with mud. We ventured. One tuft of floating bog would sink deeper and deeper, as one foot tried its buoyant patience while we were using the other as a blind man would his stick, to punch and feel the next one, and then we had come to any conclusion concerning it we would be compelled to spring at it because our other leg was getting down somewhere in the neighborhood of Australia, and we were anxious to call it back. Many times we discovered a brother so low down in the world that no part of him was visible but his head and shoulders. Then a general rally would be in order, one getting as close as he dared, another seize his unmentionables by way of encouragement, and all, another would do the same by him, and so on. We went walking, and we walked, and the dwelling at dark, and had concluded we had been nearly eight hours when we floundered in the worst marsh I know of. It is a providential thing that strength gave out as it did, for had we attempted to ford what appeared to be a small stream, which was now the only obstacle between us and shelter, we should have been drowned twice over. This "small stream" is a hundred yards wide and without a bottom, at least on this side of one hundred feet. We rested and hollowed, and although for want of strength we did not make much noise, yet we made up in quality what was lacking in quantity. Nevertheless, it did its duty, and we rejoiced to hear in echo a clear ringing human voice, urging us "stay where you are and I'll come to you." A few moments brought in view a great, tall, moving object, greatly resembling a floating wind-mill, which on closer observation turned out to be a man flinging a long pole up and down, and thereby propelling what appeared to be a plank, but a still closer look and an inquiry, brought to light the fact that this was a living being, not a wind-mill.

We were willing to trust ourselves to anything at such a time, but, really as we shrank off from the shore, I experienced the most unusual nerve twitching, no matter how lightly I grabbed either side of this skiff, I found my body determined to squirm and twitch, and my head jerked convulsively from side to side, as if involuntarily used it for a balancing pole. I couldn't have been acting any worse had I been squatting on a galvanic battery. Then that long pole just over my head looked very dangerous, as if it swung to strike me, and as it waded up in quality what was lacking in quantity. Nevertheless, it did its duty, and we rejoiced to hear in echo a clear ringing human voice, urging us "stay where you are and I'll come to you." A few moments brought in view a great, tall, moving object, greatly resembling a floating wind-mill, which on closer observation turned out to be a man flinging a long pole up and down, and thereby propelling what appeared to be a plank, but a still closer look and an inquiry, brought to light the fact that this was a living being, not a wind-mill.

Kindly did the good keeper and his wife treat us, soft were the beds provided, soundly did we sleep, after partaking of a bite or two to eat, and a cup of warm tea to drink. We found that we had been washed ashore on the eastern side of an island, with the only land in our direction from Long Point, and the only land with connection to it, yet separate from it, all the remaining adjuncts are those marshes, so celebrated in sporting history for wild ducks. The house of our refuge was the club house at the company's "cottages" and our host the chief keeper. The distance we waded was a mile and a half. Our troubles are not all told yet. We were wounded, our legs and feet were cut, lacerated with marsh grass. Bahakia heroes had no worse sabre cuts, and survive it, than we had. A portion of their body, for a sabre to make such wounds would knock back the boue. Our little sabres cut quietly but honestly. We were anxious about one of the party in particular, who was much more severely lacerated (or legged) than the others.

After a long, heavy, but truly satisfactory sleep, we awoke to realize what hunger is. We eat. Hardly had we time to pay our respects to the outside morning, than we were surrounded by a mob; such a queer looking, dressed, and behaved set of men, who, one solemn looks, except we should happen in a locality. We were surrounded by a mob; such a queer looking, dressed, and behaved set of men, who, one solemn looks, except we should happen in a locality. We were surrounded by a mob; such a queer looking, dressed, and behaved set of men, who, one solemn looks, except we should happen in a locality.

to superintend the job, it would hardly pay any one to subtract this amount from the former, for little would remain. A conclusion I came to that we might as well have given ourselves up to the lake sharks as take the marsh exchange, and, if I don't forget, are not just the things for a walking force through the mud. We turned up the nose for a mile and came to a marsh. We turned and traveled across for half a mile and came to a marsh. We walked down a mile and a half and were stopped by a marsh. Our two engineers with the four-mile wagon stopped to examine some mines, and General Earl and I kept on our journey in the wagon with the Russian Finn. It was getting toward night, and as we had driven all day fasting, the General grumbled greatly. He was chiefly concerned with the cruelty of the driver, and made loud soliloquies on that subject, which were even insulting to the Finn. However, I took a more philosophic view and checked him, for, if the beasts should die, they would rest from toil, while, if they were not whipped, neither we nor they stood any chance for meat or drink.

For a few moments the General's attention was distracted by a singular ridge on our right. The name I was told was Gutcheubuh, but that gives but a faint notion of its character. Only a picture could truly reproduce the appearance of it, but it will not be far wrong to imagine a family of leaning towers of Pisa, greatly deformed, and frozen stiff on an occasion of drunken rot.

The General carried a portable camera and would gladly have photographed the spot, but to tell the truth, his pictures developed so much blur and so little outline, that I did not encourage the idea.

Soon after this *Agua Caliente* came in sight. *Agua Caliente* means hot spring (more literally "hot water") and the singular poverty of manumature which prevails among rude people, is applied to num-ber-less places. This spring, however, had marked beauties.

A pond, covering some twenty acres, was fed by different supplies which boiled up, in some places very hot and in some quite cool, while the hottest spring of all rising separately was carried in pipes over a fine orchard full of orange, lemon and other tropical fruit trees, while a lovely grove of date palms, the largest I have ever seen, rose majestic and graceful around the adobe house where the wagon drew up.

The young man who owned the house came forward with the graceful hospitality inborn in the good Mexican to bid us welcome. No doubt he would have spread us a feast could he have done so, but knowing the poverty and abstinence of the people I was not surprised to find his provisions limited to four fresh eggs.

Now the General, a man of extensive experience, insisted that hard-boiled eggs were easier of digestion than any other dish, but as he also was a food-epoch believer in the spontaneous generation theory of certain wild crops, I stuck to my old custom of having my eggs soft.

So I told my host that I wanted my share of the dinner cooked soft or *blanitos*, which he politely corrected to the more idiomatic *tibios* or tepid. However, he understood that they were to be boiled but two minutes, so I considered the matter settled.

I saw the fish of a match in a rear building and settled down to wait. My host returned after a time and I reminded him of the required tepidness of my eggs, which he assured me should be cared for, and meanwhile he conversed amably with us.

After a great while of waiting, I asked for my dinner with increased energy, and at last it came.

I cracked the shells and the eggs rolled out as hard as a Scotchman's head. I called the landlord's attention to the state of the eggs, which he sympathetically regretted but could not account for. Suddenly an idea seemed to strike him, "You're great," he cried, "I have it; the water must have been too hot."

H. G. DILLON.

"OLD JOE CALL."

LAST February the FOREST AND STREAM asked for some information about "Old Joe Call." He lived and died in this town, Jay, Essex county, N. Y., and one of his sons, Mr. Joseph E. Call, resides here now. "Joe Call, the modern Hercules," died at the age of fifty-two years. The Keeseville Herald of 1836 gives the following interesting reminiscences of him:

His life of the late Joseph Call was rife with incidents, and although not to our purpose to play the part of biographer, yet we have thought it not unprofitable to give some of his experience, in which was displayed the great and almost incredible strength with which he was gifted.

Of his early childhood we know but little, yet one incident, however, has been related, that displays that peculiar trait of humor for which he was so remarkable. It seems that upon a certain occasion, Joe, indignant at being publicly whipped in school, no sooner made his appearance upon the floor than, seizing upon the "knight of the birch," he made "Toby did on the fly," inconspicuously thug him neck and heels out of the window, amid the uproarious shouts of his companions.

As he grew older, his natural joviality of disposition led him to frequent whimsical displays of his physical superiority. At one time he would lift a barrel of cider to his lips, and after satisfying his own thirst from the bugle, he would offer to pass it around to his companions. At another time he would silently stand behind a teamster's wagon, seize hold of the wheel, and suddenly bringing the team to a halt, would quietly remark, "A breathing spell to your nag, neighbor."

At one period of his life when a teamster himself he often found his immense strength oferrat service, for whenever his team would get "set" in a mud-hole he would get under the wagon and with his broad shoulders beneath the load, would raise load and wagon until his team could drag it out.

A celebrated wrestler from Albany having heard of Joe's reputation, made him a visit for the express purpose, as he declared, "of giving him a touch of the laucey." Joe, with his usual modesty, disclaimed knowledge of the exercise, but upon the stranger pressing him to "take hold," he finally consented. Accordingly they grappled; the stranger throwing himself into the most scientific position, while Joe, pretending utter ignorance of all rule, assumed the most care-free and relaxed attitude. The hold scarcely got fair hold when the stranger, placing his foot upon Joe's hip, attempted with a sudden jerk to throw him with "what is termed the toe lock." But Joe, anticipating his movement, quietly permitted him to assume the necessary position, and then as he stood balancing himself on Joe's foot, Joe gravely raised him into the air and danced him about as a mother would her child.

On one occasion Joe happened to spend a night at St. John's, and he went to the office of the hotel where he stopped, the conversation turned upon a visiting Joe, being a stranger to all, took no part in the conversation. At length one man, after relating several wonderful feats he had accomplished, boldly asserted that he had thrown Joe Call. Joe, as might readily be supposed, was not a little surprised at this assertion from an entire stranger, and in

AN INCIDENT OF MEXICAN TRAVEL,

WE were going to Alamos, a fine old typical Spanish town in Southeastern Sonora. However, the incident happened in a place before we got there, so I shall give no details of Alamos.

There were two ways of going; one by sailing vessel, which went at long irregular intervals, plying between Guaymas and Ajtawumpo, and after a trip of extreme dirt, hardship and toil, led the traveler to find his way on mule back from the latter port to Alamos. The other, to hire a wagon and leave the Sonora Railroad at Ortiz, when by driving for about a week you could make the journey comfortably. We went by wagons. One four-mile wagon carrying two engineers, General Earl, myself, the driver, and a little boy to throw stones at the leaders. Another wagon with two animals carried the extra baggage. This last vehicle was remarkable both for team and driver. The team consisted of a mule twice the size of a mouse, and the well-meaning but feeble remains of a horse. The first glance would make you believe that the concern would never go a mile, but you would be reckoning without your driver. This person was a Russian Finn. He spoke no language intelligibly, but conversed fluently, and from being an orthodox as I have been, or, as they are more of a "salt" than I, he thought nothing of it. If they enjoyed it, all right! "Chaeva ita son yout."

Port Rowas, Oct. VERAAX.

WE drove for several days through the flat barren lowlands, gauging our stretches by the chances of water and cork stalks for the mules. The road was pretty good, thanks to benevolent nature, for no work except that of driving over it was ever put on it; and the warm, clear nights would have made it necessary to sleep out of doors even if we had had a house at our disposal, so we camped.

Our route took us through Bucana, a little town on the Yaqui River just at the end of the Yaqui country. And here a curious fact is to be noted that deserves a digression. The Yaqui River is the largest stream in Sonora, the only one in fact, except perhaps the Mayo, which reaches the Gulf of California in spite of the maps to the contrary; the other rivers all evaporating or stinking on the way. In dry times the Yaqui carries but a little water as the Mohawk at Utica, and when swelled by rain the Mayo and Mayo spread so far over their plains as sometimes to quite join together. This low ground near the mouths of the Yaqui and Mayo rivers forms an extensive, indeed the only extensive farming district in Sonora; and it will give one an idea of the Mexican people and government to know that a band of ignorant, uneducated Indians rule this part of the country, and permit no interference by the whites, or rather the yellows. Now and then they let a white man buy a farm amid them, but they take both farm and money and turn the intruder out at any moment they think fit. As a great concession they let the mail-rider pass through their country, but other people cannot do so unless they contribute their firearms to the chief's collection, or have exceptional luck.

To return to our journey. Nothing of note had taken place until we reached the Mayo River, except the determination to embody a description of the trip in verse, which had been foisted after the production of these eight lines:

"The sailing buzzard's ragged wings aslant,
 And me weless through the heat and starmant air;
 The morning sun on my face, and my eyes
 From the low bushes heath the startled hare;
 Through the dark forest-guards' career's massive steps
 The ear's a-whirring, and the hoarse voice of a gam,
 And screeching parrot's, those wilying gems
 Of emerald, quarel' o'er their noisy game."

But now we were getting into a mining region, and the hills began to swell into more bold and rugged forms.

that spirit of fun which always prompted him exclaimed: "Why! you would swallow a common man. I should like to take hold of you myself if you would promise not to hurt me." The braggadocio instantly accepted, and they took hold. Joe, with scarcely an effort, raised him from the floor and, holding him at arm's length, said: "There, now, wrestle!" The astonished wrestler could only cry: "Who—who—the devil are you?" "The man you threw—Joe Call, at your service, sir."

But the most remarkable feat which Joe ever performed was on the occasion of an incidental wrestling match which occurred between himself and another individual during the late war (1812) at Plattsburgh. It seems that in the British camp was a celebrated English bully, whose massive strength and great skill both as a pugilist and wrestler made him the terror and the champion of the army. Joe happening to be in the English camp one day on some errand of office, it was soon noised about, and some of the officers, by chance getting wind of it and knowing of his great strength, determined to bring about a match between this Yankee Hercules and their own bully. Accordingly, having been brought together, it was proposed to Joe that they should have a "set to"; but Joe, who was anything but quarrelsome, and whose natural modesty of character placed him altogether above anything of the kind, peremptorily refused the match, asserting at the same time that he presumed the Englishman would throw him with the greatest ease, as he professed no skill whatever. To this the bully sneeringly replied that he could not only throw him but any other d—d Yankee they would bring on. This flung at the Yankees nettled Joe at once, for although conscious of his own strength, he cared little for any name to be applied to his stout person, yet when his motto came to be the object of such remarks his blood boiled at once, and he determined, right or wrong, to show the sneering bully that Yankee prowess was not to be lightly esteemed. Yielding to his patriotic feelings he immediately announced his willingness and they "took hold." The first trial was at what is termed "arms length," and Joe soon found that his antagonist was no "corrupt knight," to be handled in the sneering manner with which it had been his wont to treat his opponents of the ring. At the first onset Joe was brought to his knee. Immediately springing up he confessed himself fairly "floored," and then requested that they should take a trial at "back hold." To this the bully assented. We have often heard Joe say that previous to this time he never could discover any difference in the strength of men, but that now he felt he must exert all of his power. Seizing hold of his antagonist he bowed himself into all the string and squeezed the vein booster to his breast. The Englishman gave one shriek, his arms loosed their hold, his whole frame quivered, and when Joe released him from his grasp the bully fell, and with his eyes protruding and blood gushing from his nostrils, dead at his feet. C. M. CV. T.

JAN. S. Y., NOV. 1, 1882.

Natural History.

A VALUABLE FOSSIL.

THE announcement in the press of the discovery by Mr. L. Stejneger of a complete skeleton of *Rhinidra stelleri* will be of great interest to naturalists. This remarkable animal, which, in 1741, was abundant on the shores of Behring Island and two or three days later was seen on Komandor Islands to the order *Sirenia*, and is thus closely allied to the manatee of Florida and South America. The dugong is another living member of this group, which is found in Australia and India. In tertiary time a sirenian (*Holotherium*) inhabited the shores of Western Europe. The sirenians live in the mouths of rivers, feeding on grasses, seaweeds and aquatic plants. Sometimes they ascend the rivers to a lake water. They are sluggish animals, without any means of defense, and are easily killed. Only the fore limbs are developed, and even these are not divided, having no visible fingers, but resembling the flippers of a whale.

Rhinidra is remarkable from the fact that it is without teeth. Instead, it had a hard horny palatine plate, which worked against another one covering the symphysis of the lower jaw.

The following account of the securing of this valuable specimen for the United States National Museum is taken substantially from the San Francisco *Alta*:

"A rare and valuable specimen was brought down from Behring's Island by the Alaska Fur Company's steamer *St. Paul*, which arrived on Sunday last from the North. This was no less than the skeleton of the Arctic sea cow found on Behring's Island by Dr. Leonard Stejneger, a member of scientific societies both in this country and Europe, who was sent to the island in the interest of science by the Smithsonian Institution. The doctor was hampered in his researches by the jealousy of the Russian officials, who are acting in the interest of the Russian Imperial Academy, which is also eagerly searching for a specimen of the sea cow, but in spite of their interference he succeeded in carrying away a skeleton, which is of the greatest possible interest. This peculiar animal, which is now supposed to be extinct, once made its home on the island. Whether it has ever lived anywhere else is a question. The fossil beds of Europe contain bones of sea cows, but none which could have belonged to animals like this. In the Indian Ocean there are also sea cows, but they are rare, and they are not like the Behring's Island extinct species. The sea cows of the Indian Ocean have teeth, but those at Behring's Island had none; only two rough bone plates in the mouth with which to grind up the seaweed which they lived on. We were resting their arms on the shallow sea bottom, they browsed in droves or flocks along the shore. Whalers killed the sea cows, and natives used their bones to make runners for their dog-drawn sledges. The only account given of them by an observer is that of the scientist Steller, who was one of Behring's second expedition, which was wrecked on this island and wintered there in 1741. The specimen brought here on the *St. Paul* is perfect, with the exception of the end of the tail and the wrist bones. In addition there is a collection of seventeen sea cow's skulls, all in a good state of preservation. The animals, when alive, must have been from twenty-eight to thirty feet long, with a head about two feet long. Its arms, of which there were two on the seal-like portion of the body, had no hands. They were simply blunt ends, which were carried on the back when the cows swam, and lay down to support it as it fed. The mouth was small and unarmed with teeth; the eyes were small; the

ears merely small orifices in the head, without any sign of an external ear; the tail and fins were like those of a whale. They were not prolific, the offspring being limited to one per year to each female, and they were therefore easily exterminated.

Dr. Stejneger said he was forced to use considerable diplomacy in dealing with the natives, for had he at once told them that he would pay more than the Russians would, there would have been an order prohibiting the natives from selling any of the bones, as there has since been. All that he could do was to say that he would give as much as the Russian officials, and making himself passively well understood, the natives worked for him. They did not go to work to hunt for bones exclusively, but as they walked along the beach they took their sticks and fell for skeletons. No other government has ever sent any one up there expressly for such a hunt, but the Russians are much interested, and possess several skeletons. He also established a signal station on Behring's Island. Dr. Stejneger, who is not, apparently, over thirty-eight years of age, congratulates himself upon the satisfactory results of his expedition, and stated that the skeleton which he brought with him was worth almost its weight in gold."

THE BIRDS OF PROSPECT PARK.

Editor Forest and Stream:

In the issue of this paper for October 18, 1888, Mr. W. B. Wyman prepared a list, giving the names of the birds which inhabit Prospect Park. The list is without any annotations whatever, and mentions eighty-one species, twenty-one more than the number given by Mr. George Hughes Jones, in the *Observer* for May 11, 1887, in the Central Park Grounds, in Brooklyn City. (*Bull. N. Y. Orn. Club*, Vol. IV., p. 31.)

On glancing at the list I was surprised to see *Hypochicla ustulata* (russet-backed or Oregon thrush) enumerated among the *Turdidae*. In 1874 (*North American Birds*, Vol. I., p. 16) Dr. Brewer gave the habitat of this species as the "Pacific Provinces of the United States" and southward. As Dr. Conant says, "So far as we are aware, this thrush has a very limited distribution, being mainly restricted to the Pacific coast region, from California to Alaska, in the breeding season, though migrating southward in winter to Guatemala." And since then further observations have not greatly extended this habitat. To find this west coast form here in the east would be very interesting, and if Mr. Wyman really has an authentic record of its occurrence in Prospect Park, ornithologists would be extremely obliged to him if he will publish the data relating to it, at least something more than the mere mention of its name.

Perusing the list further, I was not a little astonished at finding the name *Lophophanes atricinctus* (black-tufted or Texas titmouse). Hitherto this species has not been recorded from anywhere in this region, its habitat being the "Valley of the Rio Grande, south into Mexico, San Antonio, Texas, Vera Cruz." (*North American Birds*, Vol. I., p. 90.) I can only say here, as I said above, if the record can be authenticated, our eastern avifauna will have received an important addition. But as our common chickadee (*Parus octocephalus*) is not given, I presume that the latter bird is referred to.

In the next species Mr. Wyman has doubtless confused the English name of a western variety with that of its eastern representative, "white-bellied nuthatch" (*Sitta carolinensis* Gmel.) reading for "white-bellied nuthatch" (*S. carolinensis* Gmel.) (*North American Birds*, Vol. I., p. 310.) I can only say here, as I said above, if the record can be authenticated, our eastern avifauna will have received an important addition. But as our common chickadee (*Parus octocephalus*) is not given, I presume that the latter bird is referred to.

Among the remaining names of interest are *Mimus polyglottus*, *Ceryle alcyon*, *Aluco flammeus americana*, and *Caprimulgus vociferans*. One specimen of the mocking bird was observed in the Hospital Grounds, but was not secured; so other authentic records for the vicinity of Brooklyn will not come amiss. Although the cardinal redbird is rather an abundant resident in Central Park, it is not given in Mr. Cones's list, and consequently the occurrence on Long Island is worthy of note. The barn owl is everywhere here in this region, and as *Scops asio* [Linn.] Bp. is not mentioned I fear the so-called "American barn owl" is meant, but our little screech owl, *Bubo virginianus*, is a local bird, whose distribution, as given by Dr. Cones, is "Arctic America; S. coastwise in winter to the Middle States" ("Key to North American Birds," p. 311). Of course a record here would be a good one, and I can only regret that a few lines were not added, explaining the cause for the appearance of this name in the list.

Had annotations of these Prospect Park birds been given in full, the record, as I doubt, had been classed as a faunal paper of much interest and value. But (although Mr. Wyman is "certain as to their identity") as it remains, I fear some errors have crept in, and not until full data are given can the list be deemed of any importance.

LOUIS A. ZENGER.

[We may state that we have, since publishing the notes on the "Birds of Prospect Park," received contributions throwing doubt on the knowledge of their author, and a glance at the list confirms, as Mr. Zenger has said, the above. It is perhaps proper to say that the list was published during the absence of the natural history editor of this journal.]

HOW TO PREPARE BIRD SKINS.

FOR the benefit of several inquirers we reprint the following directions from our issue of Dec. 1, 1887.

A Texas correspondent writes: "Can you direct me how to remove and preserve the skins of birds so that they may be mounted by a taxidermist?" We can certainly give directions which will enable our correspondent, if he has patience and perseverance, to make skins which a taxidermist can mount, but we venture to say that his first essays at skin making will not be satisfactory. To unpracticed fingers a bird skin is a very delicate thing to handle, but we will soon give the requisite dexterity. Our method of making skins is as follows:

Fill the bird's throat with cotton, and plug nostrils and any large shot holes with the same. Place the specimen on its back on a table with the tail toward you. Break both wings close to the body. Separate feathers along the median line of lower breast and belly, and make an incision from the posterior extremity of the sternum to a little beyond the vent, taking care not to cut through the walls of the abdomen. Push the skin aside and raise it on one side until the

neck joint is visible, using the handle of your knife and your fingers, and avoid cutting as much as possible. Do the same on the other side. Cut off the legs at the knee, skin down carefully as near to the tail as possible, and then divide the vertebrae, taking great care not to cut through the skin. Stand the bird on the point of its breast, and push the skin down evenly, and using the knife little or not at all. Cut off wings at break, and confine to work the skin down until it has passed over the head, and is thus turned inside out. Pull out the delicate cervical brane with the finger nails and cut that behind the eye, taking care not to injure the eyelid. Remove the eyes, taking care not to puncture them; and laying out off the head, cut away the tongue and all the flesh from the skull. Break away the base of skull and remove brain. Cut away the broken end of the humerus, and the flesh lying between the scapula and ulna, loosening with the thumb nail the quill feathers from the latter. Skin legs down to tibio tarsal joint, and remove the flesh. Powder the inside of the skin everywhere with white arsenic. Use plenty. Place a pellet of cotton large enough to fill it in each orbit, and with large birds wrap a little cotton around the legs. Turn the skin right side out again, and draw out legs and wings into their proper position. Draw out the neck, few shavings, and the feathers will fall into their proper places. Take a long wad of cotton about as thick as the bird's neck and carefully introduce it into the neck, making sure that it passes into the brain cavity. See that the neck is short and thick rather than long and slender. Introduce another little bit of cotton into the throat from below, to give that the requisite fullness. Fill the body with cotton until it is about the size of the bird in life. Do not get it too large. Close the opening into the belly by two or three stitches, or by a button. Open the eyelids and pull the skin about the head up or down, as may be necessary to give the head and neck a natural appearance.

To fix the wings in position is the most difficult part of the whole process. They must be placed close to the sides of the body, as the bird holds them when alive, and to get them into the right position take the following method: The wing must be pulled upward and backward, that is, toward the head and back of the bird, and the scapular feathers brought forward over it. It should then be bent and placed close to the side, the feathers of the breast covering its border. If its position is right there will be no feathers standing on end near it; if wrong, the feathers will point half a dozen ways. It must be made right, or as nearly so as possible, for as it lies so it will dry, and when dry, after the other wing has been arranged, and any stray feathers are out of place have been lifted into their proper position, the specimen should be placed on its back in a half cylinder of paper, pasteboard or tin, in such a way that its back will be properly rounded, and left to dry. Before leaving it, however, the feet should be crossed and tied together, the bill prevented from opening by a pin or a thread run through a nostril and the throat and tied. A label giving age, sex, locality, date of capture, collector's name, and any other items of interest, should be tied to the feet. Some collectors place the birds to dry in paper cones, others pin a wide band of paper about the shoulders, and others still merely support the shoulders and wings by wads of cotton. A little attention paid to the skin while drying will pay for the trouble attending it.

IMPORTATION OF GAME BIRDS.—Boston, Nov. 11.—Mr. Leonard, of Boston, has this week secured an order to import for fifty or sixty game birds, including snipe, and an order to the West for 500 live quail. Mr. Leonard some few years ago let loose five brace of English pheasants but he never heard of them afterward; about a year ago he came across a gentleman who had shot the last one. But this lot he will try on a different plan. I doubt if there is a sportsman or game shooter in New England that has done as much as he has done in his day. The game of the State of Massachusetts, I have known him to carry in his team and bring out two bushels of mixed grain, and distribute it for the birds; not build brush houses for the quail for shelter so that they would not get caught under the snow. It was an amusing sight one day last winter in his house to see a dozen or more live quail walking around, and his dogs lying among them, neither feign dogs or the quail paying any attention to each other.—J. N. S.

WHAT IS CIVILIZATION?—The town of Yinton is infested with rats. They live in buildings, under the side walks and everywhere. A benevolently-inclined mink being apprised of the fact came loudly into town and commenced ridding us of the rodents. He had but entered upon his work when a man saw him and called a lot of dogs and a big crowd. With a roll and a yell, which sent the mink and dog sent up the most piteous wails to heaven for help, they worried and crushed its life out and threw its carcass into the gutter. They then went home, feeling apparently that they had had raw sport in the accomplishment of a good work. In that crowd of men and dogs there was no protest and not one word of sympathy for the poor little luckless friend of the town. What is civilization?—K. (Yinton, Ia.)

LARGE BULL SNAKE.—Yinton, Iowa.—Dr. Meredith, while on a visit to a patient a mile and a half northwest of town a few weeks ago, saw ahead of him in the road a dog running around some object and barking violently. As he drew near, the dog left and went on after a team in the distance. What was his horror to see before him in the middle of the road a serpent as large around as the sleeve of his overcoat, coiled up, with its head with flashing eyes and tongue protruding, moving around and around at the top of the coil. As he did not leave, and as he was without arms, he tried to turn the horses over it. But the horses became frightened, and sprang to one side, while the snake sprang for the horses with a hissing and hissing sound that could have been heard at a great distance.—K.

A SNAKE'S NEST.—Yinton, Iowa.—Mr. Goodwin, while digging potatoes a few weeks ago just out of town, ploughed out a nest full of eggs. They were about the size of a guinea hen's egg, with a tough, leathery skin for a covering. Each one contained a snake nine inches in length, supposed to be of the bull snake variety.—K.

A BLACK SQUIBBLE.—Lockport, N. Y., Nov. 10.—Mr. Henry Weber, an expert taxidermist of this town, bought the skin of a squirrel, which he thought was entirely black, with the exception of a part of its tail, which was red.—J. L. D.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive, for publication, such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such notices?

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The digest of open seasons, printed in our issue of Aug. 16, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

HOW HE SHOT THEM.

I TOOK my gun and started for the woods. When I got there I heard a dog barking, and going up to him I found he had a squirrel up in the tree. I shot it and went on. As I was climbing over a wall up went a partridge. I shot, but I saw the partridge fly a long way and I did not hit it. I went on a little further when I heard the dog yelp, and a partridge flew past me. I fired, but scored another miss, for I never touched it. I began to think I could not shoot flying. Going along I heard the *quit, quit, quit* of another partridge and up she went, and taking great care I fired and saw the feathers leave the bird. As I was picking up the bird I heard the dog barking, and found he had another gray squirrel, which I shot. Coming out to a farm house I saw a boy; the dog went up to him. The boy said it was his dog. I told him I got the squirrels with him; he said that Zip was a stunner for squirrels. I showed him my game, when he said he had got some game that morning in his snares, and going into his woodshed brought out two partridges and a rabbit. He wanted to sell them to me. I told him he would tell of it if he did, and the folks would say I bought my game. "No," said he, "honor bright," he would never tell, and would sell the partridges and rabbit for fifty cents. I paid for them, and with my good string of game started down the road home.

On passing through a grove, my lunch of game created a little interest. By gracious, hadn't the old fellow got a good bunch of 'em," said one. "Ah, he is a splendid shot," said another. Passing a corner where stood some five or six men, they stopped me to look at the game and ask questions. "Why, by jingoes, W., where did you get them?" "O," I said, "just over the hill." I then turned and asked Mr. N. how his little girl was, he said she was very feeble, had been sick so long. I slid my hand down and with my thumb and finger broke the wing of one of the snared partridges shy, so it would hang down and look as if it had been shot. I then handed it to him, and told him it was for his little girl. "Bless you, W., you have a heart as big as an ox." I told him he would not find many shots in it, for I was careful not to shoot my game to pieces. As I started on I heard them say I was a splendid shot, didn't believe any of the young fellows could hold a candle to me on the shoot; "Why, just look a there, if I should travel the woods a week I shouldn't see so much game," said one. "O, he's a real knower; I've seen him have lots of game, in years ago."

I went home and the girls were soon picking the partridges, and the boys helping me skin the rabbit and squirrels. In the afternoon it was noisy about town that old man W. had been out only an hour, and shot the finest bunch of game seen in town in a long time, and our weekly paper had an item about it.

G. F. W.

PUTNAM, CONN.

STILL-HUNTING.

TO BE a successful still-hunter a man should be an adept with a rifle. I am not such an adept, consequently am not a very successful deer stalker. But there is a peculiar position in the sport whether the hunt is successful or not. When you are alone in the woods the denizens of the forest venture to form a close acquaintance with you, sometimes out of sheer curiosity, at other times through ignorance of the risk they run from approaching so near to their enemy, man. I have sat quietly at the root of a tree, and had a squirrel come down the trunk, spring onto my shoulder and then on to the ground, scurry off to another tree, and after encircling himself at a safe height, sit and bark at me for a half hour. They will be obliged to retreat to a safe height by the antics of a gray squirrel and a redheaded woodpecker. The bird had put away a supply of acorns in the dead top of an oak tree, and was industriously engaged in drilling another receptacle in an adjacent tree, when the squirrel attempted to ascend the oak. Redhead was watching him, however, and before he had gained the first limb flew at him with shrill cries. Bunny stood his ground manfully for a minute or two, but it was no match for the wings and honny hum of the bird, and finally he was obliged to retreat to the ground. Redhead went back to his work again, and the bunny took a position on a log where he sat and scolded, and dared the bird to come down there and try that game. The woodpecker hammered away on his hollow limb, every now and then edging around he would take a look at the squirrel and hurl defiance at him in woodpecker language, that it was easy for the observer to interpret. Pretty soon the squirrel ventured up the tree again, keeping on the opposite side of the trunk. He gained the limb when the covered treasure house was hidden, but as soon as he made his appearance on the limb the plucky little bird was on him, and drove him around and around the limb, making the air resound with his discordant cries, which soon brought another woodpecker to the rescue; and between them they made it hot for the robber. He managed finally to fitch an acorn from one of the holes, with which he scampered off pursued by both birds for some distance; then they returned to inspect their prey. They tried hole after hole, and after each examination they came to the hole from which the squirrel had fished the acorn. Then with cries of rage they sought him out, and there was the sound of a conflict. I could hear plainly the maledictions of the woodpeckers and the squirrel crying quit, quit. And then my attention was drawn to something else.

While absorbed with this by-play I had almost forgotten what was there for, and two deer had almost walked by a shot. The hindmost of the herd had seen me, and saw me just as I covered the shoulder of the foremost. "Old sweet lips" spoke, and a doe yielded up her life. Springing

to my feet I gave the other one a shot as she toppled a mound about sixty yards away. She walked into a thicket on the mound, I reloaded and started after her, expecting to find her within a fifty or a hundred yards. After traveling a few drops of blood on the leaves of bushes, but the ground having been burnt over by a forest fire a short time previously, showed no sign. A shout brought Hank to me, and we proceeded to hunt the dead deer out of reach of wild hogs, and then made an unsuccessful search for the wounded doe. Although I knew she was lying not far off, we were obliged to desist from the search to get our venison to camp, no little job, as it was near four miles, and a deer is not the easiest thing in this world to carry. A day or two afterwards some log hunters found my deer not over 150 yards from where I shot her.

Ah, those were halcyon days; I sit in one place and counted fifty-seven deer pass in sight of me, and probably half of these within easy rifle shot, but not quite close enough for my shotgun; and on my way to camp that night I came across a hunter who had just killed three out of one herd of seven. Shooting with a Sharps breech-loader, he showed me where he stood and where he killed the first one. That was handing shot about seven-five yards, the others were fired on the run. It was quick work to load a gun twice and kill two running deer before they could get out of sight in heavy timber, but some of those old deer hunters handle even a clumsy army gun very quickly, and I fear as they get to using the improved sporting rifles, that the time is not far distant when to kill a deer in the States will be a rare thing.

BUCK SHOT.

VERDESSA, ILLINOIS.

DUCKS ON THE SUSQUEHANNA.

JUDGE GILDERSLEEVE, of New York, was stretched out in a sick bed on the Susquehanna flats last Friday. Every time he bobbed up in a sitting posture and raised his gun a duck fell. Sometimes one shot would bring down several. The judge is a leading member of the American Life Team. He is fond of duck shooting, and always comes to Maryland in November to take part in the first day's sport on the Susquehanna.

The opening day was not so disastrous to the ducks as it was last year. About 5,000 were killed then. This season the aggregate was somewhere between 2,000 and 3,000. Although the birds were plentiful, the weather was too cold and clear and windy for fine sport. A clouded sky and a good breeze, not inclined to be fitful and boisterous, are needed to enjoy duck shooting at its best.

Gunsners were getting off at Havre de Grace all day Thursday. There was hardly a train from Baltimore, New York, Philadelphia and Washington that did not have a sportsman aboard. Most of them were dressed in corduroys, knit jackets, caps and boots. Some of the outfits were so stylish that it would probably never occur to the awed and admiring spectator that the owner of all this sporting splendor would most likely hang away from morning till night without hitting a duck. And it's a mighty poor shot who can't exhibit at least a pair of ducks. In the evening a crowd gathered round a bright fire in the sitting-room at general Frank Boyd's hotel and listened to each other's experiences in past seasons. The reason they did not assemble in the bar room was that the sale of liquor is prohibited in Harford county. But when the gunsners put their hands in their jacket pockets the recollection of this law made them smile. Frequent smiling led to hearty conviviality. Each new comer was cheerily welcomed and then questioned on the probability of the weather for the morrow. There was a wide diversity of opinion. "Three or four thought the wind would stop blowing, and that a calm would set in; but the majority said it would be really. The other sportsmen uniformly preferred a calm to a stiff blow, and their comfort was not increased when an old Havre de Grace gunner said he remembered a "frisky nor'wester of nine or ten years ago which capsized several boats and played the devil generally." The old fellow spoke again, just as he was leaving. He said: "Ducks was ducks in them days, gentlemen. They was never scarce then, but since these fancy sports have been a comin' here the birds has got scarce." He slammed the door as he went out. A young man from Philadelphia sat up and complained. "I did not know my hask was empty when I handed it to that old fellow."

At 9 o'clock Col. Boyd informed fresh arrivals that all his rooms were taken, but that accommodations could be had at a few of the private residences. Only the tyros went to bed. The others got aboard their scows and stayed up all night playing poker.

No boat is allowed to cross the line of the flats before 3 o'clock in the morning. The object of this is to prevent the birds from being disturbed while feeding. The penalty for a violation of this provision of the law is \$25. Eighteen boats violated it Friday. They did it deliberately, paying the fine, so as to get a good berth and be in readiness at the break of day. After crossing the line they selected positions and marked them with lights attached to poles. This done, they waited until 4 o'clock, and then put out their sink-boats and decoys. At the first approach of daylight the shooting began, and continued until dark.

As a general thing, the boats are owned by Havre de Grace gunners. These gunners formerly made a living by killing ducks for the city markets, but so many sportsmen have flocked to Havre de Grace in recent years that professional shooting is rapidly becoming a thing of the past, because more money can be made by hiring the boats to the amateurs. A scow, with sink-boat, decoys, batteau and crew will fetch from \$50 to \$100 a day. The scows are rigged with sails and fitted up with cabin, sleeping and cooking apparatus. The batteaux are used to bring the ducks to the gunner. When a party hires a scow they divide the expense and take turns in the sink-boat. The scow is anchored a quarter of a mile to windward. From three to five hundred decoys accompany a sink.

The sneak boats are cheaper. They are ordinary batteaux, painted white, and curtained from bow to midship with canvas about a foot and a half high. The decoys for a sneak-boat are far enough off to keep the ducks from noticing the boat. The boatmen are used to bring the ducks to the sneak is sculled forward until they are within twenty yards. Then the gunner rises above the canvas curtain and blazes into them. In sneak-boats as well as in sink-boxes the gunner has two double-barreled guns. Some of the sink-boxes are double.

Besides the hired craft a number of sloops and yachts were on the flats. They are owned by New Yorkers and Philadelphians. The queen of the squadron was the Susquehanna. She belongs to Mr. Richard K. Haines, of New York, and cost \$6,000. His cabin is finished entirely in

mahogany. Standing beds, a bathroom and other accommodations are included in her list of comforts. Mr. John Wainman, of Philadelphia, was out in a Corrie, a twin flat-bottom yacht. His mahogany, owned by the same gentleman, blew up in the Baltimore harbor two or three years ago and killed four men. Judge Gildersleeve and a party of friends made the yacht Widgeon their headquarters. Mr. Louis Williams, of Philadelphia, was on the Twilight; Mr. Charles Osmond, of New York, on the Reckless; Messrs. Hancock and Roberts, of Philadelphia, on the Jno. L. Williams, and Mr. Joseph Sticney, of Philadelphia, on the steam yacht Wiggon. The Wiggon was the largest yacht on the flats. The Susquehanna, Corrie and Twilight were built by Mr. F. T. Magovin, of Havre de Grace. It was the first time the Susquehanna and Corrie had been out.

The yachts stay at Havre de Grace and are manned by a crew kept in regular wages the year round.

Though professional shooting is not so large a business as it was, there is one old gunner who still holds his own. Wm. Dobson is his name. He has the reputation of being the best duck shot in the United States. He was born and raised in Havre de Grace, and is said to have begun gunning when he was only ten years old. He had to carry something along to support his gun while taking aim. He has lived on the water for forty odd years, gunning in season and spending the rest of the time making decoys. He knows the habits of ducks, can imitate their whistles, and can always bunch them by motions of his arms or feet peculiar to himself. Not only townfolk, but also strangers say that he is a phenomenal shot. His largest day's work was between four and five hundred ducks. His partner is John LeHisher, who is also a good shot. Mr. Mauldin, of Port Deposit, was with them the first day. Dobson and his partner go entirely for market. They either ship direct, or else sell to Mr. J. T. Friese or Mr. J. T. Moore, the Havre de Grace dealers. New York, Philadelphia, Baltimore, Washington and Boston markets are supplied daily. Shipments are sometimes made to Europe. The first day's prices at Havre de Grace to dealers or anybody else were as follows: Canvas-backs, \$1.50 a pair; railheads, \$1 to \$1.25; blackheads, 10 to 50 cents. Canvas-backs are rather scarce. All the ducks are fat. The gunning days until January 4 are Mondays, Wednesdays, and Fridays. Afterward Saturday is included.—*Baltimore Sun, Nov. 9.*

HAVRE DE GRACE, MD., NOV. 8.

Nearly every night train arriving at the Broad street station from the Susquehanna region, says the Philadelphia Times, Nov. 11, brings its quota of sportsmen laden with luscious game. It is the height of the ducking season, and prominent members of all the leading clubs, as well as many others, have been away with their guns and dogs engaging in the sport. The weather has not been favorable, as few ducks are accessible while it is so mild and placid, nevertheless there have been some instances of rare good luck.

Maxwell's Point, which is one of the best duck-shooting grounds in the country, is part of a tract of ten thousand acres which was formerly the country seat of Gen. Cadwalader, of Philadelphia. It was superbly fitted up, involving an expenditure of between \$200,000 and \$300,000. Everything is now somewhat dismantled; the conservatories are almost wrecks, but parts of the magnificent old house are left and are in very comfortable quarters. The shooting ground, which is about three miles from the bay, was for a time rented to a club, but now it is used by three Philadelphia gentlemen—of the sport—Mr. Hartman Kuhn, Mr. Thomas McKean and Mr. John Brown, son of Alexander Brown, the banker, who control the privileges. Mr. Kuhn is a keen sportsman, a splendid shot, and possessed of great endurance. These gentlemen, with their friend, Mr. George D. Krumhaar, one of the most successful duck-shooters in Pennsylvania, have been there during the past week and were fortunate in having some fine bar shooting. They have mostly shot from a blind; covered with reeds, and with retriever dogs of excellent training, who go out after the wounded ducks only, with great intelligence passing the dead ones by.

Opposite this place is Grace's Quarter, owned by Mr. William Johnson, who, with Mrs. Johnson, entertains great numbers of ladies and gentlemen from Philadelphia, New York and Baltimore. In the same Gunpowder region, a little beyond, is a ducking shore, controlled by some of the Philadelphians, Mr. Henry Lewis, Mr. E. W. Clark and Mr. E. C. Knight, and a little below a famous place known as "Benlies," near the junction of the Gunpowder and Salt peter rivers. Down the river is Carroll's Island, and further up is Marshy Point, belonging to Mr. George Brown, the banker, of Baltimore, and his brother-in-law, Mr. Graham. On the Susquehanna some excellent shooting has been done by Mr. T. G. Wainman, Mr. Howell Buckley and Mr. D. C. Wharton, Smith.

This Susquehanna shooting, especially that on the flats, is very different to the Gunpowder region, where they usually shoot from shore. Everything is regulated by law, and there are regular "duck police." Every sloop or boat has to pay a license of \$20, and shooting is only allowed three days in the week—Mondays, Wednesdays and Fridays. All is afloat on the sloops or scows about three o'clock in the morning, and if there is no wind they lay over pole the vessel into the shallow ground, each trying to get a good position and as far away from every other vessel as possible. The sink-boxes are then put out long distances from the vessel and hidden as much as possible in the wild celery, upon which the ducks come to feed and which gives the canvas-backs their delicious flavor. Sometimes as many as three or four hundred decoys are placed about a single sink-box. There are some boxes which hold two sportsmen, but usually they only hold one, each of the party taking turn for an hour. Once a party has been ready to start, when the parties have fitted up vessels, provided themselves with provisions, ammunition, etc., paid the necessary license, laid out hundreds of decoys, poled and towed their vessel all around, laid out for hours wet and cold in the dawning day, and then when a few ducks came down they banged away, missed them, and went home with frightful colds, and kept them from business for a week, and made a doctor's bill and a box of medicine a necessary wind-up to the performance. Ducks have been scarce this season, and much of the spoil brought home by amateur sportsmen has been secured for consideration from the professional duckers "to the manner born," who make that their business. It has grown to be an adage that with most amateurs "it requires the greedback to bring the canvas-back." The three great professional dead shots of the Susquehanna region are Bill Dobson, Perry Barnes and James McCullough, of Port Deposit.

A party of Philadelphians, among them Hamilton Disson and ex-Sheriff Wright, have been on the Northeast River

during the past week in the yacht *Mischief*, at their club house, near Charlestown, Md., famous as having been thought of as the capital of the United States before Washington was selected. They did not have much luck. Mr. Joseph L. McDaniel has invited several parties during the week to his father's place, "Shady Beach," on the North-east River. His friends, Dr. Hendry, Mr. Robert J. Parvins and Mr. John C. Savary, have been out with him on a number of occasions and did good execution. Mr. Meredith Buller, Mr. Harry Christen, Mr. John Elliotts with several friends, who have fitted up a scow in a very complete manner, have been away the most of the week and started again yesterday. Among other Philadelphians who have been after ducks during the past week, meeting with more or less success, have been Al Holmbold, Dr. D. Karsner, H. Gemrig, Louis T. Brooke, William Wood, of Conshohocken; Robert Thudium, Joseph Wright and J. F. Betz, the brever; Sport and shooting of every description is now at its height, and a party of gentlemen started last night for an extensive hunt in the wilds of Southwestern Missouri after deer, turkeys and prairie chickens. It includes Col. Barzilla Ridgway, of Philadelphia; John Taylor, of Trenton, with his two sons, and Mr. Roobling, one of the builders of the Brooklyn bridge. They expect to be gone two weeks.

MICHIGAN GAME.

THE quail shooting about Detroit this season is glorious. Nice bags are made daily close to our city. In fact, it is legal to shoot inside the city limits many miles. White woodcock there meet his fate for hundreds of straggling birds have been seen in deer yards, while several berries are now right in the heart of Detroit. I saw a dozen quail yesterday in a lumber yard not half a mile from the city hall. Last Monday Messrs. Ira Paine and William McSweeney bagged a couple of dozen a few miles out on the Gratiot road. They put up five berries inside three hours, but were rather unfortunate, as the birds mostly took to the woods. The quail are very common, and seem to be stronger than I have ever seen them before.

A pleasant trip can be had by taking the cars to Highland Station (forty miles from Detroit), where ruffed grouse, quail and black squirrels abound. One can leave Detroit early in the morning, and return at night with a capital bag. One can kill thirty black squirrels there the other day, besides a few quail.

Northern Michigan is overrun with deer hunters—more so than ever before. Why, near Jeromaville, in a space not five miles square, there are a dozen camps containing sixty hunters. Think of it, sixty still-hunters! And the poor claps are having a grim time of it; for each one of the sixty while hunting continually fears that some one of the other fifty-nine may by mistake shoot him for a deer. Sometimes, where cattle abound, deer are hunted by men on horseback, who now and then ring a cow-bell to denote the game. How would it do to send five dozen cow-bells up to that unhappy sixty? They might serve a double purpose and save some lives, as well as denote the deer, if each hunter tied one around his neck and kept it ringing. But the deer—surrounded by sixty cow-bells! Ah! whither could they fly?

Perhaps the fear of being shot makes "shining" so fashionable in the region referred to. It is said some Pennsylvania market hunters (you know it is illegal to slip venison out of our State) have been shot by means of headlights at night, and a hundred deer this season. The carcasses were cut up and packed in barrels. Will not some reader of FOREST AND STREAM in that section look into this report and at least notify the transportation company what they are carrying? About deer matters, a party consisting of Judge Speed, E. A. Baker, Ira Paine and E. H. Gillman of Detroit, Col. Morrison of Lock Haven, Pa., and M. S. Johnson of Manchester, N. Y. left Detroit last Monday night for "Camp De Kurtz" some forty or fifty miles back in the woods from Alpena. Two of the usual party could not go this year on account of home affairs. But there was another in last year's camp, whose presence now will be sadly missed. Dear, lovable, Uncle Joe. It was his first experience of camp life in the woods. What a generous, joyous, labor-sharing comrade we found him! How we loved him! A few weeks after camp was broken the telegrams from his relatives said that death had claimed our dear friend. Never was there such a genial, fatherly camp companion! And how he enjoyed those few weeks among the pines!

Duck shooting is at its height. More canvas-backs and mallards have been killed on the Monroe preserves than for years. Several shooters have averaged over fifty ducks per day for several weeks. It is to be hoped that such shooters are market buyers, not gentlemen sportsmen with the pleasure. On the Big Muddy marsh, mallards are being killed in large numbers. Two guns killed 140 (mostly mallards) last Monday on that preserve.

The Mt. Clemens Fishing and Shooting Club of Mt. Clemens, Mich., has just been organized with twenty members. The club has secured some fine marshes, which, of course, will be preserved. DELTA.

DETROIT, Mich., Nov. 16.

To-day is rainy, and too misty to "take it in" outdoors. I have just had my dogs out for a run; and as they come back wet through, I have let them into the office for a nap before the fire; but I am beginning to get a little worried that they will get sick. I will get a blanket put them back into their coats. Seven of them in a ten by ten room makes it smell altogether too doggy; and the pups haven't yet finished their romp. Now four of the older ones have "spooned" in on the office lounge, and I guess we will be all right.

Quail shooting is a complete failure around here this fall. The birds seemed to winter well, but I think the wet spring and summer must have played sad havoc with the eggs, and young birds that are now to be found. I went out Nov. 1 to my old grounds, where I had left fifty or sixty seed birds last year, and did not find a bird. I shot three partridges and came home. Next day started for a place where I was sure I would find them, and got up three in a cornfield. I killed one of them, and was ashamed of myself in the balance of the day for doing it. After hunting all the stubbles, and being convinced it was of no use, I bagged seven of them. One was a very peculiar specimen; it was a cock bird and weighed about a quarter of a pound more than the larger other one I had; the plumage was much lighter than usual, and strangest of all, the ruff was a deep chestnut color; I never have seen one like it before. I noticed the same peculiarity about color and size in the ruffed grouse I shot in Montana this fall, and that John

Davidson wrote about. John had a glorious time: "He kin of enny man kin," you know.

Our snipe shooting has been a failure this year. On grounds where I usually get several hundred birds during the season, this year I got but sixty or seventy; and though the weather is yet mild and warm, they seem all to have gone South. We had excellent September and October woodcock shooting. I think it was largely due to the entire absence of summer shooting. Our season does not open until August 1, and in that month alone were to be found, owing to the wet weather making a wider range of feeding grounds. Ruffed grouse are quite plentiful, bags of fifty to twenty birds being quite frequent.

The slaughter of deer still goes bravely on. I think there are more hunters from outside the State shooting in Michigan this sea-son than ever before. I get letters every day full of complaints of violations; and I include the following, which I think money well repaid to me. It thoroughly shows the disposition of individuals where violations of the law are known to want some one else to do the hard work and make the complaint. These folks make me tired. If people only had more "sand," and would go for the miserable scamps who pirate our game out of the season, we would have game for years to come; but they lack grit and are too lazy. Here is the letter:

H. B. Roney, Esq.:

ST. LOUIS, Mich., Sept. 15, 1883.

DEAR SIR:—We desire to call your attention and your State Association to the utterly reckless attitude of the game laws of the State, and in particular to the slaughter of deer, by market hunters. No attention is paid by the above hunters in regard to season or amount of killing.

A man by the name of "Andrews" of Yackline City has a party of an informant but at present, of thirteen hunters who are killing at present, and they are doing so in defiance of the law. Their party is to camp every day. Another party of Frenchmen from Au Train are in same line of business on same lake. In month of February last Winters Ferry lies dead on land at camp once 250 deer principal part killed after the close of season.

This man I am informed has been trapping "Trot" in season and out, in the Vicinity of Yackline City, and has several bears and deer. We have in the W. P. Splendid coverer deer and will have for some years to come if the same can be protected, which I hope and trust will receive the Association's immediate attention.

Yours Respectfully

[I wrote this man, that if their local sportsmen had not interest enough to organize a game protection club and prosecute violators of the game laws, they could hardly expect the State Association to do for them, and that we had no money to hire a game warden.—ROSEY.]

I agree with "Delta" that it would be a good thing to furnish these heathens with sound sportsmen's papers, such as the FOREST AND STREAM, of course, and I could pick out a goodly number of individuals who would afford abundant opportunity for missionary labor. Our State press is doing fair work in keeping before the eyes of the public the urgency of having a means to enforce the game laws, and sportsmen can find to better remedy at present for the neglect of the last Legislature than by furnishing articles to their local papers that will keep the people posted of what is going on in the way of butchering game.

The Saginaw Hunting Club's car, City of Saginaw, left for the Houghton Lake region this morning with a party of six seven for a deer and snipe hunt. This is its second trip since the return from the Yellowstone. MEN-SHOX.

EAST SAGINAW, Nov. 9.

DEER NOTES.

FIRST a story from Texas: Mr. John Warren is the oldest settler in Hoekley, and is probably one of the most successful deer hunters in the State. A day's sport was followed by a hunt. In 1870 he was successful in hunting experience. Through that strategic maneuvering known only to the experienced trapper, Mr. Warren came within rifle shot of an unsuspecting buck browsing upon the prairie, and fired upon him. About 150 yards further on was another deer feeding around as unconcerned as his companion. At the crack of the huntsman's trusty rifle, both deer started off at full speed, running directly toward each other. In the distance they collided with terrible force, one of them springing about twenty feet into the air, and both falling to the ground dead—killed by the collision. On examining the bodies, Mr. Warren found that he had but slightly wounded the buck at which he had shot, and that the death of each had been caused by the force with which the animals had come together.

Mr. N. E. White of Sacramento, Cal., reports in the *Be* of that city that since, in the lower foothills, the market hunters have become scarce and the Indians have disappeared almost entirely, deer have increased in numbers. When the Folsom Sportsmen's Club was out for a two day's encampment near Latrobe last week, several deer were seen by members of the party within a few hundred yards of the railroad, and one fine buck was killed within five minutes walk of the railroad station where the party had their camp. The belief is that the deer do not simply "come down" and sojourn there during the winter, but that they breed there and remain in the greasewood and chaparral thickets the year round. There have been no fires of late years in that vicinity, hence the forests have become heavy and afford excellent protection for the deer. If the present favorable conditions are maintained for a few years longer, it will be an easy matter for an experienced deer hunter to go off a railroad train and bag his game, but there is nothing funny about a rifle in his car. We trust the farmers in these foothills will continue to protect the deer by killing only as many as they can use for food, and restricting shooting in their woods to a respectable limit.

Once upon a time a Michigan man who was hauled up for shooting deer out of season got off on the plea that he had shot in self-defense; he was afraid the deer would bite him. That is a joke; but it is a good one. I remember a man-hand-to-hoof with a ruffed buck, as Sullivan says, "N. V." deer driver found out to his cost the other day. C. S. Starr and C. S. Thornton, of Monticello, and D. S. Avery, of Wurtsboro, started for Black Lake, in the town of Bethel, on a deer hunt. They secured the services of a noted driver named Andrew Couch to assist them in their sport. The first day out the rounds started one deer, but they each took a circuitous route; and the party, called in getting a shot at the animal, and Couch took the dogs into a short time their loud barking demonstrated the fact that game of some kind was started. Couch was on the alert, and presently saw a large buck coming toward him. Wishing to turn it, in order to give the party who employed him a shot at it, he discharged one barrel of his gun in the direction in which it was coming. The deer, instead of turning around, came straight for Couch, when he took deliberate aim, discharged the second barrel of his gun, and the deer

dropped to the ground, as he supposed, dead. Running to it to cut its throat, the animal sprang up and coming with a furious onslaught on Couch. He defended himself as best he could with his empty gun. He struck at it with all his might, and succeeded in breaking the stock of the shooting iron. The deer had him under his feet a couple of times, but a well-directed blow on the head with the barrels of the gun fractured the animal's skull, and he was secured. Couch, had been through a fight and his numerous bruises, succeeded in making the party who was with him. They dragged the carcass a mile to where their wagon was, and brought it safe to Smith Schoonmaker's. The deer was a large one, and weighed 200 pounds. Couch's clothes were torn into shreds, his body bruised and cut, his gun broken, but he has the proud consciousness of having killed the biggest buck in the town of Bethel for years.

Compare Couch's spunk with the exploit of three Capay, Cal., gunners. The *Weekly Democrat* reports it: "They were well provided with guns, ammunition and antidotes for snake bites, and expected to be gone several days. About twelve miles from Capay they fell in with a sheepherder and coaled to camp at his place all night. They treated him to several doses of the snake bite medicine, and this so pleased him that he informed them that on driving his sheep into the corral that evening he had noticed among the head a deer that walked on three legs, having evidently been wounded by some hunters. As the deer was safe for the night, the hunters went to bed, but rose about daylight and surrounded the corral. There, sure enough, was the deer, and after eight or ten shots had been fired by each of the nineros, the animal was at length hit and captured. Highly elated over their success, they immediately packed the deer on their pack-horse and started for home. Upon their arrival their friends were surprised at their returning so soon and with such good results of their hunt, and they have thereby acquired the reputation of being skillful hunters. The names of these gentlemen who performed the difficult feat of killing a deer after it was corralled are Milsap, Durcan and Fisher, but we wouldn't have it made public for the world, as they are all subscribers to the *Democrat*, and friends of ours."

Beaver markets do not contain so much venison as they formerly did at this season of the year, before the present Maine system went into effect.

ST. LOUIS SIFTINGS.

EX-LIEDU-GOV. NORMAN J. COLMAN put on his ten-lied rubber boots Nov. 1, and started on a deer hunt in the woods west of Gasconade county, Missouri. He was joined by the following gentlemen from Montgomery City, Mo.: Hon. J. H. Talbot, George Wright, Robert Woodruff, Capt. Wm. Heckman, Geo. Peptom, Henry Clark and Capt. Davis. The party will go twenty-five miles west of Hermann, on the Gasconade, where the deer are said to be in great numbers.

Frank Byers, postmaster of Hot Sulphur Springs, Middle Park, Colo., has presented E. W. Wardlaw a subscriber to this paper with a mail service at St. Louis, with a significant head and antlers of an elk. The animal from which they were taken was killed by Mr. Byers, who is a crack rifle shot.

The Fair Association was the recipient Nov. 3, of a name crown named "Grip," the donation of Mr. James Harding, railroad commissioner of the State. Mr. Harding describes his sabbiness as being very playful, but so mischievous became an imperative necessity. The rules distinguishing *meum a thura* were unknown to "Grip."

November 3 Messrs. J. W. Peckington, N. L. Wickwire, Thomas Kirgin, Capt. James McCluskey, Richard McClure J. Fitzgibbons, J. Clark, Ed. Matthews and B. Mesker, the gentlemen who recently made up a fishing and hunting party to the mouth of Peock Orchard Creek on Black River, in Arkansas, held a meeting at the Victoria Happy Club parlors, at the northeast corner of Seventh and Pine streets, to talk over the proposition of purchasing 100 acres of land and building a club and boat house for future use. Three more members will be permitted to join the organization, which is to be called the Junco Club, and the camp, which is to be called Camp Junco, is ten miles from Peach Orchard Creek. Another meeting of the club will be held November 11 at the same place to perfect the organization and subscribe the amount necessary for the purchase. Of the 100 acres there are now forty acres under cultivation in cotton, canebrakes covering nearly all of the residue. The land can be bought for \$300, after which it will be necessary to erect a boat house and a club house, or both combined. There is now a fox cabin, an Arkansas traveler and his family and a yoke of oxen on the premises, all of which go in with the purchase.

A well attended meeting of the Dardeneu Gun Club was held in parlor 17 of the Lindell November 6, at which no special business was transacted beyond the election of one or two officers to fill vacancies.

The reports of St. Louis sportsmen who visited the favorite hunting resorts of Arkansas, Illinois and Missouri, indicate that all species of game are in the field, but that quail have been scarce in the States. Newly all the teal ducks have winged their way to their southern wintering haunts, but the mallards are so plentiful that the man who goes gunning them must indeed be a poor sportsman if he returns empty-handed.

The manager of a sportsmen's depot in this city, when asked whether many hunting parties were organizing, said: "Yes; there are many hunters in the field, but I think there have been none for many years; and strange to say they are all meeting with remarkable success. There are about fifteen gun clubs in this city, containing an average membership of twenty persons. It is not putting it too strong to say that three-fourths of the able-bodied members of each of these are now putting in much of their leisure time in killing ducks. When we take into consideration the number of parties that are being organized in the States every fall for men who make it a business to slaughter game every fall for amusement, it is indeed a wonder that ducks, quail, etc., appear to be almost as plentiful as ever. Every year the markets are overstocked with rabbits and ducks, the supply being so large that this species of game almost becomes a drug on the market. During the present week several parties, each containing ten or twelve members, visited Black River, where they shot ducks by the wagon load. The hunting grounds of the Dardeneu and the Gun Club are well traversed by a line of railroads and there are many well fenced tracts which will have little chance to escape. In the immediate vicinity of St. Louis there are many ducks, and the supply is constantly being increased by fresh arrivals from northern latitudes. The shooting last week was very good

at Long Lake, Chouteau Slough, Hat Island, Smith's Lake and throughout the American bottom in Illinois, but it will be much better during the next few days. I am glad to see that the more thoughtful sportsmen of the country are favoring a proposition to have the season for shooting prairie chickens open at a later date in the future. Hunters should not be allowed to shoot prairie chickens earlier than Sept. 1, and every State should pass laws prohibiting them from slaughtering them before that time. Those who have watched game from year to year are usually coming to the conclusion that prairie chickens in the course of another decade will have almost become extinct unless they are protected by law from the early attacks of reckless hunters. As the laws of the different States now stand hunters are allowed to kill these birds before they are scarcely able to fly. Quail shooting very soon will be excellent, but that species of game, until a number of hard frosts have leveled the high weeds to the ground, will be hard to get at. The broods, owing to high water last spring, will be smaller than usual, but the supply will be amply sufficient to tempt hunters to break up their happy families.

Those restless disciples of Izak Walton who were highly disgusted because dismal rains during the greater part of September prevented them from embarking on their usual autumnal angling excursions, took advantage of the beautiful weather that prevailed during the first three days of the present month, and are now willing to testify that November is the most glorious month of the year. Since last Thursday morning all atmospheric conditions calculated to tempt the fishermen to his favorite fishing haunts certainly existed. Fully two-thirds of the able-bodied anglers of St. Louis whipped the bosoms of the lakes in the vicinity of St. Louis, and they did not do it in vain either. Splendid strings of bass and croppie were hauled in from Long Lake, Chouteau Slough and Horseshoe Lake. Almost all those who went to Black River returned with the malaria and large quantities of fish. One or two gentlemen who visited the river were so badly "done up" by the "fairy of malaria" that they lost two guns, a large quantity of quinine and all their fishing tackle. They were the only persons, however, who failed to capture respectable strings of fish.

CAMP-BELL.

PHILADELPHIA NOTES.

THERE are a great many quail in market at this writing far from being full grown. I did not notice this until after Nov. 1, when the Delaware law allowed shooting. This morning I saw a large bunch just received on whose throats and wings I saw the "moss" and "rust" that are not to be told. These I learned were Delaware State birds. The winter of '81 entirely exterminated the quail of Bucks county, Pennsylvania, and this season the effects of their killing off can be noticed. Complaints come from that part of the State that quail are very scarce. I was never more struck with the change in habits of the quail than I have been this season. All the coverts I have found were feeding in the stubbles very close to the fences. None were put up five yards from the woods, and I was always able to find thick cover. In old times we were often told the coverts were far from cover that the birds settled once in the field, and allowed a second shot before taking to the woods. Do not other sportsmen notice this change in the past five years?

The furore for wearing game birds in ladies' hats is raging fiercely here. Not content with ornamenting with the wing, tail and head of the gallinaceous tribe, all varieties of shore birds are used and seem to be preferred. I have noticed a large number of quinine and all their fishing tackle, and it would seem that if this fashion continues, another huge "mail in the coffins" of our shore birds will be the result. They are growing scarce enough without the new fashion aiding in their extinction. About an equal number of canvas-backs and redhead ducks are being killed at Harve de Grace and the shooting has been only fair during the week. Murky weather interfered with the laying out of the boxes.

I was told by one of a party just returned from Tuckahoe, N. C. where they went quail shooting, that the birds in that section are scarce. While absent, they indulged in a deer hunt, and to show the great uncertainty of New Jersey deer driving, three bucks were started during the day and run directly past the party without being visible excepting by one gentleman who each time was too far off to shoot with any certainty. It is conceded by all New Jersey hunters that deer were never so plentiful for twenty years. This shows the value of protection for one season. It would be well to make a note of this, and to avoid the coverts as far as possible.

Duck shooting on our river is poor just now, but down the bay wildfowl are plentiful, and when feeding in the marshes make great sport. When it is too rough in the bay for the comfort of the fowl, they invariably make for the marshes and ponds toward afternoon. At these times a blind and decoy at one of the ponds is in order.

Good snipe shooting on the Delaware neck marshes is reported by returning quail shooters.

BEFORE BREAKFAST.

TURNED out at five this morning, made a rousing fire, had a cup of black coffee, and before it was fairly light, was heading for my favorite thicket with the single-barreled semi-hammerless breech-loader. I wanted to see if any grouse were left, and I wanted to try if I had lost my old knack of snap shooting from the hip. Sooner than I thought, at the foot of the hill, in a clump of thorns, an old cock grouse started hissing and fondled away for the thicket to the top of the hill. I think the gun went off of pure coyness, of its own notion; certainly I don't know that I pulled the trigger. All the same, the old fellow dropped to the report, and lying squarely on his back, gave me his muffled roll until his breath failed. I pocketed him and went on. A steep climb, and an hour spent in a briery thicket, resulted in starting nothing, not so much as a chipmunk. At the far side of the thicket, however, there was a patch of thorns and here I saw a grouse got up and tried to go by to the thicket; one dropped dead in a stone, and two were enough, I did not follow the others, but made tracks for home and breakfast. It was the first and only time I have been out with the gun this fall.

NESSMUK.

NOVEMBER 11

Ohio.—Washingtonville, Nov. 4.—Quail are very plenty in this locality, but I never saw them so well as this time of the year. It is hard to get a good bag. They will go to water, and we hardly ever get more than the second rise. I have seen them act in this way in December, when it was cold weather, but never before at this time of the year when the weather was fine as it now is.—G. W. B.

SEDUCTIVE ITEMS.—*Editor Forest and Stream:* I send you the following for the benefit of the brotherhood, and also because it is, I think too good to keep. A week or so ago I saw in a newspaper an item which had been going the rounds, to the effect that quail were so numerous around the village of C. that they came into the doorways. Resolving to follow it up, I wrote to a resident of C., enclosing the item, with the request that he would tell me whether it was the truth, or an exaggeration, or simply a newspaper lie. Here is his reply: "C., Oct. 30, 1883.—Dear Sir:—In reply to yours of the 28th, will say quail are certainly not numerous anywhere in this vicinity. One sportsman says there are probably three or four berries within a radius of three miles. Another says, 'three buttons to one bird,' etc. Two or three weeks ago a small hevy was seen in the garden of a villager, and mention of the circumstance was made in the presence of a person who thought it of sufficient interest to send to a Newark newspaper, from which the clipping undoubtedly found its origin. As our village is but nine miles from Newark and sixteen from New York, and is easily reached by all who have any hankering that way, it can be readily seen that game has but a small chance to multiply or even to accumulate fat. Very respectfully yours, —"

This I fancy is about what these items amount to which appear now and then in print. If the truth were known, just such silly statements would be found to be at the bottom of them, circulated either by some imaginative enthusiast or wily tavern keeper.—J. L. K. (Perth Amboy, N. J.)

TENNESSEE NOTES.—Game is being brought in in great quantities at present. Sulzbacher received a large consignment of ducks and geese from Reelfoot Lake, and quail, quail, rabbits and opossums are unusually abundant. The weather has, up to date, been too warm for taking violent exercise, hence but few of our local sportsmen have been out. Hooper Phillips (the Mayor), J. N. Brooks, and a large party of friends leave for Reelfoot Lake on Monday next. Hermann Buckholz and his crowd will go to the same place in about two weeks. Jim Palmer will content himself with shooting nearer the city. A. L. Landis and Mr. Cooper enjoy their holidays up in Wilson county, where birds are abundant and sportsmen scarce. Frank Legler is one of the rising nimrods of this city, and though he seldom extends his range far from the sand hills, he is a regular buck hunter. I learn that birds are plentiful around Grand Junction, and that the dogs being prepared for the races there in December are rapidly assuming first-class form. There will be no representative from Nashville, though we have a number of remarkably well-bred and trained dogs here. Hermann Buckholz has three, Clark Pritchett two, Major Burr three or four, Jim Martin one, Wm. Cheatham two or more, and so on. I might go on enumerating until a large number would be made out. When the men from the sand hills all these gentlemen will take to the field, and "Bob White" will be the sufferer.—J. D. H. (Nashville, Nov. 11).

KANSAS LARGE GAME.—Champion, Ford County, Kan., Nov. 8.—Duck and goose shooting have been almost a failure this year. When it was quite dry, and we could have had a good chance at them in the Arkansas, there were no ducks; now it is wet, and every water hole on level prairie is full of water and ducks, but we can't get near them. There are a good many antelope, but at present they are like the ducks, stick to level prairie, water at the rainwater pools and do not frequent the sand hills or rough ground. I have been out twice, killed five in three days. The second time three in five days. There are a few buffalo in the White Woman basin, seventy miles northwest and west of there, mostly old bulls. About three hundred have been seen. I expect to go after them about December 1. There are a few reported near the head of South Beaver, 120 miles south by west of here. I think this is about the last winter that we can hunt buffalo in Kansas. I am short of companions. If any one wants to hunt antelope, kill a few and see a good many camp out in cool locations and perhaps get a shot at a buffalo, come on. It will not cost over \$4.50 a day for horse hire and grub per man, and I will warrant to a party of gentlemen a good time. This is not to make money, but a statement of the actual facts of the case.—W. J. D.

RUFFED GROUSE HAPPENINGS.—Lockport, N. Y., Nov. 10.—Mr. Thomas Warwick, living south of the city, brought in a ruffed grouse a few days since, which he said had alighted on his arm the evening before while he was carrying a lantern. Not knowing what it was he took it to Mr. Stokes Patterson, who told him it was a partridge, and for the information the captain made Mr. Patterson a present of it. Having had some experience in bird catching, the grouse, without succeeding in getting them to eat, Mr. Patterson concluded he would begin with this one by wringing its neck and eating it. The captive grouse I reported to you a few weeks since is doing finely, eating readily from the hand anything offered it. I was out after grouse on Election day, but did not find a bird, although I was in one of the best coverts for grouse in this section. I think of adopting Diogenes' plan and hunting with a lantern.—J. L. D.

ADIRONDACK DEER.—Number Four, Nov. 9.—The open season for bounding deer this year has been unprecedentedly destructive. About one hundred hounds have been employed and at least three hundred deer have been killed in the Beaver River waters alone. It is estimated by those competent to judge, that 3,000 deer have been killed in the Adirondacks by the use of dogs during the open season just closed. The small towns near the wilderness are glutted with venison rendered worthless by the chase. How long our northern wilderness will stand this drain without extermination of the game is a problem, which, it is hoped, our next Legislature will try to solve, and to amend the game law in relation to deer before it is too late. One or two more years with prey and a half months open season for bounding will pretty effectually exterminate the deer in this State.—MCSSETT.

MICHIGAN.—Central Lake, Mich., Nov. 6.—The "her-rings" have been here, though not in strong force. They were seen by several persons about Oct. 25, and were, as usual, attended by gulls. The last of the gulls was lying about the bridge at the head of the lake on the morning of Nov. 2. He left, I think, the same day. The bears have it pretty much their own way as yet. One youngling was trapped last week. In my article, "Was it Unsuccessful," published in your paper of Nov. 1, the word "he," in the second line of the quotation from Friehof's saga, should have read "he," which gives the lines a different value.—KEELP.

MOOSE MEASUREMENTS.—Washington, D. C., Nov. 6.—I saw in your last paper an account of the killing of a moose "said to have stood twenty-two hands high," etc. The form of expression used would seem to indicate that the dimensions were estimated only. I killed a moose on Monday, October 22 last which stood 6 ft. 6 in. at the shoulders, measured 72 ft. 7 in. around the body and 7 ft. 4 in. from the top of the skull between the horns to the root of that should be the tail. The horns were not large, spreading only 3 ft. 2 in., but very even and handsome, with nine points on a beam. I shot this moose twice with a 20 in. .44 cal. Winchester, 73 model, at 210 yards standing and 230 running (distances accurately measured), and he fell stone dead in less than twenty yards from where he started. The first shot, about a foot back of the shoulder, broke a rib where it went in and lodged under the skin on the opposite side. The second, near the same place, went clear through; one was as fat as the other. I mention this because some people seem to think the '73 model too light for large game, independent of whether the game is dangerous or not. I was still-hunting, with no snow, no wind, and leaves very dry and noisy.—C. CLAY.

HUNTING WITHOUT A GUN.—Worcester, Mass., Nov. 12.—One morning in September last my attention was attracted to a strange bird, which was running along the platform of the Boston & Albany freight depot. On pursuing it, it flew across the street, lighting on the ground. I followed it up, however, and when it took wing again I got sufficiently near to strike it with my hand and brought it down. It proved to be a very fine specimen of the Virginia rail (*Alphos virginiana*). I have had it mounted by Mr. E. H. Forbush, taxidermist, of this city, and the life-like, running position in which he has set it up, and being the first one of the species that I have seen here, makes it a valuable addition to the other game birds that have a place in my dining-room. The bird was, to all appearances, uninjured before I killed it, and the only reason I can assign for its not flying off, is that finding itself out of its natural locality, and being of a timid nature, became bewildered. P. S.—Had it been a crow, muskrat or ibarby, I should have presented it to the Sportsman's Club of Clinton, Mass., to be served up at the game supper, which came off Oct. 19, the day following that of their fall hunt.—CAW.

ALTERATION OF GUNS.—*Editor Forest and Stream:* Seeing you wish the experience of those who have changed the size of bores or length of gun barrels, I would say that I once owned a Moore gun, 13-bore, 34-inch barrels. I could not handle it quick enough to suit me, and cut it off four inches. I shot stronger but not quite so fast. My experience is that a 30-inch barrel is the best length for all purposes, and a slight choke for strong shooting. I think a full choke gives too much friction to the shot and takes off force.—J. H. A. (Lockwood, N. Y.).

ARKANSAS GAME GROUNDS.—Charleston, Ill., Nov. 9, 1883.—On the 5th inst. Harry Stoddert returned home from Greene County, Ark., with a fine two-year old doe. He had been hunting for four days. Mr. Stoddert reports squirrels and ducks very numerous, turkeys and deer in fair numbers, a few bears and fish by the thousands. The other boys say that Mr. Stoddert was afraid to get a hundred yards from camp for fear the guerrillas would catch him, and he was so very homesick he would not stay until the rest of the boys came home.—FOX SQUIREL.

VIRGINIA, WARRENTON, Nov. 13.—We have had a succession of rains, northwest gales and bad weather for two weeks back, and game reports are poor. To-day Hon. J. V. B. Brooks killed three wild turkeys, of which I had had occasion to see only one. He had a satisfactory proof. On the 12th, thirty miles west, bass fishing is fine. Maj. Dowman's letter reports 140 lbs. in one catch, minnow bait. In boxes three grays and one red in the Warrenton Club; C. E. F. Payne and Johnny De Lancey in at the death.—E. Z. C. J.

HUNTING RIFLES.—El Paso, Texas, Oct. 24.—*Editor Forest and Stream:* Allow me to say through your columns that I only speak the sentiment of many riflemen when I say that if any manufacturer will put on the market a 40-90 repeater, on the style of the Winchester-Martin or Bullard, he will receive my thanks. C. D. referred to this in a recent letter. I hope he will write more on the subject. Believe me, many hunters are longing for such a gun, and I am one them.—GEO. W. BAINES.

GROUSE VS. CORN.—Morning Sun, O. N., Nov. 9.—Shot four pinnated grouse this afternoon, five big plump fellows; wish I could give you a couple. Ducks are coming in from the north and sportsmen are prepared to make it warm for them here. I send you a short article on pistol shooting, or rather rabbit shooting with the pistol. My hunting trips will have to be short this fall as I have about 1,000 bushels of corn to get out and crib or haul to market in this month.—MARK.

TEXAS.—Indianola, Calhoun County, Nov. 6.—Beautiful weather and game very fairly plenty, and easily accessible at short distances. It would delight some of your Eastern sportsmen to see so many pokshuns get up at one time. So many that he would not know which to shoot at, and to walk out of the marsh a few steps off and flush a bevy of quail, with ducks in plenty overhead. The weather still continues warm, not bracing enough for a tramp though.—G. A.

THE WOODCOCK MYSTERY SOLVED.—Boston, Nov. 13.—The mystery as to where woodcock went when moulted is at last solved. "Old Wheeler" says he has "got it down fine." When he was out with his dog during the moulting season, the dog came to a point at a woodchuck's hole, and out got three woodcock. This settles it!—C. T. DUCKLE.

MASSACHUSETTS.—Salem, Nov. 12.—A Salem party starts for Wachusett, Me., this A. M., to try their luck on foxes. About here matters are quiet. Some quail have been shot, but a few snipe and woodcock met us as we went in this very season. Some coat shooting at Squam, but the shore birds rather "went back on us."

THEY BROUGHT THE GAME.—Plym, Mich., Nov. 8.—We have had a side hunt here, ten men on each side. The contestants brought all the game they could find, and so the hunt was declared a draw. Quail shooting is very fair, there are several flocks on the borders of the town.—J. N. D.

Sea and River Fishing.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The dates of open seasons printed in our issue of Aug. 10, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

"THE SAUMON."

TYPE: "THE ANGELS WHISPER."

() N. Tweed-is-a-stander!

In great hopes o' landin' a saumon were we;
I took up my station.
With much exaltation,
Whole Morton fell a-fishing further down upon the loe.

Across the stream down
My line I flae a-throvin';
A son wester blowin' right into my ee,
I jumped when me look on
I felt something pokin',
Put upon further lookin' it proved to be a trise.

Deep, deep the stream in
I saw his sides a gleamin',
The king o' the saumon, sae pleasantly he lie
I thought he was sleepin',
But upon further peepin'
I saw by his teeth he was laughin' at me.

The flask frae my pocket
I poured into the socket,
For I was provoked into the last degree;
And to my way o' thinkin',
There's naughtin' for't but drinkin'
When a saumon lies winkin' and laughin' at me.

There's a bend in the Tweed ere
It mingles with the Teader,
Perchance you may see there a wide, o'er-spreadin' tree:
There's a part o' the river
That I'll revisit ere

'Twas there that the scaly buffer lay lurchin' at me,
—From "Songs of the Edinburgh Angling Club."

MEGANTIC TO MOOSEHEAD.

AFTER ten days' fishing and hunting at Spider Lake and Hathan Bog, we left Lake Megantic, in the Province of Quebec, on the 4th September last, for Moosehead Lake. Our party consisted of Ed. Binnore, of Montreal; W. F. James, Geo. H. Morrill and F. H. Thomas, of Sherbrooke; S. D. Ball, of Spider Lake, as general fretmaker, and the writer. Through the kindness of Mr. Win Smith, Road-master of the International Railway, and Jack Kincaid, the engineer, we got a lift on the engine of the construction train to the end of the track, about five miles, while Donald McVoy's double team followed with our canoes (two birch and a Strathlain canvas) and other traps. By keeping the line of railway we could get Gordon's camp, ten miles from Megantic, at noon, but our team did not arrive until nearly sunset, and was so used up that we considered it prudent to remain here for the night, and were most hospitably treated by Mr. Clark Gordon, one of the railway contractors, a whole-souled fellow and an enthusiastic sportsman. His fishing stories are "taken on the spot," and are not fish stories by a long chalk. Some of the ponds in the vicinity of the Gordon camps and Gordon's camp, ten miles from Clark fished them. They are so little known that to some of them names have not yet been assigned. Last winter a catch of forty or fifty pounds of trout through the ice was an ordinary afternoon's work. A game of euchre and a stewed duck supper, prepared by I. D. Fraser, the affable clerk of Mr. Gordon, finished up the evening, and a shake-down was prepared in the store for the night, while McLeod and Ball luxuriated in the bay window.

The next morning, after an early breakfast, we were again under way, and by following the railway dump and tote road, managed to reach Gordon's Maine camp, about eleven miles further, early in the evening. Here we were entertained by James A. Gordon, another of the contractors, and his son Willie. The old gentleman would sooner fish than eat any time, and we have had good times together at Brompton Lake and on the Magog River. Very few can handle a rod as well as he can, and his day's fishing always figures up well on the count. Another early morning start, and we pass the camp of James A. Gordon, Jr., about 9 o'clock. This is the last camp on the line of railway, and Mrs. Gordon and her daughter seemed delighted to meet us, as they so seldom see any one except the railway hands. Here we first struck Moose River, and on we went over logs and boulders, stopping to chop a tree or two which had fallen across our path, and after a while crossed the river at the first hay farm near the mouth of Long Brook. Ball had hunted and trapped on this brook, and considers it unequalled for fish and game. At noon we stopped at the second hay farm below the Lowell Falls, and here our teamster left us. We remained here over night, amusing ourselves in fishing near the camp, until we had a two days' supply of trout on hand, the largest fish weighing 21 pounds.

On Saturday we launched our canoes, and by dint of wading and dragging managed to make some ten miles during the day. We had too much to do to think of fishing, and besides we had an abundant supply on hand. The banks of the river were thickly tracked by the footprints of moose, caribou and deer, with occasional bear tracks. The day was showery, and we were glad to camp that night on a high bank close to the river. We were wet from head to foot, but too tired to change our clothes, and a good bed of spruce boughs prevented us from taking cold. In fact we found it "in bed for coughs and colds consulting." Ample justice was done to a couple of frying pans full of trout, and a double allowance of tea, strong enough to float a harrow tooth. Nothing in the woods allays fatigue as a panikin of strong tea. When camping in Australia it formed a part of every meal, and was considered as indispensable as bread.

On Sunday we struck deeper water, and found less diffi-

culty in getting along. We passed the third hay farm, where we feloniously appropriated about a half bushel of potatoes from a patch which we found growing there. We trust the owner will accept this open confession in payment, and hereby tender him *carpe blanche* to raid our potato patch when in similar straitened circumstances. Below here we met two young Bostonians, who with a guide from Moose River village were up on a fishing trip, and who returned the next day, passing our camp while we were busy repairing canoes. Although we had very little swift water the sudden granite boulders made navigation extremely dangerous to our birches. In many places these boulders towered twelve or fifteen feet above the water, the tops of some of the highest having been blasted away to facilitate lumber driving.

Monday noon we reached Holey Falls, some six miles below our last camp, which we passed by two portages, the longest about half a mile. This portage is strewn with immense granite boulders, and suddenly dropped during the glacial period, and it is as well to say the "conquerors never saw." The first carry is over an island, at the foot of which the left branch of the river comes in at right angles over a nearly perpendicular falls of some sixty to eighty feet. These falls are a magnificent sight; on one side of them a buttress of logs has been built to keep lumber from lodging. The guide whom we afterward engaged at Moose River Village told us a blood-curdling story of how he got jammed there in cutting away an old log before the water could spruce him up by the rope to which he was fastened. It was for several weeks incapacitated from work. The falls on the other branch of the river are not so abrupt, but no boat can run them at any pitch of water and live. Where the river unites at the foot of the largest falls the spot is one of the best places on the river for trout, although not so large as in other places. We afterward passed the Spencer rips, a short fall round which we carried, but which can be run in a canoe in high water. At the Attran rips, which are passed by two short carries, there is excellent trout fishing, particularly in the large basin at the foot of the lower falls. This night we camped on a tote road on the left bank of the river, where we shot several partridges, which we fried next morning for breakfast. While breakfast was being prepared, Mr. James walked a short distance up the tote road and came back with a fine set of caribou antlers, which with the skeleton of a caribou, he had run across. Afterward, in walking down the road, he noticed a caribou coming toward him. His gun was only charged for partridge, but he stepped behind a tree, drew his revolver, and when the animal had got within about twenty yards of him he fired and cut a large lock of hair out of his mane. If it had been close season in Maine he thinks he could have made a closer shot.

About 3 o'clock Tuesday we reached Atean Pond. This is a lovely stretch of water, some six miles in length, dotted with islands and inlets, most of which are covered with small pine. The boulders appear to be mostly sandstone, and by the action of the waves have been made to assume the most fantastic shapes. We find that we have got around a mountain which has been in sight for three days, and which, like Schuchleuck Mountain, has been always ahead of us. Atean Pond is a place where the logs at this time have not done to congregate. A paddle nearly around the pond satisfied us that we had gone about eight miles to reach the outlet when half that distance would have sufficed, had we known where to look for it. After entering the pond, keep to the right instead of going through it. After a paddle of about a mile from the outlet we reached the farm of Pat McKenney at dusk, and remained there for the night. An excellent supper was prepared for us, and for the first time we did not have the satisfaction of sleeping without our clothes. Mr. McKenney is one of nature's noblemen. He is a native of the North of Ireland, but has lived on this farm for the past fifteen years. He has a market at his door for all he can raise. The lumbermen pay good prices in cash. His farm comprises 200 acres of excellent land, and is situated a short distance above the outlet of Wood Pond, a sheet of water about three miles long from inlet to outlet, or five miles to its greatest length. Nobody should go within ten miles of Pat's without making it a point to stay at least one night under his roof, and if the tourist be made of the right stuff, he will be treated with the utmost kindness and something besides. Just think of the charge—meals, 20 cents; beds, 10 cents each! Our breakfast consisted principally of "chicken fixins," done up in a style to tempt an epicure, while the potatoes had a most excellent relish. Pat is of a very communicating turn, and possesses a fund of pleasant anecdotes. If his daughter was only as talkative as she is handsome we should have liked it better.

On Wednesday morning we paddled through Wood Pond and down the outlet half a mile to Moose River Village. The cultivated farms, with the fields of ripe golden grain, were beautiful from the pond, and the mountains in the background formed the framework of a very attractive picture. Some large trout were seen rising near the outlet. Moose River Village contains some thirty or forty neat cottages, and is situated on the stage road between the forks of the Kennebec and St. Joseph, on the Quebec Central Railway. A daily stage runs between these places, the river being spanned by a covered bridge. Here we saw our Boston friends, who had arrived just before our leaving by the stage. We engaged the guide Abner C. Moore, accompanied us to Little Brassus Lake, and dropped down the river a few rods, where we stopped for dinner. We never had a guide who gave us so much satisfaction as did Moore; a more courteous and obliging man doesn't exist, while in preparing a comfortable camp he cannot be beaten. His charges are \$2 per day, with canoe, which carries three men and baggage. His address is Moose River Village, Me., and this is a good point from which to start on a fishing trip either up or down the river. It can be reached by two days' staging from the Quebec Central Railway at an expense of about \$1.

From the village to Long Pond are six miles of nearly dead water. The banks of the river are beautifully wooded, and each stretch of water presents a perfect panorama of loveliness. Long Pond is nine miles long, and we camped on Wednesday night about two miles down on the right-hand side, at a favorite trout spawning bed. The inlet is lined with stakes and booms for some distance to prevent lumber from floating away from the river at high water, and tie up to the shore are several rafts or headworks, with shanties, in which the men live. Two line-looking farms occupy the northern shore of the pond, where the men were busy harvesting.

Thursday we paddled through the pond and camped, about the middle of the afternoon, a few rods below the outlet, at the remains of a dam which had been erected to facilitate

lumber driving, and had washed out. Here we caught some twenty-five pounds of trout, the largest weighing two and one-quarter pounds. These trout were without exception the finest we ever caught, and were as fresh, plucky and curly as any salmon. Two or three islands on the river formed the foreground of a charming picture looking up the pond. Our camp ground here was the prettiest and most comfortable of any we had on the trip. From Long Pond to Little Brassus is a long four miles, and the worst part of the river. There are on the way several nasty falls where we had to let the canoes down with ropes. At one patch of about four feet there is excellent fishing. This part of the river is ornamented with several very small falls, diverting the current to keep lumber from lodging, and there is a good lumber camp on the left bank with stoves and bunks complete. A fine tote road follows this side of the river. To go from Long Pond to Little Brassus took us well into the afternoon. A hut is built at the head of Little Brassus which until recently was occupied by one Jones, a whisky smuggler who was accused of lifting over \$1,000 from a party of lumbermen, and who lately "lit out," leaving his small corner, some flour, salt beef and dried apples for chance comes to help themselves. We appropriated a pound or two of dried apples. Here we parted with our guide Moore and started down the lake and river, reaching Big Brassus, two miles further, at sunset. From the inlet to the outlet of Brassus is four miles, and it was pitch dark when we camped at the first place. The lake is about seven miles long, and is two miles in width, and in going to the outlet it is necessary to keep well to the right. Shoal water runs out nearly half a mile. Any one unacquainted with this lake would imagine that the outlet was on the extreme left or north end of it. As we had no time to collect bougus or fuel we passed an uncomfortable night.

The next morning, Saturday, 10th, we made an early start, three of us taking the canoes, while the other three took the lake road on the left bank of the river. In passing about the first two miles of the lake, we caught some splendid trout, and could have enjoyed excellent sport if we had not been eager to push ahead. The weather looked threatening, and we were anxious to cross Moosehead before the wind should be too high. At two successive cists, as the canoe swung in the eddies, I caught two trout, one weighing 24 and the other 14 pounds. From the lake to Gertrude Island is rough water, but we ran all but two short stretches without leaving the outlet. From Gertrude Island to Moosehead is still, smooth water, and we reached the boats and sighted the Mt. Kineo House at 11 A. M. Two or three farms have been started on the right bank of the river, and the land, though rough, seems good. To the Mt. Kineo House, the distance from the river is two miles, and we reached there at noon. So much has been written about Moosehead scenery that we could do nothing but repeat what others have said. It is very beautiful. The towers up like a wall some 500 feet and forms a magnificent background to the hotel and adjacent buildings, reminded me of the background which Table Mountain gives to Cape Town, in South Africa. The old hotel was burnt last year but a new one is in course of construction, which will accommodate about 500 guests. At the time of our visit, there was only accommodation for about 80, and they were short of fuel and provisions. From the hotel, the boxes and supplies from the hotel and store. Mr. Demian, the manager, was very attentive and obliging, and the manager of the store is also very accommodating, his prices are reasonable, and it gives us pleasure to acknowledge his kindness to our party. We were all in a very dilapidated plight, and after getting the wherewithal to keep the pot boiling, we crossed the bay to the next point, pitched our tent, had dinner, and had my boots repaired. After a thorough change of clothing we started back to the house. Two of the younger members of our party had expended considerable time in fittivating themselves so as to be presentable to the lady guests, and it was too bad that just as they had got fairly aloft their canoe took a notion to come the Esquimaux kvak game, and they reached shore swimmi'ngly. However, they were plucky enough to start a rousing fire, and in a course of about half an hour had dried up their boots. The boys saw a number of guides on hand and ready to accompany parties, and all appear to be quiet, attentive men. It perhaps isn't wise to particularize, but among those we saw, our own choice would be J. H. Quilty or Fred Smart, both have splendid canoes, and considering that they weren't paid for doing so, showed us a great deal of kindness and attention. Parties who don't want to put on style can get a good substitute in the guides' boarding houses for forty cents. Some of the guides, particularly the Indian ones, have their own shanties. They make the best birch canoes we have seen (carrying three and baggage), at a cost of about \$30.

Sunday we spent in strolling around and on Monday morning Messrs. James, Morrill and myself took the steamer for Greenville, leaving the other three to return by Moose River. Our trip had taken eleven and a half days; they made the return trip in seven days, taking advantage of several currents, especially the one to Holey Pond by which some twenty miles are saved. Off the outlet of the lake we picked up a gentleman who had been fishing there with good success. He showed us four trout caught in the Kennebec before seven o'clock that morning, all weighing over three pounds each. We saw one caught near Mt. Kineo House which weighed five and a quarter pounds—as pretty a speckled trout as one could wish to see. There are also a few very good trout in the Bangor's Birch Island, containing one or two acres, a great resort for picnic parties and a perfect gem in the setting of the lake. From Greenville we staged to Blanchard, twelve miles, fare one dollar including baggage. Our Strahan boat farm seemed to be a curiosity and our statement that it was a patent lien coop was satisfactory to some of the inquirers. From Blanchard we took the Bangor and Piscataquis Railway to Bangor, where we were met by the cars bound up to the Bangor House, where we found excellent accommodation and comfortable quarters. Mr. James had business with the G. T. R. ticket agent here, and while waiting his return from supper amused himself by promenade in front of the office. Imagine his disgust when a policeman told him "he had better move on," as he had been hanging round that corner long enough." Mr. James prides himself on his wit and wit and wit, and he put up a good deal of Bangor policemen are not fitted with very keen perceptions when they couldn't see the gentleman sticking out of his old fishing suit; but the fact is that he looked very much like a river driver on active service. Next morning he was taken down again, when he picked up his household boots at the bedroom door and found "50 cts." chalked on the soles. We left Bangor at 8 A. M., the cars being crowded with excursionists and a fair at Lewiston. Mr. James was the fortunate possessor of a

FRICTION OF BULLETS.

Editor Forest and Stream: In a recent issue of your paper Mr. A. B. Dodge suggests that less friction may be caused by bullet No. 6, by my trajectory experiments to give a flatter curve than some of the lighter ones. ...

What occurs inside the barrel of a rifle at the moment of discharge is more a matter of conjecture than of absolute knowledge. But we can fairly assume that the friction of the bullet against the barrel, and the atmospheric resistance, ...

The inertia increases with the weight. The friction developed at the passage of a bullet through a clean rifle barrel is dependent on: 1. The amount of upset given the bullet. 2. The length of the cylindrical portion upset. 3. The lubricant used. ...

The amount of upset increases with the initial pressure (which is the same for each bullet No. 4 also conformed most closely to the form of least atmospheric resistance as determined by Prof. Bashforth. ...

But the increased weight and upset which cause prejudicial results also have advantages, that perhaps more than counterbalance them. The initial pressure of higher combustion is more perfect, and the escape of gas more effectively prevented, and the greater the weight the less the atmospheric resistance. ...

Indeed, I believe that some of your correspondents have given too much weight to this subject of friction, as where not properly developed, it is a hindrance, and it probably produces advantageous forces in a far higher ratio. JAMES DENNER, Nov. 10, 1888.

RANGE AND GALLERY.

EXCELLENT MILITARY SHOOTING.

Harford, Ct., Nov. 8.—The record of the First Regiment, C. N. G., is shown at the close of this season's target practice, is very creditable. Says the Courier: "The splendid results of the season's work are deserving of more than a limited notice. ...

The present system of target practice in the Connecticut National Guard requires that every man shall begin to shoot at a certain distance if he succeeds in making 19 points out of a possible 25, he is promoted to the next class, which is 300 yds. ...

The distances are 300 and 500 yds., and five shots are allowed at each range. Two trials only can be made, and if a marksman succeeds in making a 50 per cent. score he is a marksman and entitled to wear the State badge. ...

Each range is 1200 feet apart, and if a marksman succeeds in making a 50 per cent. score he is a marksman and entitled to wear the State badge. ...

ANGLING TALKS:

BEING THE

Winter Talks on Summer Pastimes

Contributed to the FOREST AND STREAM

By GEORGE DAWSON.

CONTENTS:

Simple Wise Men, About some Distinguished Anglers of our Time,
About Bass, About Salmon Fishing,
About Grayling, Salmon and Sea Trout Haunts and Habits,
A Memory, Several Relevant Topics,
Reminiscences, Angling Mishaps,
Odds and Ends.

Extract from the Preface:

"The 'Talks' attracted wide attention at the time of their publication in the angling columns of the FOREST AND STREAM and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable. These 'Talks' are brimful of manly, wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he performs shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's Memorabilia: he who reads, if he be an angler, must go a-fishing; and if he be not, straightway then must he become one."

Limp Cloth, 78 Pages, sent postpaid on receipt of price, 50 Cents.

T. G. DAVEY, Publisher, London, Ont.

KYNOCH'S Patent "Perfect" Brass Shells, MANUFACTURED BY KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin plate metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and do not admit of a heavier charge, as owing to the thin metal, inside of meter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectively crimped with tool (represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

SHOOTING SUITS

Of Waterproofed Duck, Irish Fastina and Corduroy.

Unequaled in Convenience, Style, or Workmanship.

WRITE FOR CIRCULAR.

THIS

Is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pouches. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

Danz' New Pat. Decoy Duck

This is a double folding decoy, consisting of two flat wooden floats, hinged to either side of a flat wooden float. One of these acts as a keel to hold the decoy upright, but if it gets tipped over, as both sides are alike, no harm results.

We also make to order the double decoy with different profiles on opposite sides of the float; say a mallard on one side and canvas back on the other. So you have two dozen ducks for the price of one dozen.

Sportsmen who have tried this pronounce it "The Decoy of the future." Its excellence is so apparent, we now make no other styles. A large variety always on hand, including Mallard, Teal, Red Head, Canvas Back, Blue Bill, etc.

PROFILE AND COMBINED FEES ALWAYS IN STOCK.

PRICE LIST.

Ducks, either style, with cord and anchor, complete.....per doz., \$12 00
Goose, for stubble shooting....." " 12 00

ANSWERS TO CORRESPONDENTS.

cepted the flow of the tide as a criterion of navigability. The decisions of the different States are not in harmony on this point. The large rivers of Pennsylvania are regarded as navigable, and the ownership of the river bed is in the State, while the courts of Mississippi discard entirely the idea that because a river is useful as a means of transportation, it is therefore navigable in the common law sense of being public. The Chancellor of New York used the words "boatable" and "navigable" synonymously, and thus applies them to the waters of the Hudson and Mohawk rivers, and an associate justice stated that "the rivers in England above tide, in point of fact are not navigable except for small craft; reasons, therefore, exist in that island for the common law rule, which have no existence in this country. It is contrary to fact to assert that our immense fresh-water rivers are not navigable, and it is matter of just exaltation, as well as benefit to the country, that in the United States we have rivers which above tide are navigable to a greater extent than would be the circumnavigation of the United Kingdoms of Great Britain and Ireland. It is therefore preposterous to contend that the limited doctrines of the common law are applicable to the Mississippi, Ohio, Susquehanna, Niagara and St. Lawrence. If applicable, the owners of land on these streams have a right to go to the center of the rivers, and Grand Island in the Niagara, with 18,000 acres, would belong to the owners of the shore."

An eminent author has collected and examined the multitude of decisions of the various States with this result:

"Though it would be impossible to reconcile the rulings of the various courts in this country upon the question, 'What is a navigable stream?' it may be useful to give the result of some of these, in order to see in what respect they differ. It seems to be conceded by all, that streams in which the tide ebbs and flows are what are known to the common law as navigable; and further, as will be stated hereafter, land bounding upon such streams extends only to the line of the high-water mark. But some of the courts regard the large rivers in this country above tide-water as navigable, and carry the line of land bounding upon them to low-water mark. The subject is very ably and learnedly discussed by the courts of Mississippi, who make what seem to be the true and proper distinction between public and navigable streams. They show that it does not depend upon the capacity for navigation by boats or other craft, but is borrowed from the law of nations. By this, tidal waters are public highways for all nations, and therefore the State can only own or exercise control over them; whereas intra-territorial streams are subject to State jurisdiction as to being navigated; and it is competent for the State to grant the soil under these rivers, subject to a public use of the waters for purposes of traveling, and carrying on trade. In that way the ownership of the soil may be in the riparian proprietors, subject to the easement on the part of the public of passing in boats, rafts, etc., upon its waters. The courts examine critically the decisions of the various courts, and come to the conclusion, that whoever owns lands bounding upon such streams owns the soil to the *flum aquæ* (middle of the stream), subject to the right of navigating its waters by the public. The large rivers in Pennsylvania are held to be navigable, and the bed of the stream belongs to the State. If land is bounded by such rivers, the line is that of low-water mark; but it is subject to the right in the public to pass over the space between high and low water marks, in boats and for fishing. Islands in such rivers belong to the State. Low water means ordinary low water; so that if, at very low water there is no flow between the bank and the supposed island, it would not make it a part of the mainland if at the ordinary state of the stream the water flows between it and the bank. The same rule applies in Indiana in respect to the Ohio River. In Illinois the Ohio is a navigable river and a public highway, but persons using it as such have no right to land on or to make use of the shore above the line of low water. The owner of the land between high and low water may erect and maintain a wharf thereon and charge anyone for using it. The ownership of the bed of the stream to the *flum aquæ* seems to be conceded to the riparian owner, but subject to the use of the river as a highway by the public. In Kentucky, the riparian owner of lands bounded by the Ohio owns to the thread of the stream, subject to its being used as a highway. In Michigan, if the bed of the stream belongs, as in case of navigable streams, to the State, riparian owners may not extend wharves in front of their lands; otherwise, though the stream be a public way, they may erect such wharves, if they do not thereby unreasonably impede the passage of water-borne craft. The courts in New Brunswick recognize the above distinc-

tion between navigable and public streams, and the ownership of the soil under them by the riparian proprietors. In Wisconsin the courts hold Rock River a navigable stream, and excepted, as such, from the mill laws; but they evidently do not give it the incidents of a navigable as distinguished from a public stream, inasmuch as they hold that the ownership of the soil under any of her rivers is not affected by its being declared navigable.

In this distinction, as to the rights of riparian owners, between a public and a navigable stream, the courts of Alabama, Ohio and Maine coincide, while those of Maine hold that one is liable to indictment who stops the navigation of one of these public streams. Whereas Davies, J., in a very elaborate opinion, maintains that the Mohawk is a navigable stream, like all the large rivers in New York; that the State owns the bed of these, that land bounding upon them extends only to the line of low water, and that islands formed in the stream belong to the State. The courts of Pennsylvania adopt the same rule in respect to the Monongahela River and other large rivers in the State, the bed of the river to the low-water mark belonging to the State. They trace this doctrine to the Roman law which gives the bed of all perennial streams to the public, ignoring the English common law on the subject. The law of Pennsylvania, in making the low-water mark of such streams the boundary of the riparian owners, is adopted in North Carolina and Tennessee."

The right of Parliament in England and of the State Legislatures in this country, where unrestricted by constitutional restraints, to abridge the public rights in waters below low-water mark in favor of individuals or corporations, is established beyond possibility of dispute. The same is true of land between high-water mark and low-water mark wherever the shore is, as by the common law it is, the property of the State. In the exercise of its power to regulate fisheries in its public waters, the State may exclude its own citizens and citizens of other States from taking fish there.

It has been held in Maryland that the State may grant the exclusive right of planting oysters in public waters. A private right to dig shell-fish along the shore has been recommended in England and Connecticut. An English decision is to the effect that while the right to take seaweed below low-water mark belongs to the public, it may be acquired by an individual through prescription or by a grant. New York decisions have conceded that a person may have an exclusive right of fishing even in arms of the sea and other tide-waters. The courts and Legislature of Pennsylvania have acknowledged an exclusive right of fishing in riparian proprietors on the banks of the Delaware River down to low water, as a private easement existing by grant or prescription. Massachusetts holds the right of fishing in all its rivers subject to legislative control. So the Maine Legislature is free to appropriate and regulate fisheries in tide-waters, which would be otherwise public.

Chancellor Kent states that the shore below ordinary high-water mark may become, by grant or prescription, private property. It has been repeatedly held both in England and this country that there is a property in living game unreclaimed arising *ratione soli*, or from the ownership of the soil, and that that property consists of at least the exclusive right of the landowner to take the game which comes upon his land while it is there. As the land under public waters belongs to the State it would seem to follow that this property in game therein is vested in the State as an incident to its ownership, and the State could, therefore, make private grants of the right to take such game. The State has the additional right, as one of its police powers, to regulate the taking of game throughout its territory, on private as well as public lands and waters. It may exclude all killing of game, or restrict it to certain periods of the year. Familiar examples of private and exclusive grants of this kind are those to the Hudson's Bay Company, and of the Alaska seal fisheries. As the right of landowners adjoining public waters to take game or fish does not extend beyond the boundaries of their land, unless specially extended by grant or prescription, their rights in game as against the public, will generally be found to be co-extensive with their proprietorship in the soil.

CHEAP GUNS AGAIN.—Through inadvertence and temporary lack of supervision an advertisement was permitted to appear in our last issue which, under ordinary circumstances, would not have been admitted to this journal. We may also explain that the cunningly worded footnote attached to the advertisement in question was a part of the electrotype block, and should not be taken in any sense as our indorsement of the gun.

NAVIGABLE WATERS AND SHORE RIGHTS.

Editor Forest and Stream:

Can private rights for hunting and fishing purposes extend over public and navigable waters?

The best locations and grounds along the Atlantic seaboard and the great lake shores, for shooting wildfowl are rapidly becoming private property. Now what authority have these owners of points and shore-lines to prevent a hunter from shooting from a boat—a yacht—wherever the boat or yacht will float? Does the Government ever permit navigable waters for any purpose to become private property? And what is the legal definition of navigable waters?

A short time since an attempt was made by private parties to acquire title from the Government of the valuable sporting grounds in and around St. Clair lake and river. The scheme was unmasked and defeated by prompt action of some of the best sportsmen of Michigan. In discussion with a friend, I claimed that no title could be acquired from the Government that would bar one from shooting or fishing from a boat, provided the sportsman did not land. Was I right?

In considering the questions raised by our correspondent it is of the first importance to determine the ownership of lands under water. By the principles of international law, which is another name for the usage of nations, the territory of a State extends not only to all its ports, bays and such parts of the sea as are enclosed by its headlands, but also to the distance of a marine league from all its shores. Within these limits the property of the State is absolute. It has been suggested by high authority that the United States would be justified in attaching even a greater portion of the sea to its coast.

According to the English common law of riparian rights, which, though not fully adopted in the United States, has guided most of our litigation, the State holds the land under all of its tide-waters, that is the sea, arms of the sea, and rivers where the tide ebbs and flows. Landowners along these waters own to the high-water mark, while the shore, which is the space between high-water mark and low-water mark, is the property of the State. Along rivers above the flow of the tide and upon the banks of streams and ponds, riparian owners own to the *flum aquæ*, or middle of the water, and if one person owns land on both sides of the water the entire river bed is his. The public, however, have a right to navigate and take fish from all public or tide-waters, including the taking of shell-fish from the shore. Even in those waters without flow of the tide, if they are useful for transporting boats and rafts, the public has an easement as in a highway of a right of passing to and fro.

It is not easy to define navigable waters. The common law applied the word navigable to tide waters only, terming all others unnavigable. Our courts have never entirely ac-

god of the setting sun. Half a mile out the two foot passers, attracted, it seems, by my martial air, came up to me...

They were each clad in the cotton shirt and drawers, straw hat and rawhide sandals of the country, and each carried a light blanket, done up in very small compass, for their entire luggage.

As we came up a starved dog, forgotten or left purposely by some other party, hung around, fearing to come near, as we were on our march.

Mariano's manners had in a quiet way been gaining in insolence during the whole trip, and I was not sorry when we at last came in sight of the station where we should part company.

This demand was rejected and he, scorning the offered wages, went off ostensibly to look up some officer of justice, really to work upon my timid disposition.

At last with a humility that was almost pitiful he begged me to pay him the amount I should deem just, and so, cheered by this crowning triumph of the Saxon blood, I hurried the cars in a happy mood and was on my way northward away from the dreary insolation of southern seas and southern climes.

H. G. DELLOS.

REMINISCENCES OF COLORADO.

SOME ten years since or more—more, if anything—I spent the greater part of a year in the silver mining regions of Colorado. Four hopeful individuals, including your most obedient, owned a hole in the ground, known as lode, lead, shaft or silver mine.

Why named Chicago I cannot say. This country is very windy, especially on the mountains, but I don't know as the mountains near the lakes are more windy than other localities. If they were, the name would be more appropriate.

At the junction of these streams was then being erected a sawmill and boarding house, the wood cutters for the reduction works for the treatment of silver ores, the discovery of which in considerable quantities at that time had opened a new district that promised rich yields.

At this place the trail turns directly south, keeping along the bank of leaping, foaming Chicago Creek to the lakes, up through deep, dark gorges, with lowering mountains on either hand, wooded and rocky. Squirrels, small and gray, chatter in great numbers unafraid, grouse run across the trail, or whir away from its side, while bruin and mountain sheep, and mule deer are not infrequently met with.

Fourth of July was to be observed as a general holiday by our quartette, and three of the members were to spend it in town, as we did every Sunday, but I concluded that it would be a good opportunity to make my intended visit to the lakes, going across the country in preference to following the trail, as thereby I might see more game, and

put my foot, as all tourists wish to do, where foot of man never before trod. I slept above the height of the third, the boys having gone to bed early next morning, rose, cooked my simple breakfast, put a couple of biscuits and a piece of bacon in my pocket, buckled a Colt's navy around me, took a rifle pistol, for I had no gun, and started on my tramp of somewhere from thirty to forty miles, intending to go and come in one day.

It was a most charming morning. The sun just fairly inaugurated a new day, and from his course above, the far away plains plainly visible in the clear morning air, though more than seventy miles away, with the silver thread of the Platte glistening in its devious course, touched with his slant beams the snow-covered peaks, awakening rose blushes, making the grand old summits inexpressibly beautiful.

As I descended, the trees, no longer torn and harassed by the raging unimpeded winds of the summit, rose straight, tall and graceful, such as would have made a shipbuilder's eyes water. Trees not more than six inches in diameter at the butt, stood straight as arrows sixty feet, while others larger rose proportionally higher and as straight. Down, and still downward I went. Now across a "bench" and on toward again lower jagged rocks and fallen acres of timber, blown prosstrate by terrific storms, torn up by the roots by whirlwinds and waterpuffs; now under a vast canopy of evergreen, over a carpet of pine needles as soft as the softest Wilton, and again through miles of burned timber, dead, erect and white, divested of bark and worn smooth in the storms of years, while beneath the long grass and beautiful flowers of every hue grew in luxuriant abundance, affording ample grazing for deer and elk, whose tracks I frequently saw, though the feet-footed beauties were not visible.

As I descended, the trees, no longer torn and harassed by the raging unimpeded winds of the summit, rose straight, tall and graceful, such as would have made a shipbuilder's eyes water. Trees not more than six inches in diameter at the butt, stood straight as arrows sixty feet, while others larger rose proportionally higher and as straight. Down, and still downward I went. Now across a "bench" and on toward again lower jagged rocks and fallen acres of timber, blown prosstrate by terrific storms, torn up by the roots by whirlwinds and waterpuffs; now under a vast canopy of evergreen, over a carpet of pine needles as soft as the softest Wilton, and again through miles of burned timber, dead, erect and white, divested of bark and worn smooth in the storms of years, while beneath the long grass and beautiful flowers of every hue grew in luxuriant abundance, affording ample grazing for deer and elk, whose tracks I frequently saw, though the feet-footed beauties were not visible.

Then my way lay in the ascent nearly the whole distance. Conies barked at me from rocky ledges, disappearing, as I approached, with a yelp, heading into crevices, as if with danger to their skulls, but coming up again like Mark Twain's frog, "flat-footed and all right."

I neared at last the timber line, and as I stood in the edge of and admiring this midsummer day, a huge snow-bank, sending out at its foot a stream of pure, cold water, a couple of mountain sheep, which had waded or seen me from the vast meadow where they were feeding, came flying down and disappeared swiftly in the wood. I made a quick detour in hopes of getting a shot, but I might as well have chased the lightning.

Traversing the plateau a few rods, I stretched away upward a mile or more from the timber line to the cliff that affords a magnificent outlook north, south, east, and west, with scarce an obstacle to the vision. I looked down on the beautiful sheets of water I had come so far to see. Seemingly but a stone's throw beneath me the upper and smaller lake lay dark and still, but I found on descending the almost perpendicular side of the mountain that it was fully a thousand feet beneath the spot where I had first gazed upon it.

This sheet of water, not indeed a large lake, only a pool of water of about twenty yards in diameter, yet resting there untroubled, dark and beautifully blue, mirroring the rocky wall that rose sheer a couple of thousand feet from its very edge, threatening to topple from its lofty height and make a magnificent ruin of the lovely scene, this little lake is a thing of beauty to be enthusiastically admired.

I climbed toward by the side of the stream, clambering over rocks, swinging by bushes, picking my way between huge fragments of the mountain fallen from their aerial perch, until I stood in a little grove of stunted pines near the border of the lake. Here hunger nipped me, and as it was now half an hour after noon, I sat down on a log and lunched. Seven hours and more I had put in in good honest walking in the midst of the Rocky Mountains without a path, and I was a rapid walker then. Twenty miles at least I had come. The water of the greater and beautiful lake, some before and around me. The lake lies in a vast amphitheater of mountain wall, open on one side, and but partly there, to allow an outlet to the water. The eastern wall rises almost perpendicularly, thousands of feet of solid wall with scarcely a break from base to summit; bare rock, chipped as with Titan hammers, without, as I remember it, a bush or tree to its crest. One seldom realizes solidity as here.

On the south a stream of water, reminding one of Tennyson's "wall of thimble lawn," comes down from the heights above through glittering snow-banks that reach almost to the lake. What wonder if the waters were life! On the southwest rose the rocky rim of the great basin air in the air, its beelling cap clear cut against the blue dome, while on the west and northwest the walls rose only a little less loftily. A short distance from the lake on the lower northwest slope of this vast dish, a grove of stunted, ragged, gnarled, wind-battered pines cling to the rocks, struggling for existence, but barely holding their own. The waters of the lower lake are very deep, as are also those of the upper, but the lower is the greater attraction in the west. In the west, one-third by a sixth of a mile in extent, and abounding in speckled trout, which sometimes take the fly readily. I took a line and fly from my pocket, hunted up a pole and made a few casts, but without avail. Only one fine fellow rose, but as he neared the surface his appetite left as mine came at sight of his comely proportions, but to no purpose. I regretted his decision, but could but admire his sagacity and grace as he turned tail, and with wary motion settled out of sight. Then I concluded that trout were not in season and put up my rig.

Near where I sat was a hunter's or tourist's camp, a lean-to of saplings and bark. A smouldering fire and grazing pony near by told of recent occupancy, but the occupant was away. The familiar odors of camp were abroad, and I should have been glad to join somebody in a pot of coffee, but was content, perforce, with gazing on a heap of old coffee grounds near the shanty.

After resting awhile and enjoying the wonderful picture, I returned by consulting my watch that it reached home that night I should have to be paddling along in a canoe, a few feet in their recent tracks, and after a toilsome climb reached the rocky rim from whence I had first beheld Chicago lakes. With a last look at the limpid pools far beneath me, and at the wonderful evidences of the throes of nature, I struck the "route step," only to be stopped soon by a severe hail and rainstorm, to escape which I walked under the overhanging edge of a huge rock as big as a small house. The storm over, I set out again, and in a very few minutes was on my legs, and I was compelled to wade in the long grass of that mountain meadow.

I returned by a different route, keeping along a vast "bench" on the mountain side, hoping to be able to keep it the whole distance home, and so avoid wearisome climbing, but I found the inevitable gorge, and the *descentes awenti* was not *facilis* by a long way, no more so than the ascent on the other side, but once upon the "bench" on the opposite mountain I kept it all the way. About five o'clock camp was pitched, and I was compelled to stop, as I took off my shoes and stockings, wrung the water out, and chafed my legs until able to proceed. At seven o'clock I unlocked the door of the cabin, threw a fine fat grouse on the table, myself on the bunk, and thanked my lucky stars I was not on the distant mountain side with nothing to eat and cramp in my legs.

EARLY FIELD LITERATURE.—Editor Forest and Stream: In a work just published by the Century Company, entitled "Sport with Gun and Rod in American Woods and Waters," I have, in a note in the article "Canvas-Back and Terrapin," quoted the book of J. S. Skinner, "The Dog and the Sportsman" Phila., 1845, and have stated that "this is the first book published in this country on the dog, game and the gun." I was led to this statement by a similar one in the preface of the author, who says: "The work here offered contains, it is believed, the first separate and regular treatise which has been published in this country on the kindred subjects, the Dog, Game, and the Gun." After the article "Canvas-Back and Terrapin" was in print, I came in possession of a yet earlier publication, entitled "The American Shooter's Manual, comprising such plain and simple Rules as are necessary to introduce the inexperienced into a full knowledge of all that relates to the Dog, and the Game of the Gun; also a description of the Game of this Country, by a gentleman of Philadelphia county. Phila., 1847." The work, it is said, was written by Dr. Kester, of Philadelphia, and contains much interesting matter, and is so well worthy the perusal of sportsmen of our day, that extracts from it could be cast into a readable article for FOREST AND STREAM. It opens with the following paragraph: "The art of shooting is an art which has not been practiced in this country, excepting by a few individuals, for more than forty years, and in England for not much more than double that length of time."—ALFRED M. MAVER.

HON. JAMES GEDDES.—Sportsmen in the State of New York may be glad to know that Hon. James Geddes, of Syracuse, has been re-elected to the Assembly. He is widely known as a game sportsman and an ardent friend of game protection, and it was a matter of surprise to us that he was not placed on the Committee on Game Laws last winter. In consultations of this committee Mr. Geddes was frequently sent for and his advice sought. He should have been a member of it, and we hope that sportsmen may have the advantage of his presence in the committee this coming legislative season.

As a sort of tenor accompaniment to the report came the bark of the little cocker, and a grouse rose and flew out of that lively I slipped a cartridge in time to salute the next one as he rose up. Then a cartridge stuck going into the gun, and Fred cut a stick and punched it out. Again we cast off Frank, and—

Partridge to right of us.
Partridge to left of us.
Partridge behind us.
Down to the ground they fell.
Many an empty shell.
While from gun aim'd not well,
Loud echoes thundered.

That is clumsy, I know, but its chief merit is its naked, blistering truth—all but by one and by the hundred—for the truth is, they only rose by rose and by time. When a person essays parody, or parody, or uses language more or less hyperbolic, we are accustomed to excuse it under the name of "poetic license."

"But hold on," says an old veteran in the back seat, "how many of these birds did you get?" "Only three." "Now tell the truth, how many of them did you shoot sitting?" "We pretty much always, that is, occasionally, shoot 'em dying when—you killed them all on the ground or in trees." "Well, if we did, we gave them to the sick." "No difference, you should have banged away at them, and trusted in Providence to provide for the sick." Bonaparte is credited with the profane saying, that "Providence is with the side having the heaviest artillery," and the great Puritan Captain is said to have advised his men to "trust in Providence and keep your powder dry." While I go back on "Napoleon most emphatically, I endorse the great old soldier's remark: "It is useless to trust in Providence if we willfully neglect to do our part." Now my part would be to get a new gun, and if the artillery were a little heavier than my present ordnance all the better. Though the firm I am using "exceeds all others for close hand shooting," I am not happy. A man can't do good shooting with a gun between the breech and barrel of which a common envelope can be inserted. Don't think I am lying about the envelope either, for I have just picked up the one in which I intended to send this communication, and slipping it in without opening the breech, I have driven the plunger through it. The skeptic will find it in the waste basket of FOREST AND STREAM and get some practice in hunting at the same time. But to return to my story.

On our way home we flushed a woodcock, and marked him down in a strip of alders, which we worked carefully and repeatedly, with an end dog, and failed to find our game. Then we took our way slowly to the east. And that day's shooting did me good. It threw my mind away from the scenes upon which it was too liable to dwell morbidly, to those that were enacted years ago on the same ground. I passed over that day—"for after all old things are the best." It half beguiled me of my cares; but I cannot say it soothed me into smiles, bibulous, or otherwise. And so ends a very minute, and strictly truthful account of my first hunt this year, if you don't believe me "ask John" of either Ford.

L. L. FLOWER.

LONGEVITY OF SPORTSMEN.

SOME references have been lately made in the public press to the above subject, and to Mr. Horatio Ross having shot his stag on several birthdays after completing his 80th year. It is his long and custom of mine, perhaps through early attention in very different branches of knowledge, to note the effects of genuine field sports upon their followers. Accepting the undeniable fact that genuine sportsmen are, in all my experience, peculiarly humane to inferior animals (it is your ignorant citizen, and, above all, your citizeness, who drives a horse to death), nothing has appeared to me more certain, during observation extending now to exactly half a century, being since I first entered on business in 1853, than that this humane and generous habit, practiced benevolently upon themselves. It may be that they come to acquire some peculiar knowledge of hygienic laws as applied to mankind, who until recently were supposed to be superior to them. Hence our black plagues, our jail fevers, and our still existing epidemics. Whatever is the cause, the longevity of sportsmen—I mean those who have come within my own scope—shooters and anglers, is most remarkable. It is not alone that they are long-lived, but that they preserve their faculties until nearly the very end. Not with them the veteran legs superfluous on the stage.

The most indefatigable angler I ever knew, and also the most expert, was the famous Capt. Murray, who successfully yielded his rod on the river Eschaqui until his ninetieth year. The swift-running streams of the north are supposed, not without reason, to clarify the air over their banks, and so tend to the great longevity of Scottish anglers. In my own experience comes an angler who, to an extent certainly not to be praised, seems to have afforded a living proof of what Sir James Paget has lately advanced—that our sporting proclivities are the hereditary results of the habits and means of subsistence of our remote ancestors. This I have long promulgated in my more lasting works on shooting and kindred sports. The friend to whom I refer had inherited to a remarkable degree, and therefore carried his love of field sports to what may be called a culpable extreme. As Etie Decahire, in "The Antiquary," could not give up his sauntering life among the bonnie Scotch hills and dales for permanent comfort, so my friend sacrificed the great commercial success within his easy grasp for the love of the chase in every form. So his physical powers became apparently incapable of fatigue or injury. At seventy years of age he had an accident, attended by such extraordinary bodily injuries that if I were to describe them medical men would denounce me by name. At seventy-three years he was himself again, and he followed the foxhounds as before on foot, until high 100 years of age, dying not long ago at exactly the age of 100 years and two months. This was not a man living in a pure, bracing district. He lived in Glasgow, a city not looked upon as peculiarly salubrious, and his excursions were around the neighborhood, never extending less than twenty miles a day, except on Sundays. If I were to describe his constitutional, I should bring down a swarm of hornets to my hearer's ears, as they are, as his primitive love of the chase. His case is pure muscle and physical power versus modern intellectualism. I pretend to no decision; I only record.

Mr. Horatio Ross's case is an exceptional one. Among my numerous friends I may select one, a "merchant prince," the senior and active partner of one of the greatest British

firms, whose operations ramify into every portion of the globe. I can vouch for the fact that one of their recent operations was entirely successful, that their plans, in effect most beneficently the food supply of Great Britain from our own colonies, amounting to, in one transaction alone, a very appreciable percentage of the imports of wheat from the United States for a whole year. This revered friend, a man of muscular development, slight in form and graceful in motion, conducting a vast business, finds his recuperation in shooting. Wearing on his 90th year, for a number of seasons past he has made it a practice, shooting over dogs in the old orthodox manner and without an assistant, to kill as many brace of grouse to his own gun on each succeeding 12th of August as he has numbered years of life. I pretend to no deductions, or at least to promulgate them. Such facts may be worthy of consideration by more learned men than, yours most respectfully—J. D. Dougall, in *London Times*.

THE OLD SETTLERS.

A PAMPHLET has been published by Mr. H. C. Sedgewick, of Dansville, N. Y., giving some very entertaining reminiscences of the early days of that town. We are told that one of the early settlers, Mr. McCoy, and his neighbors purchased meat from the Indians at a stipulated price, the rate of exchange being fixed by Mrs. McCoy, which was two pumpkins, six turmps, or two quarts of corn meal, for a hundred pieces of change. This was satisfactory, and as Mr. McCurdy says, was a legal tender throughout the valley. True, it must cost more time and trouble to kill a deer at some times than at others, but it also cost more to grow pumpkins and turmps some years than it did others, which balanced it exactly; if sometimes a smaller denomination of currency was required, who does not perceive that a pumpkin could be cut into parts, or a turmp sliced into small pieces for every purpose of change. Rattlesnakes were so plenty that we killed from four to six daily. These snakes and whip-poor-wills flourish in the same soil and timber alike, and Mr. M. thinks that they will not be found on soils unfriendly to wheat; his brother having purchased a farm in Burns sold it for the above reason.

The valley about Dansville had been a favorite abode of the Indians. They were entirely friendly, coming here to hunt and taking such numbers of deer which at that period were abundant here.

Dansville's first watch and clock repairer, Robert Teasdale, was a great fox hunter. The citizens often heard the inspiring bugle blast of his famous hound Music while running deer or foxes on his own account all over the length and breadth of the "Mountain," making the forest ring with echoes loud and clear, mellow as a French horn, again lower like a note finally dying away in the distance to nothing. A queer whim of his dog was that he would never cross a certain bound on the north, even though the game was only a few rods over the line.

Forty years ago, says Mr. Sedgewick, Mill Creek was a large, clear and rapid stream, averaging a depth of 2½ to 3 feet, abounding in speckled trout. Often have I seen Mr. Opp standing on the bridge near his (now Redshaw's) mill catching his basket full of the beauties in a short time; another good troutery of the district was the one owned by paper mill. Speaking of Opp's mill reminds me that it was a convenient place for us barefooted cowboys late in the fall, on our route to and from the pastures near the Pinnacle, to drop in and warm our aching toes and fingers by the office fire in the mill while we listened to the amazing stories of the frequenters there.

All good citizens will agree with me that there was much more to be enjoyed in this old-fashioned way than we experience in these modern ones, and I don't wish anybody to dispute it. Winter, old style winter, was regular and reliable in its visits, and once set in, a long run of sleighing could be relied upon, and sleigh makers were happy faces because they had no "old stock" to carry over; all the sleighs, cutters and pungs came out and with musical jingling bells coursed merrily off the snow. Three months winter was satisfactory to all, and everybody had a sleigh ride, even the old maids as well as the young ones. Hunters passed through on their way to the hunting grounds in Allegheny and Pennsylvania, and loads of venison were to be seen on our streets, and townspeople banqueted on venison, bear steak, pussy hare and partridges. Deer were abundant throughout Western New York, and were yearly to be seen in the suburbs of Dansville. I give four instances of my own observing it, of seeing one cutting across Esq. Hammond's farm, in another instance of a party of us cutting across the gateway, clearing a high rail fence half way up the declivity with ease, not checking his gait in the least; another one crossed the road at the south line of the cemetery, about ten rods from us "cow driver boys," as much surprised as we were, then dashed off into the woods; also when a boy staying with grandma at the farmhouse a little this side of the Pinnacle, a large buck walked into the yard and looked leisurely in the window, as if wishing for a better acquaintance. There was a deer runway this side the Pinnacle leading to a "lick" in the neighborhood. To wind up the deer topic, right here on Main street one day, as Hiram Kuhn was standing in Esq. Day's back yard, a deer pursued by hounds came running up to him for protection, Kuhn caught and held him while the pursuing hunters cruelly killed the poor creature.

Solomon Feustermacher arrived here from Allentown, Pa., in 1805, and he, together with his brother Isaac, built a large share of the earliest frame dwellings in Dansville, besides being employed by Col. Rochester to erect buildings in the embryo city of Rochester. He also built for himself and tenants the only three-story building in the county at that date, which was nicknamed "Solomon's Temple," and on account of its spacious dimensions was considered a "wonder" in those days. "Uncle Solly," as we called him, was a genial man, fond of a joke and a hearty laugh that was a luxury to hear, and was no inconsiderable sportsman among the other "crack shots" of the day with his old Kentucky rifle. Many is the time I have seen him returning home from the hunt loaded down with partridges, wild pigeons, rabbits, etc., which were abundant in all this region, and besides did not require one to tramp any great distance to find them. Sitting by his comfortable log fire on winter evenings, I delight to hear him relate stories of early times and early settlements, one of which I remember well enough to reproduce here.

A large pack of wolves were in the habit of sweeping around the southeast arm of Mount Teasdale on to what is now the Conrad Welch farm, where there was a distillery near the present farmhouse. "Uncle Solly" and Jake Baumberger, desirous of a little brush with the wolves,

armed themselves and went there one night to lie in wait for the "varmints." Late in the night they heard them coming, as if making a great rattling racket. Baumberger could exactly tell what a wolf howl it was, he put into practice and was immediately answered by the howlers, who mistaking it for one of their own species. This he repeated at three intervals, the wolves constantly coming nearer; however on the fourth howl by Jake they became suspicious and suddenly retreated over the hill, not venturing into that locality again, for their suspicious ones aroused, they were too shrewd to be drawn into a death trap. And let me here remark that the wolf is just as cunning as the fox or a little more so. The object was accomplished in satisfying ourselves from the neighborhood, which was in the direct route to where some domestic stock were railed-pen in, a little further down toward the village. It is in keeping with this narration to mention that a worthy old settler once told me that in the very earliest days of the settlement an Indian was killed by wolves near what is the Mountain Dew Brewery.

All dwellers in Dansville thirty-five to fifty years ago will remember "Hoover Bob," as R. G. Day was called. When "pigeon time" came he would successfully snare them when all others failed entirely, or got but a trifling few. He was bothered by hawks at times who came round to prey upon the pigeons, and once when one of them swooped down and took his "cool pigeon" he captured him; then, tying to the neck a hollow alder and tube filled with powder, and attaching it to a burning fuse, he shot the powder into the hawk, enjoying the sweet revenge of seeing Mr. Hawk come into the air. His "hildie" was as dear to him as any only son would be; he could play only one tune—and that to perfection, from years' practice. He was addicted to the customary liquor habits of those early days, but I take pleasure in saying that he reformed, and when I saw him a few years since he was not "Bob Day" nor "Hoover Bob" any more, but a well-dressed gentleman.

CANVAS-BACK AND "BOB WHITE."

THE ducking season on our waters commenced Nov. 2, and our sportsmen have had a week of unloyed pleasure and sport, not only on the many small tributaries of the Chesapeake Bay, but on the "Cove" of the Susquehanna, this being the principal "sporting ground" of our principal clubs.

I could not forego the sport of our first day's shooting, and together with W. E. Buckbee, E. M. Mitchell, F. M. Denny, W. H. Linticum, E. L. Coulson and W. N. Nunsom, all members of the Baltimore Ducking Club, took the boat on the evening of the 1st Inst., and were then first on the "Flat." There were eight or ten steam yachts of club, from New York, Philadelphia and other cities, and about thirty sporting yachts from "My Maryland." The day opened with a fierce north-west wind, and proved anything but an agreeable one for shooting, yet there were from 3,500 to 4,000 ducks secured. This is the lowest number killed on these flats, first day's shooting, in a number of years, and yet it was considered good for the weather all had to contend with.

The largest number was secured by the Baltimore Ducking Club, which counted at the close of the day's sport 100 canvas-backs, redheads and bay blackheads, with a number of baldpates, all of which were in most excellent condition. The condition of the ducks arises from the fact that our laws prescribe a month's respite after they first come to us from their Northern retreat. All in all, the yacht Helena, of the Baltimore Ducking Club, had a very lively and happy day of it, notwithstanding the severe blow from the north-west she had to encounter.

The guns used by the sportsmen were 10-bore Scott, Hollis, and other English as well as American makers. Our club used the W. W. Greener 10 and 8-bore hammerless new patent locks, which we found in every way superior in the hands of our best shots. This day's shooting was the first time the 8-bore Greener hammerless gun was ever used by us, any one else on these flats. This gun was imported by W. H. Linticum, of the Baltimore Ducking Club, especially for "royal blood" shooting on the Susquehanna. It is full choke, and weighs 13½ pounds, carrying a charge of 7 grams powder, and 2 oz. No. 4 shot, and when wielded in the hands of Mr. Frank M. Denny, known as one of the best overhead shots in the United States, it is no wonder that the club to which he gives credit, came off victorious against all competitors. The numbers of our best club are all first class shots, and so recognized, even by the most envious of our competitors.

Canvas-backs ("royal bloods"), since the cold wave struck this region, have made their appearance in almost (seemingly) endless numbers, and the prospect is a good one for the shooting season. There are no "big-gunners" abroad on our waters now, and the wildfowl are not mercilessly slaughtered by merciless men by this means. Since the laws were invoked to capture and punish them, and which was done by the legitimate sportsmen, the wildfowl have been less shy, and good shooting is had on all of the shores along the bay. Night shooting with these swivels heretofore has done more to destroy and drive away the wildfowl than anything else, and it will not be permitted in Maryland waters again, as a sharp lookout is kept after those who wish to break the laws, and if they make their appearance, it will be with a considerable price for their detection, capture and punishment.

Come and see us and have a good day's shooting in January or February, and I will let you try my W. W. Greener patent self-ejector hammerless gun, and if you do not bring down every "royal blood" coming within fifty yards, we will have to class you in "C." I have used it for one year, and with such success, yet not on its mechanical working, but in its shooting, for even the trial of it by the editor of the FOREST AND STREAM would no doubt be more than a successful showing in his favor. Come along, then, and we will cause you to be amply repaid for your trip. The law prescribes the days for shooting, and hence we expect to have good shooting all the season through, as the days of respite given the wildfowl will keep them undisturbed on their feeding grounds. More anon. ROYAL BLOOD.

BALTIMORE, Md., Nov. 17.

P. S.—I send you this clipping from the Baltimore Sun. It was written by a man who has been the best and truest of all. (The November, and the partridge shooting season is in its zenith!) Eager sportsmen, with dog and gun, are on every outgoing train, and huge bunches of the plumb little *perdrix* hang in front of every provision store. November is the month for shooting, and Virginia or North Carolina are the hunting grounds that rank above all others. Just at this time it may be safely estimated that five thousand sports-

MR. BAYARD THAYER'S LEMON AND WHITE POINTER BITCH "RUE."
Winner of Members' Stakes, E. F. T., November 20, 1883.

The Kennel.

FIXTURES.

BENCH SHOWS.

December 19, 20 and 21.—New Orleans Bench Show. Entries close Dec. 10. Charles Lincoln, Superintendent, New Orleans, La.
December 10.—Meriden Poultry Association Bench Show, Meriden, Conn. Joshua Shute, Secretary, Meriden, Conn.

FIELD TRIALS.

December 3, 1888.—National American Kennel Club, Fifth Annual Trials, at Grand Junction, Tenn. D. Eryson, Secretary, Memphis, Tenn.
December 3.—Gilroy Rod and Gun Club's Third Annual Field Trials at Gilroy, Cal., for dogs owned in California, Arizona, Oregon and Nevada. Entries close Dec. 2. E. Leaviesey, Secretary, Gilroy, Cal.
December 10.—New Orleans Gun Club's Southern States Field Trials at Canton, Miss. Entries close Dec. 9. J. K. Renaud, Secretary, New Orleans, La.

THE EASTERN FIELD TRIALS.

HIGH POINT, N. C., Nov. 19.

THE fifth annual field trials of the Eastern Field Trials Club opened here to-day with the running of the Members' Stakes. During the whole day the weather has been very warm, and it has been impossible for the dogs to do themselves full justice. The work, therefore, has not been first-class, although some of it has been very good. Birds are very plenty, and there has been no trouble about finding them.

The heats for the Members' Stakes were run outside the club grounds, and the result at the close of the day completed this contest, except as to the deciding heat, which will be run to-morrow.

The heats for the Members' Stakes were run outside the club grounds, and the result at the close of the day completed this contest, except as to the deciding heat, which will be run to-morrow.

The heats for the Members' Stakes were run outside the club grounds, and the result at the close of the day completed this contest, except as to the deciding heat, which will be run to-morrow.

The heats for the Members' Stakes were run outside the club grounds, and the result at the close of the day completed this contest, except as to the deciding heat, which will be run to-morrow.

CORINNE.—Geo. T. Leach, New York, red Irish setter bitch (Peter—Countess).

FLASH.—J. Heron Crossman, New York, orange and white English setter bitch (Lincoln—Daisy Dean).

RAB.—Elliot Smith, New York, lemon and white pointer dog (Rush—Romp).

GERTRUDE.—J. W. Orth, Pittsburgh, Pa., black, white and tan English setter bitch (Gladstone—Nellie).

RUE.—Bayard Thayer, Lancaster, Mass., lemon and white pointer bitch (Snapshot—Ruby).

BROCK.—George T. Leach, New York, red Irish setter dog (Count Bosco—My Dutchess).

MONDAY'S RUNNING.

HIGH POINT, N. C., Nov. 19, 1888.

The fifth annual meeting of the Eastern Field Trials Club opened here to-day with the running of the Members' Stakes. During the whole day the weather has been very warm, and it has been impossible for the dogs to do themselves full justice. The work, therefore, has not been first-class, although some of it has been very good. Birds are very plenty, and there has been no trouble about finding them.

The heats for the Members' Stakes were run outside the club grounds, and the result at the close of the day completed this contest, except as to the deciding heat, which will be run to-morrow.

FIRST SERIES.

In the first heat Mr. Coster's Buckellev beat Mr. Elliott Smith's Don Juan.

Mr. Leach's Corinne beat Mr. Crossman's Flash.
Mr. Orth's Gertrude beat Mr. Leach's Rab.
Mr. Thayer's Rue beat Mr. Leach's Brock.

SECOND SERIES.

In the second series, Buckellev beat Corinne and Rue beat Gertrude.
This ended the running for the day, leaving the concluding heat between Buckellev and Rue to be run in the morning.

SECOND DAY.

[Special to Forest and Stream.]

HIGH POINT, N. C., Nov. 20.—The weather this morning was beautiful, but it soon clouded up, and at half past ten began raining. There have been occasional showers through the day. This has very materially changed the condition of the grounds, and it is now more favorable for the running.

A large number of spectators were on hand to see the finish of the Buckellev—Rue contest for honors in the Members' Stake. Both dogs did excellent work; they were down one hour and twenty minutes, when Rue was declared the winner.

ALL-AGED STAKES.

The results of the drawing for the All-Aged Stakes are as follows:

GUS BONDHU.—D. C. Sanborn, Dowling, Mich., black and white setter dog (Dashing Bondhu—Novel).

CARRIE J.—W. B. Gates, Memphis, Tenn., black and white setter bitch (Count Noble—Peep o' Day).

LORD SEFTON.—Neversink Lodge Kennels, Guymard, N. Y., liver and white pointer dog (Croxeth—Vinnie).

DON.—R. T. Vandevort, Pittsburgh, Pa., liver and white pointer dog (Price's Bang—Peg).

ST. ELMO IV.—Dr. S. Fleet Speir, Brooklyn, N. Y., black, white and tan setter dog (St. Elmo—Choi).

MAV II.—Bayard Thayer, Lancaster, Mass., black setter bitch (Pratt's Trim—Earl's Stim).

FLIDA.—Frank D. Lewis, Indianapolis, Ind., liver and white pointer bitch (Bow—Flight).

RUBY.—J. H. Phelan, Jersey City, N. J., liver and white pointer bitch (Woodruff's Dick—Fawn).

LADIE FAYRE.—Dr. S. Fleet Speir, Brooklyn, N. Y., blue belton setter bitch (Emperor Fred—Wanda).

LONDON.—H. Bailey Harrison, London, Ont., blue belton setter dog (Paris—Lill).

RUE.—Bayard Thayer, Lancaster, Mass., lemon and white pointer bitch (Snapshot—Ruby).

CROXETH.—Neversink Lodge Kennels, Guymard, N. Y., liver and white pointer dog (Young Bang—Macdonald's Jane).

GROUSE DALE.—Win. A. Buckingham, Norwich, Conn., orange and white setter dog (Water's Grouse—Daisy Dale).

GATH.—W. J. Crawford, Memphis, Tenn., blue and tan setter dog (Count Noble—Peep o' Day).

VISION.—Francis R. Hitchcock, New York, liver and white pointer bitch (Croxeth—Vinnie).

MARGUERITE II.—H. W. Fawcett, New Albany, Ind., liver and white pointer bitch (Faust—Devonshire Lass).

SEE.—P. H. & D. Bryson, Memphis, Tenn., black, white and tan setter bitch (Druid—Ruby).

DOCTOR DUER.—W. A. Strother, Lynchburg, Va., blue belton setter dog (Gladstone—Frost).

DON JUAN.—Elliot Smith, New York, lemon and white pointer dog (Sensation—Psyche II).

BANG BANG.—Westminster Kennel Club, Babylon, L. I., orange and white pointer dog (Price's Bang—Princess Kate).

GLADSTONE, JR.—I. T. Perkins, Brooklyn, N. Y., lemon and white setter dog (Gladstone—Frost).

MAIDEN.—E. S. Wamaker, Elmwood, N. C., blue belton setter bitch (Darkie—Rosy Morn).

SCOUT.—D. G. Elliot, New Brighton, S. I., N. Y., liver and white pointer dog (Croxeth—Beile).

TRIM.—Forked River Kennels, Forked River, N. J., liver pointer dog (Strong's Pete—Nellie).

PRINCE AL.—Moorfield Kennel, Elmwood, N. C., lemon and white setter dog (Leicester—Dodge's Rose).

ROCK.—Fred E. Lewis, Tarrytown, N. Y., orange and white setter dog (Water's Grouse—French's—).

LALLA ROOKEH.—C. J. Gould, New York, lemon and white pointer bitch (Sensation—Grace).

CHRISTMAS BILL.—R. T. Vandevort, Pittsburgh, Pa., lemon and white pointer dog (Ready Money—Luck of Eden Hall).

VICTOR.—J. M. Avent, Hickory Village, Tenn., orange belton setter dog (Gladstone—Frost).

PINK B.—W. B. Mallory, Memphis, Tenn., black and white setter dog (Gladstone—Countess Key).

RAB.—Elliot Smith, New York, lemon and white pointer dog (Rush—Romp).

DONNER J.—Forked River Kennels, Forked River, N. J., liver and white pointer dog (Dan—Psyche).

PRINCESS WARWICK.—Forked River Kennel, Forked River, N. J., black, white and tan setter bitch (Warwick—Ollie).

LIE.—J. M. Taylor, Lexington, Ky., black, white and tan setter bitch (Gladstone—Juno).

LADY ROMP II.—Moorfield Kennels, Elmwood, N. C., liver and white pointer bitch (Prince—Romp II).

PRIDE.—C. Fred Crawford, Pawtucket, R. I., liver and white pointer dog (Croxeth—Royal Fan).

LIST OF WINNING YACHTS, 1883.

EXPLANATIONS OF ABBREVIATIONS, ETC.

In column of lengths, the water line is given when known; lengths marked with an * are B. Y. C. sailing length, 5/8 W. L. plus beam. "1st C." "2d C." etc., indicates first, or second class. "T." indicates tons. Two figures connected by a short dash "-" indicate that the length is somewhere between the "1st" and "2d" under or over the figures placed after them. Several clubs gave champion cups to be held by the boat winning two or more races; these are put in column of prizes in the following way: "B. Y. C." shows the Beverly Y. C. championship; while "C." shows one champion race won. The Monument Beach championship is indicated by "M. B." and a single race in it "M. B. Tor. Cup" means the Toronto Cup; the other championship abbreviations are of clubs already given. "4th" and "5th" in column of Third Prize: mean fourth and fifth prizes.

Table with columns: Name, Owner, Club or Port, Rig, W. L. Length, No. of Races Won, 1st Prize, 2d Prize, 3d Prize, 4th Prize, 5th Prize. Lists various yachts and their owners across the page.

Table with columns: Name, Owner, Club or Port, Rig, W. L. Length, No. of Races Won, 1st Prize, 2d Prize, 3d Prize, 4th Prize, 5th Prize. Lists various yachts and their owners across the page.

Table with columns: Name, Owner, Club or Port, Rig, W. L. Length, No. of Boats, etc. Lists various boats and their owners.

SEA CRUISING.—The schooner Gemini, Commodore W. F. Weld, had a cruise in April. Schooner Fortuna, Mr. Henry S. Hovey, left for the Mediterranean last Tuesday.

PERSONAL.—Vice-Commodore Wm. Letts Oliver, yawl Emerald, San Francisco, U. S., has been in this city for a few days and devoted some attention to the examination of our Eastern yachts.

GANET.—This yawl will be changed to a sloop. She has shown great speed and is well adapted for after-noon sailing in mid-summer her owner is anxious to give her a faster rig.

HULL Y. C.—A committee has been instructed to report on code of signals, which code, if possible, is to be conferred to others in use by prominent clubs.

RACES SAILLED LAST SEASON.—In Q. Y. C. race, August 10, there were three starters in first class, the match being won by Queen Mab.

MEASUREMENT.—The general sentiment in the East is in favor of water line length, judging by correspondence received.

increased in proportion, as iron board would add much to the boat's ability.

WOOD DECK.—Could you tell me where I can procure young wood ducks? I intend trying the experiment of raising young wild ducks with tame ones.

I. A. C. West Dedham, Mass.—Please inform me where I can get some carp? Ans. Write Mr. E. G. Blackford, Fulton Market, New York...

G. F. W. Connecticut.—Can you give me the address of some place where they can send furs and have them made into a hat for a lady? Ans. We should think that if the furs are cured your local milliner could make the hat.

G. L. North Tarrytown, N. Y.—Can you give me some information regarding the oyster laws in the State of New York? There are a number of oystermen from Louisiana and other places dredging for oysters in less than twenty-five feet of water in the Hudson River...

Other parts of the State are: Laws of 1868, chap. 23, amended by laws of 1872, chap. 431, laws of 1878, chap. 802, amended by laws of 1879, chap. 87. The address of the game protector is Joseph H. Goswin, Jr., Kingsbridge, New York city.

PUBLISHER'S DEPARTMENT.

A steel pen, like a race horse, should have good usage, being equally on each rib and the penholder pointing to the shoulder. With an occasional rest, in conjunction with every instrument made of steel, an Esterbrook Pen will accomplish wonders.—Ad.

The Ohio & Mississippi Railway is the shortest and quickest route between St. Louis and Cincinnati and between St. Louis and Louisville, and the road between Louisville and Cincinnati. Palace sleeping coaches and solid trains are run between all three cities. Through palace coaches are also being run by this road between St. Louis, Washington, Baltimore, Philadelphia and New York, and between Cincinnati and New Orleans. Sportsmen desiring to transport their dogs over this road may get an order to have them passed free by writing to W. J. Skidmore, General Trussing Agent, relieving at O. Kennels always ready, so that there is no chance for losing a dog or having him hurt by baggage.—Ad.

"DON'T HOLLER UNTIL YOU ARE OUT OF THE Woods."—Sometimes we people have but little sympathy for the sick. Not long ago we heard a gentleman chaffing a friend who was using Humphrey's Homeopathic specific for indigestion. It was not a month before this worthy was using the same remedy, and praising it, too, for its power over his troublesome stomach. In fact, Humphrey's Homeopathic Specifics Nos. 1 and 7, for coughs and colds, cannot be excelled. It allays the nervous, itching sensation in the throat produced by a hard, distressing cough, relieving at the same time the hoarseness and severe pain in the breast, at which his friends had become alarmed lest an attack of pneumonia was setting in. At the juncture he commenced using Specifics Nos. 1 and 7, taking six pills every few hours. The cough soon became milder; hoarseness passed off; strength and appetite improved and in a week he was completely cured, having used no other medicine. Since then he has learned that Specifics 7 and 1, have promptly, effectually and inexpensively cured thousands of similar throat and lung difficulties, and no longer wonders at his friend's unqualified praise of No. 10 Specific. He speaks from experience now, and with suppressed amusement remarks, "It is never well to holler until you are out of the woods, you know."

Answers to Correspondents.

- No Notice Taken of Anonymous Correspondents. S. W. P. H. Florida.—Write to H. B. Bailey, 62 South street, New York. W. H. O., Bridgeport, Ct.—See FOREST AND STREAM of Oct. 25 and Nov. 8, 1883, for waterproofing receipts. J. A. B., New York.—The Clinax gun cleaner will answer your purpose admirably. Follow the instructions which accompany it. G. O.—Catsuits have been built with lead on keels and iron boards which have proved successful. Other experiments of the kind are said to have failed. Should prefer iron keel and ordinary board. You can lighten up the boat a little by resorting to outside weight, or else increase rig. An iron board is heavy to work and when housed carries weight up. The experiment is, however, worth making if rig is

THE MILD POWER CURE. HUMPHREY'S HOMEOPATHIC SPECIFICS. In use 30 years.—Each number the special prescription of an eminent physician.—The only one safe and sure and reliable cures for the following principal diseases. Price: 1. Fever, Congestion, Inflammations, 25 Cents. 2. Worms, Worm Fevers, 25 Cents. 3. Crying Cough, or Teething of Infants, 25 Cents. 4. Hay Fever, Croup, Whooping Cough, 25 Cents. 5. ANGLING TALKS:

BEING THE

Winter Talks on Summer Pastimes

Contributed to the FOREST AND STREAM

By **GEORGE DAWSON.**

CONTENTS:

- Simple Wise Men, About some Distinguished Anglers of our Time,
- About Bass, About Salmon Fishing,
- About Grayling, Salmon and Sea Trout Haunts and Habits,
- A Memory, Several Relevant Topics,
- Reminiscences, Angling Mishaps,
- Odds and Ends.

Extract from the Preface:

"The 'Talks' attracted wide attention at the time of their publication in the angling columns of the FOREST AND STREAM, and were received with very cordial appreciation. It is thought that their collection into the present more permanent form will prove acceptable. These 'Talks' are brimful of manly wholesome sentiment; there is in them all not a particle of cant. Their sincerity and overflowing spirit at once win the reader, and he perceives shares the author's enthusiasm. The effect is magical, like that of the mimic players in Xenophon's *Memorabilia*; he who reads, if he be an angler, must, so to speaking; and if he be not, straightway then must he become one.

Limp Cloth, 78 Pages, sent postpaid on receipt of price, 50 Cents.

Manufacturers of

HEXAGONAL SPLIT BAMBOO FISHING RODS

REMOVED TO 153 MILK STREET.

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior goods. Send for catalogue.

Bargains that should be in every Sportsman's Hands.

A FEW COPIES OF THE SECOND EDITION OF

"WING SHOOTING"

Left, and will be sold for 50 cents each.

Methods for cleaning and loading the modern breech-loader; practical hints upon wing shooting; directions for hunting snipes, woodcocks, ruffed grouse and quails.

Illustrated: Bound in cloth, sent by mail prepaid on receipt of price, 50 cents; formerly sold for \$1.00.

T. G. DAVEY, Publisher, London, Ont.

K YNOCH'S
 Patent "Perfect" Brass Shells,
 MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and cl ser, and admit of a heavier charge, as owing to the thin metal, inside of meter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectively crimped with tool (as represented in cuts) and straightened out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Samples will be mailed without charge to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO.,
 SOLE AMERICAN AGENTS

101 & 103 Duane Street, - New York.
 WILLIAM READ & SONS, Boston, Mass. Agent for New England States

UPTHEGROVE & McLELLAN,
 VALPARAISO, IND.

HOLABIRD
SHOOTING SUITS

Of Waterproofed Duck, Irish Fustian and Corduroy.
 Unequaled in Convenience, Style, or Workmanship.
 WRITE FOR CIRCULAR.

THIS

is our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$2.00. Send breast measure.

Danz' New Pat. Decoy Duck

This is a double folding decoy, consisting of two metal profiles precisely alike, hinged to either side of a flat wooden float. One of these acts as a keel to hold the decoy upright, but if it gets tipped over, as both sides are alike, no harm results. We now make to order the double decoy with different profiles on opposite sides of the float; say a mallard on one side and canvas back on the other. So you have two dozen ducks for the price of one dozen. Sportsmen who have tried this pronounce it "The Decoy of the future." Its excellence is so apparent, we now make no other styles. A large variety always on hand; including Mallard, Teal, Red Head, Canvas Back, Blue Bill, etc.
 PROFILE AND COMBINED GESE ALWAYS IN STOCK.

PRICE LIST.

- Ducks, either style, with cord and anchor, complete..... per doz., \$12 00
- Geese, for stubble shooting..... " " 12 00
- Geese, combined for land or water shooting..... " " 21 00

Fifteen per cent. discount where our goods are not on sale.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, NOVEMBER 29, 1883.

VOL. XXI.—No. 18.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 419 Strand, W. C. S. London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 185 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

MARKSMANSHIP MARVELS.

THERE seems just now to be a wave of exaggeration passing over the shooting world, and the papers generally are striving to outdo each other in telling tales of wonderful accomplishments with small arms. Pistols seem to have the call in this fashion of fable, and the little "pops" are credited with all manner of records, often so far beyond their real capability, as to be unworthy of a moment's credence. From the West comes a tale of a boy hunter who uses but a wee pocket pistol, yet goes abroad bringing down everything and anything in the form of game or vermin. Bear or beetle seem to fall alike before his six-grain bullet. He merely picks out a channel to the center of life, finds a way of cutting the heart in two, or secures a short passage to the brain seat and then lets fly and the beast falls. The story tellers are not particular about distances, a few hundred yards more or less are of no consequence, and we are not quite sure but that some of the shooting is done at dead of night with the moon hidden beneath clouds.

The old yarns from the Indian story books are bad enough, where Long Tom and muzzle-loading shooting sticks were made to send silver bullets with mathematical precision to the hearts of heartless savage abductors of beautiful frontier maidens, but this latter day drift is still more ridiculous in its disregard of physical limitations.

The latest form of the craze is to turn the taste for this shooting silliness to advantage in theatrical advertising. One famous day is made to spend the night after returning from her stage work in shooting cats from the back fences of the hotel where she may be stopping. Another uses up an entire pack of cards, sparing the court cards, but picking off the other 220 spots in regular order. These same notoriety-seeking professionals have wonderful "scapes, in which a pretty little ivory-handed, gold-plated, elegantly-chased,

magnificently-mounted, fit-in-your-watch-pocket mitrailleuse is made to send a horde of ruffians away in a stampede. It would not do to have one killed, because then doubting-reporters would ask irreverently: "Where is the stiff?" No, the artistic prevaricator and claqueur gives only such a story as will not afford the least chance for the probing pen of contradiction. The maxim of the advertising agent seems to be that anything other than good acting, will make the fortune of his charge, and so he seizes the demand for shooting fables, and works it, in its own vernacular "for all it is worth."

Out from the West comes now with a yearly regularity some phenomenal shot, over whose shooting at ranges of a few feet the spectators in their ignorance and the writers on space rates exhaust all the adjectives of our richly-endowed language. We expect they will keep on springing up to issue challenges, have a wordy war, succumb to the seduction of Eastern fire-water, and make way for others of their sort. Protest seems useless, and we can only make up our minds to bear the pest until the popular fancy turns.

The fact is, that shooting well is an accomplishment worth possessing, and therefore worth earning. It can be secured only by hard work, and with any make of weapon there is a limit of accuracy which cannot be surpassed. A pistol with a barrel but an inch or two long is nothing more than a dangerous toy, as likely to harm as help.

YACHT RACING IN 1883.

THE season recently brought to a close has been a most prosperous one throughout, and wound up with events which will have great weight in the choice of model for new boats projected to meet a challenge from abroad for the famous old piece of silverware won by the America some thirty years ago. The season has also been marked by a fresh departure on the part of FOREST AND STREAM in securing full reports of the chief racing events in Eastern and Western waters as well as at home, an enterprise to which no other publication has shown itself equal. This year has also been the first to find any journal sufficiently strong to close its columns to the extended notice of shifting ballast races, thereby discouraging an imitation upon the sport which in its evil influences is to be charged to a great extent with the perpetuation of faulty conceptions and that caricaturing of naval architecture which has enabled an ordinary cruising cutter to overwhelm a representative light displacement vessel hitherto supposed to be invincible.

The total number of races sailed, as exhibited in the list published in our issue for Nov. 15, foots up 195, including one subsequent addition. To this should be added 25 races among small craft of local renown only, of which details were too meagre to incorporate in the body of the list, making altogether 220 matches sailed in six months. Of these no less than 63 are to be credited to the month of August, July following next in number with 40, June occupying third position with 39, and September showing exactly the same activity.

Geographically the racing waters may be divided as Eastern, including all to the east from New Bedford; Metropolitan, including the Sound and regions tributary to New York; Central, the Delaware and Chesapeake; Southern, everything south of Cape Henry; Western and Northern, the great chain of fresh-water lakes with the St. Lawrence and Halifax, and last, the Pacific coast, to cover all that transpired in waters accessible from the Pacific Ocean. The activity in these districts is shown in the following summary:

Eastern.....	83 races.
Metropolitan.....	67 races.
Central.....	5 races.
Southern.....	5 races.
Western and Northern.....	34 races.
Pacific.....	races.

The East therefore still maintains its lead as the most active racing center in American waters, and the lakes, and the Dominion of Canada in general, put in a very respectable showing, destined to expand rapidly, as yachting has only just taken firm root on the American shores of the fresh-water seas. Only in New York waters is shifting ballast still a half-hearted custom among small boats. Elsewhere its pernicious and misleading tendencies have been recognized, and with isolated exceptions, all matches are now ordered with fixed ballast.

In the East the Beverly Y. C. leads off with 13 races, the Hull Y. C. has 10 to its name, the Dorchester Y. C. 7, and the Quincey Y. C. started six times. In the Metropolitan district the Larchmont Y. C. sailed 7 matches, all other clubs only two or three straggling throughout the season. On the Lakes, the Toronto Y. C. carries off the palm with 6 matches

while the Halifax squadron sailed the same number. To the East and to the Beverly Y. C. belongs the credit of having brought to the line the largest racing fleet ever assembled in America or any other country. The match of Aug. 13 saw 238 boats entered, of which 173 started. Only a week later the Hull Y. C. followed up with 124 entries and 79 starters, all of them fixed ballast boats. The largest number of starters in any one race in New York waters was collected for the fall match of the Knickerbocker Y. C., the fleet reaching 32, an extraordinary number for this vicinity. Many of these were, however, only shifting ballast contrivances, which can hardly be classed as yachts proper. Next week we will consider the table of winnings.

ROBERT WALLE'S DEER SHOOTING.

IN the year of grace 1756, and of the reign of King George II, the twenty-ninth, in Brumfield parish of the British colony of Virginia, one Robert Walle, a laborer, thinking to make the pot boil, went out into the woods to sit for deer. His aim was good, his flint-lock true. The bullet sped to the mark. Robert Walle brought down his game. But it was not a deer.

The record of the shot was written out in the beautiful copper-plate writing of the court clerks of the day, and filed away among the papers of the Court of Culpeper county. There it remained. George II. died and George III. succeeded to the throne. The ink had not yet paled before the colony of Virginia joined with her sisters to throw off the British rule. Through the strife and turmoil of the seven years' war the story of Robert Walle's shot was preserved intact. The paper grew yellow with a hundred years. Virginia was again the theatre of war. A Massachusetts volunteer picked up the rusty court record and took it to his New England home. The years went by. The men of Massachusetts and of Virginia forgot that they had fought as enemies, and joined each other to celebrate in Virginia the victories of the colonies. Again the years went by. To-day, while the bunting on Broadway is still flying in commemoration of another Revolutionary event, we copy the old Culpeper colonial court record, and give to the readers of FOREST AND STREAM the story of Robert Walle's deer shooting:

At a court held for the County of Culpeper, on Friday the 4th Day of June 1756, on the Examination of Francis Walle, charged with the Felonious Slaying one George Roberts.

PRESENT:
Francis Slaughter, William Green,
James Pendleton, Daniel Brown &
William Williams Gent.

Francis Walle late of the Parish of Brumfield in this County Laborer being led to the Bar in the custody of the sheriff, charged with the Felonious Slaying one George Roberts late of the Parish & County aforesaid and being Demanded whether he was Guilty or not Guilty confessed he was Guilty, though it was an involuntary Act, for that he accidentally shot the said George Roberts, as he was sitting for Deer believing him to be one, and as no one was Privy thereto, he went immediately & Informed the Father of the said Deceased what had happened, and helped him Home with the Dead body, whereupon John Roberts, Father of the said George Roberts, who was killed being sworn & Examined as Witness for our Lord the King against the said Prisoner. Declared he believed the Prisoner's Confession to be true, and no other Witness appearing against him it is therefore the opinion of the Court that the said Francis Walle is Guilty of Chance Misdemeanor and that he ought to be tried for the said Fact on the sixth Day of the next General Court and on his Prayer is admitted to Bail.

How the trial ended we have no means of determining; but as Robert Walle had proved himself to be such a good shot with his flint-lock at the "man target," it is not at all improbable that his services were enlisted in the campaigns of the Revolution.

BOOKS.

THE readers of the FOREST AND STREAM are widely scattered over the face of North America and other portions of this terrestrial ball, and a very considerable proportion of them are fortunate enough to reside in the country, often at a distance from large centers of population and where bookstores, or at all events, bookstores with large stocks to select from, are not easily accessible. And yet, almost all who take the FOREST AND STREAM are readers of books, and desire to keep up with the current literature of the day. Realizing this, as well as the difficulties of those at a distance who may wish to purchase books of any kind, we have made arrangements to furnish any books published on receipt of the publishers' price, to those who may send to us for them. We will also subscribe for our customers to any magazines. We have long published a list of books interesting to sportsmen, which we would forward on these terms, and have now, in response to earnest and repeated solicitations, determined to broaden our field as above stated. From this date, therefore, any magazine or book published will be forwarded on receipt of the publishers' price.

OUT OF LUCK.

THE Miner had only been a few days at the ranch. He had stopped there for a brief visit on his way from an examination of some mines down in Dakota, and his professional duties would soon call him away again to make other subterranean explorations. This was to be a bit of a rest, however. For a little while he was to lay aside his usual occupation of penetrating deeply into the bowels of the earth, and subjecting to scientific scrutiny such portions of these viscera as he could lay bare. Here there would be no opportunity for him to open prospect holes, or shovel dirt, or sink shafts, or drive tunnels. Here there were no mines and no prospects. So for the present, pick and pan, and sledge and drill were standing idle against the house, and their owner went hunting up in the mountains, or lounged about in the warm sunshine, or took part in the different labors of the ranch.

It was a pretty busy time and all hands were at work. Some of the men were chopping in the timber, and building a slide down the face of the mountain behind the house. Additional barns and corrals were being put up. A few loads of hay were still waiting to be hauled to the stacks, and all the work and saddle horses were to be shod. Still, with so many mouths to be filled, it was necessary to send into the hills every two or three days for meat, and this labor usually fell to the Miner and the Scout. The Miner was an old mountain man. He had sunk his pick in many a silver-bearing hill in the Rocky Mountains, and his pan had tasted the waters of almost every stream from the Platte to the Gulf of California. The gold of the Black Hills, the silver of Colorado and the copper of Arizona had each had some story to tell him, and he had wandered through the ancient Spanish workings of the historic mines of Old Mexico.

Now it so chanced that the Miner, though he had traveled so long in this western country, had never happened to stumble on a mountain sheep within fair ride range. Once or twice, to be sure, he had fired at one of these animals, at five or six hundred yards distance, but, of course, without results. Elk, and blacktail and white-tail deer without number, he had killed, and he had been lucky enough to drive the lead into the flank of a huge old grizzly, as the bear was industriously occupied in endeavoring to dig out a woodchuck from among the rocks on a steep mountain side, and had seen the wicked fury of the monster as he turned and bit the wound. But he had never killed a bighorn. Of course, therefore, bighorn seemed to him of all game the most desirable. Whether or no he would have an opportunity to capture one now, seemed doubtful. In the hills near the ranch there were few or no mountain sheep, but about twenty-five miles to the northward was a lone mountain, where they were abundant. It was a rough pile of yellowish sandstone, rising perhaps two thousand feet above the plain, and dotted here and there with dark pitch pines, which were visible as tiny blackspots against the light colored rock as far as the mountain could be seen. Its sides were steep and rugged and its crest rose sharply to a knife edge. A horse could not get about on it at all, a man had to scramble up or down, half the time upon his hands and knees, but it was just such a place as the sheep delight in, its difficulties of ascent presenting no obstacles to them.

One evening as they all sat together in the "living room" of the ranch, the Miner's desire to kill a sheep was mentioned, and the Boss on hearing of it, told Scout that he had better take a pack horse next day, and go with the Miner over to this mountain for a hunt. They could go there and back, he said, in two days and so could make the trip and have one day to hunt, and be back at the ranch before the time fixed upon for starting for the railroad. The plan seemed a good one, and preparations for the start were made at once.

Early next morning Bell and Bill were saddled, and on Jill, the yellow mare, was cinched the pack saddle. The Miner was an old packer, and with his invincible "diamond hitch," had conquered many a Mexican pack, and so the task of putting the pack on Jill—who had never before carried one—was intrusted to his greater experience. The side packs were carefully prepared, weighted and slung in place, and the sling rope tied; then the remainder of the pack, consisting only of three or four pairs of blankets, was piled on; a small tent fly—in case of a snow storm—thrown over all; the lash rope adjusted, and the cast—so mysterious to every man who is not a packer—made. Then as each part of the rope fell in its proper place, followed the tightening beneath, and at the corners. There were the usual reconstructive groans from the horse, as the cinch drew tighter, the customary calls and grunts from the men, as with one foot braced against the pack or the animal's quarter, they surged back upon the rope; the swinging of the load after all had been made fast, and the sighting from before and behind to see that it was properly adjusted and hung evenly, and finally the satisfied remark, "I guess that will ride," which announced that the packing of the beast was completed.

The hunters when they started off were not in all respects satisfactorily equipped. A day or two before, an accident had disturbed the sights on the Miner's rifle, and he had not since been able to get them back into their old place so that he could do satisfactory shooting. The Scout was in trouble too. His horse had rolled with his saddle and had sprung the tree so that it could not be used. He was therefore obliged to take a light saddle which had been used by the sheep herder, who had almost spurred the cinch in two. In

order to provide the Miner with a satisfactory gun, it was determined to stop on their way at one of the sheep camps in the hills, and get from the herder the rifle belonging to the Boss, which had been left there a week or two before.

All their preparations had not taken long and the sun was not very high in the heavens when the little train moved out from the ranch. An attempt to let the yellow mare follow resulted only in disappointment and vexation of spirit. She was not accustomed to traveling in single file, and though the Miner rode behind her twirling the end of a lariat in order to encourage her if she grew weary beneath her load, she often manifested a disposition to turn aside and to lie down and roll upon the prairie. The names with which she was pelted at each demonstration of this kind were hard enough to keep her going for a quarter of a mile; but this sort of thing required too much vocal effort on the part of her drivers to be altogether agreeable to them, and presently her lariat was arranged about her head as a *Jayhoo*, or halter, and the other end was passed to the Scout, who rode on again, dragging the beast behind him, while the Miner followed close at her heels. As she kept pulling back and turning from one side to the other, the strain on the rope was nearly continuous, and presently the Scout passed it under his leg, and about the horn of his saddle, and then she followed better, and the leader's arm rested.

So they rode quietly along, the Miner sending long streams of smoke from his nostrils as he whiffed at his cigarette, and the Scout taking comfort in his old black pipe. The never ceasing wind whistled over the prairie, carrying in its cool freshness some hint of the approaching winter, and bearing, too, the pungent odor of the sage, with now and then a breath of the fragrance which it had stolen from the pine forests (through whose damp recesses it had just been hurrying). On the slopes of the mountains just above them were a few white dots that marked a band of feeding antelope, and down over the lakes large flocks of ducks were swinging about, sometimes clustering together like a black cloud and then stretching out in a long hazy line, like a fading smoke wreath becoming more and more faint. Among the sage brush on the prairie the white-winged blackbirds—black no longer, but now in their autumnal dress, brown birds—were feeding, uneasy and restless as, except in the breeding season, they always are, and in the dust of the road the shore larks, yellow-throated and with black cravats, ran along before the horses or rose with a sweet mellow twitter almost from beneath their feet. Over the distant hills the late autumn had thrown her haze, so that their slopes were veiled in mist, and only the far-off outlines seen, shadowy and indistinct.

For the most part the travelers were silent, since in the fresh wind conversation, at the distance which separated them, was impossible, except by shouting. They rode along, sometimes crossing pleasant grassy valleys, through which flowed little sparkling streams, and where the moist earth supported a thick sod, or again traversing narrow hogbacks, where nothing grew but sage brush and greasewood and cactus, until they rounded the point of the mountain, and reached the divide between the Muddy and Sage Creek.

The yellow mare had been going along very quietly and well. So much so indeed that she had been quite forgotten, but now she called attention to herself in an impressive manner. The Scout suddenly heard behind him a sound of pounding on the earth, and turning in the saddle, saw that Jill was bucking "like a bay steer in the corn," and that the saddle had slipped back till it was over her loins and was still retrograding. Evidently the pack must go. Forgetting his weakened cinch, the Scout whirled his mare, intending to throw the pack horse, but a sudden side movement on the part of the latter brought the lariat sharply across Bell's heels, and forthwith the latter joined in the dance. Bill, who was not far behind, caught the spirit of the other two horses, and he too began to pitch. The Miner stuck to him like wax, but Scout was less fortunate. As soon as the sharp strain was brought on the rope which joined the two mares, Scout's cinch broke and his saddle was "snaked" off his horse. He accompanied it. Then there were five animated figures to be seen on the bare prairie—a man riding a bucking horse, another man standing on his head and one shoulder, with a saddle clasped between his thighs, a brown mare running off and a yellow one standing still and gazing with malicious satisfaction at the ruin she had wrought. Describing graceful parabolas through the air, or just fallen upon the ground, were the goods and chattels of the hunters; the Scout's gun, three or four pairs of blankets, a hatchet, a rubber sheet, the side packs, a tin kettle, and all the various impedimenta of a camp—a pitiful wreck.

Even as he stood there on his head, the humor of the situation struck the old man, and he could not help chuckling inwardly at the amusement that some of the boys would have felt could they have beheld the scene that had been enacted. In a few seconds he was on his feet, and walked to where his rifle lay, picked it up and assured himself that its sights had not sustained any injury, then started off to catch his mare, which had stopped bucking, and was now walking away about fifty yards from him.

The Miner's horse was now quieted, and he came riding back with a serious face to inquire as to the injuries which his companion might have sustained. Bell was easily caught, and the scattered company being again assembled, the amount of the damage done was reckoned up. It was discovered that beyond a few bruises to the dismounted horse-

man and the breakage of his saddle gear, absolutely nothing was lost or injured. In a short time the broken cinch was neatly repaired with some buckskin strings, the pack once more placed on Jill, and before long the little cavalcade was once more quietly moving along over the prairie. A couple of miles more brought them to the valley of Sage Creek, up which they turned and soon reached the shepherd's cabin.

It was a little after noon, and the white valley from which every blade of grass had been worn away by the daily passage over it of the sheep, was baking in the hot sun. The shepherd was of course out with his flock, and in all probability the rifle which they had come to get was at that moment slung to his saddle. The band would not come in until nearly sundown—too late to start off again for the gray mountain, which looked as far off now as it had when they started that morning from the ranch. The desired gun could not be found in the cabin, so Scout told the Miner that if he would wait there with the pack, he himself would ride off over the hills and see if the sheep could be found and the rifle secured.

It might be imagined that it would be an easy matter to take up the trail of a band of 2,500 sheep, and follow it wherever it might lead. And so it would be were the band had passed but once, or at a considerable intervals of time; but here was a valley along which the animals passed at least twice each day, and so left an inextricable confusion of tracks. It was, therefore, more a matter of good luck than of skill that the Scout, as he rode along, picked out what appeared to be the most recent trail, and followed it up over the hills, until after riding perhaps two miles, he heard the tinkle of the sheep bells, and soon saw on the neighboring slope the gray moving dots that he recognized as the feeding animals. Among them sat the shepherd, as usual, deep in a novel, and near him his pony grazing, while at his feet was curled the black and tan collie, without whose services his task would have been so much more laborious. Riding up to him the Scout dismounted and filled his pipe and then the news was asked for and given by both. The doings at the ranch and the directions of the Boss were detailed, and the condition of the sheep inquired into. The herder said that quite a number of the sheep had the scab, and he urged on Scout the importance of having the whole bunch dipped as soon as possible, and the latter felt that he ought to return at once to the ranch and report to the Boss. On reaching the cabin, therefore, it was decided that he should ride back as speedily as possible to the ranch and report the condition of the sheep, while the Miner should go with him part way, and hunt a little among the timber, and then return to the cabin. Scout, if he had time, was to return that night, and if not, then the next day at the earliest hour practicable. It was now the middle of the afternoon, and time to be moving. They therefore unpacked the yellow mare and picketed her out, and then mounting, rode across the valley and up into the hills. Scarcely had they gone half a mile when they saw appear on the crest of a sparsely timbered ridge the forms of half a dozen elk. They were moving along at a brisk walk, and soon disappeared in the forest. The Miner secured his horse to a fallen tree and started after them on foot, while his companion, as soon as they were well out of sight, pushed on for the ranch. When he reached it the sun had set, and it was too late to get back to the cabin before dark.

It was but just gray dawn next morning, however, when he was in the saddle and slowly climbing the mountain side on his way back. When he came within sight of the cabin he was puzzled. It was after 8 o'clock, but the bars were up, and the sheep still within the corral. No smoke rose from the chimney of the little building, yet at that hour of the day it could scarcely be that the shepherd was still in bed. He noticed, too, that of the three horses which should have been there, only the yellow mare was to be seen. When he reached the cabin he found it empty. There were two beds, on one of which he recognized the Miner's blankets, but these had been long deserted. He placed his hand on the stove. It was almost cold. The Scout was thoroughly puzzled as to what had taken place. While he was cooking his breakfast, he indulged in speculations as to what had taken the two men away from the camp. The most plausible explanation seemed to be that the Miner had killed an elk the previous evening, and that the two had gone to bring it in. This, however, was unsatisfactory, for it did not seem probable that the shepherd would have gone off for this purpose, when he should have been away with his sheep an hour or two earlier. Stepping outside the door of the cabin the Scout took another long look up and down the valley, and while he was doing so, saw the Miner appear on foot out of the creek bed, scarcely half a mile from where he stood. Really the puzzle was becoming more and more intricate. Why should the Miner be walking? In a few moments the two met at the door of the cabin, exchanged salutations, stepped inside and sat down. The Miner bore a very grave countenance, and Scout waited for him to speak. He said:

"Scout, I am afraid that I have lost my horse. It happened in this way. I was coming back last night from the hills and rode down the second creek above here just at dusk. By the time I reached the main stream it was nearly dark. I started to cross the valley in an open, level place, and was riding quietly along when suddenly the horse went down half up his body in a mud hole. He floundered two or three

times, but could not free himself, so I jumped out of the saddle to the bank. Even then he could not get out, but lay there sinking in the mire. I tried to pull down a stick to put under him, but could find none that would give way, so I turned and ran down here for an ax. When I got back, which was in about twenty minutes, there was no horse to be seen. At daylight this morning we went back there, and found where he had come out. We have been looking for him ever since, and the herder is still out, but we can't find any trace of him."

"Are you sure he is not there in the mud?" asked the Scout.

"Quite sure, for I have sounded it, and about three feet below the surface it is hard, rocky bottom," was the reply.

"The horse is all right then," said Scout. "He will go back to the ranch; but how about the Bosses gun?"

"That was slung across the saddle, and was left there when I went for the ax."

"It is probably still on the saddle, then; and if the old horse goes back on the prairie it will be safe, but if he goes across the mountains and through the thick timber, it will probably be torn off, and most likely lost. The best thing to do, I think, will be for me to ride the hills between here and the ranch, so as to catch the old fellow, or find his trail if he is still in this neighborhood. He may possibly have fed about all night, and be only just now starting for home. I know that he did not go back by the Sage Creek trail, if he had, I should have seen his tracks."

At this moment the herder came riding up to the cabin, and reported that his quest had been unsuccessful. He had seen no tracks that were made by the lost horse. The messages sent him by the Boss were delivered, and he took down the bars of the corral and let out his eager flock, which at once started for the hills. The Miner and the Scout then went down to the creek bed to view the scene of last night's catastrophe. At the point where the little tributary entered the main creek the rocky walls of the valley were forty or fifty yards apart, and the intervening space was a smooth level meadow. Above and below this the quaking aspens grew thickly, but here it was grassy and without timber, save for an occasional clump of willows. At the lower edge of the meadow was what looked like an ancient breastwork—here and there broken down by water—two feet or more above the general level of the ground. In fact now that there was daylight to look the ground over in, it was plain enough that it was a heavier meadow.

Any one who has traveled much in the mountains knows what traps for man and beast beaver meadows are. The method of their formation is something like this: The beavers, finding a suitable place, build their dam, and by it the water is backed up over a considerable area, and the ground becomes thoroughly soaked. The spring freshets bring down each year from the streams above great quantities of mud, chiefly decayed vegetable matter, and this sinks in the comparatively quiet waters of the pond. After the lapse of years the pond thus becomes too shallow to be used by the beavers, which then move off and build another dam somewhere else on the stream. The old dam no longer receives attention. It rots, becomes leaky, and at length the water breaks through it, the pond is drained, and the water returns to its former channel. For a year or two the old pond bed is covered with a rank growth of weeds and water-loving plants, but as the moisture gradually leaves the soil, the common grasses take the place of these, and the beaver meadow looks like any other portion of the valley. There are almost always soft spots in it, however, bog holes and narrow ditches, into which man and horse are likely to fall, and it is frequently a matter of the utmost difficulty to get a horse out of one of these places without injury.

The spot into which old Bill had walked was one of these bog holes. It was full of soft black mud, on which grew enough green grass to conceal its real nature until you were quite close to it. In the daytime no one of experience would have attempted to pass over it. At night any one might have done so. There in the mire could be seen the spot where Bill had been, and from it leading to the opposite bank, a distance of but eight or ten feet, were the marks where his hoofs had sunk deeply into the soft soil as he had floundered out. The tracks led down the creek for a few yards, and then turned into it again, and it could be seen where he had dived and then crossed over to the other side. There the trail was lost.

The two men then started up into the hills to see if they could find any trace of the missing animal. To both of them the loss of the rifle seemed a much more serious matter than that of the horse. If the latter was alive it was a moral certainty that he would sooner or later turn up at the ranch, but it was not at all sure that he would have gun, or saddle, or bridle on him when he appeared. Besides, even if he did not return, money could buy another horse well enough, and the loss would not be a serious one, but money could not replace the old rifle, so battered and bruised by rough usage, and yet so unvaryingly effective in its owner's hands. When one has carried a gun for years, has killed with it many hundreds of head of game, and has had sometimes to rely on it for his life, it becomes to him something more than so much wood and iron. It is a dear friend, to which he is as much attached as if it were a living, sentient creature. So, although it seemed likely that the horse had returned to the ranch by the prairie, over which he would probably carry the gun in safety, it was possible that he might have done so

through the timber, where he would have been almost sure to strip it off; and therefore the two partners traveled all day over the hills searching for the trail. About 3 o'clock they met by appointment at the cabin, neither having seen any traces of the horse. The Miner had seen three elk and the Scout three deer, two of them just as he was returning to the cabin, and within rifle-shot of the door.

It was now determined that the latter should return to the ranch by the prairie, see whether Bill had come in, and return in the morning with a horse for the Miner, when they would continue the search. Half a mile down the valley the Scout came upon the tracks of a horse made within twenty-four hours, and going in the same direction he was following. A careful examination of them convinced him that they were those of the lost beast, and when three hours later he rode up to the ranch he was not much surprised at seeing old Bill in front of the house, quietly munching the grass. The first person seen announced that the horse, with gun and all his accoutrements in good order, had been brought to the house by a cowboy that afternoon. He had come to the cow camp the night before about twelve, and had been detained there. When during the day the drive passed the ranch, Bill manifested a disposition to turn toward home, and one of the men brought him to the house to see if he belonged there.

The next morning about 9 o'clock the Miner saw appear over the bluffs near the sheep camp two mounted men and a led horse, and when they stopped at the cabin a broad smile of relief and satisfaction overspread his countenance as he recognized old Bill and the long rifle. The time to be devoted to sheep hunting had all been wasted in horse hunting, and they had nothing to do but to pack up and return to the ranch. When they rode up to the door, Grizzly Jake, who was at work at the carpenter's bench, sang out to the Boss: "Here come the sheep hunters. Out o' luck, boys, ain't yer?" Yo.

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

FROM where rise the transparent, rushing streams, which form the headwaters of that mighty northern river the Saskatchewan, south to the Yellowstone, from the foothills of the Rocky Mountains between these two rivers, east to about the 104th meridian of longitude, west from Greenwich, was once the home of the Blackfeet. Here, as nowhere else in our whole country, has nature piled up great mountains and spread out vast prairies with a more than lavish hand. All along the western border of this region, the Rockies lift their snow-capped peaks above the clouds. In the northwestern part are the Porcupine Hills. South of these the three lonely buttes of the Sweet Grass Hills stand surrounded by a vast expanse of prairie. Further to the southeast, and running parallel with the Missouri, are the Bear's Paw and Little Rocky Mountains. South of the Missouri, between it and the Yellowstone, is a vast cluster of ranges, the Highwood, Belt, Judith, Moccasin and Snowy Mountains. Between these mountain ranges, and between the river valleys stretches everywhere the great prairie. Not the brilliantly flowered prairie of the south, nor the green marshy plains of the far north. Except for a few short weeks in early spring, the short, sparse bunch grass is sere and yellow. The ashy gray of the sage brush but adds to the general sombreness of the landscape. Perhaps in the distance a range or two of mountains may loom up with startling distinctness, although a hundred miles away, or they may appear enveloped in a blue misty haze, the "gathering of the ghosts." The seemingly dreary prairie is not without its beauty. Everywhere it is cut and seamed with great deep ravines, whose perpendicular walls are crowned with fantastic columns and figures of sandstone, carved by the storms and winds of ages. Here and there, on some high bleak ridge, a few scattering pines may be seen; short stunted trees with huge gnarled limbs and great black roots which twice around rocks and creep into fissures, seeking a secure foothold against the fierce blasts of winter.

Not so very long ago these prairies were graced with countless herds of buffalo and antelope; along the wooded valleys of the stream, and on the pine-covered slopes of the mountains, were once numberless bands of elk, deer, sheep and bears. Some of the game is yet to be found. Bands of the ancient inhabitants are yet to be seen—small remnants of a once mighty nation. Still camping where their forefathers were wont to pitch their lodges, some of them preserve their native dignity and hold to their ancestral customs as sacredly as ever; others are demoralized, discouraged and indifferent. On the prairie, but partly concealed by the thin grass, lie the bleached skeletons of the buffalo. In the trees by the river, securely fastened on their aerial sepulchres, lie the motionless forms of the many dead, whose ghosts are happy in another land. The broad, deep trails, where thousands were wont to pass on their annual hunts, are now grass-grown and nearly obliterated by the leveling hand of time. To those who were accustomed to see the prairie covered with living forms, the smoke of a thousand lodges curling upward in the still, clear air, the change is marvellous which a few short years have wrought. There are those of us idle dreamers, who would that it might be otherwise. But it may not be. The weaker organism must give way to the stronger, the lower to the higher intellect. Before the bullets and far deadlier fire-water of the whites, these simple men have been swept away like leaves before a wind. "But they were only Indians," say some. True; yet they were human beings, they loved their wild, free life as well as we love our life; they had pleasures and sorrows as well as we.

It is not the purpose of this paper to give a history of the Blackfeet since the discovery of their country by the whites. It is enough to say that like most all other Indians they have bitterly opposed the march of civilization and have been defeated, and that the "Piegiens," one of the tribes of the Blackfeet yet remaining on United States territory, are in as destitute a condition as is possible for a people to be.

According to tradition, the first white men the Blackfeet

ever saw were a detachment of the Hudson's Bay Company, which established a trading post on the Saskatchewan at the close of the last century. In the journal of Lewis and Clarke's expedition, the narrator mentions meeting the Blackfeet when the expedition were on this side of the main range. Blackfoot tradition, however, makes no mention of this fact, and the writer is inclined to believe that some other tribe must have been mistaken for Blackfeet. Surely such an important event as the first visits of white men to their country would have been included in their traditions, and in their unwritten history Mr. Jos. Kipp has the honor of being the first white man they ever saw south of the Saskatchewan, he having come up the Missouri to the mouth of the Marias River with an expedition of the American Fur Company's men in 1839.

At the time the American Fur Company established its post at the mouth of the Marias, the Blackfoot nation was in its prime. At that time it is said to have numbered some 2,500 lodges, or 25,000 people. It was the largest and most powerful body of Indians in the Northwest. Together with its allies, the Sarcees and Gros Ventres, some twenty hostile tribes were without difficulty kept beyond the boundaries of its vast hunting ground.

The Blackfoot nation consists of three tribes, the Blackfeet, Bloods and Piegiens. Each tribe consists of a number of "gentes," a "gens" being a body of consanguineal kindred in the male line. Below is a complete list of the gentes of each tribe. The writer has taken great pains to translate the names so as to retain the meaning as closely as possible. Any one familiar with an Indian language will understand how difficult this is to accomplish.

Tribe *Siks-nh-káh*—Blackfoot, from *Siks-i-náts*, black, and *áh-kah* *tebat*, foot.

GENTES:

- Páh-ká-náh-náh-gíks*—Rotten bows.
- Má-tah-tas-íks*—Many medicines.
- Siks-ín-ábáks*—Black elks.
- E-máh-áh-pah-ká-sí-gíks*—Dogs naked.
- Áh-kí-sahn-káks*—Much manure.
- I-gó-máh-ká-ká-íks*—Sliders.
- Sí-gíks*—Liars.
- I-sáks-ták-íks*—Biters.
- Páh-tá-m-íks*

Sí-íks-sís-tóp-gíks—Early-finished eating.

Áp-áp-kí-gíks—Skunks.

Ík-sáks-ní-áh-wat-áp-íks—Meat-eaters.

Tribe "Bloods," *Kí-nah*. The meaning of this word is uncertain. Perhaps it was originally *Áh-kí-nah*—many chiefs.

GENTES:

- Siks-ín-ábáks*—Black elks.
- I-gó-máh-ká-ká-íks*—Sliders.
- Áh-tró-náks-tóts*—Many lodge-poles.
- Áh-pó-t-á-kí-nah*—Behind direction "Bloods."
- Ís-tse* *Kí-nah*—Woods "Bloods."
- Ín-úh-ké-só-gíks-stóm-íks*—Long-tail lodge-pole.
- Né-tí-áks-íks*—One fighters.
- Páks-sí-íks*
- Síks-áh-páh-íks*—Black blood.
- Ák-íks-áh-áh-íks*
- És-sí-áh-áh-íks*—Hair shirts.
- Áh-kí-páh-íks*—Many children.
- Síks-áh-náh-náh-gíks*—Short bows.
- Áp-áp-kí-gíks*—Skunks.
- Áh-táh-íks*—Many horses.

Tribe "Piegiens," *Pé-lán-í*—spotted tan, that is, a robe which has hard spots on it after being tanned.

GENTES:

- Pé-níh-sáks*—Small.
- Áp-áp-kí-gíks*—Skunks.
- Káh-mé-íks*—Buffalo manure.
- É-pók-é-mé-íks*—Fat roasters.
- Áh-pí-táp-íks*—Blood-people.
- Né-tó-íks*—One eaters.
- Kít-í-m-íks*—Laugh.
- Síks-áh-sí-pu-m-íks*—Black mocassin soles.
- Sí-íks-áh-áh-gíks*—Early-finished eating.
- Mé-áh-é-áh-pé-sáks*—Seldom lone some.
- Méh-í-íks*—All chiefs.
- E-máh-áh-ká-ká-páh-íks*
- Ík-sí-n-áh-páh-íks*—Worm people.
- Méh-kín-íks*—Big tops.
- Síks-áh-páh-sí-íks*—Black fat roasters.
- Mók-áh-íks*—Mad campers.
- Né-tí-sí-té-sí-m-íks*—Bulls come close.
- Síks-áh-ké-sí-íks*—Black smoke-holes.
- Má-tah-tas-íks*—Many medicines.
- Né-tó-íks-áh-ké-sí-páh-íks*—One will their hearts.
- Áh-kí-páh-ká-ká-íks*—Many loose women.

It will be readily seen from the translations of the above, that each gens takes its name from some peculiarity or habit it is supposed to possess. Thus, the Blackfoot gens "Sliders" was so named on account of the great love the people had for sliding down the banks into the ice on buffalo ribs. "Behind direction" is the name for the north. The gens "Behind direction" Bloods was so called because it was greatly attached to an extreme northern portion of the great hunting grounds. The gens "Kít-í-m-íks" Laugh, was so called because its members were seldom seen to laugh. "Kít" is the sound which asks a direct question and may be represented in our language by the words do, did, is, are, and was, when used in asking direct questions. The Piegan gens "Blood-people" received its name on account of its members' abnormal appetite for cooked blood. The name of the gens "Small" is perhaps the only one which gives no clue to its meaning. Long ago, says tradition, this gens was out on a hunting expedition, and, meeting a camp of mountain Indians, traded buffalo robes for robes of different mounted animals. Upon returning to camp the other Piegiens were surprised to see them wearing such small robes, and ever since they have been called "Small."

It will be noticed that each tribe has a few gentes which

are common to one or both of the other tribes. This is caused by persons leaving their own tribe to live with another one, but instead of uniting with some gens of the adopted tribe, they have preserved the name of their ancestral gens for themselves and the descent. It is not probable that the names of the gentes are very ancient. The Blood gentes "Many horses" and "Many children" are neither of them thirty years old. The Piegans gens "Stiff-tops" is also a comparatively new name. Each gens is governed by a chief chosen by the ceremony of the "Medicine Lodge" which will be described in another place. However, it can hardly be said that chiefs govern the gentes. Matters of importance are attended by all the chiefs, medicine men and married warriors of the tribe. A council is called "they-all-talk," a tribal and a gentile council house "in-the-middle-talk-to-each-other-house."

The Blackfeet have very few laws for the social and military government of the people. The law regarding murder is, that the murderer must be killed by some of the male relatives of the murdered; if the murderer escapes, some one of his male relatives may be killed in his place. If a married man, who has no near relatives, dies, the widows must demand some warrior of his gens to avenge him. Thus, in the story of "Red Old Man," which is as follows: "And some widows, whose husband had been killed by the Crows, painted their faces black and came to the lodge of Red Old Man, saying, 'Our husband is dead, we have no one to avenge him,' and the woman cried. Now Red Old Man's heart was good. He could not bear to hear the women crying, and he took his weapons and rushed out saying, 'Go, you will avenge his death.'" A woman guilty of adultery was punished for the first offense by cutting off the end of her nose; for the second offense she was killed. For lesser crimes there is no punishment save the contempt and jeers of the camp, which are dreaded as much as the penalty of death. A coward, one who will not go on war expeditions, is made to wear the dress of a woman, and is not allowed to braid his hair. His relatives must make up and sing. Children in the lodge, beging from lodge to lodge and sleeping with the dogs.

As the members of a gens are all relatives, however remote, men are prohibited from marrying within it, they must seek wives from some other gens. Polygamy is practiced. All the younger sisters of a man's wife are his potential wives. If he does not choose to marry them, he must be consulted regarding their disposal to other men. There is no marriage ceremony. A man having found a woman he thinks will suit him, sends one of his friends to her parents' lodge, when, in a roundabout way, he is praised for his valor, good heart, etc.

After an interval of a few days the friend is again sent to make a formal demand for the woman. The parents of the woman then call a family council to discuss the advisability of letting the young man have her. Often a price is set—a number of horses, valuable furs, etc. If within his means, the young man pays it, and the bride is escorted by some female friend to his lodge, where she immediately orders upon her duties as if she had always been accustomed to them.

If a man die his widows may become the wives of his eldest brother. However, if he does not choose to marry them, they are at liberty to marry any one else. If a man wish to divorce his wife, he accomplishes it by taking back the price he paid for her. The woman is then at liberty to marry again. The widows of a man, whose wife is called "sits-beside-his-wife," she is invested with authority over all the other wives, and does little but direct the work of the other wives and attend to her husband's wants. Her place in the lodge is on the right side of her husband's seat. She enjoys the great privilege of being allowed—to a certain extent—to participate in the conversation of the men, and often, at informal gatherings, take a whiff out of the pipe as it is being smoked.

Female children are generally named by their mothers or some female relative. Male children by their fathers or some male relative or friend. Female can always be distinguished from male names by the terminations, thus: Antelope-woman, Sitting-up-in-the-air-woman, Little-elk-teele-woman, etc. As soon as a young man has taken part in some brave deed he is allowed to choose a new name for himself by which he may be known for the rest of his life. However, names of a man, including personal property, as are his bows and arrows or his shield, and other things bought and sold, large prices sometimes being paid for them. Favorite men's names are White Shield, Bear Chief, Wonderful Sun, Running Wolf, Yellow Wolf, Wolf-coming-up-the-hill, Young Bull, Water Bull, etc. A very singular custom exists among the Blackfeet, that a man must not, under any circumstances, meet or speak to his mother-in-law, and if this rule be broken, the mother-in-law may exact a heavy payment from the offender. The writer has been unable to learn any special reason for this. Some say that the sun made the law, others that it is improper for a man to meet his mother-in-law for fear she might hear him say something impolite.

[TO BE CONTINUED.]

A BIRD OF NO FEATHER.

A FREQUENT contributor to the FOREST AND STREAM relates a good story about his endeavors to be agreeable to a distinguished nobleman, who, some four years ago, visited that portion of America where our friend lives, and is there known as the Commodore.

The nobleman in question, who, by the by, is very learned and a literateur of high order, became interested in the fish and fishing in the neighborhood of an ancient city. Our friend having described in such glowing terms the beautiful lakes and the fine speckled trout inhabiting them, the nobleman expressed a desire to pay them a visit. Our friend volunteered his services, boat, rods, flies and general outfit, and made arrangements to receive him with his son, the Marquis, and two daughters, Ladies M. and E.

On the appointed day, a beautiful fine day afternoon, the party drove out to a renowned lake about twelve miles from the city, and were soon comfortably placed in the fishing boat which was to take them to the lake. The Commodore, as a mirror, but not a trout would rise to corroborate our friend's description of their beauty. Mortification and disappointment were depicted on his broad countenance at their want

of success, and the host then took the forward part of the boat and put into play all the art years of practice had perfected him in, but not a rise could he get. Turning around to see how his guests were amusing themselves, he found them dissecting a wild flower picked up on the road, and comparing it with others of the same family they had known in Europe; the nobleman mentioning the scientific name asked if other members of the same family were to be found in America. This question was too much for our friend, who, keenly feeling his want of knowledge of botany, had to declare his ignorance of the subject. A dead silence followed for some time till the nobleman, casting his eye upon the adjacent rocks, then asked if he could tell him of what formation the rocks were composed of. Our friend, the subject of geology had to be confessed by our friend, who felt that he was entirely the wrong man to entertain such scientific strangers, but being bent on establishing a claim to knowledge of some sort, turning to the Duke he told him that in America few men devoted much time to scientific studies.

"Why is that?" said the nobleman.
"Because," answered our friend, "it don't pay; in this country one gets on by his learning and his energies for money-making, and the scientific man has a poor chance in the race for wealth. Yet," he added, "Your Grace must not form an estimate of our people's knowledge of many refined studies by my ignorance of botany and geology. We all try to cultivate a taste for some of the arts and sciences. Some of us are musical; others sketch, paint, or do something which can be made useful as well as agreeable. As far as I am personally concerned, being fond of shooting and fishing, I have acquired a familiarity with our birds and fishes, and my knowledge of ornithology, or pisciculture, I shall be happy to place at your Grace's disposal."

"Thanks," answered the nobleman, "I am well acquainted with your American birds, and can tell the name of many of them by their song. For instance, the bird we now hear is the robin"—and so it was—which for the moment fully established the Duke's knowledge of that bird at least. A little further on another songster attracted his Grace's attention. He said to our friend:

"Of course you know that bird?"
"Oh, yes," he answered, "very well, indeed. They are very plentiful here about, and in fact everywhere."

"I also know him," said his Grace. "That is the—the—well, I have got his name on the end of my tongue; how odd a sort of pronunciation it. What do you call that bird?"
Now, though our noble friend's eyes twinkled with satisfaction, the Duke is especially connoisseur by himself, and with a most respectful bow, he answered: "That bird, your Grace, is called an Irish nightingale, but it is really a bird of another feather, or rather no feather at all, it is a frog." Here our friend looked at his distinguished guests to see the effect of his wit. He met a stolid stare of the most incredulous kind, and the nobleman said he was mistaken, that the bird was well known by him, but its name for the moment forgotten.

Our friend was too modest to dispute with a live Duke, and merely asserted that the object in question was near at hand, and ordered the man to paddle on. The party soon came to a dead tree lying partly submerged; a small frog was seen sitting on the end of it, which gave one chirp and made one dive in the lake. His Grace looked a little red in the face and said it does appear to be a frog after all.
With another bow, but not so low as the first, our friend smilingly remarked that he was happy that his Grace would not leave America with the poor impression he might have formed of some of its people's scientific knowledge by his own display of ignorance of botany and geology; and he now relates this story in evidence of his success on a very trying occasion, to show that he knew something of natural history, that mistake could occur even in the best families and with most learned people.

Natural History.

LIFE AT THE BOTTOM OF THE SEA.

IN connection with his inquiries into the food fisheries and fishes of the coast of the United States, the Fish Commission has carried on important scientific investigations. While trawls are being set, for the purpose of inquiring into the abundance of fishes in certain localities, and for finding new fishing grounds, with but little additional expense to the Commission, extensive dredging operations are carried on, bringing up immense numbers and kinds of animals never seen before by the human eye. Not only are these animals of importance to the purposes of inquiry, but the character of the food of bottom fishes, but they are also of immense scientific value, since many of them present curious types of structure not found in animals inhabiting the shallow waters, and often unknown, except from fossil types supposed to be long since extinct. It is a curious fact that many groups of animals, a few years ago thought to be represented only by fossil types, have recently been found inhabiting the deep seas in places in great numbers, and it is reasonable to suppose that such groups as the Trilobites may sometimes be found upon the ocean bottom. The Crinoids, so widely distributed and so numerous throughout the fossiliferous rocks, but, a short time ago, placed upon the extinct list, have been found very abundantly and in considerable variety in certain regions. Whereas, a few years ago it was asserted that there was not a single living tree Crinoid, we have today no less than fifteen species embracing several genera, from the North Atlantic alone. When the whole ocean bottom is explored as thoroughly as certain regions of the North Atlantic, who can tell what curious forms may not be found?

About twenty-five years ago it was believed that no life existed or could exist below a few hundred fathoms; yet now, from off the coast of New England alone, we have over a thousand species, and every year at least fifty new species are added. Nor is it curious that it should have been supposed that no life existed in the ocean depths, when we take into account the great pressure, the cold and the almost absolute darkness, which exists there. The average temperature is 36° Fahr. Of course the great pressure is overcome by allowing gases, having the same pressure as the surrounding water, to permeate the body tissues, thus producing an equal pressure in every direction. By photographic experiments it has been proved that there is practically no light upon the bottom, the sensitive prepared paper coming up without an impression. Notwithstanding this fact, most of the animals have well developed eyes, although some are totally blind. It is the supposition, therefore, that the

animals with eyes must depend upon phosphorescence for light, and, furthermore, that phosphorescence must be very common and very brilliant. Certain corals, and a few other animals, retain their phosphorescence even after being brought to the surface. Although animals are very abundant in these great depths, not a vestige of vegetable life has ever been found at any deep sea dredgings. The reason for this is of course that sunlight is essential for the nourishment and growth of plants, which is not at all the case with animals.

The *Bothrops* of Huxley, which was supposed to be the lowest form of life, in fact the primary starting point of all life, hardly an animal, yet not a vegetable, merely capable of motion and taking food, has been proved to be nothing but a mass of organic life of organic matter, covering the bottom of the ocean throughout the world. *Foraminifera*, the lowest forms of life found upon the ocean bottom, allied to the *Amoeba*, so common in fresh water ponds and on damp leaves and pieces of bark, and, at the same time, to the animals composing the chalk deposit of England, form a layer upon the bottom, that depth of which has never been ascertained. This foraminiferous deposit, commonly called Globigerina ooze, is composed of many species of animals, showing beautiful concentric rings of different lines, while *Proboscis*, some of which may live upon the surface of the water and drop to the bottom after death, but the most, probably, living and dying upon the bottom. These animals, composed of only one cell, secrete shells of carbonate of lime, microscopic in size, but when looked at through the microscope, presenting beautiful colors and fantastic shapes. Some are as smooth and glossy as the best glazed china ware, showing beautiful concentric rings of different lines, while others are rough and lobed in a manner which defies description. Still others have the most beautiful shade of pink, and some present in color a most delicate chocolate brown. We find them tubular, coiled, cross-shaped, spherical, oval, and in masses which look as though the animal started with a spherical form, and, wishing more room, pushed out a portion of the side into a hemispherical protuberance, and repeated the process until however more room was needed, until a mass of lobes upon lobes is the result. Perhaps the most curious form is one which has the general shape of a Nautilus, and upon making a horizontal section it is found to be composed of chambers, too. Although these animals are usually not larger than the head of a pin, that symmetry exists which is always found in the living and the natural, but seldom in the accidental. Spherical protuberance, and repeated by symmetry, exists even in these so-called beings, the lowest form of animal life. In no case do we find one of them having the irregular outline which is to be seen in grains of sand, chipped off from larger rocks and worn into accidental shapes. Some pre-established law causes these regular forms; in fact, causes them to produce like regular forms, differing in no respect from their parents.

In these *Foraminifera* communication with the outer world is obtained by means of holes in the shell, out of which the pseudopods are projected. By means of these little feel-like projections motion is obtained and food procured. But little is known of the life-history and habits of these animals, coming, as they do, from such depths, and not being adapted to life upon the surface. The chalk cliffs of England were formed by similar animals, living in the cretaceous period, but probably inhabiting shallower waters than the present *Foraminifera*. In many of the fossiliferous shells is mixed with thick blue mud. By placing the mud in a tub of water and stirring the contents, then allowing the heavier portion to sink and pouring the top water off, and repeating this a few times, an almost perfectly pure deposit of *Foraminifera* is formed in the bottom of the tub.

Covering this mixture of mud and shells, usually in great abundance, often with extreme variety of forms, sometimes being both varied and in abundance, but never entirely barren of life, we find many forms, representing nearly all the groups of the animal kingdom, except the higher vertebrates and insects proper. Although the stony, many-poled coral is not at all represented upon the bottom, still we find many forms of the *Gorgonia* or soft corals, as well as the single polyp stony coral. The soft corals are represented in extreme variety and by remarkable and curious forms. *Prinocylus*, *Prinocylus*, *Prinocylus*, and *Prinocylus*, and *Prinocylus* coral, both first found on this side of the Atlantic, and presented to the Fish Commission by the Gloucester fisherman and this summer obtained by the Commission itself, are remarkable for their great size and beautiful color, the former being a very delicate pink, the latter, a pink bordering upon the red. Specimens of the tree coral four feet in length, bear evidence of being more branches, while we have many others, which are very beautiful, but in a natural condition would have undoubtedly been ten or fifteen feet high, and nearly that number of feet in width. The animals forming this colony produce in unison a rather tough but spongy mass, branching and gradually growing in bulk. The polyps can contract and withdraw into the mass of the stem, but are fixed permanently in one place. In the case of the bush coral a hard silicious central axis is secreted in each branch, and the polyps live in the soft parts, attached by their tentacles to the wall which they secrete. When the polyps are rubbed off a hard stem is left, which could easily be mistaken for a petrified branch of a tree. In both cases the whole colony is attached to a rock. Upon the stem large barnacles often two inches in diameter, resembling rock barnacles, excepting size, frequently make their homes.

In a few places rocks are found upon the floor of the ocean. These are usually found only in places where they might have been carried by ice in comparatively recent times, but in a few places we have taken large conglomerations of clay, containing fossils of animals at present inhabiting these localities, thus proving that they must have been formed in comparatively recent times. In places where rocks are found, such animals as must of necessity have some solid base to build upon, as sponges and the like, exist in abundance. But the sponges and the like, exist in abundance, frequently met with, sponges are almost entirely unknown.

Here are noticed the devices which nature is continually adopting, to adapt herself to circumstances. A free swimming polyp just budded from a mother colony, being accidentally transported from stony grounds to a softer bottom, by force of instinct, at a certain period searches around for some hard substance upon which to fix itself and start a new colony; but failing to find a substantial base, it is obliged to fix itself upon the soft mud, and the same groups of *Gorgonia*. It grows, but in doing so will become top-heavy and tip over unless something is done. Buds from this have the same experience, and gradually, after many years, a membrane grows down at the same time that the colony grows

coats. Feeling through them slowly, she at length took one down, shook it, and folded it up in a neat bundle, and with an injunction of secrecy handed it to me. It was a new one that the old gentleman had taken a dislike to, by reason of a misfit or some other slight cause, and it had been left there for years unworn. A hurried home with my prize. Entering my room and finding the door locked, I went back, and the buttons surpassed any buttons I had ever seen; but ere far ahead of the Major's. I even thought of how I would surprise him when he came back. I tried it on; my countenance fell. Grandfather weighed a hundred and eighty pounds, while poor me could hardly turn the scales at seventy-five; so you can guess how it fit me. Not to be outdone, I cut off the sleeves, then took a strip one foot in width out of the back; this was done without cutting the collar, so you may know how it looked when I pinned it together to see how it would fit. I was beaten, at my own end; could see no way out of my dilemma, and lay down on the bed and cried from pure vexation, and went fast asleep.

The next morning my dear devoted sister picked up the fragments and at once took in the situation. "Poor boy, you shall have a hunting coat if I have to make it myself." And make it she did; but oh, what a job. Week after week we two worked on that coat. We would cut and trim, me begging all the time to save the pockets, she striving to spare as much of them as possible. Then the pieces would be stitched together and laid out on the floor, the glass in the parlor when she would laugh at me, and I would peer over my shoulder to see the back. Improvements would be suggested and puckers pinned down. Then the whole would be taken apart and more cutting and paring. Such a time with a coat mortal man never saw. So, after a month's hard work and with a loss of half of the pockets it was declared a fit, and I was happy. The fact is, it fit pretty well, and looked splendid, considering it was rebuilt by two young persons who never saw such a garment apart before.

"What became of it?" Age, that is the rub. I wore it for two seasons. And one day I had stolen off shooting against orders, so at night when I got home I took off my coat and hid it beneath a bush in the front yard, intending to take it to my room when the old man went to bed. My gun I took to the stable. When I went after my coat it was gone. Next morning at breakfast the head of the house had a merry twinkle in his eye, and asked pleasantly, "Are you going to the moor to-day, my son?" Then I knew who got my coat. I never saw it again.

CHAS. ROBEY.

A WEEK IN ISSAQUENA.

IT was years ago. A party of seven left the Mississippi River steamer at Tallulah, in Issaquena county, Miss., and followed by a retinue of servants, proceeded to the residence of Tom Mayfield. Thence, the following day, we were to go on to the Good Intent plantation, where our great mansion house was waiting to receive us.

Mr. Mayfield's house was crowded, Mills D. Nicholson, North Ike Cheney, Charley Balfour, and two or three others were there, as by agreement, to have a grand hunt; hounds were tied up on all sides, pandemonium seemed to reign. John Hadley, an old woodsman, was dispatched to the creek for old Lize and his pack of bear dogs. It was at once decided that our party and the assembled company should open the chase, as soon as signs could be found, beat the forests, and make Good Intent our objective point.

The country, as is the entire valley of the Mississippi, was that, covered with a heavy growth of timber, and a heavier undergrowth, interspersed right and left by bayous, sloughs and lakes, with a formidable stream (Steele's bayou) intervening between the river and Deer Creek. It was no joking matter therefore to follow the dogs, as no one of our party saw the trail. He was fully booked in the mark, the dread of being lost started each one in the face. This proved however, a minor consideration when old "Tarpley" opened on a trail, Lawyer, Perplex, Sandy, Phillis, Dick and Moses joining in the most delightful septette that had been listened to in a long time; the younger hounds and the volunteer curs and halfbreds were likewise influenced, until the echo's coming and going through the still of the crisp, clear morning resounded in the wilderness, a melody which only a naturalist could fully appreciate. The scent was fresh, dogs and riders elated, and we went scampering at a rapid gait after the game, excited and intoxicated almost with the prospects. Fancy added to the scene still more joy; here came sweet sounds of old Spot's war cry; Lize was on the road, and only a few moments were required for his pack of twenty couples to augment the already majestic chorus.

Never was such a run known, so large was the combined pack, that brain had no time for strategy, but acted upon leg bail. At Newsum's bayou, he managed to take water, and thus delude the dogs for a few moments, and might have done so entirely, had not one of Lize's dogs, Beppo, which he had attempted to leave at home, straggled behind, and seeing the beast on the opposite side of the stream making away as fast as possible, opened on him a note or two, which the artists of the main pack recognized, and in less than two twinkles had put them all on their mettle again, forcing him to take to a large gum tree, from which, as soon as we got up, J. H. D., being honored with the shot, killed his game with a natural shot. He was fully blooded in return, as a souvenir of his first big game in America.

Here the dogs were treated to a feast of blood and the entrails of the bear, and afterwards coupled, as their run had been a hard one, and we had yet five or six miles to do before reaching "Good Intent." On reaching the house we found everything in readiness to make the whole party comfortable—bath tubs, rough towels and a change of clothing absorbed at least an hour, when we all sat down to a supper such as only a good housewife can prepare. Venison and bear steaks, broiled chickens, hot dolls, stews, coffee, a golden colored butter, and milk as rich as cream. Pipes of "kill-knick" were then smoked, yarns and adventures related in rapid succession, until checked by the introduction of an old-fashioned urn, smoking hot, a crustkin of rare "Irish" loaf sugar, tumblers and lemons. Of this nectar each one took a long pull, and then to bed to dream of the past, and rest the weary bones for the next day's run.

Bright and early the huntsmen's horns aroused the company from a sound sleep, and the sun appeared (the Englishmen in full rig of boots and breeches), a simple breakfast with an ample amount of hot coffee, was partaken of, and to horse was the order next evening. Our mounts were better on this occasion, as Jim, John, Buck, and Bill

were led out, fresh as three year olds, and as sleek as Derby winners. It was the intention of Lize to cross the creek just below the house, and lay on the dogs at the end of the lane, but in this he was frustrated by hearing several hounds, evidently running a hot trail, and coming toward us. Said he:

"Mass Harry, that's old Spot and Whiskey over dar, and I kno's dey don't sing dat way for nuffin, so I tink we better go long down frow de field, and de nuffin turns up, den we'll cross de bridge at de Keiso Place."

We had not gone more than a quarter of a mile beyond the quarter houses before the pack with us began showing evidences of uneasiness, and in a very short time afterwards proved they had cause for it, for at the eastern, Spot, Whiskey, Beppo, and Mayfield's Lawyer crossed the stream, and headless of our presence, went at lightning speed across the cornfield, in the direction of what was known as the burn; immediately what dogs were coupled were turned loose, and then was presented the handsomest sight I ever beheld in the field. Fancy, render, not less than fifty dogs on a fresh trail, running so close together that a tarpaulin would have covered them. Our horses were given their heads, and the fastest chase ever heard of in the swamp ensued. Fortunately there was a gap in the fence through which we dashed, enabling us to keep within sight of the pack, which was within the game so hard, that in less than five hundred yards from the clearing the dogs had brought them to bay. After searching some time among the foliage of a high oak we discovered two panthers, the W. W. F. and Captain W. were allowed the first shot; the captain took deliberate aim and killed the smaller of the two, but C. W. W. F. was less fortunate, only severely wounding him, it coming down, half climbing and half tumbling, in among the trees. Here began a most bloody fight, a number of the poor brutes were killed, and as many more badly cut and scratched. Dr. Nicholson, however, started up close enough to deal a deadly bullet into the beast's head, ending the fray.

The pack was so badly used up by this encounter that we determined not to tax them any more that day, so we returned to the house, and after kenneling the dogs, imposed a deer drive for the afternoon. The overseer on the plantation being the lucky possessor of a couple of fair deerhounds, he was called into requisition, and gave a very pretty chase, which ended in my father's bagging a doe of about ninety pounds weight when dressed.

The two following days our foreign guests amused themselves shooting ducks and snipe, of which there were any quantity in the creek and along its banks.

The dogs having somewhat recuperated, the week's hunt was brought to a close by quite a lively day's work, during which two bears and a catamount were killed; my father, who was a dead shot, killed one of the bears, Charley Fore the other, while the catamount fell to the gun of Tom Mayfield.

To hunt in the swamps of Mississippi at the time of which I write, was the most exciting sport in the South, in fact, it required first-class dogs, the best of guns, men of endurance and courage, or otherwise it was attended with considerable danger. On some other occasion, in connection with the statement of requirements, I will attempt to give a description of being lost in this vast monotonous wilderness, and then the assertion as to the danger attending hunting there will be more appreciated.

J. D. H.

AMONG THE MAHOGANY CUTTERS.

THE mahogany cutter often completes his work for the day at an early hour soon after midday, and the more industrious, who are also lovers of the sport, improve the remaining daylight in exploring the dark forest for game, which is plentiful enough to insure a reasonable return for the labor. The cutter equips himself with his single-barrel gun, costing four or five dollars, loaded with a double charge of powder, a good supply of soulin, a palm full of shot, covered by another wadding of oakum. The whole is hammered down with solid blows of the ramrod. A traveler in South America says these guns never burst, supposed because they are warranted not to, and no other reason is known.

Over his left shoulder the hunter puts a canvas bag, containing a bull's horn powder flask, a calumet and shell fancifully carved and opening like a box, containing percussion caps, a small canvas bag fastened with a string for shot, a case of deer skin, which rolls up, as a respirator for the head and neck, pipe and tobacco, and a cocoanut shell for tinder for lighting the venerable solace of his tired moments, when pausing in the chase. More than this, if the hunt is liable to be one of several hours, the collection may include a flask of gin, a breakfast basin, a roasted plantain or two, a piece of dried beef, and a case knife.

Thus prepared he wanders forth into the forest for deer, peccary, gibbon, curassou, quail, armadillo, iguana, squirrel, monkey, or any of the many other species of animals which abound in the region.

The Indians of the interior have a curious instrument, more common fifty years ago than now, which they use with the voodoo poison to kill both large and small game, and which shows how easily the lack of firearms is overcome, and an effective substitute invented. It consists of a long blow-pipe and can be described as follows: A reed called ourah, some ten or eleven feet long, of a bright yellow color, smooth inside and out, without joints and hollow, is taken for the wood. There is no apparent taper, one end being as large as the other. This is enclosed in a species of palm, and a brown color, capable of polish, and with joints about six inches apart. The inside consists of a pulp, which is easily removed. The mouth end is tied with silk grass to prevent any splitting, and the other end secured with a seed of the acuro fruit, cut horizontally through the middle and a hole made in the end, through which the end of the blown gun extends. The arrows are nine inches long, made from a hard and brittle palm, sharp at the point and sometimes burned at the opposite end to make them still harder than the natural wood. The arrow, tipped with poison, is placed in the end of the blowpipe, the hunter collects his breath for a puff, and the missile goes straight to the mark, a bird high up in the top of some tall tree two or three hundred feet away. The Indians are very expert with the weapon, and seldom fail to bring down the bird when within a distance of three hundred feet. For larger animals the bow and arrow are used.

In both cases, however, death is the result of poison, and not from the wound, which in itself may be of a trivial nature.

The voodoo poison, which is used, is made from the voodoo vine, Indian pepper, the pounded fangs of the labrador snake, bitter root, two plants which contain a glutinous

juice, and two species of ants. When prepared it makes a brownish paste. The preparation is considered by the Indians a work of danger, and is a matter of considerable form and ceremony. The poison when introduced into the blood produces a fever and death in short time. The flesh of an animal killed by this poison is said to remain unincorrupted, and eating it is never followed by any bad results. The Indians of warm climates have little incentive to labor, except when impelled by hunger, and when the stomach commands him to work with his unique weapon and the voodoo poison, he wanders in the forest and, with silent footsteps and sharp eye, soon brings down a supply of game sufficient to answer his needs for days, and enough to make the amateur sportsman more than satisfied could he enjoy the same amount of good fortune.

FRANKLIN MASS.

IN THE OHIO BOTTOMS.

A QUAIL shoot among the Ohio River bottoms and hills in the vicinity of the Queen City of the West, may not fail entirely of interest to your host of sportsmen readers. Leaving courts and dusty law offices behind, in company with cousin Will, we boarded the evening steamer on the 18th inst. for N. R., twenty-one miles east of this point, for a couple of days' sport. The weather was windy and very cold, but the wiser heads predicted milder weather to-morrow, in which they were not mistaken. Home folks gave us a hearty welcome, and after father told us that he had flushed a fine covey of quail out of the garden the day before, we began to feel the enthusiasm that always precedes a contemplated day's shooting.

The next morning, with horse and wagon, by this time joined by Ned and Shot, two staunch and reliable setters, we drove three miles up the river to the wide Ohio bottoms, not caring to disturb our quail about the farm at home. Horse stabled and blanketed, a fence was cleared adjoining a cornfield fringed by stubble, and the dogs lied up to work. Back and forward they go over the field, when Ned suddenly checked his speed, proceeding cautiously through some water, and in an old rail, an old hen, and a couple of coveys flushed wild at our approach, but not soon enough to escape my fire, which brought one bird to bag. Away they go out over the road near by and up along a hillside, dropping among some stunted shrubs and thick blue grass.

The spot being approached where they were marked down, Shot stood well with nose not more than three inches from the bird, and was backed finely by Ned. Bird flushed and fell to the fire of cousin Will. At that moment a bird flushed wild and fell to my fire. A little further and both dogs point separate birds, five or six birds rise and two birds alight to bag; then they all rise suddenly and miss above right and left. The ground being very rough, we abandoned these birds and proceeded to another stubble, where a beautiful point was made by Ned. A double trippled me at this fire; and the birds flying out of reckoning were not followed. Ten coveys were our find that day, out of which twenty-four birds were bagged. On Monday following twenty-six birds fell to our fire over another lay of ground, out of seven coveys in certain localities in this region would be very fine, were it not for the rough ground and sometimes impenetrable cover, where birds scatter when flushed. Two weeks ago Monday, over beautiful grounds, out of eight coveys I had the great pleasure of bringing to bag thirty-one quail out of forty-one shots, twice killing two birds across each other's line of flight. I do not expect to do it again this season. If this be a mild winter, with our short close season, I predict for next fall the finest shooting ever known in this section.

J. A. P. CHENETON, Ohio, Nov. 22.

ANOTHER OLD BARN-DOOR.

BACK from my Governor's house seven rods is the barn, an ancient, weather-beaten structure, the door of which is full of rat-holes, and is shot, and after the ability of the hunter to hit, at least, a flock of barns. Let us go out and look it over; perhaps we may recall some, if not all, of the circumstances under which the bombardment occurred.

Many of these shots were undoubtedly made with no other object than to empty the gun after returning home from a day's shooting. Well, they don't signify much, but bring up the memory of tired legs and lame back, yea, and often an empty game bag.

That was in the palmy days of the muzzle loader, when the feat of knocking a high-bird out from the top of a tall stub off-hand was something to be proud of. But here are other punctures, dim and indistinct, and nearly obliterated by the elements; what are they? Those must be holes made many years ago, before I left the shelter of the paternal roof, during a pistol practice between the Governor and myself. I then possessed a little single shooting nondescript, with which I would enter the lists against the Governor's Smith & Wesson .22-shot. Well, the Governor was a pretty good shot, but somehow I generally made the better string. When he would declare that "the cussed thing wouldn't shoot straight anyhow." But not always would I come off the victor. An exceptionally fine lead of his would sometimes rattle me so that he won—but we will pass on. This is something evidently of a later date, judging from the freshness of the timber; here is a spatter of little bullets just in beyond the surface of the board. Yes, that was done with a Flobert rifle that I brought home with me during my annual vacation for a few days; but I thought those marks nearest the center were made by my sister. Somelov or other she would find the bulleye officer than the rest of us; but of course we were too gentlemanly to beat her.

Looking around on the other side of the door we see splinters which indicate the passage of something larger than a .22 ball shot hit. We can easily explain this. The Governor's .22 short had been growing all these years and had attained the dignity of a .32 long, with which he proposed to do my duty in the acting S. A. W., and I determined there and then to settle the differences of former years, so we plastered up a target and took a position distant ten rods, five shots each.

You see those two, one above the other, seven inches apart, and the other a trifle to the left and the other two were just outside the target. Those were mine. Now glance along to near the top of the door, there ran father's bullet through; to the left, about four feet and two below, is another, that is No. 2. The others were longed for, but I forgot those marks nearest the center were made by my sister. Somelov or other she would find the bulleye officer than the rest of us; but of course we were too gentlemanly to beat her. Here we are nearly to the end of our door, but I cannot

overlook the spot whereon I patterned my breech-loader; look at the No. 8 pellets, are they not beautifully spread? Guess 't would puzzle Bob White to get through there without sustaining serious injury, but if I remember rightly some of them did get away long since, but the brush was thick, you know, and the sun shone glaringly in my eyes, or something of that kind, and I am diverging.

Let us look to the next observation carefully, something may have escaped our observation. Nothing, I guess; hold on; a little chip knocked from the edge of that knot hole recalls the time when seven years since I fired three shots at it from a revolver, and for some time surely thought I had missed the door, but upon a closer scrutiny, found they had gone through the magic circle, and entered a stick of stove wood, piled against the door. There they were, a copper would cover the three. That is all. The old door is a landmark of the history of my life, to which I often turn with never failing interest and emotion. Upon its battered surface is a record of some of my deeds; some I trust are recorded above others, upon the hearts of humanity. Would not our deeds be better if they all could be seen as plainly as those marks upon the old barn door?

B. W. S.

MEMPHIS, MICH., NOV. 22.

THE OLD SETTLERS AGAIN.

Editor Forest and Stream:

I enclose you the story of one of the early pioneers of 1816, relating to the first settlement on the Western Reserve, which is in the northern portion of the State of Ohio bordering on the south shore of Lake Erie. The writer tells his story well, and I send it to FOREST AND STREAM, knowing that it is worth recording.

DR. E. STERLING.

CLEVELAND, OHIO.

"The variety was the common gray wolf (*Canis occidentalis*), a grizzly gray on the back, a yellowish gray or dirty white below, a bushy tail fifteen to twenty inches long, and such a wicked expression of countenance, no wonder that the incessant tolling of poetry to prevent starvation has treated the proverb, to keep the wolf from the door. These undesirable animals were numerous in the forests of those early days, and yet the sheep and hams were comparatively safe to what they are now. The reason was not that they were less disposed to feed on mutton, but their assaults were usually confined to the hours of darkness, and knowing the exposure of the flocks in the night season, it was as regular a part of the evening chores to see that the sheep were all by count safely yarded as to milk the cows. But the worthless dogs of the present day are a pest to the pasture or any other, if the farmer should chance to be absent, at all hours of the day and make terrible slaughter among the innocents.

"In the autumn of 1836 we left our field of labor in Monroeville, Huron county, O., for a visit to the old hearstone, and reaching Jefferson found that the united head of the family had started with their own conveyance—railroads were little known then—for a visit to the vicinity of Auburn, N. Y. Purchasing a coat we followed on and enjoyed the visit with them. When we returned, being somewhat weary of the saddle, we took passage on a steamboat up the lake to Ashtabha, and thus reached the farm some time before the rest of the company. Father left a flock of some forty fine sheep. Tidings was brought by a neighbor soon after our arrival that the dogs had been among them and such a scene! Scattered over the field were the dead or dying; only one, probably the best, killed, had any marks of violence upon his body. The others were just bitten in the neck and the life blood sucked out. With the assistance of a brother we commenced dressing them, first finishing the work for those that were still breathing, and ere the sun went down one-half of the cherished flock were hanging in the barn. What a sight to greet the owner when he returned the next day! This was a greater loss than he had suffered in all the former years, by wolves, of which we started to write, and to which let us return.

"We cannot speak from personal knowledge of wolves ever attacking man, though he have read of such conduct on their part even in Ohio, and severe hunger no doubt might induce such action. Soon after the founding of our settlement two of the brothers, Michael and Daniel, united in building a saw mill, perhaps the first in that section. It was located on Mills Creek, near the west line of Jefferson, but in the township of Austintown. All hands were unbroken forest, and a mile from the homes of the owners. The demand of customers and supply of water at certain seasons, required that the mill should clatter day and night, but neither could induce them to hoist the gate on the first day of the week. From personal experience we speak, that two persons were competent to this labor, though it sometimes required hard lifting. One came on duty 12 noon and kept things buzzing until 12 midnight, and was then relieved by another until the Saturday noon allowed one to depart for twenty-four hours. The time to which we refer was in the early winter, when the ground was covered with a light snow. Uncle Michael was doing the service which closed the weary week at the mill. During the long hours of darkness which at that season of the year lie between sunset and sacred time, he was aware that there was unusual disturbance around the mill-yard and even on the log-way. When the time came, therefore, to leave the mill for a half mile walk to the woods, he took a wooden yard, in addition to his lantern, which in those days were made of perforated tin and illumined with a tallow candle, a hand torch. Torches were a wonderful invention to lead a company of evening worshippers to the place of service, the attendants at husking bees or boys who went 'cooning. They were composed of slung bark from the hickory trees, and the material for them was always kept in stock for times of need. With one duly lighted torch sallied forth to find him way at once pursued by a pack of hungry wolves. The fire of their eyes was distinctly visible as they came near to him, and the snarling and snapping of their teeth like an orchestra to quicken his steps. They continued their pursuit until he had entirely left the woods, but the glare of the fiery torch was an effectual preventive against his feelings as well as hearing their teeth. A visit by the light of day showed that the surface of the entire mill-yard had been pawed up by them while he was still at work.

"Many a time in those boyhood days have we stood trembling while the other members of the family were filling the pails to overflowing with the rich milk treasured up by Pink, the first family cow that we remember, and her associates as the day had passed quietly in the fields of sweet grass and clover. But why tremble? In the not far distant woods, north and south, the wolves were joining in their evening chorus preparatory to their night marauding, and as their howl echoed respectively, the fact was an abiding

one that when the milking was done the cows were to be driven to the pasture. When relieved of their burden of sweet milk they could be whipped up without damage, which we were always taught should not be done before milking. Reaching the end of the race, down came the bars with a will, the drove hustled in, bars put up again, and the whip was applied to the road as though it might hasten the returning steps before the wolves should put in their appearance, demanding a supper from the boys' legs.

"A hunter by the name of Read, as famous in the wolf capture as was Uncle Squires in taking the deer; in his forest rambles one day discovered the hiding place of a litter of young ones, which he easily secured, and making his way to a farm house obtained his supper and a small basket in which to carry the pups, and returning to the woods near the place of capture for his night work to secure the mother also. He had not waited long before the cries of the young ones in response to pinched ears brought her within the reach of his rifle, and added another bounty to many won before. Speaking of bounty, as early as 1799 the Territorial Legislature passed a law offering a bounty of \$1.25 for each wolf scalp killed in the State. The State Legislature in 1821 raised the bounty to \$3, and also authorized the commissioners to pay \$8 more, making \$11 in Ashtabha county still another increase was made by personal donations—as each taxpayer came to settle with the county treasurer he was solicited to add to the bounty money such an amount as he was willing to give, and we are credibly informed that at one time it reached the liberal sum of \$100 for each scalp. This policy had the desired effect and soon rid the county of these night marauders as an abiding place, and it was only as traps that they were heard from. Our country-wise legislators thus early became anxious to preserve our young men from the slaughter of the intoxicating cup as the sheep and lambs from the wolves how different would have been the history of our noble State today.

"Having paid our respects to some of the more showy and important game, let us not overlook the lowly. Among quite a variety of these we will first introduce the porcupine, sometimes erroneously called the hedgehog. High authority asserts that "there is no proper hedgehog in America." They possess a remarkable provision of nature for their protection in the spines or quills with which the body is armed. The animal is very clumsy, but an excellent, though slow climber, and in the late winter and early spring was often found in the tops of the forest elm and basswood trees, obtaining its food from the bark and buds of the tender twigs. It was not necessary to look up in hunting them as the ground and the trees would show their industry by the large number of twigs they had dropped.

"Their method of defense was to keep their quills erect and a free use of their tail, which moves so quick that some have erroneously supposed they could shoot their quills, which they cannot do, but was to be the foe, man or beast, that comes in contact with these points. They are loosely attached to the skin, barbed at the point, which is as sharp as a comb, so that they easily penetrate, retain their hold and tend continually to become more deeply inserted. Many an hour have we spent in pulling them out of the dog's mouth, and once took one from the top of the head which had worked up from the lips. Porcupines were often met with when we made nightly visits to the fields of growing corn, with dogs, guns and torches, and if a dog was foolish enough to attempt to taste one it spilled all the sport for that time, and he never returned for many days for that time, and he never returned for many days for that time. It is recorded that dogs, wolves, the lynx, and the cougar have been known to die from the inflammation produced by its quills.

"There was one dog in the township that knew how to manipulate them so as to take their life without coming in contact with their weapons of defense. It was brought from the East by Rev. Joy Handy, and afterward became the property of Mr. Lidel, who owned a farm north of the center house. Soon after taking up his abode there, his master found porcupines lying dead in the cornfield, which awakened quite a curiosity to solve the mystery. He rather concluded that it was the work of the dog, and yet had never found any quills in his mouth. One day he heard a low bark from the dog in the growing corn and hastened to ascertain the cause. Approaching with care he did not attract the attention of the dog or his plaything, which he continued his motions around his bristly pet, occasionally giving a low bark, until the animal had become familiar with his presence and began to lower his points of defense, when the dog with a quick bound placed his nose under his prey, grappled it by the throat, and soon placed him *hors du combat*, after which he walked silently away. But the mystery was solved and the value of the dog greatly increased in the estimation of his owner. The work of the porcupine is so easily obtainable. We do not add our endorsement from experience, but can testify that their quills are highly prized by the Indians, who use them to ornament theiroccasins, belts, bags, baskets, etc., as others can testify who have seen them offering their handiwork for sale at the summer watering places, or even in the city of Cleveland.

TOOTING FOR DEER.

A PARTY of deer hunters went forth from Central Lake the other day. They were in earnest. "Meant meat," in fact, and as one of their number had two or three of the antlered monarchs "yarded out," they fully expected that there would be blood on the knife before night. The van was led by Mike, who carried a tin horn. His mission was to take up the trail, when found, and still be tooted on. Much did he order to terrify the deer, and made it run in the direction of one or more of the confederates, who were supposed to be posted at convenient strategic points. They took their stations accordingly, and the man with the "tooting weapon" (as Pathfinder would have called it), trailed the woods. In time, he found a track. He tooted, and followed on. The trail led him by many a devious way, through some of the worst country (for a lazy man) that has ever been manufactured, and yet manfully he trailed on, and still he tooted on. Much did he encourage the hearts of the lonely ones who waited with ready rifles and more or less of patience at the runways, and more did it probably surprise the tootee, which, however, all unknowing of the frightful designs of the tooting man, strayed on and made no sign. The track of the tootee in the snow, was as the track of an average deer—its turns and windings were not unlike those which the hunter had been accustomed to see on like occasions, and he was not jumped over logs and the like, or came eight or ten feet at a bound. Thus stood matters, when at length the tooter,

coming near a ridge, held his Spencer at a ready and nooted. Then he ascended the ridge and tooted some more, when to, upon the opposite ridge a shape appeared. It was the tootee. The hunter paused against. For one moment words failed—he caught his breath—dropped horn and rifle, and solemnly ejaculated: "It's a sheep." Deceitless and sleepless came the hunters home, and mightily they returned, but in the silent watches of the night there came a rum of elephantine size, which sat on Michael's stomach tooting horns; and straight the shades of all the deer his hand had slain, and all the grisly mutons he had chewed, came trampling over his chest, and tooted too.

J. P. SQUIBBER.

ELK RAPIDS, MICH.

MINNESOTA DUCK SHOOTING.

THE duck season has closed here, not by reason of the law but because there are no ducks, as the little lakes have all coated over with ice. Spring opened so late here that not one-tenth the usual number of ducks put in their appearance. The lakes in which wild rice is to be found all yielded an abundant crop, and we hoped for good shooting this fall. We hoped in vain. There were a few on the rice lakes but none elsewhere.

On the first day of October a party of four, composed of Fisher, J. D. Jervis, J. D. Mack and your author, and a servant, engaged a steamer and started for a rice lake eight miles east of Long Prairie where ducks were reported plenty. We had one boat in the wagon, and on the road picked up several ruffed grouse. When we reached the lake we found that four men had preceded us and had all the ducks driven off the lake, but were giving it to the blue-heads. We were all unacquainted with the lake and we pushed off about 4 o'clock. Mr. Jones and myself, who have shot together for the past seven years, comprising one boat crew. Soon after getting started in the fall rice near the eastern shore the birds began to come, but we were not in their track and only an occasional flock or a single bird came near us. The first eight shots were clear misses and we began to think we had lost our skill. Presently two wood ducks were seen approaching from the north and whirled cut the air about forty yards from us, and then dropped into the form. We had been shooting behind our game.

The booming of the guns at the other end of the lake told us that our friends were not idle, and the thought that they might show up the largest bag at the camp in the evening made us exert ourselves more, but in spite of our efforts we could not bring down more than one bird for every four shots. Our boat was cranky and caused us to miss a great many shots, and once Mr. Jervis came near falling into the water—gun, cartridge box and all. We shot as long as we could see and returned to camp with only twelve ducks, leaving about that number in the fall rice, being unable to find them. The other boat returned with six, making a grand total of eighteen birds for two hours' shooting with four guns.

The next morning we were in our places some time before it was light enough to shoot, but at the first shot most of the ducks were up and left the lake. We remained till 9 o'clock and returned with twenty ducks, our partners coming in with two.

The parties who had preceded us, we understand, went home without a bird except the blue-heads, though they had fired something like 200 shots. This was poor shooting, but we had a good time nevertheless, and returned to our various duties feeling better for having spent our day on the water—gun, cartridge box and all. We shot as long as we could see and returned to camp with only twelve ducks, leaving about that number in the fall rice, being unable to find them. The other boat returned with six, making a grand total of eighteen birds for two hours' shooting with four guns.

LONG PRAIRIE, MINN., NOV. 20.

ST. LOUIS SIFTINGS.

IN the interior of Missouri, thirty or forty miles beyond Rolla, there still remains a wilderness as wild and romantic in many respects as the favorite hunting grounds of the Indian in the far West.

A party of St. Louis hunters embarked on a fourteen days' hunt through this wilderness on the 12th. The deer hunters, Messrs. J. B. Schulte, the Excelsior Gun Club to visit Rolla and make arrangements for having their stores transported in wagons from Rolla to the edge of the wilderness. Having performed his duty in a highly creditable manner the advance agent of the party returned and reported he had hired five wagons and several teams for the journey. This information was so satisfactory to the party that they decided to devote the greater portion of their time to spearing their tents and setting traps in order for effective work. The party consisted of Messrs. J. P. Schulte, Fred Pohlman, C. Koehler, H. A. Tibbs, Louis Luckner, Theodore Rick, H. H. Schulte, Henry Bitter of Waterloo, and Mr. Pestole of Rolla.

Last winter the members of the St. Louis Gun Club divided themselves into two teams and shot a match at quails in open field for a supper. They will probably repeat this sport this winter.

November 10 Capt. Ries, W. R. Cottrill, Maj. Buchanan and Mr. Bow called their dogs, shouldered their guns and started to the Union depot in high spirits. They were also "large game hunters," starting on a week's hunt to the St. Francis River in Arkansas. Deer and bear are reported quite plentiful in that section, and, being good marksmen, they are likely to meet with great success before they return to this city. They took enough ammunition with them to last a week, but unless the shooting is exceptionally good they will return before expiration of that time.

A large party who desire to confine their attention to hunting small game left on the 10th for the grounds of the Dardenne Gun Club. Duck hunting, which has been good at the grounds of the Dardenne and Cuvier Gun clubs for nearly two weeks, is still sufficiently tempting to entice many St. Louis sportsmen from their family firesides and all places of business. Sportsmen will not disturb quail to any great extent until a cold wave drives the ducks further south.

Charley Boyd and Messrs. Gillespie, Mulcahey and Alexander spent a day in fishing and hunting at Horseshoe Lake. They caught eleven fish and bagged twelve quail and six ducks.

Hunters in great numbers are returning to the city from excursions into the interior on account of the growing scarcity of ducks, which, they say, had been driven southward by the cold wave. Quail they reported as being quite numerous.

Mr. Thomas Annan and party have returned from a fifteen days' hunting and fishing excursion to Current River. They

shot several deer and bagged a large quantity of smaller game, including a number of wild turkeys.

The Cottrill party, who went to the jungles of Arkansas November 10 in search of deer, have not yet been heard from. They will probably ship a dead deer to each of their friends before the close of the week, and probably a bear or two also. They went to a bear country and not to a "bar" game country.

Henry Nagel and Mr. Susinsky engaged in a shooting match, November 17, at Carondelet, for a stake of \$50. Each shot at fifty wild pigeons, and Nagel won by killing a majority of thirteen.

November 21 the Fair Association received a donation from W. W. K. Wilson, of Calhoun, Mo., in the shape of a white opossum. The animal is a splendid specimen, and was captured by George Rank and W. Roach.

CAMP-BELL.

PHILADELPHIA NOTES.

THE cold weather of last week brought to our ducking shores a fresh supply of fowl. The warm and murky spell which has followed and almost total absence of wind and presence of morning fog has made shooting bad. Brant are plentiful at Barnegat and Tuckerton bays. Large flocks could be seen during the cold days mentioned, quietly feeding on the drifting grass in the channel in the bay which runs parallel to Long Beach. These birds invariably decoyed any traveling fowl that made their appearance, while the shooter in his sedge-covered boat at some inland near by rarely waited for his motionless decoys to attract the attention of a rang of new coming birds.

Mr. C. Howard Clark, Jr., of our city, has lately returned from Wyoming Territory where he has been enjoying great sport among the large and small game of that region. I shall be able to give you some points of interest from this section of the country in a short time.

Illegal hounding for deer is being openly indulged in in the counties north of Williamsport, Pa. The Pine Creek, Jersey Shore & Buffalo Railroad has opened up and made easy of access what was formerly an isolated section, and a wholesale violation of the law with dogs is going on there this season and many deer are being killed. Fine grouse shooting can be now had on the line of this railroad, but the country is of the roughest description and comfortable sleeping quarters scarce.

Parties who have returned from Maryland and Delaware, report having run across a flight of woodcock which have come in from the north. These birds have doubtless started in advance of the late cold weather.

During some winters in which there has been some sharp weather, I have known the woodcock to remain in numbers through the entire season, or at least until February, in the spring swamps on the line of the railroad running to Berlin, Md., where a young market-shooter having found them, kept his secret, and shipped during the month of December, over a hundred birds to Philadelphia, from the section named.

The once famous duck shooting point, owned, I believe, by Mr. Stokes, on the Sinupecuxet Sound, quite near Ocean City, is entirely ruined since the bridge was built that spans the sound. The club house and point was within a stone's throw of where the bridge now is, and consequently all the fowl that are not entirely "shut off" by the draw, pass over at such great heights as to be entirely out of gunshot.

The buildings on the beach at Ocean City, also add their effect in frightening the fowl, and last, but not least, the gill-net fishermen set their nets all over the sound when ice does not prevent, and these generally occupy the very feeding grounds the ducks would select. As a shooting ground, excepting for shore birds in summer, the Sinupecuxet Sound may be said to be a thing of the past. Hovo.

MORNING SUN, Iowa, Nov. 19.—I see you in your issue of Nov. 16 make me jump about 500 miles east to Morning Sun, Ohio. The road transit did not hurt me much, as I am still here safe and sound enough to walk seventeen miles, as I did one day last week on our return from our annual shooting trip to the Missouri bottom. I don't believe there is a pinnated grouse within 100 miles of Morning Sun, Ohio, and a pack of them would bring out every gun in that section of country. Game is not at all plenty here, but we have vast quantities of it compared to Southern Ohio, and I love to give some of my friends there a "day out" when they visit me here. Ducks and geese have almost "given us the go by," as they are not as plenty as in former years, and old duck hunters "sigh for the years gone by," and many were the yams we heard, in our last camp, of the days when the hunters, not the ducks, were happy. With us ducks were so scarce that four of us only bagged fifteen in our three days' hunt. One morning the mercury went down to 8° and again to 7°, but if ducks had been flying thick I guess we could have stood the cold. The last prairie chickens we killed were large fine ones, three of them weighed two and one-quarter pounds each, and the other two pounds scant. Ah! What nice ones they were. Quail are fairly plenty, enough to make good sport, I think, but I hope to speak more intelligently about them in the near future.—MARK.

WARRENTON, Va., Nov. 21, 1883.—A nipping frost, the first of the season, has marked the hunting here. Mr. Jas. K. Maddux killed nineteen (19) quail yesterday in nineteen successive shots with my gun, a Colt choke-bore. He missed his twentieth bird in a dense cedar grove. His shooting was all done in a thick scrubby cover. He is off to-day to kill some birds for your own editorial table, and I hope he will have his usual success. He is the best wing-shooter I ever hunted beside. In the field he will discount Carver or Bogardus. Quail, ruffed grouse and turkey are plentiful now, and scarcely any pot-hunters around.—E. Z. C. J.

DUCKS FOR CHICAGO SHOOTERS.—Chicago, Nov. 19.—At Cedar Lake, Ind., thirty-eight miles from Chicago, on the L. M. A. & C. R. R., there is excellent duck hunting about this time. Two friends of mine were out there last Friday and Saturday, and shot twenty-eight ducks. Twelve fell into the lake, and it was so rough that they could not go after them. The fishing is also good. I was out there and spent summer before last, and I had all the fishing I cared about for a while. I went out one morning and caught about fifty fish between 4:30 and 6:30 o'clock.—E. K.

HARTFORD, Conn., Nov. 19.—Coming down on that early train this morning, as we crossed Warehouse Point bridge I saw a large flock of wild geese going north. They were flying very high. Rather late, isn't it?—J. F. J.

AN ALABAMA SIDE-HUNT.—Nov. 21.—The third annual hunt of the Gulf City Gun Club commenced on the 18th and terminated on the evening of the 19th instant. Fifty-three of the members participated in the sport. The total score of Captain H. P. Vass's team was 5,123, and that of Captain G. W. Tunstall's 3,194. Vass's majority 2,929. Had it not been that the weather was unpropitious for certain kinds of game, notably ducks and other water fowl, the ordinary Nimrod would have had nothing left over with to test his skill on the coming winter. By half past two o'clock yesterday evening, the various reports of the results, together with the game, had been brought in, and all the different varieties counted and recorded. The following is a list of game killed: Deer 3, rabbits 5, woodcock 106, chicken hawks 11, sparrow hawks 22, owls 5, quail 1, curlew 1, quail 157, poulin snipe 18, plover 1, doves 159, robins 159, larks 102, wiles d'caux 23, ducks—canvas-back 14, black mallards 3, common mallards 21, gadwall 23, pintail 9, widgen 8, red-heads 6, teal 5, and other ducks 88, making a grand total of 815. There were no incidents connected with the hunt other than those which usually happen on similar occasions. Although the game was not plentiful, all had a jolly good time, with no accidents of any description to mar the pleasurable enjoyment of the sport. Mr. E. Carre, of Captain Tunstall's team, won the medal for best score made; and Mr. Geo. Boltz, of Captain Vass's team, wears the club medal for the ensuing year. Captain Vass's team won the medal for best team scores. It will be remembered that Captain Vass's team won the contest last year and the year before, the score last year being 3,114 in his favor against 2,439 for Mr. Tunstall's team. The gunning feats of the members of the two teams were duly celebrated last evening in the rooms of the Gun Club. A long and varied bill of fare was presented, which was enjoyed to the utmost by those present. After the feast Judge Semmes, President of the Club, made the address of greeting, and offered a toast to the winning team. This was ably responded to by Captain Vass. The health of our sportswomen was also kindly remembered. Remarks were made by a great many members, and the occasion was a most cordial one in all respects. The proceedings were continued until a late hour, and will long be remembered in the annals of Mobile sportsmen.

BELOIT, Wis., Nov. 17.—The chicken season closed some time ago, and although we have had fine sport, the bags of our sportsmen were much smaller than during most seasons. The quail prospects are quite bright. We have a gun and shooting club in town, which is in constant practice, and when their brigade enters the quail regions, "death and disaster" will naturally follow. Duck shooting has fallen into ill-repute since the trying adventure which one of our grocers and a certain druggist had lately. Having informed all their friends and enemies that they were going out duck shooting, and proposed to show what science and skill could accomplish. About 10 o'clock in the evening they returned in a somewhat exhilarated condition, and walked through the main street of the town, carrying over their shoulders six mud-hens and three tame chickens. Since then no Beloit has tried duck shooting. Lauderdale Lake, a small body of water about fifteen miles from Beloit, is securing some notoriety as a good field for sportsmen. A neat club house has been erected. The lake is lined by marshes and rice lands, and furnishes a first-class duck resort. It is rumored that the Club House at Koshongum Lake has changed hands, and that it will be much improved during the present season. The Beloit Hunting Club expect to celebrate Thanksgiving with a grand rabbit hunt. Sides will be chosen, and the side having the largest bag at a certain time, will have the privilege of eating an elegant spread at the other's expense in the evening. Much fun is anticipated, and tame rabbits are in the greatest demand.—* * *

NEW ORLEANS, La., Nov. 17.—A party of four left last Wednesday for a hunt at Chef Menteur. The next day they started out after the game which they hoped to bring back to the city. The weather was extremely cold, and although the party was in the best of spirits, the cold made them appear very blue. A heavy blow and occasional rain did not add to their comfort or improve the prospects for fully bags to take back home. The prairie was full of water, caused by the strong east wind, therefore snipe hunting had to be abandoned. The scores made were: Provisano 8 ducks, Paterno 9, Cook and Burkhardt 11. The party returned home Thursday night, well pleased with their hunt. Hunters point to it as a noticeable fact that there have been more mallards killed this year than ever before. In fact, very few ducks of any other species have been seen at all, thus far. Yesterday evening Louis Cook, Rapho, Rich, Frostcher and C. Colin left for Chef Menteur on a deer hunt.

DELAWARE SHOOTING.—Brooklyn, N. Y., Nov. 24.—The Delaware law prohibits that a non-resident of the State, or "foreigner," as he is called by the natives, must first take the precaution to provide himself with a certificate of the Association. The best shooting is found in the southern part of the State; wildfowl shooting at Rehoboth and down the coast line is unsurpassed, while quail and rabbits will be found in abundance about Georgetown or vicinity. Mr. Robt. A. Rosenbaum, at Rehoboth, is vice-president of the Delaware Game Protective Association, and is ready to aid in finding good sport.—HOMESPUN.

UTE DEER KILLERS.—The Sweetwater (Wyo.) Gazette reports: "The Ute hunters still work on destroying deer and elk for their hides, and occasionally picking up a few head of horses. It is a burning shame. With all the show of military forts scattered throughout the country, our settlers are without protection."

SAN FRANCISCO, Cal., Nov. 12.—A party of hunters from the Austin and Butte Mountains went up to the sink of Humboldt last week and killed over a thousand ducks, geese and pelicans. They report Pyramid Lake as alive with water fowl.

TO AMATEUR PHOTOGRAPHERS.

WE have taken, with amateur outfit, two views from the windows of the FOREST AND STREAM office, and we shall be glad to exchange one or both of them for amateurs' photographs of camp scenes and other pictures made by the sportsman tourist. The views are 5x8 in. No. 1 is an instantaneous picture. It shows the north side of the Post-office, Mail street, a strip of the City Hall Park, and a varnish sign over on Broadway. There is also a pic-wagon delivering pies to the stand on the Post-office corner, with a fat pedestrian in the foreground. No. 2 is a view of the City Hall with the roof of the new County Court House, other public buildings, the top of Stewart's old wholesale store, and a slice of the American News Co.'s building in Chambers street.

Sea and River Fishing.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. Will not our correspondents favor us with notes of desirable points for angling excursions?

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The digest of open seasons, printed in our issue of Aug. 16, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

DIRGE OF THE DEEP SEA TRAWL.

A NAUTICAL DIRGE IN TEN STANZAS.

OF network, coarse and brown,
Made up in Gloucester town,
A purse-like bag; am I, and narrow;
Bound tight to iron frame,
Deep sea trawl is my name,
And the bottom of the sea I am to harrow.

"Mid sailors' smothered laugh,
I mout toward the "gaff,"
"And there bring up roundly with a jump;
"Lower away!" cries a voice,
And 'mid the witch's noise,
I fall into the scot with a plump.

With eyes distended wide,
They gaze from o'er the side,
In eager and hushed expectancy,
As slowly from their view,
Through depths of ether blue,
I sink softly to the bottom of the sea.

The engine's mournful throab,
And the piston's tearless sob,
Are sounds that all soon are lost to me,
For the frame to which I'm bound,
Is jerked along the ground,
Far down at the bottom of the sea.

O'er rock of varied hue,
Through mud of liquid glue,
I'm twisted with remorseless energy;
Through groves of coral fair,
And shoals of fishes rare,
I groan along the bottom of the sea.

With such unwholesome food,
Which is doubtless for my good!
I feel my sides phlegmatically distend;
And when my stomach's full,
With strong and steady pull,
My upward journey tollfully I wend.

Like some monster in disguise,
I soar upward toward the skies,
Through depths of pure cerulean blue;
And the same expectant eyes,
Wait to greet me as I rise,
To their wonderling and deeply anxious view.

When high enough they think,
I'm dropped into a sink,
And my waist encircling girdle is unbound;
And sages, young and old,
My stomach to unfold,
In scientific solicitude stand around.

Then I'm washed off with a hose,
My treasures to disclose,
And my undigested load surveyed with care;
And the sages' eager eyes,
Discern each unknown prize,
That renders unto science things most rare.

To plough and turn the soil,
In unrequited toil,
A slavish drudge I'm thus compelled to be;
But my spirits will not lag,
For some projecting snag,
Will kindly leave me—at the bottom of the sea.

SEPT. 4, 1883.

J. C. M.

PENNSYLVANIA ASSOCIATION.

Editor Forest and Stream:

In your issue of Nov. 15, page 309, an article signed "Homo" says that the Anglers' Association of Eastern Pennsylvania met on Nov. 16; and that "the most prominent question before the meeting was the discussion as to the giving of a fish dinner by the society." "Homo" was not at the meeting, or possibly he would have come nearer the facts than he did to the dates, and it is not the first time that he has had to be set straight in reference to the Association's work.

The Anglers' Association was organized about one year ago, with the primary object set forth in the constitution: Article 1. The preservation, protection and increase of edible fish in the waters of Pennsylvania; and the enforcement of the laws concerning the same, and to increase the interest in angling.

The FOREST AND STREAM, outside of its business venture, of course, has had somewhat similar objects, and its aid and encouragement, as well as that of all other honest newspapers, our Association asks and expects; but the inuendo is unfair and uncalled for, and we feel sure that the correspondent, and not the paper, is at fault.

The Association began with a few, a very few earnest workers, and has increased until the roll now numbers more than 200 members, and in that number I am proud to be one, for many of them are among the solidest business men of the city. The Association's objects have been kept steadily in view, although they cannot be fully accomplished at once. The reports of the officers, which were read (not in "Homo's" presence), but which will be sent to you before being published, are, to say the least, encouraging.

Not to recite them all, the Delaware has been cleared of fish dams from the northeast corner of the State to Easton, and over 100 destroyed on the Susquehanna. Large numbers of nets have been confiscated, several streams have been restocked, and illegal fishing in a number of places has been stopped.

The dinner of which "Homo" speaks is not a dinner of the Association at all; it is a dinner of the members.

The Association's objects are set forth in their constitution: but the work that we have cut out for ourselves, as you know, is not an easy one, and it is not strange that we get hungry or that we desire to become more closely acquainted one with another. No better way has ever been found for such a purpose than a good "feed," but our "feed" is personal and not of the Association.

PHILADELPHIA, Pa., Nov. 21.

The writer of the above communication has misinterpreted the spirit of the note to which he takes exception; it was not written nor printed as an immoderate mistake; however, quite possible, and I would exhibit equally refreshing in those days of so many game and fish protective associations chiefly given to dining and wine. For the spirit displayed by the Anglers' Association of Eastern Pennsylvania we have the highest respect, and we have noted with much satisfaction the energetic way in which the society has set about the accomplishment of its self-imposed task.

TROUTING ON THE BIGOSH.

FIRST DAY.

IT will be useless to hunt for the Bigosh on the map, for that is not the true name of the river, but only a pet name bestowed upon it by a select party, and used to keep its exact location from the knowledge of certain friends who might adventure get wet feet and take cold if they went browsing around our favorite trouting grounds. This reason is still a valid one, and although some of our party have pretended to divulge, "in strict confidence," the real name and haunts of this famous stream there is good reason to believe that its waters still mount along in their accustomed channel without being troubled by the wading boots, or disturbed by the boats of those who so strenuously sought to find where so many large trout were annually taken.

I don't mind telling you how the Bigosh came by its present name, because if you should stumble on it and come across good old "Uncle Ben," who has been our guide, philosopher and friend, he might casually speak of it as the Bigosh, but might be both to give you the correct derivation of the name that he wanted, or he might materially assisted at the christening. Now this was the way it came about: One of our party has a boy called Jack, and to set the matter of his paternity at rest, I don't mind telling you further that when Jack goes to his father to have a fish-hook cut out of his thumb, he does not come to me. Now, Jack is fond of fishing, and a couple of years ago, when he had an invitation to spend his vacation with a country cousin, who mentioned "lots of trout," he went, and with him, as usual, went Uncle Ben. On his return, the stories he told, accompanied with vouchers in the shape of large trout, made his father feel sadly in need of a vacation also; but as it is written that it is not good for man to be alone, he invited the party now known as "we three," and we went also.

Allow me to introduce Uncle Ben: farmer, obese, jolly, about 50, fond of fishing and owner of a small boat. The conventional "guide" is not known on the Bigosh because it has not been visited by "an honest man," creates the supply, and Uncle Ben volunteered his services and the use of his boat, partly from love of fishing, partly from a surplus flow of the lactical fluid of human kindness, and partly from curiosity to "see you fellows catch them ere big trout with them little whip stocks." Uncle Ben's "pole" would never be mistaken for a whip-stock, for, as he said, and we believed him, "jest let one of them all-fired big trout git a good hold on the hook and he's got to come, by gosh!" This plective was a favorite one with him, and usually appeared somewhere in a sentence either as an introduction, an interpolation, or a final exclamation. Its constant use had left its impression on his great wandering, honest face, so that a look of surprise from him left his open mouth in the shape of forming the words, and the laughing-wrinkle on his fat cheeks seemed always ready to pucker in readiness to assist at its utterance.

"We three" never included Jack, who always accompanied us as an appendix, and a voluminous one at that, for he was only a boy, full of enthusiasm, curiosity and chat; therefore there were five persons in the little boat. Of course you will say that there were too many, and we will grant you this without argument. We had rigged our casts under the wandering scrutiny of Uncle Ben, and the frequent repetition of his favorite word. After a few casts Jack took a small trout, and Uncle Ben, in his excitement, took an oar as he yelled, "You got him! You got him! You are swifd! don't break!" By gosh, I wouldn't believe it; but wait till one of their big ones bites on their feathers, and then, by gosh, look out!

Drifting down slowly we occasionally picked up a small trout, but nothing which seemed to alarm Uncle Ben for the safety of "them ere whip-stocks"; he was already satisfied that a three- or four-ounce trout could be captured with them, and waited, with more or less patience, to see what he was pleased to term "an old lunker" hook on to a light rod. After passing the sandy point, where the big pines stand, we came to a bend of the river where a deep pool was partly shaded by inclining hemlocks, and here the old man became nervous in anticipation of broken rods, and an opportunity to display the staunchness of his trusty "pole."

"Right in there, chuck yer fly over there by that dead cedar limb if you want to get hold of a lunker," shouted Uncle Ben, "that's where me and my boy took them five trout last year that weighed twenty-one pounds, plump, no ounces more nor less," he continued. A few casts and one of "we three" had a rise that indicated considerable avoirdupois on the part of the riser, and the vigorous singing of the reel confirmed the indications. A fight followed which did not differ sufficiently from the regulation struggle with a four-pounder to warrant a description of the details of how line was given and taken; how there was danger of entanglement with the cedar limb; and how we saw the line off under the boat. We all know how that is, and how hearts beat quicker and pulses throbb as the chances of victory or defeat incline toward the angler or the trout. This has been written so often that I am as glad of a chance to skip it as you are that I have done so. Here I think I have an advantage over the reader in having placed him under an obligation, and hope that the sparing of a threatened infliction will be appreciated.

You should have seen Uncle Ben! Sometimes he stood erect in the boat, his 190 lbs. making it unsafe at any distance above the gunwale, and again he sat down with a thump when admonished that an erect position was not the safest one in a boat. His face was a study. Sometimes his white teeth gleamed with satisfaction, and anon his puckered lips hid them from view. Once, when the trout leaped high,

and he thought the moment of paring was near, he held his breath, expecting to see either rod or line snap; but when the tip was lowered and slack given until the fish was fairly down again, and the strain gradually brought upon it once more, he drew a long breath and his lips formed his pet phrase, though no sound came from them. He felt the relief which comes after passing a dangerous point, and he evidently had a higher opinion of fly-rods than before, and mentally confessed that he had learned how to enjoy fishing more than ever, and was inwardly calculating how many eggs and how much butter it would require to have "one of them 'ere rods" sent to him from New York.

The fight was over, and the battle was won. A huge trout was coming in on its broad side, weak and exhausted, and when Uncle Ben saw its inside side gleaming in the play of sunlight through the cedars, a more moderate attack of his former excitement came on. Dropping his steering paddle and waving the landing-net, which he had retained a firm grip on, he jumped up in readiness to land the fish. Alas! his excitement made him forget his posterity, and in trying to correct a forward lurch by a backward one, he seated himself overboard. The boat, relieved of the strain, righted, and we saw Uncle Ben in the form of an inverted rainbow completely below the surface. He turned, rose, his head appeared above the water, and blowing the fluid from his mouth with a force that sent it into the boat, he spluttered out: "By gosh!"

This was the river named. At first we only called the pool where the big trout was taken, and where Uncle Ben moistened his clothing from hat to boots, the Bigosh, but gradually we extended the name to the whole river, and it has become a household word, adopted even by Uncle Ben when speaking or writing to us, and each year we look forward to a week of trouting on the Bigosh. Of course Jack laughed at seeing Uncle Ben make a hole in the water, no need to tell that. The trout? Oh, the splash gave him a scare and strength to break away. FRED MATHER.

[TO BE CONTINUED.]

PENNSYLVANIA FISH NOTES.—For years back the tributaries of Pine Creek, which is a goodly sized stream running into the Susquehanna two or three miles above Jersey Shore, Pennsylvania, have been among the best trout waters of our State, owing to their being difficult of access, and many fine fish could be taken from their waters. Last season the new railroad, "Pine Creek, Jersey Shore and Buffalo," which was connected with the Reading Railroad, opened up this inaccessible region, and took tourists by the score to the fishing grounds, and the consequence was that thousands upon thousands of trout, large and small alike, were brought out. I listened to the lamentations of two gentlemen from Jersey Shore to-day, and they say the new railroad will in another season ruin what was their only reliable grounds, judging from what they noticed this spring and summer. They tell me black bass through the Susquehanna at Jersey Shore, and that an astonishing number are taken every season on layout lines. This summer it was discovered that the bass were wormy, an early report being circulated, no one could be induced to eat the fish. "The consequence was the out-line fishermen ceased their work. Weirs and fish dams, I am told, are numerous in the same section. My informants state positively that they have seen the genuine salmon (not the wall-eyed pike that is sometimes called salmon in the Susquehanna taken near Jersey Shore on the Susquehanna River. Can this be so?"—Homo.

Fishculture.

FISHWAYS IN THE OSWEGO RIVER.

SOME three years ago an appropriation was made by the Legislature to cover the necessary expense of building fishways in the Oswego River, over such a long stretch, and in the fact that this stretch was the favorite resort of the kingly salmon and still the home of that prince among freshwater fish, the small-mouth black bass, might again offer such inducements to the finny tribes generally as to result in the recovery of its waters. This appropriation was largely expended by the Superintendent of Public Works of the State, under direction of the Fish Commissioners. Because of some delay, unaccountable at the present, the time for which the appropriation was available lapsed, and the ways were not built.

A second appropriation passed the Legislature of 1882, but failed of the Governor's signature, and it was not until the present summer that the money, the recommendation of the Commission being renewed, and the necessary action of the officials to act, came in conjunction. This happy concatenation of events, however, did take place during the past summer, and we have our fishways.

On the 19th of August the receipt of the first timber four ways were constructed and in working condition. These are placed as follows: One at the lower dam, a distance of a little more than one mile from the river's mouth; the second at the "high dam," a mile from the first; the third at the lower dam and a half further up stream, and the fourth at the Battle Island dam about eight miles from the mouth. The first dam is 10 feet in height, the fishway 12 1/2 feet long and 6 feet broad; the second dam rises to 12 feet high, and is 10 feet long by 6 feet wide, and the fourth dams are each about 8 feet high, and the ways to about 34 feet in length by 6 in breadth.

The rule of the way is 3 feet of length to every 1 foot of height. The figures given show that this has increased to 4 to 1, making the inch much more gradual.

The form of way is that adopted by the U. S. Fishery Commission, known as the latest McDonald, being the invention of Col. McDonald, of Virginia, and was put in under the personal supervision of Dr. J. W. Simmons, the superintendent appointed by Col. McDonald. Under his instructions and immediate supervision was P. M. Cunningham, Esq., the contractor, whose experience in other dock, pier and marine work is enough to insure the success of the Oswego River ways if such a thing was possible.

With such assistants, then, the State authorities had but little doubt of the result of their work, and the next day, the thorough expiration of the same, was foregone conclusion.

Such gates could be placed in position at all four of the ways for \$100 to \$150. It would seem a pity to lose the full benefit of this work for the lack of so inexpensive an addition. H. OSWEGO, Nov., 1883.

SALMON BREEDING IN MAINE.—At the Penobscot Station the work of spawning salmon was closed Nov. 8. The stock of salmon hatched in June as breeders numbered 468. During the summer 153 of them died; 297 were taken out at the spawning season, 30 females, 60 males, an unusually large percentage of females. Of eggs there were obtained 2,400,000. At Grand Lake Station 1,000 Schoedde salmon were taken between Oct. 20 and Nov. 30. Of females there were 719, 601 of these proved gravid, and yielded 97,650 eggs, an average of 1,404 eggs apiece. The weather has been unusually favorable to comfort, and doubtless in consequence of the warmth the fish matured earlier than in ordinary seasons. The ground has been covered with snow since Oct. 27, and is everywhere entirely covered with ice, and enough ice has formed in the narrower parts of Grand and Penobscot lakes to interrupt navigation.—C. G. A.

The Kennel.

To insure prompt attention communications should be addressed to the Forest and Stream Publishing Co., and not to the individual names whose absence from the office matters of importance are liable to delay.

FIXTURES.

BENCH SHOWS.

December 10, 23 and 25.—New Orleans Bench Show. Entries close Dec. 10. Charles Lincoln, Superintendent, New Orleans, La.
December 10, 17 and 24.—Florida Bench Show, Meriden, Conn. Joshua Shute, Secretary, Meriden, Conn.
April, 1894.—The Cleveland Bench Show Association's Second Bench Show, Cleveland, Ohio. C. M. Shulz, Secretary, Cleveland, Ohio.

FIELD TRIALS.

December 3, 1893.—National Animal Kennel Club, Fifth Annual Trials at Grand Junction, Tenn. Dr. J. P. Brown, Secretary, Memphis, Tenn.
December 3.—Gilroy Rod and Gun Club's Third Annual Field Trials at Gilroy, Cal. For dogs owned in California, Arizona, Oregon and Nevada. Entries close Dec. 2. E. Leavesley, Secretary, Gilroy, Cal.
December 10.—New Orleans Gun Club's Southern States Field Trials at Canton, Miss. Entries close Dec. 2. J. K. Renard, Secretary, New Orleans, La.

A NOVEMBER RUN.

THE first of November was one of those charming mornings that no lover of the chase would let pass without proper celebration. It was calm, balmy and clear, with the smoke from the chimneys drifting to the north—the perfection of a fox-hunting morning. I never let such an opportunity go by without improvement. At early sunrise I was in my saddle and off to the fields. Fourteen Byron bitches followed next. Four of them were thoroughly young, and eight were puppies, four of them only eight months old. I have secretly entered the hunting ground, when Bet struck a gray fox and all quickly joined in, the puppies with as much enthusiasm as the trained matrons. The trail being a warm one, we came out in the forest in the interval between himself and the pursuer. The necessity of repeated doubles was imperative now, and well did he understand and repeat this maneuver. The scene of the race was well adapted to such tactics, but it was, at the same time, quite in favor of the hound. It was a large old field, well covered with pine tops of several hundred acres, with occasional patches of thick undergrowth of pines just sufficiently extended to break a view by his pursuers, but not thick enough to render a rest for ever so second. A roundabout ground in this vast old field, repeated again and again, did this sturdy fox test the value of every trick the ingenuity of a fox ever invented. The eight Byron puppies could never be thrown off the track, and were as sure as the wind to follow the leader, and having the flank to their seniors. Occasional slight dashes increased their eagerness up to the closing of the scene, occurring just one hour from his commencement. T. G. T. GASTON, N. C.

DINKS.

AS age succeeds to age and reason to tradition, so the realities of the past become the myths of the present. While the history of Ulysses is relegated to the domain of pure fiction, the story of his dog here remains a fixed quantity.

The fidelity of the dog, man's constant friend, has been the theme of two illustrious writers of every age; nor is by any confusion of intellect that

"The poor Indian, whose untutored mind
Sees God in clouds and hears him in the wind!"

thinks that

"Transported to that better sky,
His faithful dog shall bear him company."

Dinks was a setter of ancient lineage, and would scarcely condescend to notice a cur of low degree, but upon meeting such a one would trot by with nose and tail at an elevation such as would verify disdain.

Dinks became very much attached to me and when he had an attack of loneliness at home would start off to pay me a visit at my place of business, some three or four miles away. He would call at my door, and when he was invited to enter, he would enter by thieves on such occasions, and as I could not induce myself to chain him, I resolved to find him another kind master. So I gave him to a friend in the country, and he thrived but a few months, and then died. I was surprised to find, after eighteen months thereafter, I was surprised to find, and complete recognition by Dinks, who immediately resumed his old relation. Subsequently I gave the same gentleman a cocker spaniel pup, which I named Puss, and he was very much attached to me. He was very much pleased when I visited him, and if Puss were on hand, poor Dinks had to stand fire from both front and rear.

The Puss and Dinks combination was finally successful, and Dinks was so completely satisfied that he scarcely dared stir his head from under the house, where he had taken refuge, even to get food. Affairs remained in this condition until a subsequent visit I made two years after. Dinks again recognized me, followed me everywhere, and did not say any arisal issues of his existence. Visiting him, I was very glad to see a good thrashing, though it afterward transpired he only awaited my departure to re-establish the former condition. Dinks monopolized my entire time during my stay, sleeping at my door at night, and I was so glad to see him, he would come to me to assure himself of support and give a growl at the cooker, who seemed fully to realize the significance of the situation and march off slowly under evident mental protest.

The day after I left Vinograd resumed his usual authority.

Drove Dinks to his lair, and continued to inspire him with fear, until finally Vinago fled. After Dinks had reluctantly secured himself, that his enemy had disappeared, he returned to his former haunts as much inspired as increasing age and infirmities permitted. At the time of my third visit I was again remembered, though eighteen months had elapsed, and the morning I retraced (for hours I supposed) I had chased Dinks, as he was now here in sight, but I was mistaken.

As I drove through a village I had to pass, I saw Dinks leisurely drop himself in the road from over a fence directly in my path. He doubtless saw the carriage driving from the house and knowing he was not permitted to follow, made a short cut through the woods, a thing he had never been known to do before, and met me as I have described.

Securing him, I continued my journey, and I am told for a week after my departure he acted as one bereft of reason, and inquiringly around the place, and finally disappeared, to seek me in the village where he had last seen me, and remained there until he was nearly starved before he would return home, although entreated to do so.

Deceptively setting in, his master determined in mercy to destroy him, and for that purpose procured two grain-mill-impine, fixed it in a pen of milk, shutting it with Dinks in the stable. When the doors were opened the milk had disappeared to the last drop, but Dinks was alive, and yet lives, in better health than for years, doubtless in expectation of another year from his old master. Geo. C. HENNING.

WASHINGTON, CHAS. NOV. 1888

THE EASTERN FIELD TRIALS.

THE fifth annual trials of the Eastern Field Trials Club commenced at High Point, N. C., on Monday last under very favorable auspices. The game last week was a success in the running up to Tuesday night. On Tuesday it commenced raining at 10:30, the showers increasing in frequency until we were obliged to suspend the running at 2:30 and return to town. Wednesday morning it still rained, and we did not get to the hotel until nearly 11 P. M. On Thursday, however, there was an occasional very slight shower, but upon the whole the afternoon was favorable, except that the birds were inclined to run and the work in consequence was not so good as would have been ordinarily. Thursday was a capital day, except that it was a little too warm, nevertheless good progress was made, and some exceptionally fine work was done. Friday it again rained, and continued with slight intermission through the day, rendering it necessary to postpone the running.

On Saturday the weather was fair, and it was very warm. Excellent progress was made with the work, no less than twelve heats being finished. This is one more heat than was run on the best day last year. The quality of the work is quite so good as we expected to see, although some of it was first-class. The running for the Members' Stake will be finished to-day. We published a cut of the winner last week.

Judge Wilson was obliged to return home and it was decided to finish the All-Aged Stake under the two remaining judges, and in order to expedite the running so that those that were going to Grand Junction could get away in season, it was decided to appoint extra judges for the Derby, and commence running that Monday morning while the All-Aged Stake was being finished. Messrs. J. O. Bommer and Elliot Smith were appointed to act with the judges, the All-Aged Stake was Adams would join them. Mr. Bergundahl being obliged to return home.

THE MEMBERS' STAKE.

The first event upon the card was the Members' Stake for a pair of plate, and for that purpose a senior ran his own dog. We had hoped to see at least a dozen or more entries, but several gentlemen who undoubtedly have entered their dogs could not be present, and only eight put in an appearance. Following are the entries and the order in which they were run to wit:

- BUCKLEWELL.—W. A. Coster, Flatbush, L. I., orange and white English setter dog (Druid—Ruby), against
- DON JUAN.—Elliot Smith, New York, lemon and white pointer dog (Sensation—Psyche 11), against
- CORINNE.—Geo. T. Leach, New York, red Irish setter bitch (Peter—Conness), against
- FLASH.—J. Horro Croswain, New York, orange and white English setter bitch (Lincoln—Daisy Dean), against
- RAB.—Elliot Smith, New York, lemon and white pointer dog (Rush—Jump), against
- GERTRUDE.—R. W. Orth, Pittsburgh, Pa., black, white and tan English setter bitch (Gladstone—Nellie), against
- RUE.—Bayard Thayer, Lancaster, Mass., lemon and white pointer bitch (Snapshot—Ruby), against
- BUCK.—George T. Leach, New York, red Irish setter dog (Count Bosco—My Duchess), against

BUCKLEWELL AND DON JUAN.

The first brace, Bucklewell and Don Juan, were cast off on a steep side hill at 9:30. Bucklewell ran in the first heat of the Members' Stake last year and was beaten by Peg. Don Juan was entered last year in the All-Aged Stake, but was taken lame and did not run. Both dogs were in the best of shape and covers a lot of ground. Although they are not fast they can stay, and are capital dogs for a week's shooting. They were cast off in a patch of stubble which was drawn blank. We then crossed the gully through some pines to a large and likely looking field of stubble, corn and weed patches. Don was the first to find; he pointed very nicely to the scent of a bevy, but was not quite rigid, although he held his position, while Buck, who had struck the trail below him, rounded them out in good style. Coster, to order, flushed them, and winged one. Buck dropped to wing. Don laid dropped, but commenced drawing on and was dropped to order, Buck failing to find the bird which had run. They were worked some 200 yards into the corn, both kneeling, but the birds got up wild before either could establish a point. We then swung back into a patch of corn, where Don laid pointed and then swung out, refusing to come to call, and went straight to another large bevy, which he pointed in grand style. Buck bucking in equal manner. Coster, to order, flushed them and killed one. Buck dropping to wing and Don to order. Don was sent to retrieve, but did not go far enough and failed to find, but when we moved on Buck picked up the bird and brought it nicely. We then beat out some likely looking places, where both dogs showed sign of game, but nothing was found.

We then swung round, where some of the birds were marked down, and Buck pointed a single in the dry leaves, but the bird flushed with the judges came up, and the dog got no credit for it. Taking a longer turn, we swung back toward the town without a find until we came to a large open field, where Coster walked into a fine bevy. Following them up, Buck pointed very nicely a bird which soon flushed itself.

The dog was steady to wing, but soon went on a few steps when another got up, and took the lead. Don walked among them as they were getting up, but stopped to order. The dogs were then worked over the ground for any that were left, and Don found one and pointed just as it rose, and was a trifle unsteady to wing. The judges then consulted and the dogs were ordered to go and be ordered to Bucklewell. Down two hours and twenty-two minutes.

CORINNE AND FLASH.

They were at once put down, both dogs had not been before handled by their owners, and were not under good control. Corinne is rather a pretty red Irish bitch, with quite a turn of speed. She also did some good work, and will, doubtless, make a good dog, if properly handled. Flash is a fine orange and white of good size, she moves fairly well, but carries her head rather low. She did not have much chance to show her good qualities, although we were told that she works very well. They were cast off where the last brace were taken up, and worked toward the scattered birds, but only two of them were found, and they got up before the handlers and judges. We then beat out some sedge and weeds, but found nothing until at the foot of a knoll Flash flushed a hare and gave him a good race up the hill. After about a dozen yards of pretty lively work the hare got caught in it and squatted, but Flash, whose blood was up, kept on. Just then Corinne came up, and before the hare had got his wind she routed him and raced him back, and as the lay of the land was in her favor she got in some very good work and was fast overhunting him. Judge Wilson called a shillout at her and put a stop to the run. We then crossed the road to a field of sedge where Corinne flushed a bevy that she should have pointed. Working on after them both dogs made very pretty points, Flash in single, and Corinne in another with one barrel, and for a while there was quite a shower of birds and feathers, no less than seven coming to grief. Corinne retrieved one very nicely, and a little further on she found another and brought that in good form also. We then went in the pines, where Flash put up one, and a little further on Leach flushed one and killed it. Corinne then pointed a single very prettily, but Croswain, who did not see her, flushed it while forcing his way through a thicket. A little further on Flash scored a flush and she was ordered up, and the heat awarded to Corinne. Down forty-two minutes.

RAB AND GERTRUDE.

They were at once put down among the scattered birds. Rab ran in the All-Aged Stake last year and showed some capital work, but was beaten by Croxteth. Gertrude runs a good race in the National Derby of 1888, although she did not get a place. Last year at the same trials she was also very fast and won honors on the bench. They were cast off in the thick pines among very close lying birds, which was unfortunate for Rab, who is a fast and wide ranger, and before he had got settled he was beaten by Gertry, who is a very careful, well-headed bitch. Rab pointed a fine flush, and also scored a flush, while Gertry made a beautiful point, which Rab at once honored in grand style. The bird was flushed to order by Orth and missed, Gertry dropping to shoot while Rab moved on a step or two. A little further on Rab put up one, and Gertry at once followed. A little she swung out to wing, and then the bird got up, and pointed. Gertry backing him nicely, when the rest of the bevy flushed beyond them. Moving on Gertry laid pointed a rabbit, and soon after she pinned a brace of birds, which Rab also pointed, but was not placed. Rue was the first to miss, both dogs remaining steady. They were then ordered up, and the heat was awarded to Gertrude. Down eleven minutes.

RUE AND BROCK.

They were now called for, but Rue not being on hand we went to Bucklewell. After him, who was the last heat was flushed, and they were cast off in the open field. Rue has been in the papers often, and is well known to our readers as a noted winner on the bench. She was purchased by her owner at the New York show last spring at the long price of \$1,000. She was very fast and was found to be fast on the crossing a fence, and ran most of the time on three legs. She is quite speedily and stylish, a wide ranger, and has a good nose. Brock won the Members' Cup on Robins Island two years ago. He also ran in both the Members' and All-Aged Stakes here, but was not placed. Rue was the first to find, but did not fairly established her point when two birds were flushed by her handler in going to her; he shot at one but missed it. Rue remaining steady. Both dogs then drew on, and were found pointing close together, but the bird flushed before the judges came up. Rue then crossed a gully and made a stylish point. Brock was called up to back, but the bird flushed wild before he got there. This was very well done by Rue. Working in a little further, we were ordered up, and were found pointing. Brock backed her in good style. She drew on a few steps and laced her bird in first-class style. Thayer, to order, flushed and killed the bird, which Rue retrieved fairly well. Working on Rue again pointed very prettily just as a bird flushed in the open field. Rue was the first to point, and Thayer, to order, put up the bird and killed it, and Brock retrieved very well. A little further on one got up near Rue in the dry leaves. We then crossed the road where Rue made a handsome point just as a brace of birds flushed in front of her. The dogs were ordered up, and the heat awarded to Rue. Down forty-four minutes.

This ended the first series with the following summary:

- First Series.
- Bucklewell beat Don Juan.
- Corinne beat Flash.
- Gertrude beat Rab.
- Don beat Brock.

Second Series.

Bucklewell and Corinne were cast off and worked through a patch of sedge to some woods, where we waited some time for permission to hunt a good looking field. Obtaining leave they were again cast off and worked over the field nearly to the road, where Buck pointed a little sedge, and throwing up his head swung out for the bird and struck the trail in grand style. Corinne came and backed him indifferently, and was a trifle unsteady to wing, when Coster, to order, put up the bevy, killing one. Corinne, to order, flushed them and they were ordered to retrieve, when Corinne went on and brought the bird. A portion of the bevy settled in some woods, where we followed them on foot. Buck doing some very careful work in the dry leaves, but he could not get near enough to them to establish a point. Corinne, to order, flushed them and sent him; he then scored a flush on one that we thought he should have pointed. We then worked down a branch a short distance, where the spectators put up a bevy which went over a knoll, except two or three which settled near us—one of them being flushed by Corinne. We then worked toward the rest of them, and Buck jumped into a very gamy point. Coster, to order, flushed the birds, but did not shoot. They were then ordered up, and the heat was awarded to Buck. Down, including about twenty minutes' wait, one hour and twenty minutes.

GERTRUDE AND RUE

They were at once called and put down on the same ground. Meantime several birds had got up all around us. Working down a gully, Gertrude ran into one down wind and flushed it, for which she was ordered up. We then swung out into some woods, where she located a single in very stylish manner. Thayer, to order, put up the bird, but did not shoot. Soon after two or three birds flushed wild ahead of Rue. We then

beat through some sedge to the woods, and turned back to find that the last birds settled, one of which Rue pinned in fine style, Gertrude backing in equal good form. The bird was flushed by Thayer to order, but not shot at. We then turned back and beat out the sedge to the road which we followed east a short distance to a patch of sedge which we worked out to some low pines, where Gertry challenged to the scent of a bevy and commenced roading them very nicely, when Rue came up and getting their course, swung out after them and located them, making a beautiful point. This was very well done, and they were ordered up, but Rue advanced the heat. Down one hour and fourteen minutes. It was now nearly dark, and we started for town. It is but fair to Gertry to say that she appeared to be all off, and did not run in her usual good form. This ended the second series. Following is the summary:

Second Series.

- Bucklewell beat Corinne.
- Rue beat Gertrude.

Third Series.

BUCKLEWELL AND RUE. Tuesday morning we left the hotel a little before 8 o'clock and took an easterly course. The weather was splendid, giving promise of a splendid day for shooting. The dogs were out for some minutes past a short distance out of the town in a piece of woods, and worked down a branch to an open field, which was drawn blank. We then went down the road through some woods where Rue challenged and roaded nicely a short distance, but soon got over. We then went to the farm of Major Sauer, which is highly cultivated, and is just the place to find the birds, for they have plenty of feed and cover.

Working through a large orchard where a crop of millet had been raised, the dogs ranged on, and Rue had a little the best of Buck in speed, she had partially recovered from her lameness and apparently realized that she must put her lameness as well as her best foot forward. Buck, however, was the first to find, making a capital point to a large bevy in order to the farm of Major Sauer, which is highly cultivated, and is just the place to find the birds, for they have plenty of feed and cover.

Working through a large orchard where a crop of millet had been raised, the dogs ranged on, and Rue had a little the best of Buck in speed, she had partially recovered from her lameness and apparently realized that she must put her lameness as well as her best foot forward. Buck, however, was the first to find, making a capital point to a large bevy in order to the farm of Major Sauer, which is highly cultivated, and is just the place to find the birds, for they have plenty of feed and cover.

We then worked over the field to the edge of some woods, where a fresh bevy flushed from a thicket, and settled among the trees. Rue swung round to order him and also pointed a bird which flushed itself a second or two after. Then at least twenty-five got up all around us, both dogs remaining steady. One of the birds settled in the grass, and Rue made a nice point to it just a second before it got up. Crossing out to the edge of the woods, Rue swung round to order them, and with her head high in the air, located them in capital style. Meantime Buck got in a very gamy point to the same bird, which flushed as we came up. A few more then swung in, and Rue struck the trail and roaded them out very nicely. Buck, who was a little on one side, backed her, and as she moved on, he drew a few steps and made a nice point of a very large bevy, which rose as we came up, and several scattered birds also got up at the same time. Rue swung round to order him, and made a beautiful point, which Buck instantly honored in grand style. Judge Adams, shooting for Thayer, flushed the bird and scored a miss, both dogs remaining steady. Rue then moved on a little and again pointed, and two more were put up, and Rue ordered to retrieve, and she was ordered to retrieve. Rue who was declared the winner of the Members' Cup. Down one hour and thirteen minutes. This was a capital heat, the work of both dogs being of a high order of merit. Following is a summary:

First Series.

- Bucklewell beat Don Juan.
- Corinne beat Flash.
- Gertrude beat Rab.
- Rue beat Brock.

Second Series.

- Bucklewell beat Corinne.
- Rue beat Gertrude.

Third Series.

- Rue beat Bucklewell and wins the cup.

ALL-AGED STAKE.

GUS BONDIU AND CARRIE J.

Immediately after the finish of the Members' Stake this series was called to the card, and a handsome sum of money. Gus Bondiu came to the post in excellent condition and ran much better race than we expected to see, judging from his previous performances. He ran last year in the National Derby, and was beaten by Carrie J. in his first heat, by Pink and by Carrie in the other two places, and he was also beaten in the Louisiana Derby, and was beaten by Bidley in his first heat. Carrie J. also showed up in capital form. She was entered in the Chicken Trials Derby last year, but did not start. At the National Trials last December she divided third with Arthur Dan in the All-Aged Stake, beating Gildery and Startle and was beaten by the winner, Sue, in the third series and by Peep O' Day for second place. In the National Derby at the same meeting she beat Gus Bondiu, Pride of the South, and Pink B. and Short. Gus Bondiu was handled by H. M. D. Sanborn, Dowling, Mich. and Carrie J. by H. M. Short, Middleton, Tenn. The dogs were cast off in a large field of sedge and weeds; both moved very well at a fair rate of speed. Gus in a gamy, business-like way, and Carrie with a crowd of dogs, was at once well to the plough, both bothered a little with larks as they gained distance, but soon settled down to work. Beating down to a brook or branch as it is called here, we turned north to a fence and then swung back toward the spectators who were out for some time on the foot of a hill the birds were in the field. We had gone but a short distance when Carrie dropped very prettily and commenced roading but Short called her off, very wrongly, as it afterward proved, and we worked up the hill, the dogs swinging round a scattered bevy which got up by two or three in the hands of the handlers and judges came in the direction of the birds went down the hill and the dogs were sent in their direction, but had gone but a short distance when Gus made a gamy point to a large bevy near the place where Carrie had been called off by her handler. She honored the point in a stylish manner. Sanborn, to order, putting up the birds, winged one, which both dogs failed to find.

dogs, Carrie sat stert and Gus backed her. She appeared to be pointing, but Short thought she was not, and as she moved on readily to order, we gave her the benefit of the doubt. On a little further Carrie made a point which Gus backed. She then drew on, but the birds flushed before she had located the both woods. Then at the head of a gully Carrie pointed a single and Gus, closing round the point, sent and also pointed. Short flushed the bird to order and missed it. This was very pretty. We then swung round near to some woods and down to a branch, when Carrie challenged Gus on this side, and he moved in order to back and pointed a brace of birds in fine style. Carrie went on, and as soon as she saw him she also appeared to catch the scent, and half pointed and half backed very prettily. Sarnon, to order, put up the bird which he missed by a short distance. A bevy was seen running on the ground, the spectators and judges, and the dogs were swung round, but not far enough to hit them.

Gus then made a false point in some weeds, Carrie backing him in beautiful style. Making a cast low down the hill, Carrie pinned the birds in this style, Gus backing her nicely. Sarnon flushed them to order and killed one, which Carrie retrieved in good form. Then down the run Carrie again made a point, and Gus backed her, and the bird was flushed to order. Moving a few rods, both pointed, and nearly at the same instant a bird which was put up to order. Gus then came round where a bird had been marked down, and should have pointed it, but scored a flush instead. A little further on Gus made a point, and Carrie backed him. A few rods more, Gus soon after pointed, when the bird got up and Carrie close by its side, backed him. Sarnon claimed the point for Gus, and Short agreed with him, and the false point was scored accordingly. Carrie then pointed, and Gus backed her, but she soon moved on. Gus then swung into the thicket and made a very good point to a single which Sarnon flushed to order. The judges consulted and awarded the heat to Carrie J. Down one hour and twenty-eight minutes. This was a rattling good race, and greatly enjoyed by the large number of spectators present who had a fair view of nearly all the work.

LORD SEFTON AND DON.

Although it had commenced to rain, this brace were at once called. Lord Sefton, handled by Phillip Thurlie, has improved in looks since last year, when he ran here in the Derby, beating Elsa, but was beaten by Lalla Rookh in his next heat. Elsa, who has been the best runner of the most natural ability. Don, handled by his owner, R. T. Vandevort, is well known as the first pointer to win first at a field trial in this country. He won at the Chicken Trials last year, beating the Dan. Last year he was runner-up, and at the national trials in 1897, he beat the cracks Grouse Dale and King Dash, and was beaten by Peep 'o' Day and Maxwell.

They were cast off in some sedge where the last heat was finished, and worked up the run to a thicket, where Don found a single and pointed it, and Carrie backed him. Lord Sefton made his magnificent back to the point of Daisy Laverack. Sefton, called up and back, did so, but became unsteady and drew up, and a bird flushed near him. Two more were, to order, put up in front of Don, who then roared very nicely, but lost.

We then worked down the branch, and two or three were flushed out of some high grass, the dogs having no chance to locate them. We then swung round up the hill, where Don made a grand point, which Sefton backed in beautiful style with his head high in air. Don then roared very nicely, and carefully down wind, and Sefton drew round in front of him and flushed the birds. They were then ordered up, and the heat was awarded to Don. Down fifteen minutes. This was a hot heat, and we did not get a chance to see the dogging move, but judging from what little we saw, both have improved since last year.

ST. ELMO IV. AND SMUT.

It was now raining fast, but the judges called for this brace. St. Elmo IV., handled by E. H. Haight, has greatly improved since last year, and he has made a fine appearance. He ran in the Chicken Trials last year, but was beaten by American Dan, and through a misunderstanding was withdrawn, or he would have had a chance for third place. He also ran in the Eastern Derby last year, beating Roy, and was beaten by Count No. 1, handled by Wm. Tallman. He was entered in the Eastern All-Aged Stake last year, but did not start. When cast off Smut, who was entirely unacquainted with her handler, could not be prevailed upon to hunt, except for a few rods, and was withdrawn, and the heat was given to St. Elmo at the end of three minutes.

FLIDA AND RUBY.

This brace were at once called. Neither has before appeared in public. Flida was handled by Jess M. White, and Ruby by Haight. They were cast off in a field of sedge. Both dogs started at a good gait, Flida taking the lead, and quaring her ground, and ranging in fine style. The sedge was drawn blank.

They then moved on down the ravine and across the hill in some oat stubble, to a hillside of pines and sedge, where Ruby pointed the scattered bevy. Flida, being brought up refused to back, and she flushed the birds. They were then ordered up, and the heat awarded to Ruby, at 11:20. Down ten minutes.

LADY FAYNE AND LONDON.

They were the next brace. Lady Fayne is quite a handsome animal. She was cast off in the last year, but did not start. London made his first appearance in public at the Chicken Trials last year, where he was beaten by Count No. 1 in his first heat in the All-Aged Stake. At the Eastern Trials, last November, he beat Daisy Laverack, Gladstone, Tom, Croxteth and Tinkit, and won first. A few weeks later he ran in the All-Aged Stake of the Louisiana Trials, and was beaten by Coleman's London, and divided second with Foreman. Lady Fayne was handled by Haight, and London by Phillip Thurlie. Lady Fayne was so good, we state that she has had ten days of preparation for the trials.

They were put down at 11:50 on the edge of the pines, where the last brace was taken up. Both dogs started off finely, London at a good steady gait, and Fayne ranging and quaring her ground, and showing good speed and good style. The pines and adjoining sedge were drawn blank, and the dogs were ordered over the fence into a piece of woods, where some birds had been marked down. London having gotten ranged up to the fence, and the birds running round it, they swung through the woods, came to a magnificent point on five or six birds that had settled in the leaves.

Lady Fayne coming up dropped to a staunch back. The birds were flushed and Tallman made an eye right and left, but the dogs dropped to a crouch, and he ordered on, and retrieved his bird handsomely. Lady Fayne was sent on to retrieve the other bird, but after a good deal of hunting failed to find it. They were then ordered on over a fence into the field of pines, and sedge, where they were ordered to back, and the dogging move then across a branch up the hill to a patch of weeds on the side of the hill, where Lady Fayne found and pointed a single bird, and was backed by London in handsome style. The bird was flushed by Haight and killed by Tallman, both dogs dropping to a crouch.

Lady Fayne, sent on, found the bird and refused to retrieve it. They were then ordered up and the heat awarded to London. Down twenty minutes.

RUE AND CROXTETH.

This brace was now called, although it was still raining. Rue, who, it will be remembered, had just won the Members' Cup, was handled by Phillip Thurlie. He made his first appearance in the All-Aged Stake at the Eastern Field Trials on Robins Island in 1896, where he beat Trim, and was beaten

by Sensation in the second series of heats. In 1897 he ran in the All-Aged Stake of the Eastern Field Trials, beating Count No. 1, Baronet and Belle, and was beaten by Grouse Dale and Withdrawn. He also ran in the Eastern All-Aged Stake last year, beating the pointers Monarch, Rab and Lalla Rookh, and won a pointer cup. He was beaten by London in the fourth series of heats in the All-Aged Stake, and then beat Gladstone, and won second place. He was handled by Phillip Thurlie. Croxteth on the Saturday previous had hurt or strained himself across the job, and when he examined him on Sunday, he could scarcely walk, and his prospects for starting were anything but brilliant. He, however, so far recovered that his owner decided to run him. His appearance through the heat, although very weary now and then get in a good bit of work, Grouse, first and foremost, himself. He was also off, and did not come near up to the form in which she ran in the Members' Stake.

They were put down in the edge of a patch of woods where the last brace was taken up. Rue, Croxteth crossed the branch and flushed two birds in a scattering bunch of alders, and stopped to wing; they were then worked down the branch into an adjoining field which was drawn blank. It then commenced to rain very hard, and they were ordered up at 12:20. After work at the field, Rue was cast off at 1:35 in a stubble field and worked down toward the branch where a large bevy of birds flushed wild ahead of the dogs and handlers, and dividing, about half of them went across the hill into a field of pines, and the other half went down on the branch. We then moved on and Rue pointed where the birds flushed. We then worked on down the branch, and Croxteth made a nice point in some sedge near the fence, on the left side of the branch. The bird was flushed to order, and shot at once, as usual, at the same time. Rue laid out a bird about twenty yards to the right on the edge of the branch, which she flushed at the report of the gun.

We then swung round across the branch to a piece of woods, where Rue made a point, and worked up along the upper edge of the woods, Croxteth ran into and flushed a large bevy of birds, which were marked down at the lower end of the woods, on a hillside, and into the meadow on the other side of the woods, where she swung around and worked the edge of the woods to the hillside of stubble and weeds, when Croxteth flushed two birds in a patch of briars and brush. Rue, coming up, made a nice point in the same briars, and was nicely backed by Croxteth. Mr. Thayer, to order, went on, and both dogs roared in after him, and another bird was flushed by either the dogs or handlers, we could not tell which. We then moved on down the creek, when Croxteth pointed a single bird in the meadow, Rue backing indifferently. The bird was shot, and another and another dog were ordered to shot. We then crossed and worked out to the meadow, both dogs doing some nice work in quartering and ranging. Croxteth again pointed, but moved on, having discovered his mistake, while Rue, who was some distance ahead, was being brought up.

We then swung round the head of the meadow to a dense thicket of briars and bushes, where some birds had been marked down. The dogs and handlers went into the thicket, and almost at the same instant Rue made a point, and the birds were flushed to order and missed it. They were then worked up the thicket, where Croxteth flushed a single bird and dropped to wing. Moving on cautiously up the fence, he again flushed a single bird; they were then worked down to the edge of the woods, where Rue made a point, and she swung round to the left and worked through the weeds, when it commenced raining again, and they were ordered up for the day at 2:35.

On Tuesday morning it was still raining, and continued until nearly noon, when it showed signs of clearing, and we made a start.

Just east of the town the dogs were ordered down, and Rue's master had changed his hat for one of gay colors, and as soon as she saw it she refused to recognize him, and went back to the hotel. She was soon brought back, however, and they were cast off, both showing evident signs that they were not all right. Working down a ravine and then up a branch we saw some birds, but they were not in any of the points. She beat her Dier, Gladstone, Jr., beat Maiden, Prince Al and Rock, divided second with Pink beat Victor, Princess Warwick beat La, Foreman beat Luna May, San Roy beat Honest Harry, Lady May, a bye.

GROUSE DALE AND GATH.

Gath ran in the National Derby last year, beating Richard III, and was beaten by Pink B. in his second heat. He is of medium size and quite good looking, with great speed and a very easy way of going. He was handled by Short. They were put down a few minutes past 12, where the last brace were taken up. Rue, who was at once changed when the birds got up, Gath backing him in good style. They were then given a short spin up the branch, Grouse half pointing where the birds were flushed by Rue. They were soon swung back toward the woods, where Rue had been marking down, but it was raining slightly and the scent was apparently poor, and the dogs were crowded too fast, and nothing was done except that Grouse challenged and half pointed two or three times, Gath backing nicely. When the judges came up, Rue ordered on, and she swung round to the right, where she had been. We then worked down the run to the road, where we crossed the branch.

Working east, Gath half pointed three or four birds that he should have held. The dogs and handlers came up, and he flushed within a few feet of the place where he stopped. We then moved on down the branch a short distance, when Grouse made an elegant point, which Gath backed in magnificent style. When the judges came up, Grouse moved on and missed the bird, which she retrieved in good form. They were then ordered up a hollow in faultless style, Gath backing very nicely. When near the birds, Grouse lost it a moment and drew a short distance up the hillside, carefully feeling for them. Meantime Gath drew on to the hollow and struck the second bird, and he swung round to the birds, which flushed close ahead of him, while he was very carefully drawing on.

Some of the spectators thought that Grouse should have let the birds go, and that he was not taking into consideration the fact that the birds were running over the wet leaves, and that the scent apparently was poor, with only the slight

est indication of wind, and that not in his favor, we considered the work very well done and worthy great praise. When the birds got up, Tallman killed one, which struck the top rail of the fence and remained there. Grouse retrieving it in faultless style. We then went on, and Gath made a beautiful point, which Grouse backed in an elegant manner. Gath soon drew on, with Grouse also drawing behind him, but both passed by the bird, which flushed partly behind him. Then in the woods Gath, while going like a ghost, fell flat to the scent of a large bevy, Grouse backing as soon as he saw him. Short, to order, put up the birds and missed them. Both dogs then went over a fence out of sight, and the dogging move, pointing or backing, we could not tell which, but nothing was found. We then worked down the hollow, and turned into a field of sedge and weeds. Gath ranging wider and faster than Grouse, first and foremost, himself. He was also off, and swung round to the likely-looking place, a workmanlike manner. After beating out the field both dogs swung round to the lower corner near a branch, when Gath, who had the good luck to be nearer the birds than Grouse, very gracefully ran down on point to the scent of a large bevy.

Short complaining of a lame hand that prevented him from shooting, the judges ordered Tallman to kill a bird; but, as they were sure to fly over a weeked-looking patch of briars, Short stepped in and flushed them before Tallman could put in his shells. The judges then compared notes, and the dogs were ordered up and the heat was awarded to Gath. Down one hour and twenty-nine minutes. This heat was watched with considerable interest, and we heard many regrets that it was not run under the most favorable weather conditions, as with two dogs like these we would have been sure to see a great deal of very fine work.

VISION AND MARGUERITE II.

This brace were at once called. Neither has appeared in public before. Vision is rather a pretty bitch, of small size. She is an easy mover, with a fair amount of speed. She did not show up very well in this heat, appearing to be afraid of the crowd. She was handled by John White. Marguerite is a medium-sized bitch, not quite so fast as Vision. She did not get down to her work in very good form, and also appeared to be confused by the crowd. She was handled by White.

They were put down where the last heat was finished, and ordered over the fence among some scattered pines where Vision made a point under a pine, and Marguerite also pointed evidently the same trail, as both soon commenced roading toward each other, and alternately pointing and roading, they passed the birds which were flushed by the horses. We then took quite a turn, and gave them a chance to immortalize themselves, but they failed to improve the opportunity, and after nearly an hour, during which time neither did much good or bad, they were ordered up to go down again, and a flush.

At the conclusion of the heat between Honest Harry and San Roy, Thursday evening, they were again put down and worked in some weeds among scattered birds. Marguerite pointed the birds which were flushed by the horses. The bird was flushed to order, but there was no shell in the gun, and the words that followed failed to stop the bird. We then worked down a run where Vision pointed, but soon moved on to locate her hunt, which was seen to fly from a bush five or six feet from the ground. Working down the run Vision swung into some woods, and made a stylish point, and then roared out and located her bird very nicely. White flushed the bird to order and missed it. The judges then then they were ordered up, and the heat was awarded to Vision. Down one hour.

We give below a complete summary of the running in the All-Aged Stake of the Eastern Field Trials up to Saturday night:

- First Series.*
SETTERS.
 Carrie J. beat Gus Bonhill.
 St. Elmo V. beat Smut II.—withdrawn.
 London beat Lady Fayne.
 Bang Bang beat Don Juan Dale.
 Sue beat Dr. Dier.
 Gladstone, Jr., beat Maiden.
 Prince Al and Rock, divided reserved.
 Pink beat Victor.
 Princess Warwick beat La.
 Foreman beat Luna May.
 San Roy beat Honest Harry.
 Lady May, a bye.
POINTERS.
 Don beat Lord Sefton.
 Ruby beat Flida.
 Croxteth beat Rue.
 Vision beat Marguerite II.
 Bang Bang beat Don Juan Dale.
 Scout beat Trim.
 Lalla Rookh beat Christmas Bill.
 Donner J. beat Rab.
 Lady Romp II. beat Pride.
 Cruiser, a bye.

- Second Series.*
SETTERS.
 St. Elmo IV. beat Carrie J.
 Gath beat London.
 Sue beat Gladstone, Jr.
 Bang Bang beat Princess Warwick.
 Foreman beat Lady May.
 San Roy, a bye.
POINTERS.
 Don beat Ruby.
 Vision beat Croxteth.
 Bang Bang beat Scout.
 Lalla Rookh beat Donner.
 Lady Romp beat Cruiser.

- Third Series.*
SETTERS.
 Gath beat St. Elmo IV.
 Foreman beat Sue.
POINTERS.
 Don beat Vision.
 (Special to Forest and Stream.)
 HIGH POINT, N. C., Nov. 26.—The weather to-day was un-favorable until nearly noon, when we started out with the dogs.
 In the All-Aged Stake Bang Bang beat Lalla Rookh. Pink B. beat San Roy. Don beat Lady Romp. Gath beat Foreman.

- Fourth Series.*
 Don beat Bang Bang. Gath beat Pink B. Gath beat Don and won first prize and the setter cup; and Don won both pointer cups.
 In running for second place, Grouse Dale beat St. Elmo IV. Pink B. beat London. The heat between Grouse Dale and Pink B. was unfinished.
 All of the running was of a superior order. The heats between Bang Bang and Lalla Rookh, between Gath and Pink B. and between Gath and Don were especially fine.

THE DERBY DRAWING.

The Eastern Field Trials Derby has had a larger number of entries in proportion to the magnitudes than has before been seen in this country, no less than twenty-one of the sixty-eight entries being. Below are the starters and the order in which they are drawn to run. There are twelve

setters and nine pointers, which were drawn in braces alternately, commencing with the setters.

MAIDEN.—E. S. Wammaker, Eauwood, N. C., blue belton English setter bitch, February (Darkie—Rosy, Morn).

MAY DAWN.—Jess M. White, Chester, S. C., black and white English setter dog, Feb. 19 (Count Noble—May Laverack).

NB.—J. A. English, Mount Olive, N. C., lemon and white pointer dog, July 25 (St. Valence—Boulab).

JILL.—A. E. Godefroy, Gwynard, N. Y., liver and white pointer bitch, April 13 (Croxeth—Lass).

BLUEBELL.—Ed. L. Mills, Washington, D. C., blue belton English setter bitch, March 24 (Dashing Lion—Armid).

SAN ROY.—H. H. Matlock, Riceville, Tenn., lemon and white English setter dog, March (Count Noble—Spark).

PRIDE.—S. Worthington, Glenora, Miss., liver and white pointer dog (Croxeth—Royal Fan).

DRAKE.—A. E. Godefroy, Gwynard, N. Y., liver and white pointer dog, Aug. 13 (Croxeth—Lass).

RUSH GLADSTONE.—J. M. Aven, Hickory Valley, Tenn., black and white English setter dog, July 18 (Gladstone—Donna J.).

KATIE D.—D. C. Sanborn, Dowling, Mich., black, white and tan English setter bitch, May 1 (Count Noble—Dashing Novice).

NELLIE.—J. Heron Crossman, New York, lemon and white pointer bitch, February (Sensation—Lill).

BANGOR.—E. B. Downing, Wilmington, Del., liver and white pointer dog, July 10 (Poyner's Bang—Jean).

COUNTESS C.—L. Yearsley, Jr., Coatesville, Pa., black, white and tan English setter bitch, March 21 (Dashing Lion—Armid).

PRINCESS HELEN.—J. Otto Donner, New York, lemon and white English setter bitch, March 28 (Thunder—Bessie).

BRYAN.—F. R. Hitchcock, New York, tan and white pointer dog, June 21 (Sensation—Walter's race).

LONDON BEN.—R. T. Vandover, Pittsburgh, Pa., liver and white pointer dog, April 3 (Don—Lack).

ST. ELMO V.—Dr. S. Fleet Spier, Brooklyn, N. Y., black, white and tan English setter dog, Oct. 12 (St. Elmo IV.—Countess Louise).

PRINCE OF DIXIE.—C. E. Wallin, Montgomery, Ala., blue belton English setter dog, May 26 (Gladstone—Countess Druid).

STUNNEL.—Westminster Kennel Club, New York, lemon and white pointer dog, Aug. 22 (Sensation—Bellona), a bye.

POARBER.—J. M. Aven, Hickory Valley, Tenn., black and white English setter bitch, June 3 (Gladstone—Ress).

BOB WHITE.—Louis C. Egan, New York, lemon and white English setter dog, April (Young Laverack—Lady May).

(See col in Forest and Stream, No. 36.)

THE DERBY.

In the Derby Maiden beat May Dawn, Ned beat Jill, Sam Roy beat Blue Belle, Drake beat Stunner and Katy D. beat Rush Gladstone.

The running in the Derby was remarkably good. If the weather is favorable the trials will finish on Wednesday. The judging is the most satisfactory that we have ever seen.

ROBINS ISLAND FIELD TRIALS.

THE members of the Robins' Island Club met at their club house on Robins Island, on Monday evening, Nov. 19, to draw for the Field Trials to be run on the 20th. The club house was filled to overflowing with members and their guests. The enthusiasm of the members and the attractiveness of the large open fireplace here made late hours the order of the day, but the Executive Committee insisted upon "early to bed and early to rise," and they prevailed. Quite a change was made in the entry list, as by common consent the entries were opened and any change members wished to make in their entries was permitted, the closing the entries so long before the trials being acknowledged to be a mistake.

The prizes consisted in the All-Aged Stake of, first, a silver goblet; second, silver dog collar; third, a silver mounted dog whip; in the Brace Stakes, a silver whistle; in the Derby, a silver album; and in the chief contest, was of course for the first prize in the All-Aged Stake, and several dogs were named as the certain winners, if they could be judged by their previous work. The following dogs were high up in the estimation of not only their owners, but the members generally: Mr. Plummer's Moke, Mr. Waterbury's St. Ives, Mr. Dickerman's Don, a handsome liver and white pointer; Mr. Kendall's Montague, Mr. Force's Doctor, Mr. Taylor's Douglas, one of the handsomest dogs on the island; Dr. Spier's Maida and Prince Hal. Mr. Fubanus's Berkeley was not expected to come up to his last year's score, but he had been suffering for some time back with rheumatism, but he surprised all the next day by running well enough to get into the second series of heats, among the winners. Judges Pratt, Bridges and Polhenus were quick and prompt in their work of the scores, and by Tuesday night the All-Aged Stake and the Brace Stake were finished. The following were the winners:

ALL-AGED STAKE.
First, Dr. S. Fleet Spier's Maida.
Second, L. Waterbury's St. Ives.
Third, W. B. Dickerman's Don.

BRACE STAKE.
Mr. Waterbury's St. Ives.

Mr. Force's Doctor.
These stakes finished the running for Tuesday, and the Derby was run on Wednesday morning, the winner being Dr. S. Fleet Spier's General Arthur. In the running of this stake, Mr. Bullard's Blado of Grass made tie with Mr. Force's Moke, a very pretty and promising pointer. They both did excellent work. Mr. A. S. Swanwick and Mr. Kendall's credit in Daisy in this stake. She is of the old Rodman-Dash stock, and was bred by Hon. C. E. Pratt. She is a beauty, and made tie very hot for the winner.

The trials were run under the Robins Island field trials rules, and as last year so they proved this, a great blessing, and the rapid finishing of the trials. The birds are very abundant upon the island, more so than ever before. Mr. Hinnan was quick and himself in the condition in which he brought out the dogs, and his work was well credited in keeping the house as "neat as wax." She is a thorough-going housekeeper, and equal to any emergency.

The weather during the trials was all that could be desired, except on the morning of the start—Tuesday—when there was a very dense fog covering the island, making it difficult to see

forty yards ahead. Anxious to finish the trials, the dogs were ordered forward and it was soon seen that the fog would prove disastrous to the chances of Mr. Plummer's Moke, a dog of superior nose, speed and ranging qualities. And so it did, for Mr. Plummer and Moke were soon lost in the fog. Moke, having found a berry, pointed in an open field. The judges and spectators came on, filed them and they settled in an adjoining woods, where Moke followed, entirely out of sight of the judges. Meanwhile Mr. Force's Doctor was doing good work near at hand, and was scored well up, while Moke was credited with disobedience, for the same work which would have secured her credit in a day's trial. They were ordered up and Moke was as good as out of the race. Hard lines, was it not?

Another dog met his fate in an equally unfortunate manner. Mr. Swanwick's entry, Romeo, ran with a dog whose rank condition led him to make a double chase soon after being put down, and they were both taken up at once. When the judges came to sum up the scores made during the run, in order to select the four dogs making the highest scores for competition in the second series of heats, it was found that Romeo had not had his score filed out, and he was left out, it being "too late." This was fortunate for the winners, for it is well known that Romeo can take care of himself in any company. We sympathize with Mr. Swanwick, and wish him better luck in another Boston show, except on all things were harmonious, and the men and dogs agreed, as in the Robins Island Club's Field Trials of 1883 were a great success.

BRIDLE PATCH.

BOSTON FANCY DOG SHOW.

Editor Forest and Stream:

Have you heard about the Fancy Dog Show now being held here in Boston? I enclose herewith a catalogue for your perusal, though it is no premium list. This show advertises 200 dogs, but 150 will fully cover the number. A great many people do not know the difference between a bench show and a dog show, but there is as much difference between them as there is between a dog and a trot and a circus. This show at Horticultural Hall entirely dispels a fair, the managers and gentlemen of the meet and spectators agreed, as in the Robins Island Club's Field Trials of 1883 were a great success.

The management of the show now being held here, in reply to an inquiry as to who would judge the dogs, gave out that Dr. Geo. Walton had offered his services. This is not quite near the truth as the show is near what it should be. I know for a certainty that Dr. Walton did not offer his services. More than this, he would not have served in such a place under any circumstances. This is the time in which the manager of dogs, and a man deeply interested in making dog shows what they should be, and when Boston shall be able to hold a good show, the Doctor stands ready with his purse open to assist in every way the improvement and advancement of the bench show. We are glad as these are introduced by illegitimate dog shows, it is true honest men and honest shows take matters in hand.

If the management of this fancy dog show would take a few lessons from superintendents Chas. Lincoln or C. A. Andrew, they would know better than to try to force such a show as the present on the public.

BOSTON, MASS., Nov. 21

"AMERICAN KENNEL REGISTER."

THE entries for the December number of the *American Kennel Register* will close on the first day of the month. That issue will be the concluding number of the first volume, a new one beginning with the first entries already published in the first eight numbers of the *Register*. The number of 530 dogs of the different breeds, with other particulars concerning them. To show the character of the record thus kept, we extract from the November *Register* the following entries in the English Setters' class:

ENGLISH SETTERS.

- 495. **Beauty G.**, white, black and tan bitch, whelped January, 1882. Breeder, Dr. F. B. Greenough, 10 Charles Street, Boston, Mass. Owner, Mr. Leroy F. Patterson, Bainbridge, Ga.
- Dan—**Colby, by Whisker; Belle's Dan—Llewellyn's Lilly II. out of Rose, by Rob Roy out of Pickles.
- Dam—**Greenough's beauty, by Copeland's Shot out of Dr. Mason's Dora, by Torr's beauty, by Colton's Molly.
- 496. **Belle of Bedford**, lemon and white bitch, whelped June, 1883. Breeder, Mr. J. H. Adams, Lynchburg, Va. Owner, Mr. L. B. Brown, Liberty, Bedford county, Va.
- Dan—**Belle Duval, by champion Gladstone out of Strother's Frost, by Leicester out of Victoria, by Dash II. out of Joll III.
- 497. **Blaine**, orange and white dog, whelped June 23, 1882. Breeder, H. W. Durgan, Bangor, Me. Owner, Mr. H. K. Thatcher, Bangor, Me.
- Dan—**Hall's Dashing Dan, by Lofly (Prance—Leda) out of Maud Miller, by Rob Roy out of Pochabon.
- Dam—**Burgin's Ruby Taylor, by Whisk (Adams's Drake—Countess Ada) out of May Taylor, by General Ely's Grouse II. out of Sibber, by champion Leicester out of Doll.
- 498. **Count Rapier**, white and black dog, whelped June 28, 1882. Breeder, Wm. Dean, Hanover, Mich. Owner, Mr. W. R. Gates, Memphis, Tenn.
- Dan—**Druid, by Llewellyn's Prince (Dash II.) Moll out of Llewellyn's Dora, by Duke of Gloucester, by champion Llewellyn's Dora—Magnolia, by champion Leicester (Dan—Lilly II.) out of Sanborn's Nellie, by Belle out of Diaple.
- 499. **Donna**, blue belton bitch, whelped Dec. 16, 1880. Breeder and owner, Mrs. Charles A. Packard, Bath, Me.
- Dan—**Royal Blue, by champion Gladstone out of Jersey.
- Dam—**Dryad, by Druid out of Nilsson.
- 500. **Forest Dora**, blue belton bitch, whelped March 13, 1882. Breeder and owner, Mr. C. A. Stone, London, Ont.
- Dan—**Champion Llewellyn's Dan (Duke—Prance) out of champion Fred, by Prince—Lilly II.
- Dam—**Countess Delia, by Druid (Prince's Dan) out of Princess Leda, by Rob Roy out of Lory.
- 502. **Gold Findings**, blue belton dog, whelped July 19, 1883. Breeder and owner, Mr. Wm. Colcord, St. Joseph, Mo.
- Litter brother to Forrester (A. K. R. 50).
- 503. **Index**, black, white and tan dog, whelped July 10, 1883. Breeder and owner, Mr. W. H. Colcord, St. Joseph, Mo.
- Litter brother to Forrester (A. K. R. 50).
- 504. **Rajah**, orange belton dog, whelped May 18, 1883. Breeder, Dr. R. F. T. Elkton, Md. Owner, Mr. E. H. Rainey, Kalamazoo, Mich.
- Sire—**Dashing Monarch, by Llewellyn's Dash II. (Blue Prince—Old Kate) out of Countess Moll, by champion Llewellyn's Dan (Lilly II.) out of Pochabon, by Brock out of Dora.

505. **Ruth**, black, white and tan bitch, whelped July 18, 1883. Breeder, Mr. A. Stark, Gloucester, New county, Dorset, Devon, Mr. Thos. F. Connolly, Grant street, Flatbush, Kings county, N. Y.- Sire—**Bergundin's Bate (A. 212), by Llewellyn's Dan (E. 1,350) out of Llewellyn's Ruby (E. 1,334), by Statter's Fod out of Statter's Rheebe, Dan, by Field's Duke out of Statter's Rheebe.
- Dam—**Stark's Madam Llewellyn, by Bergundin's Bate (A. 212) out of Rooksie, by Adams's champion Rock (A. 329) out of Adams's Dora (A. 328).

The subscription price of the *Register* is one dollar per year.

CURRENT DOG STORIES.

XIX.

The telephone has enabled a physician, several miles away, to detect whether a child had the croup. The child's mouth was held near the mouth-piece of the instrument, and the physician heard its cough. But more singular than this is the following case of a dog recognizing its master's voice through the telephone.

Jack is a rough dog that found his master by telephone. In some way Jack got lost, and ultimately was found by one of his master's friends, who went to his office and asked by telephone if the man had lost his dog.

"Yes; where is he?" was the reply.
"He is here," Suppose you call him through the telephone."
The dog was then placed over the mouth-piece, and his master said, "Jack! Jack! how are you, Jack?"

Jack instantly recognized the voice, and began to yell. He licked the telephone fondly, seeming to think that his master was inside the machine.

At the other end of the line, the gentleman recognized the familiar bark, and shortly afterward he reached his friend's office to claim his property.—*Sidney (Australia) Exp.*

XX.

A NOBLE REVENGE.—Robert Louis Stevenson, in the concluding part of his "Silverado Squatters" in the December *Century*, describes an eccentric poor white and his story of a vengeance taken on a clergyman, who bore a grudge against him and had poisoned his dog. "The dog was a long time for a man to do, now, wasn't it? It wasn't like a man that, nobody. But I got even with him—I poisoned his dog!"

XXI.

"Many years ago," says the lady who narrates the tale, "my husband had his portrait taken by T. Phillips, Sr., R. A., and subsequently went to India, leaving the portrait in London to be finished and framed. When it was sent home, about two years after it was taken, it was found to be under a red velvet sofa, preparatory to being hung on the wall. We had then a very handsome, large black and tan setter, which was a great pet in the house. As soon as the dog came into the room he recognized his master, though he had never seen him for two years, and went up to the picture and licked the top of it. This anecdote was told to Phillips he said it was the highest compliment that had ever been paid to him."—*Nature's Stories.*

XXII.

The *London Spectator* publishes, over what is no doubt a bona fide signature, a story which should serve as a warning to reverend gentlemen possessing exceptional powers of detection. A clergyman, we learn from the fact that this term was used in the text, was a "minister" or "presbyter" and not a churchman in full orders is referred to—a clergyman had a favorite and very intelligent dog, who committed a grievous fault one Sunday morning. His master, on returning from church, did not beat him, but only scolded him, and talked to him most bitterly, most severely. He talked on and on for a long time in the same serious and reproachful strain, and the dog was so deeply impressed with his own total depravity that he refused all food, pined away and died in the course of a day. Two weeks later, the same clergyman, whose dog was whose first part of which should teach clergyman how dreadful may be the effect of severe and protracted denunciation on a sensitive and trusting temperament, while the second should suggest his heartiness that he ought not to take such talk too much to heart. The trouble with the poor dog was that he believed all that was said to him, and was so painfully conscious of his inability to answer back that it broke his heart."—*The Continent.*

XXIII.

A chase and novel form of amusement was provided in Washington on Monday evening when two colored boys were entered in an eating match against a boy and a dog. The stakes were five dollars and the conditions were that each team was to eat as many loaves of bread as possible, topping off with a day's work. The pie season had just passed and then to run around the square; the sum of their achievement determined the contest. One of the darkeys ate three and a half loaves of bread and the other four, and each put himself outside of his class. The dog, whose name is Bulger, consumed nine-four loaves of bread in the pie season, and then to run refused the pie; whereupon his partner, a boy named Sam, who had eaten five loaves of bread, devoured his own pie and Bulger's too, and won the race around the square by a head. Hereafter field and glory will be once awarded to Sam and Bulger, and the stakes to their baker.—*Tribune.*

DOG TRAINER WANTED.—There is, of course, as much difference between individual dogs as human beings. Some can, perhaps, be successfully trained while under six months, and others cannot. Our own experience in this particular has been both satisfactory and disappointing. One favorite dog we commenced with when he was about three or four months old, and we have had more real pleasure in shooting over him than over any other. Another we treated to the same early education, teaching him to first point all articles that he was to retrieve. In a few days he was a year old he had so much "point" in him that he would squawk off his feet every time he saw a quail, and we have had more real pleasure in shooting over him than over any other. Another we treated to the same early education, teaching him to first point all articles that he was to retrieve. In a few days he was a year old he had so much "point" in him that he would squawk off his feet every time he saw a quail, and we have had more real pleasure in shooting over him than over any other. A GENTLEMANNLY SORT OF A FELLOW.—*Editor Forest and Stream:* Hon. J. V. P. Brooke, of Warrenton, Va., has a setter dog which possesses more sense and good manners than many a man exhibits. If the door of his master's office is ajar he will push it open and enter, and in entering he invariably closes the door, pushing it shut with his forehead. If the setting is closed and he wants to enter, he will knock with one foot until he attracts attention from inside. He often enters the hotel where I board, always closing the door after entering. There are two papers on the table, and on one of them he sits down, and goes for the paper for his master and carries it to him and then, returning to the office, gets a paper for Mr. Shepherd, the butcher, who invariably rewards him with a piece of meat for his services. The dog's name is H. I believe that if you would carry off his papers, and on the first day he would carry off a dog of rare intelligence and a good hunter in the field.—*NED BUNTLINE.*

sways between the piers in grand style and rode safely behind a very tricky breakwater. The harbor is very small and is now only used by a fleet of stone-boaters—small scows, schooner-rigged—employed in raking from the rocky ledges just off shore flat stones, which are carried to Toronto for building purposes. Distance from Toronto, 40 miles.

A cold lunch was enjoyed here, and then with masts down all got up to the beach. The Doctor gave his order for the masts to be taken off the boat and the rigging to be left on the deck at certain low tides, all managed to get through, and were soon paddling up and down the beach. The Doctor gave his order for the masts to be taken off the boat and the rigging to be left on the deck at certain low tides, all managed to get through, and were soon paddling up and down the beach.

A scouting party was now sent, out to try and find a farm-house and a place to make a camp. The Doctor gave his order for the masts to be taken off the boat and the rigging to be left on the deck at certain low tides, all managed to get through, and were soon paddling up and down the beach.

Next morning was very warm, and a gusty wind blowing from the north-east. The Doctor gave his order for the masts to be taken off the boat and the rigging to be left on the deck at certain low tides, all managed to get through, and were soon paddling up and down the beach.

After tea o'clock the Doctor retired under his canvas, the boys to their splendid straw couches in the tent. Next morning was very warm, and a gusty wind blowing from the north-east. The Doctor gave his order for the masts to be taken off the boat and the rigging to be left on the deck at certain low tides, all managed to get through, and were soon paddling up and down the beach.

A general discussion of the value of full and hollow lines followed. Mr. Kimball said the Clyde canoes are full and hollow lines and also compared them with the Pearl. Referring to Mr. Fowler's remark on canoes not being fitted for sea work, he instanced a cruise of three boats on the coast of the United States, a distance of fifty miles from land to land. He also advised canoeists to design their own canoes instead of buying at random from a builder, as the occupation was in itself pleasant and instructive. Mr. Norton said that he had seen a number of canoes, each for a specific purpose, and recommended for work in rapids the open Canadian canoe, in which one man is seated in the bow and one in the stern, and in a small canoe with little canvas.

Mr. Wilkin took up the question of sailing, suitable padding, etc., and advising the building of the medium type, in connection with which he mentioned the Shadow, built by the Four and Red Roy models. Mr. Vaux, referring to the Kacine canoe, mentioned a case of a lapstrak and Kacine boat, cruising together, and their owners disagreeing. The Shadow was the victor. The Kacine boat was said to settle the matter by each flogging his opponents boat. The owner of the lapstrak drew back and lay at the Kacine boat with his bow to the wind, and the other boat, and his innings, the former was said to be a ride home in the Kacine.

Mr. Stephens replied to Mr. Wilkin, remarking that the Shadow canoe had not changed in the line of improvement and was a favorite model for the points open claimed for its advantages had almost entirely disappeared, and asserted that what was said in favor of the Shadow would apply to any good canoe. He suggested further some points of the ideal cruising canoe, length 14 to 15 ft., beam 30 in., depth about 18 in., stern forward gun, a flat floor, straight sides to bottom, a narrow stern, a wide fore-castle, a high stern, and a well rounded deck, low nearly upright, with the deck raised away from the sternpost, bulwark, canvas, bulkheads in either end, and air space in middle of canoe below deck. Mr. Vaux spoke on the changes in the Shadow, but the points mentioned were pointed out, deeper keel, and the rounding off of the sternpost. A further discussion of methods of building was started by Mr. Whitlock, who mentioned the new building of the Kacine canoe, which was said to be of great strength and durability of a lapstrak boat. Mr. Stephens spoke of the excellent construction of the Everson Shadow, instancing some of the older boats, and the other canoes. He thought canoe life had sustained, and her present condition.

The subject for the next meeting (Dec. 14) is 'Cruising Canoes: Model, Rig and Construction.' Messrs. Knapp and Bingham, and the other canoes, and also a new model of a cruising canoe. Messrs. Hoffman, Whitlock and Breatin were appointed a reception committee for the meeting, and the meeting was adjourned to Dec. 14. Most of those present stayed for further conversation. The result of this meeting, which was only an experiment, has been just encouraging, and it is hoped that the next meeting will be attended. A cordial invitation is extended to all who are interested in water sports.

PERSONAL.—Mr. Chas. L. Norton has returned to New York and will sail again Monday for the weekly meetings of the N. Y. C. A. M. Van Renesse, Jr., N. Y. C. A., has returned to New York after a summer's yachting in England. Mr. A. G. Crane, Clyde C. C., is also in New York by the way of Europe, but is expected home about Christmas. We had a call this week from Mr. Hende W. Bailey, canoeist. Mr. C. C. Norton, Mr. Bailey came to Toronto to see the other canoes. He is a member of the N. Y. C. A. and is one of the best men in the N. Y. C. A. He is now in the Pittsburgh C. C. who are over 90.

DOWN THE MISSISSIPPI.—Messrs. Knapp and Bingham, whose canoe from the Mississippi was described in FOREST AND STREAM of Oct. 29, is now in Toronto. A full account of their cruise is promised after its completion.

Yachting.

To insure prompt attention, communications should be addressed to the Forest and Stream office, and not to individuals, in whose absence from the office matters of importance are liable to delay.

MAY.

WE learn from good source that the crack forty foot racer May is already in the hands of its new owners, the New York Yacht Club. Built in 1881 at Greenwich, by Robert Stead & Co., this cutter was built in New York City, and is one of the best boats in Europe, but is expected home about Christmas. We had a call this week from Mr. Hende W. Bailey, canoeist. Mr. C. C. Norton, Mr. Bailey came to Toronto to see the other canoes. He is a member of the N. Y. C. A. and is one of the best men in the N. Y. C. A. He is now in the Pittsburgh C. C. who are over 90.

THE CABIN TABLE IN WINTER.

PLEASEWHO will be found a reference to the yachtings arranged by canoeists to take place every three weeks throughout winter. My cannot a similar plan be adopted by the owners of small yachts? There is no objection to this, and it is a very desirable thing. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration.

The most desirable of these three classes, from a sporting point of view, are those yachts which directly exhibit physical as well as mental exercise in their management and use; which call into being a vigorous, athletic life and promote quick perception, steady and thoughtful action in many directions. Large vessels are their own advertisement. They require no coaching, nor even unity of action, to recommend themselves to all eyes. They are built for speed and are the contingent of gentlemen indicated by choice to the owners of a sail and sail sure to be supported in pursuit of an innate spirit of rivalry. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration.

The fleet of small yachts is the barometer by which the popularity of the sport is to be judged. They are the most desirable of these three classes, from a sporting point of view, are those yachts which directly exhibit physical as well as mental exercise in their management and use; which call into being a vigorous, athletic life and promote quick perception, steady and thoughtful action in many directions. Large vessels are their own advertisement. They require no coaching, nor even unity of action, to recommend themselves to all eyes. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration. The only objection is to the expense of the same. The cost of the table is not to be taken into consideration.

way of calling together the owners of small yachts for purposes they can accomplish the kind of sailing that is the smallest yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

"THEREFORE."

DURING the past summer it may be remembered that Mr. Minum built for Mr. Dimou the sloop yacht *Irval*, an unusually deep boat of large displacement. The one now building is of extremely light draft and of small displacement, and is different in type from the *Irval*. It seems that after trying the deeper boat Mr. Dimou became satisfied of his preference for a lighter draft vessel. As this gentleman has undoubtedly had more boats built for him than any other yachtsman in the country his choice of the light draft, shoal yachts, after trying the deeper boat, is a significant fact, especially in the general tendency just at present is toward larger displacement vessels.—*Herold*.

Because Mr. Dimou builds a boat with large displacement and the boat is of a type which is the kind of sailing that is the smallest yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

SOMETHING must be allowed for the frantic efforts of our varans with contemporary to make even a moderate showing in comparison with the other yachts. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

The same incapable source tells a handful of readers that the sail area and length rule has been universally rejected in Great Britain. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

We are further told by the same source that the sail area rule is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

When FOREST AND STREAM first stirred up the measurement question by discussing the cases from their file, our pages were filled with a discussion which was not only a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

Having of our own choice, after mature deliberation, rejected the measure of sail area and length rule, and sail with a tendency to set 'single length' upon the throne once again. It is a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

EDITOR FOREST AND STREAM, Dec. 7, '82. As your journal sets the cue to all others, the best acting only as a foil for the receipt on your part, permit me to suggest some of the reasons why you are not only a pleasure which would strike a sympathetic chord in the masses who would be glad to see a small yacht, but the best, the least first cost and expenditure for keep.

all know the rest of the journals will soon follow you lead, as they have done on all other issues you brought into prominence.

Whist! hush! Say nothing about length measurement. If the boys will rush on to destruction with their eyes wide open, let them have a good and hearty laugh. I have no objection to their having a good and hearty laugh. I have no objection to their having a good and hearty laugh. I have no objection to their having a good and hearty laugh.

From this quotation it will be observed that we foresaw the trap to which all hands were rushing, and that we were not the first to see it. When the boys were in the trap for foreign shores there will be waiting and crashing of teeth. "Oh, had we only followed the advice of Forest & Stream!"

A WEEK ON GREAT SOUTH BAY.

W. F. and H. O. D. concluded to spend their holiday on the "Fender Model" of a boat. They had a very successful week on the occasion of a sporting journal, and by taking three trips across the bay with an outfit, H. O. D. made a quick review of the boat's performance. The boat was a bark of 25.31, long of 8.67, and 3.00 deep. The craft selected, as reported by H. O. D., was a bark of 25.31, long of 8.67, and 3.00 deep.

The first day the captain undertook to get her under way with no assistance but that of the crew. The orders to haul on the three tacks were given by the captain, and the crew were very soon at ease. Having been corrected in his impression and shown the proper rope, the captain's orders were obeyed and the boat sailed. The crew were very soon at ease.

The captain returned to his vessel, still the small hole in the sail was not mended, and the boat was not under way. The crew were very soon at ease. The captain returned to his vessel, still the small hole in the sail was not mended, and the boat was not under way.

The crew was just lighting a fresh weed when, in the capacity of forehand he announced "stake southeast of you, easy now, how much I will do it, just squeeze it on the windward side, you know, without touching." Truly the captain did it, and the boat sailed. The crew were very soon at ease.

The crew was just lighting a fresh weed when, in the capacity of forehand he announced "stake southeast of you, easy now, how much I will do it, just squeeze it on the windward side, you know, without touching." Truly the captain did it, and the boat sailed. The crew were very soon at ease.

that she is superior, having none of the useless fancy curves, surface decreased, etc. This claim for least wetted surface can hardly be supported. The wetted surface of a 25.31 long of 8.67, mean beam 5.31, mean draft 4.51, and supposing her to be a perfect wedge, her bulk is 340 cu ft. Leaving the ends of this wedge out of consideration, the area of the two sides exposed to friction of the water is 253.9 sq ft.

"Remind me here to note what is a misprint or an oversight: 'The length of the cylinder is 25.31, 4.51, 5.31, the mean draft 25.51, instead of 23.11.'"

Resting my quotation from "Houan's" letter: "Now taking this as the basis of comparison, the area of the half cylinder of the same length as the wedge, we find that the area exposed by its sides (omitting the ends as before) is only 223.9 sq ft., a difference of 29.9 sq ft. as will be seen in the following table. It is to be noted that the conclusion is clear that convexity from loading to keel favors least exposure of surface, and that it is the semicircular, not the flat, surface that we should endeavor to secure if we are aiming at small areas."

The above seems conclusive and would be correct. But it is not, as will be seen in the following table, the area of the half cylinder of 25.31 long, of such diameter, that it shall contain 330 cubic feet. Then the whole cylinder will contain 660 cubic feet to 330 cubic feet for the foot.

As we cannot get a cylinder containing just 33.851, to the foot, without going into fractions too much to be desirable, we will take a cylinder whose diameter is 4.51, to give 728 cubic feet to one foot of length of the cylinder. Then, 28.51, the whole length of the cylinder, is 20.735 cubic feet in one foot—677.33 cubic feet in the whole cylinder, and 171.83 cubic feet for the half cylinder. The area of this one-half cylinder, on its outside, is 8.67 ft., one-half the circumference of the whole cylinder to the foot—.2531 ft.—.1265 ft., one-fourth of the length.

The area of the two sides of the wedge is 236.07 ft. Area of the half cylinder is 236.15 ft., which leaves 10.08 in. in favor of the cylindrical form and not of the wedge. The percentage is 40.423 and not 12 per cent. It is still further from 12 per cent. "Coming now to the consideration of lateral resistance, the whole of the wedge is a simple section from keel to deck, is about 47.6 ft. With a beam of 5.31, it is a wedge of 16.6 ft. With a height of 4.51, it can be inclosed within a section which has a dead rise of 3 ft. to the garboard." (I protest against measuring dead rise by any standard of measurement.) The area of the wedge is 236.07 sq ft., any person can get the exact rise designated. When given as above, a dead rise of 3 ft. to the garboard, it is 236.07 sq ft. The area of the half cylinder is 236.15 sq ft., which leaves 10.08 in. in favor of the cylindrical form and not of the wedge. The percentage is 40.423 and not 12 per cent. It is still further from 12 per cent.

It is the same number of FOREST AND STREAM "Laker" says, "Fender type is almost an exact copy of a boat built for racing on Lake Ontario. It is only fairly good; on comparing the lines they look almost identical."

Here is another positive assertion and trial. Two yachts may look very alike, but one may be vastly superior to the other. I fancy you are right. The design is so original (although called out in the "Fender" type, tried 15 years ago, etc., etc.) that no design published in Forest & Stream has ever been so close to the real thing as ever built from the Fender will show her warts to most of our competitors; at least, that is the judgment of W. J. P. Fox, New York, Mich. [From Local Paper.]

Last Sunday a party of five met from this village engaged in sailing on the yacht *Minerva*, of Long Lake. During the early part of the day the weather was all that could be desired for that kind of pleasure. The wind was from the west, and the sea was smooth and increased to almost a hurricane, and although reefs were taken in the mainsail, they were capized when nearly opposite the island. Fortunately the boat was not blown overboard, and the crew were not injured. They were patiently awaited for assistance to come to them. Their unfortunate position was discovered after about half an hour by Sam Morrow, at the point where the boat was blown overboard. The boat was blown overboard in getting them off in a rather wet and chilly condition. Had the capsize occurred at a later hour the result might have proven more disastrous.

WILLESIAE CAPSIZES AND DROWNS—The westerly gale of Nov. 17 spread havoc along the coast among flat bottomed and light draft boats. The boats were capsized by another vessel. School Sloop Annie Gertrude was capsized off James Point, Chesapeake Bay, and eight hands were drowned. Schooner Scamman's Prize was capsized off the point of the same bay, and five hands were drowned. School Schooner A. Kirwin capsized; crew rescued by passing vessel. Another schooner capsized off Annapolis, crew still missing. A fourth schooner capsized off the point of the same bay, and five hands were missing. Sloop Maggie of Erie, Pa., capsized on Lake Erie, all hands lost. Schooner James F. Richardson capsized in Kedges Straits, near the mouth of the Chesapeake Bay, and five hands were missing. Schooner of Erie, Pa., capsized on Lake Erie, all hands lost. An unknown schooner capsized off the point of the same bay, and five hands were missing. The boats were capsized by another vessel. School Schooner A. Kirwin capsized; crew rescued by passing vessel. Another schooner capsized off Annapolis, crew still missing. A fourth schooner capsized off the point of the same bay, and five hands were missing. Sloop Maggie of Erie, Pa., capsized on Lake Erie, all hands lost. Schooner James F. Richardson capsized in Kedges Straits, near the mouth of the Chesapeake Bay, and five hands were missing. Schooner of Erie, Pa., capsized on Lake Erie, all hands lost. An unknown schooner capsized off the point of the same bay, and five hands were missing.

STAY ASHORE.—There is a fearful aversion in some quarters to a drop of water. People who shun water, woe betide the old man who has no business afloat. Yachting is a manly sport, and it takes men to enjoy it. Old women frightened at the thought of a little dew ought to stay ashore. The sport is a manly one, and it takes men to enjoy it. Old women frightened at the thought of a little dew ought to stay ashore. The sport is a manly one, and it takes men to enjoy it. Old women frightened at the thought of a little dew ought to stay ashore.

"HUNT'S MAGAZINE."—The November number of this London publication contains the last half of the British schooner *Softwing's* log of a 17,000-mile cruise in the Atlantic. The *Softwing* was a 17,000-mile cruise in the Atlantic. The *Softwing* was a 17,000-mile cruise in the Atlantic. The *Softwing* was a 17,000-mile cruise in the Atlantic.

THE FENDER MODEL.

Editor Forest and Stream:

Since the publication of the Fender Model in Forest and Stream, Feb. 8, 1893, it has been the subject of many inquiries in that particular type of model, judging from criticisms and inquiries in your paper. In No. 12, Feb. 12, 1893, mention is made of some giving the results of a trial of the Fender Model. I have not seen the results, and I am not sure that they are correct. I would like to devote some attention before you publish results of actual trial. As "H. C. H." seems to be the author of the Fender Model, I would like to see the actual design, I hope it will not be deemed officious if I correct some false deductions made after Fender's lines were first published. I consulted the original design, and find that the Fender Model is a Fender Model. In the same number Clapham claims the Fender idea, and as the bills tried that type twenty years ago; found her excellent. Why did he not go ahead and give a perfect model from so old and good a beginning? In same number, "J. H." experience with Fender's shape was not favorable. He says that the Fender Model is a Fender Model. He says that the Fender Model is a Fender Model. He says that the Fender Model is a Fender Model.

Paper Shot Shells, Breech-Loading Cannon, &c.

Our Shells cannot be excelled by any in the country. Our Cannon is an entirely new thing, and the most complete yacht cannon in the world.

SEND FOR PRICE LIST.

KYNOCH'S
Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and elier, and admit of a heavier charge, as owing to the thin metal, inside of acter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (with-out charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

YACHTS' WINNINGS FOR 1883.

THE list of winning yachts published exclusively in FOREST AND STREAM for Nov. 22, shows a total of 381 boats, among whom the prizes of the season were divided. The total value of these prizes reaches about \$4,500. The winners are to be assigned to the various districts in the following numbers:

Eastern.....	182 yachts.
Metropolitan.....	115 yachts.
Western and Canadian.....	57 yachts.
Central.....	18 yachts.
Southern.....	9 yachts.
Pacific.....	— yachts.

The total number of schooners winning prizes was 16; the number of sloops, cutters, and yawls 193; the number of cutboats 115; catamarans 3; luggers 1; spits 1; and the rig of the rest not known. Among the winners we find the names of 18 cutters. Of this fleet there were 26 yachts over 45ft. length on loadline, 53 yachts were from 45ft. to 30ft., and 302 yachts under 30ft., including a few whose length is not known but which probably will all fall into the smallest class. From the foregoing it will be seen that the East captures the largest share of the glory with a long lead in the number of winners, and that schooners as sporting vessels constitute but a very small fraction, there being already more cutters in the list than yachts of the class which once were considered to be especially of our "national rig." In point of size, large yachts likewise make a very limited display, no doubt due to the cost of keeping big vessels as well as to their unwieldy character for short, near-by sailing.

The largest number of races sailed by any one boat was 16, this being credited to the Niobe, Mr. J. F. Brown, Dorchester Y. C. Second in number of starts comes the Dandelion, Mr. C. F. Adams, Beverly Y. C., with 15 races, and then follow David Crockett, Queen Mab and Spray with 14 races each. Joker, of the Hull Y. C., was sent away 13 times; Amy and Kismet, 12 times; Lillie and Thisbe, 11 times; the sloop Gracie, Messrs. Flint and Earle, N. Y. Y. C., 10 times; the Myrtle, of the Hull Y. C., the Samaria, of the Dorchester Y. C., the Spider of the Beverly Y. C., and the Wildfire of the Quincy, each 10 times. With the exception of the Gracie, these are all Eastern boats.

The largest number of prizes was taken by Queen Mab, having won 8 firsts and 1 fourth; Dandelion the same; Niobe, 3 firsts, 4 seconds and 1 third. The record of the sloop Shadow, Dr. John Bryant, Eastern Y. C., is the best in the list, with 7 firsts for 8 starts.

Among the cutters we find the Aileen, of Toronto, finished 3 times and won 2 firsts; Beetle, of Beverly, started 3 times and won 2 firsts; Carnita, of Beverly, started three times and won 1 first and 1 second; Maggie finished 4 times and won 2 firsts and 1 second; Mona started once and took second prize; Peri, of Chicago, started once and took first prize; Mr. Hyslop's Petrol finished 4 times and took 2 firsts, Vayu, of Boston, got off in one match and captured first; Velenar, of Halifax, raced 3 times, taking 2 seconds and 1 third; Verve, of Toronto, finished 3 times and won 2 firsts; Wenmah started 5 times and landed 4 firsts; Bedouin finished 4 times and won 2 firsts, and so on. From this it appears that, considering the heavy odds against cutters in the way of numbers, crews inexperienced in their handling

and the blunders in building which always accompany the introduction of new schemes and methods, the cutters have come in for the biggest half of the prizes in proportion to the number of times they were started, which is encouragement enough for the future outlook of yachts which recommend themselves so strongly in other respects.

GALLERY EXTENSION.

THE opening of a new shooting range in this city seems to call for a renewal of the warning which we have before given in respect to the management of these places. They are sources of mischief or places of innocent enjoyment, precisely as they are mismanaged or well conducted. There is a continual menace of danger and this needs to be guarded against from the opening to the closing of the range. While a rifle remains exposed there is the risk that somebody may put a ball cartridge in it and then mischief of some sort or degree follow.

There is one cardinal rule which, if carried out and lived up to, will prevent a large majority, if not all accidents that are so often heard of, and it is from the violation of this rule that all the mishaps we now recall have come. The rule is, that the rifle shall never go beyond the reach of the attendant. When the lad or man in charge hands the shooter a rifle or weapon of any sort, he should stand close beside the marksman. While it is raised to the shoulder and the muzzle points targetward, there is no attempt at interference, but if the shooter turns to speak to a friend behind him, or any third party in any way comes to render assistance or intermeddle in any way, then the hand of the attendant is laid quietly and firmly upon the barrel of the rifle and it passes at once into his possession and control. There is no dispute, not a word need be spoken, and there is an avoidance even of any appearance of censorship over the actions of the shooter.

To carry out this scheme of control it will be seen that the ordinary counter or barrier between the shooter and the attendant is insufficient. Both must be free to act provided they act properly, and free to check each other in case any dangerous pranks are even unwittingly indulged in. With such a care vigilantly carried out a shooting gallery may be as safe as any other resort, provided, of course, that it is in the first place constructed with proper care, and that the weapons are regularly inspected at short intervals of time. Places of shooting resort not thus fitted up and not thus conducted ought to be suppressed, and the police and Board of Health could conduct no better crusade than one against these miscellaneous death traps.

WORK IN THE FIELD.—We give an unusual amount of space in this issue to kennel news. The report of the field trials in North Carolina is extended and detailed. The description of the running will interest all practical field shooters. One of the great charms of a day in the stubble is the working of the dogs. If your setter acquires himself well there is in that full compensation for a light bag; if he will, flushes, breaks to shot and conducts himself in general as a canine insane asylum "broke loose," no bunch of plump birds will cover your disappointment. A field trial, then, is only, under another name, a shooting excursion; and a field trial report is an account of actual field work, in which prominence is given to the canine performers.

DECEMBER is the last month for game shooting in most of the Northern States. This year, owing to the lack of snow, the huddled covies have not been potted on such a wholesale scale as in other years. With the coming of cold weather, many sportsmen, both anglers and shooters, are turning their faces southward. One very pleasant phase of a Northern man's pleasure trip South is the cordiality with which he is welcomed by the residents there. We hear this spoken of repeatedly by gentlemen upon their return. Perhaps the hint is unnecessary, but we suggest to the tourist going South that he will find letters of introduction desirable whenever they can be taken.

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, but who would presumably be interested in the paper.

THERE IS A VAST DISTINCTION between a "sporting man" and a sportsman, and between a "sporting" paper and a sportsman's paper.

CORRESPONDENTS ARE RESPECTFULLY REQUESTED TO write on one side of the paper only.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

DON'T.

A LITTLE book entitled "Don't" has made a decided hit this season. It is found in all the bookstores; confronts you on the newsstands, and greets you in the cars. The book tells its readers what not to do. "Don't put your knife into your mouth," it says; "Don't spit tobacco juice upon the carpet," and "Don't" be guilty of a thousand or two other similar offenses against good breeding. All these "Don'ts" are well enough. Perhaps it was worth while to print them. The offenses are venial; and the man who habitually spits tobacco juice on the carpet might contend that, after all, it is only a matter of taste. There are far more important injunctions. If we were to write a book telling people what not to do, it would not relate to etiquette in the parlor, but to conduct in the field. The first chapter would be something like this:

- Don't point your gun at yourself.
- Don't point your gun at any one else.
- Don't carry your gun so its range includes all your hunting companions.
- Don't try to find out whether your gun is loaded by shutting one eye and looking down the barrel with the other.
- Don't use your gun for a walking stick.
- Don't throw your gun into a boat so the triggers will catch and deposit the charge of shot in your stomach.
- Don't use your gun for a sledge-hammer.
- Don't carry your gun with the hammer down.
- Don't be a fool.
- Don't you forget it unless you have serious intentions of leaving this mundane sphere.

When we had written so much we would stop. This would be a tract instead of a book. So much the better; we should look about for some philanthropist, who wanted to save human lives, to distribute this tract by millions.

These exhortations may have a familiar look to the reader. We have printed them before. They were copied into scores of newspapers and repeated all over the country. Perhaps they saved some lives. But, if we may judge

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

SECOND PAPER.

IN ancient times the Blackfeet used dogs to transport their household goods when moving camp. But the people were not then very migratory. In those days the dwellings were made of stones, sticks, mud and grass. Tradition, however, does not mention the size or shape of them. With the advent of the horse (Blackfoot: *Bo-nok-kah-meh-la*, *W. C.*, elk dog) all this was changed. Instead of building stationary dwellings the people made portable lodges of tanned buffalo cowskins; and, mounted on their strong ponies, roamed at will all over their vast domains. The first horses the Blackfeet possessed were stolen from the South. It is said that "those who made stone arrow points saw no horses." So it must have been at about the close of the last or the beginning of the present century that they first possessed them.

Before the days of trading posts the Blackfeet made kettles of earth, cups and ladles of mountain-sheep and buffalo horns, bowls of wood, fishers and tanning implements of flint and bone, and awls and needles of bone. Knives were made of flint, bows of mountain-sheep horn or wood, backed with sinew and sometimes with snake skin. Arrow and spear points were of flint, long, narrow and slightly barbed. The ancient dress of the men consisted of a cowskin shirt, breech-clout, belt and leggings, and a toga of cowskin or a buffalo robe.

The women wore a short-sleeved gown of cowskin, short leggings of some kind of fur, and a cowskin or buffalo robe toga. Moccasins were made in winter of buffalo robe. In summer of cowskin with parfleche* soles. Necklaces, bracelets and earrings were made of animals' teeth and claws and birds' claws. White, yellow and reddish earths were used for paint.

The Indians are represented as being a silent, sullen race, seldom speaking and never laughing or joking. However true this may be of some tribes, it is certainly not true in regard to the Blackfeet. The social customs of these people are an interesting study. Let us imagine ourselves in the midst of them for a day and see how they live. It is just sunrise and the fires are being kindled; vast quantities of smoke are rising from the smoke-holes of the lodges and ascending in thin columns in the still morning air. Everywhere women are seen carrying water and food for the morning meal. Here, close by, is a large, plain lodge. Let us enter it. As we push aside the curtain and enter with much difficulty through the small oval hole, we are greeted by the owner of the lodge with the salutation, "Enter, friend; sit;" and with a wave of his hand our host motions us to a seat on his left. While he is preparing a pipe full of tobacco, let us examine the interior of the lodge. "The seats, or more properly lounges, are each about seven feet long. At either end of them are inclined frame works of willow on which as also about the entire length are spread buffalo robes. Behind, brightly painted cowskins are hung to more effectively keep out the cold air. Between the lounges, in the little triangular spaces, are piled various sacks of painted parfleche, which contain dried meat, dried berries, and different articles of general utility. Our host's seat is directly opposite the doorway, on a right angle to the rest of his wives; on his left, where we are sitting, are the visitors' seats. Suspended from a lodge-pole behind a long row of drying meat is a baby. It is swathed in a huge roll of furs and only its head is visible. Like most all Blackfoot babies it never cries, but restlessly rolls its great black eyes about as if seeking to understand what is going on about it. For the first year of its life the baby is kept in this roll of cloth, incapable of moving its hands or feet. At the end of that time it will be released, a straight, well-formed child.

While we are smoking the pipe, we hear the owner of an adjacent lodge shouting out for a "feast," that is, giving out the invitations. He says;

Mek'-o-se-pe-tin ki-tum-6k-wah Nit'-6k-wap-ah ki-tum-tin
 Eagle you will eat Bird Medicine you
Gk-6k-wah Ap'-pe-kim-nyo ki-tum-6k-wah
 will eat White Spotted-Robe you will eat
 and so forth through a long list of names, and at the close adds:

Nu-6k-kin ki-toke-o-tchis-i-po-wa.
 you then

He has mentioned our names in his shouted invitations, so of course we must attend. As we enter the lodge we find we are the first arrivals, but the other guests soon come in and take their places, according to their rank, near the host or near the doorway. "Medicine" men sit next the host. Next to them come the chiefs, warriors and old men. The young unmarried men are seldom invited to a feast. Before each guest is placed a plate of food, which is all he may have. If he does not eat it all, he may carry the remainder home with him. No food is set before the host, however; he does not eat in the presence of his guests. Every one eats slowly, and a general conversation is carried on. Sometimes the talk is about the success of a war party, or again one may tell of some funny incident, at which there is a general laugh. When all have finished eating, the great stone pipe is filled with a mixture of "larb" and tobacco, and handed to the guest on the extreme right, who lights it, after which it is smoked in turn to the extreme left and then handed back to the one who lighted it, and thus kept going around the circle until it is smoked out. After three pipefuls of tobacco have been smoked, the host ostentatiously knocks out the ashes and says, "Kyt!" whereupon the guests arise and file out of the lodge. All day this feasting is kept up, and often far into the night.

While the men thus while away the hours in feasting and smoking, the women may be seen seated at work, tanning robes or skins, drying meat or berries, or making moccasins. The children pass their time in mimic warfare and dancing, or making mud images of men and animals. If in winter, they may be seen sliding or spinning tops on the ice. The tops are made of bulls' horns, and are kept in motion by whipping with pliable thongs. These children may be seen in the middle of the winter, playing on the ice and snow without clothing or moccasins. If they become sick nature is their only physician, and nature is their only cure. The incessant drumming and singing which is kept up by the patient either dies or recovers. Only the very strongest constitutions can successfully buffet the ills of Blackfoot child-

hood. Is not this a good illustration of the survival of the fittest?

Gambling is a favorite amusement. On pleasant days the men have an out-door game which is very popular. The small wooden wheel used is about four inches in diameter. It has five spokes, and on these are strung different sizes and colors of beads. At each end of a level space rods are placed about thirty feet apart. Each rod is black and four feet between these rods by two players, who throw arrows at it. Whichever first succeeds in bringing his arrow in contact with a certain spoke which has been agreed upon wins the game.

The only other game the Blackfeet have is what we call "kill the button." It is played by both sexes. When only men play, a large lodge is cleared, and an equal number of players take their places on each side of the lodge. In front of them are placed rails on which tie to the gambling song is beaten with sticks. Each man bets with the one directly opposite him, and the stakes are piled up in a heap on the ground. Some skillful player now takes two little bones, one white and the other painted red. As the song is begun he deftly tosses the bones from one hand to the other, rubs his palms together and finally holds out both hands to the one opposite to guess which contains the red bone. The winner then takes the bones, and finally dies away. He keeps going, first one side losing then the other, and sometimes it is kept up for a night and day. The bets vary in value from a necklace to two or three horses. This gambling song is the most weird tune the writer ever heard. At first it is a scarcely audible murmur, like the gentle sighing of an evening breeze, then it increases in volume and reaches a pitch unattainable by most voices, sinks quickly to a low sound, rises and falls like waves, and finally dies away.

But when the sun has gone down, and darkness spread her sable mantle over the land, then the Blackfoot camp may be said to have fairly waked up. Bright fires are kindled in every lodge. The sound of drum, song, and laughter fills the air. The Indian dogs, which have dozed on the sunny sides of the lodges during the day have also waked up, and mock their brethren in the darkness beyond with long drawn, melancholy howls. In one lodge may be seen a group of old men, smoking the great stone pipes, and telling of the "deeds of other days." In several lodges, professional story tellers are entertaining large audiences with tales of the past and stories of the adventures of the ancient men and animals. As the speakers become interested in the stories they are relating, they rise to their feet, and with wonderfully perfect gesticulation and voice, imitate the movements and speech of the characters in their legends. Grouped about them sit the cowboy listening expectantly, and some of them laugh at some funny part of the story. So spellbound are they at the rhythmic voice and movement of the speaker that the men forget to keep the pipe lit, and the women drop the half sewed moccasin from their motionless hands.

There, in another lodge, a party of young men are going through a war dance preparatory to a raid on the horses of some neighboring tribe. In another lodge a party of men and women are having a dance, and the music is being furnished by the musicians, who beat time to the dance song on drums made of rawhide stretched over a hoop. On one side of the lodge stand the men, on the other the women. As the drumming begins all sing and dance. The "step" is a double bending of the knees. Occasionally a woman will dance over to one of the men, and deftly throwing her toga over both their heads, give him a hearty kiss, whereupon there is a general shout and laughter, and the man is obliged to make the woman a present of some little article of finery. Standing by the fire are huge bowls of food of which the dancers partake at intervals. Such was the life of the Blackfeet when the writer first knew them. With plenty of buffalo meat for food, and plenty of buffalo robes for clothing, no people were happier than they. But now, surrounded by a strange race which is driving the game from their land and depriving them of their means of sustenance, what wonder that they are silent and sullen?

[TO BE CONTINUED.]

EGERIA PARK.

FIRST PAPER.

IMAGINE that few of your readers know much about such a place as Egeria Park, or have heard of the wonders and the beauties of the Rabbit Ear, Gore and Flat-Top ranges of mountains surrounding this most attractive of all the Colorado parks. I call it attractive because its scenery is all charming and grand; and I also use the word in a sporting sense for the reason that within and immediately upon its borders game and fish are found in such abundance and variety as to fairly startle and finally satiate the boldest and hungriest of sportsmen. I think its merits in this respect were first written about by Sir Geo. Gore, for whom the lovely range of mountains that encircles it on the south-west was named, and who raised this Rocky Mountain country on a grand hunting expedition with a retinue that old trappers say "looked like a circus and menagerie caravan" in 1842. He calls it the gem of the mountains, and says he could find it in his heart to make a home there were the advantages of civilization a little nearer.

Since his day civilization has come, with all its blessings, to the surrounding State; and year by year immigration is changing the wilderness and utilizing the thousands of acres of luxuriant grasses that are the element of vast herds of horses, cattle and sheep. Last year a post-office was established in the Park, and since the removal of the Ute Indians perhaps twenty ranchmen have settled within its limits. The tourist or hunter can now ride on the rail to within fifty miles of Egeria, and can have a roof over his head and a "bunk" in some stockman's cabin every night, if he desires, while making the trip from the present terminus of the railroad to the west side of the Park. It is probable that the settlers who "stick their stakes" there be of the right stripe and take the trouble to enforce the laws for the preservation of fish and game. With a little help of nature it might be made a huge "preserve" for all time, and furnish reasonable sport for half the hunters in America for a hundred years to come.

But let me give my reader some idea of its extent, its location, principal features, and how to reach it. It is located

in Routt county, in its southeast corner and directly east of, and adjoining, the northeast corner of the old Ute Indian Reservation. Its extent is thirty-five miles north to south, and about twenty-eight miles east and west; or, between the foothills of the Gore and Flat Top ranges. The streams that "head" in these mountains and flow into the Bear and Grand, and through the Park, are almost numberless, and not one that I have seen a line into but is a good trout stream. I cannot name them all. In the principal ones are Pass Creek, Fish, Black-Tail, Rock, Roaring Fork (or Sarvis), Crooked and Brush.

Follow me in my first trip (then in 1872) and we will soon be there. Of course, at that time the rail went no further in that direction than Denver; now you can go by steam to Empire via the Colorado Central, or to Dillon, in the valley of the Blue, by the Denver and South Park extension, or Denver and Rio Grande. In the former case you will have a wagon or horseback ride of seventy-two miles, and in the latter of nearly fifty miles, before you strike the Eastern foothills of the Gore where Pass Creek falls into the Muddy, and which we will make our starting point. The wagon road is good from either of the towns I have named, and there need be no fears on the part of the sportsman of taking a good load of everything necessary to make his stay enjoyable. The road is so well provided that you will not "balk" at a "sharp pitch." The pass is not over 9,000 feet above sea level, and the grade of the road is very easy. From the Muddy to the first crossing of Pass Creek—half way up the mountain—is about eight miles, one and a half of which may be cut off if the party travels on horseback, by taking an Indian trail at the first crossing of the creek.

When I first went over, we stopped for noon, and I have always, in subsequent trips, aimed to do likewise, for there is abundance of grass for your horses; a splendid spring flowing a stream that would turn a mill wheel, breaks out of the hillside, at the very roots of an enormous pine, and the view of the Muddy valley, that further up the mountain is cut off by the dense pine forest, is here magnificent.

Two or three hundred yards up or down the creek from this point you will find a succession of beaver dams, where the "mill" pulling, brings us to your supper table. The dam here under one dam is three-quarters of an hour, and it was not a good day either. By going half a mile further up the creek to where the aspen thickets and the pines come together you may jump a deer almost any summer day and have venison for supper, but we generally leave that part of the business till we make night camp on the latter side.

After lunch we "hook up" and a couple of miles steady uphill pulling, brings us to the upper crossing of Pass Creek, a beautiful spot where once lived Albert Weber, half ranchman, half hunter and trapper. He had a nice, cozy, comfortable log house, with substantial stable and corral, forty or fifty fine cows; made butter in the summer, trapped and hunted in the winter and was "getting ahead" finely when (here is the old story, I could tell you of a hundred of my acquaintances) one day he went to the store at Hot Sulphur Springs for his "provisions." In his return he found on his "movements" a number of "bad" asses. A band of Utes had come along; killed three of his cows for the hides, of which they make bow-cases and gun covers, confiscated such household goods as took their fancy and then fired the buildings. I saw him afterward and laid his case before the Department, but he never got a cent. The Indians wouldn't swear they did it, and in these cases a white man's testimony isn't worth a cent.

From Weber's to the summit the grade is easy and the road good, passing through a pine forest of perhaps fifty or sixty years' growth, with now and then a pretty little park of a few acres luxuriant with wild oats, fox-tail and blue-joint grasses, and bright with flowers from June until October. These little openings that are such beautiful features in the mountain landscapes of Colorado are also favorite spots for those who like to hunt the deer and elk, for these animals, which generally hide hidden in the thickets during the summer days, seek the openings toward evening to graze, and the hunter who can command a view of one of these miniature meadows at sundown will almost surely get a shot before dark unless he has in approaching it given the game the "wind" or startled it by a cough, a sneeze or a heavy footfall.

Well, here we are at the summit, and we drive out of the shadow of the terrific pines into the sunlight of Echo Park, an oblong opening on the crest of the mountain three-quarters of a mile by a quarter, and in the very center a clump of willows, with a spring, the head of Pass Creek. Stop here a moment, lift your voice so as to be heard distinctly a couple of hundred yards, and your words come back to you with the same distinctness with which they left your lips. The Utes say it is "bad medicine," and with all their traditional lore for picturesque and ancient doing places, no Indian camp-fire was ever lit there, though this trail has been traveled by them for nearly fifty years that we know of. Within 200 yards of the spring I have just mentioned we cross a tiny rivulet flowing the other way, west; and now we are on the down grade, and two miles more of tolerably rough travel bring us to the western foot of the pass, on to the banks of jolly sparkling Black Flat Creek. Turning the horses' heads to the right and pushing through a pile brush—without a name—we find ourselves in one of the mountain meadows, where we will make the night camp, although it is but 3 o'clock P. M., for before nightfall we must have a deer, so if you will wait and imagine that it has taken a week for us to lariat our horses, pitch our tent, chain our shepherd dog to the front pole, and with shouldered rifles start up the mountain, I will tell you in my next letter of the deer we started, missed, crippled, killed; of the elk we heard, but saw not, and how I killed my first bear. YAMPAH.

DENVER, Col., November, 1888.

DEER AT SEA.—Portland, Me., Nov. 29.—The British seaman Howard came in yesterday with one of Howard Knowlton's deer on board, which had been picked up about five miles out at sea. The animal escaped from the garden on Peak's Island last summer, and had not been seen since, probably having kept in the woods at the lower end of the island. This is the biggest feat of capturing deer in the water on record. The Adirondack lake deer killers are nowhere.

*Rawhide.

Natural History.

CHANGE OF NAME.

THE Council of the American Ornithologists' Union recently voted to establish a journal in the form of a serial publication, its publication to begin in January, 1884. Mr. E. A. Mearns was chosen editor, and he is to be assisted by a staff of associate editors, who will be named by the Council, and under whose management the periodical will be published. The *Nuttall Bulletin* says that "upon this action being known it became a question with the members of the Nuttall Ornithological Club whether the Nuttall Club should continue to publish an organ, which, under the new conditions, could only be a rival of that of the Union. The two organizations being virtually one in interest and purpose—the latter being to some extent the outgrowth of the earlier—the case where a greater includes a lesser, the Nuttall Club, at a meeting held October 1, voted to discontinue its *Bulletin* with the close of the present volume, and to offer to the American Ornithologists' Union its good will and subscription list—to place the *Bulletin* in the hands of the Council of the Union with its traditions and prestige, with the tacit understanding that the new serial of the Union shall be ostensibly a second series of the *Nuttall Bulletin*."

CURIOUS DEER ANTLETS.—A Grass Valley (California) paper says: "Dr. I. W. Hays has in his possession the antlers of a deer that was run down by dogs and caught and killed by two boys, at Fleming's ranch a few days ago. The antlers are in the usual form, but from the base of the right antler a single prong, about eight inches in length, grows downward at an angle of 60 degrees. Another prong grows at the base of this one and closely surrounds it in the shape of a horn. There is also another, and independent horn, close by the other which is about two inches in length. There was another prong growing out of the base and on the outside of the same antler, which bent back over the long prong, with the point resting between the antlers on the top of the deer's head, but unfortunately this was broken off at the time the deer was captured. Deer hunters say that in their experience they have never seen such a singular formation of the antlers."

GAME BIRDS AT SEA.—*Elbow Forest and Stream*.—Welft Havre, Oct. 29, at 7 A. M., on the steamer Labrador. The night following, as we came down the Channel, but out of sight of land, some two dozen small land birds of various species came aboard the steamer, also two fat rump rail. They were carried out to sea with us, and occasionally took long flights away, but always returned. The second day the rail were so exhausted that they were caught in the hand alive, as were also most of the small birds. The rest perished in a storm we passed through on the third day out. The migratory quail sometimes become exhausted in crossing the Mediterranean sea, and seek refuge on the ships; but I have never before in all my fifteen ocean trips, seen so many birds come aboard on leaving the coast of Europe.—FAYETTE S. GILES.

LARGE GRAY EAGLE.—Shawnee town, Ill., Nov. 30.—Col. Wash, Callicot of Waltonborough, last Wednesday shot a large gray eagle with a Spencer rifle, making an entire skin. The bird was a fine specimen, and measured seven feet five inches from tip to tip and three feet from beak to tail. The specimen was skinned and stuffed by C. J. Lemen, of Shawneetown, according to directions given in the FOREST AND STREAM, in a recent issue. Its mate was shot the week before by Mr. Logan, near the same locality. What would be the cost of mounting such a specimen?—X. [The cost would be about \$15 or \$20.]

A HEAVY GROUSE.—Boston, Mass., Dec. 2.—Mr. John Q. Bicknell, of East Weymouth, Mass., who, by the way, is a crack shot and a thorough sportsman, recently shot a ruffed grouse that weighed two pounds after the feathers and wings had been taken off. Quail, wild quail, abundant in that locality this season, the gentleman referred to having made a number of good bags.—J. S. W.

THE BOHEMIAN WAXWING.—Agricultural College, Ames, Iowa, Nov. 22.—The Bohemian waxwings have again appeared in considerable numbers. I have seen several flocks that appear to be staying about here, as though they were passing on their way. The first visit of this part of the country was in the winter of 1878-9, when they were quite abundant.—F. E. L. BEAL.

SWALLOW-TAILED KITE IN MAINE.—An ornithological note of very unusual interest has just been communicated to us by Capt. Chas. Rendree. He tells us that Mr. Manly Hanly of Portland, Maine, writes that he has just had word of the capture of a swallow-tailed kite (*Elanoides forficatus*) in the bull breast plumage, and that the specimen has been preserved for him.

Game Bag and Gun.

PROTECTING GUNS FROM RUST.

Returning recently from a two years' trip abroad, I have been interested in reading the back numbers of FOREST AND STREAM, and particularly the discussion carried on a year or two ago by sportsmen as to the best method of protecting gun barrels from rust spots. Before going abroad I read up the various authorities on the subject, but as the "doctors disagreed," I rejected the rust preventers, mercurial ointment, shellac and other things suggested, and chose a method I had never seen mentioned, to prevent my Wadley breech-loader and Shelton auxiliary rifle from rust during my absence. My gun had seen pretty hard service for two winters in Florida, three and four years ago, and the barrels were somewhat "froekled" when I put it away. But I put corks in the breech end of the barrels, melted some pure tallow and poured in, corked up the muzzle, smeared some tallow on the outside, rolled the barrels up in half a dozen newspapers, packed away in a crate. After reading the discussion referred to, I proceeded with more fear and doubt to examine my gun. Pouring some warm water upon the barrels the long stems of tallow slipped out—I hope nobody will be "wicked" enough to suggest that they might have been utilized for candles—and I found my gun looking rather better than it did when I put it away, and it seems to me as if some of the blemishes were either

magnified in my memory or have dwindled by time and tallow. I took the precaution not to have the tallow too hot when I filled the barrels, so as to avoid any possible injury to the gun. And hereafter, when I want to put my gun away for even two or three months, I shall put my trust in tallow. M. H. R.

EAST BRIMFIELD, MASS., NOV. 23.

MY OLD MUZZLE-LOADER.

IN TWO PARTS—PART I.

THE editorial in FOREST AND STREAM of November 8, 1883, on the "Old Gun," recalled so many pleasant memories connected with our old muzzle-loader, that I can not refrain from recording a few of them to the honor of the cherished piece. Yes, this ancient friend and companion has been the apple of my eye; it is still so dear to my heart that I mean to keep it as long as I live.

The editor's remarks on that new breech-loader are echoed in my heart, but when he touches up so glibly those happy memories of the ancient muzzle-loader, every fibre vibrates and thrills with magnetic sympathy. Yet the unbidden tear will start from the eye when I contrast the shiny appearance this Wesley Richards presented to my admiring gaze some thirty-three years ago. Then she was a beauty—the stock so elegantly finished, with its drop of three and one-quarter inches, and barrels so nicely adjusted as to come to the eye with the most perfect balance, that I had only to glance over them and follow the bird with the eyes; intuitively the gun kept pace with the object; and when the forefinger pressed those delicate triggers there was a quick, angry explosion, and a cloud of feathers rose, while the victim hit the dust as if by an electric shock had whirred it into a lump of lifeless flesh.

Bettie, as I named her after my first love, never missed fire, never failed to kill in reasonable distances if held on the object. Her reasonable distances were most uncommon ones for other guns in early times. It was my usual custom to give my friends the shot. If they failed, then Bettie told her deadly tale, and there was meat. A hundred yards, and up to 143 yards fairly measured, I once made one of the happiest shots I ever made. It happened in this wise. Sixty-eight years ago I asked Gen. E. Kirby Smith for a furlough to go hunting. He gave me a beautiful furlough, and he loved it as dearly as I did. For three long years I had been in service and not a moment had I had as a furlough. The application was granted for fifteen days. My body servant was to drive a six-mile wagon with plenty of eatables, and with two faithful soldier comrades I set out from Marshall, Tex., to go to Moore's Cross Roads in Bowie county, not far from the present town of Texarkana. My man Sandy rode by my side and carried my rifle and my big Greener, while the faithful Bettie Richards, laid across the saddle, was ever ready to speak and bite. Oh, what a beauty she was then; weight, 7 pounds; barrels, 32 inches; bore, 14; made of the finest and most malleable wire steel I ever saw; not a scratch about her; sleek, nice and fresh, as if she had never been used, instead of having seen twelve years of hard service.

Deer were too numerous to talk about. One could find them anywhere, every mound covered with sumac bushes had a small herd of them lying thereat some time of the day. Six days had we hunted, and thirty-nine fine fat deer had fallen to our shots and been brought to camp by Sandy. The sixth day we planned a big hunt, inviting half a dozen of the citizen hunters to join us. We were to form a V, and to break on the west side of the road that leads from Sulphur Fork Ferry to the cross roads, and our calculations were made to bag no less than twenty deer that day. Our own pack of eleven feet and untiring hounds had been largely increased by several neighborhood packs. The new dogs infused fresh animation in our faded pack, and when a whole herd of deer bounded up shortly after we left camp, there was a war of music that would almost have raised a dead hunter from the grave. The deer separated, and every dog seemed to pursue his own deer. By agreement we were not to break our V until we had passed over a certain place where it was thought we would be most successful in "jumping" and getting near shots.

The dogs dashed off in front of us, but in a short time three of them turned back and brought ahead of them one of the old hound heads that always love to play a trick on the hunter. He expected by returning in this way to find us gone, and he would be safe. He only made a slight miscalculation, as many a mortal makes. The three hounds pursuing him belonged to me, and were headed by Countess, a yellow-tan, that was swift as a ghost, and vindictive as a bull-terrier. The buck passed inside the V, receiving both barrels of the man on the right flank. Then he dashed down in easy shooting distance, getting a double shot from each man until he came to the one in the fork. From him he got two shots and a "Woo Tom," steadily and true, in the left arm of the V, getting double shots from each as he flew along in terror-stricken speed. The dogs became doubly animated. Countess opened every bound in full sight and not a hundred yards behind him, while a soul-enlivening yell came from each hunter after firing, and again as the dogs passed by him. There were eight of us, some one hundred and fifty yards apart, making it nearly half a mile across the flanks from the extreme points. I had stopped my rifle, and "Woo Tom" steadily under fire, as if they were both blind and deaf, as soon as the first shot was heard. I was just beginning the ascent of a gently sloping ridge, with grass and brush not high enough to hide a deer, and in a good position for the run of a deer were it to descend, but rather too far for a shot were it to take the top of the ridge.

Fourteen heavy guns in quick succession, with the shouts of the hunters and the fierce yelping of the hounds, had almost distracted Sandy, who was seated on his horse in easy distance to hand me the rifle should I need it. I must honestly confess I was awfully excited, and I wonder who would not be under such circumstances? The buck and dogs were kept from sight by a thicket of pine, and would not be seen unless the deer should keep the top of the ridge or come down the descent.

Old Gun Tom had become inspired to the degree of raising his head from the grass, and with one ear thrown forward, the other back, he seemed to drink in the roar as if it did him good all over. Quickly I saw him turn his head to the top of the ridge, and he was carefully looking for me, as if he had been himself for the coming shot, and then there was a glimpse of something blue flying rather than running.

"Take de rifle," whispered Sandy. "Ye can't tuck him, Massa, with your little Bettie." "No," said I. "Bettie will kill or wound no Countess will catch him, see if she doesn't," and I turned Tom so as to get a broadside shot. Never had I seen a deer making such speed before, with head elevated,

horns thrown back on his shoulders, body stretched to the utmost extent, he was going so fast and so straight to ground, as to appear as if he were flying. "Down in the hole," I cried, and I missed, he was whispered to Sandy, as I threw up Bettie with my one arm, carrying her full thirty feet forward of the terror-struck animal, and some six feet above. The right barrel cracked; instantaneously the buck sank to the ground, falling on his right side with a crash audible to us that distance. By the time we could give one blast of triumph from our horn, Countess was fastened to his throat. Now, but a hunter can realize the joy I felt as I said to Sandy, "I knew Bettie would not disgrace herself, and won't I crow over those other fellows."

My wonderful shot was seen by several others, and when the distance was actually measured it proved to be 143 yards. I always shot one buckshot—three chambers and three to a chamber—using two Ely felt wads over powder and a cardboard wad over shot. I had a mould made to mould eighteen shot on each side, so that it was not troublesome to make my own shot. Then, too, I always believed my moulded shot killed longer distances. The buck was struck with three shot, one breaking the neck, and passing through the other side, and the third breaking the neck above the hips.

Several the officers were made for Bettie. She was "Miss Bettie Richards" at that time, and money could not buy her. She was "Madam Bettie" about ten years ago, but now she is "Old Bettie"—like her master, used up, good for nothing, unsightly—but we will never part, old lady, too many bright memories cluster around you. My grandchild, a sturdy little boy, points to the great brass band that holds the shackling stock together, and says, "pretty, pretty," and wants to handle it, but it is forbidden fruit. "Precious in my sight is the buck I battered hard, even more so than when I killed that buck. I am getting on too fast. Three rousing blasts brought up every hunter. The fine shot was discussed, and each endeavored to excuse himself for missing. "Ah, gentlemen," said I, "there was but one thing that prevented your killing him, you did not make allowance for his speed; you shot behind him. I thought of this and fired thirty feet ahead, with the result you see. Never shoot at a deer or bird making uncommonly fast time with a hope of killing. Calculate the distance from the gun to the game, and then shoot with due allowance, you will strike the game every shot." This was a deer of unusual size—a very old one, for his mouth was getting quite gray, while the body was very blue. He had seven points on one horn and five on the other, but the beams were unusually large. I did not joke my companions for their failure, but Sandy made up the silence on my part. He was decidedly overcome with joy, never failing to praise his master. Five more deer we bagged that day, making over forty-five all told in one week's hunt. Our two soldiers succeeded in killing thirty, which made the sum total of seventy-five the deer. The skins and hams brought back to Marshall to our ordinance warehouse attested the number bagged.

Our citizen friends planned a bear hunt for the next week in the Red River bottom, above its forks with the Sulphur. We accepted their invitation, struck camp the next morning, and that night camped near the plantation of a Dr. Booker, whose son joined us the next day and remained while we were there. Bear were very plentiful; we could not go out of gunshot of the camp without getting one. But they were so poor, and the cane so heavy and dense, our dogs could not bring one to bag or to tree. One sucking cul was caught and killed by the dogs, the total result of a three days' chase. We were satisfied and struck camp, and I rolled back home before my furlough expired, and was there congratulated on the birth of a child during my absence.

But I am digressing—overlooking the deeds and good qualities of old Bettie. Ah! me, I shall never forget the time how she saved me from the ferocious jaws of an old she bear. I can see the brute now, as with mouth wide open, her huge red jaws fawning with white froth, the great ivory tusks glistening like stars, when she rushed upon me with an appalling roar. No help was near, no way to escape instant death, except in a sure shot from Bettie. What if she were to miss fire—death stared me in the face. Bettie was thrown to the shoulder, my eyes looked over the deadly barrels, the forefinger rested on the right trigger. One bound more was made, the head was elevated as if she thought of seizing me, she was in the air. She was thrown, and my fingers tightened, there was a deadly explosion, for Bettie never failed to fire. That ball and buckshot cartridge crushed through the open mouth, striking and unjoining the neck bone. With terrible force she fell where I was standing, but I had sprung aside, and instantly Bettie's left barrel roared, and that monster's brains bespattered the ground and I was saved, but my nervous system was shocked, so that I did not get over it for some time. My pack of dogs had caught one of this bear's cubs, and it was crying out piteously when she rushed up for its protection. Have I not good cause to cherish that never-missing-fire gun, my dear old Bettie?

Another good shot, and a wolf hunt booms up before me with a train of thoughts dove-tailed, and falling into line, so soldier-like, that I cannot refrain from relating it. Several years after the late "unpleasantness" I received a note from my brother-in-law, Robert N. Hunter of Dallas county, Arkansas, asking me to go over and join him in a wolf hunt, as he had discovered the thickets where two old ones had reared their young, and the night was growing so late that he was not going to. This was enough. "Old Tom," my gray mule, was saddled, Miss Bettie cleaned and oiled, and the pack of thirteen hounds all coupled in pairs, except Countess. She was tied and led for fear of her running off before I could get to the place appointed for us to meet.

"Cunning as a fox," is the old adage, but it applies as well to the wolf. My Hunter informed me that the two old she-wolves had reared their young not half a mile from his house, that his flock of sheep pastured every day around them, were driven at night into the field adjoining the thickets, and while constant depredations on flocks some distance from his house were made, yet he had not lost a sheep. Now, was not this a near approach to reason?—it was more than sassa city—a wife equal to any that a fox plays, and partaking of human reasoning. Were one of his sheep killed, these wolves knew it would lead to their discovery, most certainly to their being driven away from that portion of the country, and very likely to their being killed. Furthermore, he stated he had never heard a wolf howl in his neighborhood, while it was so common to hear it in the northern part of the country. A fortuitous accident led him on foot into this dense, marshy thicket that morning before breakfast, and he had discovered on a piece of hummock ground the place where they bedded and the play grounds of their young ones. From the tracks freshly made in the oozy soil, he was of the opinion there were some dozen young and two old ones. Countess was the only strike dog for wolves in our pack

We had no difficulty in getting the balance to join her in running anything on which she opened. The trouble would be to get her to the place where she would be most likely to strike a wolf track before meeting with a fox or rabbit. Through deer were abundant we had no fear of finding one so close the wolves. Our plan was for Mr. Hunter to lead her into the thicket where he found the play grounds, and then encourage her to open on the fresh sign he had observed. The rest of us were to keep the balance of the dogs with us until we heard Countess in full cry, and then break for her, each man to follow on his own "hook" and do his best in getting a shot.

The young wolves must have been playing on their grounds, and ran off at the approach of Hunter, for he had no sooner led Countess loose than she ran into the marsh, and in a moment was in full cry. In five minutes the entire pack joined her. In addition to my thirteen, there were half a dozen more good hounds of his young neighbors, whom he had invited to the hunt, and who brought their dogs with them. For fifteen minutes there was an unbroken roar from this great pack, and then a stop—a confused noise as of dogs fighting, and in a little while Hunter came out, dragging a young wolf, but nearly as large as any of our dogs. He mounted his horse, requested us to keep a sharp lookout, and stated he would ride into the thicket and force them to leave so that we could get shots as they should break for the hills.

But a short time elapsed before the whole pack were under full cry. Several times they made the circuit of the thicket, then came the howl of a gun. The pack ceased baying, but it was for a moment, when all again gave mouth, dividing into three packs. A gun on the opposite side from where I was seated on Tom broke on my ears, and that pack, consisting of two or three dogs, ceased their cry. I knew a wolf had been killed, and I supposed Mr. Hunter had killed one also. The bigger portion of the pack were making to my stand, but some turned out of shouting distance, and rising a hill some five or six large bays, scaling the mountain, with Countess not far behind them. Hunter was riding like Jehu, keeping up with some of the rear dogs, and hallowing every jump of his horse. As they were bearing toward Cypress Creek, I knew at that late time of the evening I could do nothing, so I turned old gray Tom toward the house and slowly rode home. Before supper two more of the hunters came in, bringing with them two more young wolves. It was late when Mr. Hunter got back, and tied up and his saddle with a large blue sheepskin. He told me, "After we left the thicket this old she made direct for Cypress Creek, not less than eight miles on the air line. She ran the bottom for some time, but the dogs pushed her so tight she made for the old Hurricane on her way back to where she was started, when the dogs overhauled her on the high hills about four miles from home. She fought for her life, inflicting some ugly wounds on Countess and crippling several others before I could get a chance to shoot her without killing a dog."

We had secured four in all—three young, and one old one. The night was spent, until long after the small hours, planning how we should catch and kill the other, the next morning.

A heavy rain fell before daylight. It cast a damper over buoyant spirits, for we well knew the other old one would return and take her young away from that part of the country, and in some dense thicket, and it was noted extremely doubtful whether we could stumble on their trail after such a rain.

The sun rose clear the next morning, but it was with no jubilant feelings we mounted and rode to the thicket, with little or no hope of striking a track. As we had anticipated, the dogs could not find a scent of one anywhere. From there we rode rapidly to every spot we could think of as being a hiding place for the mother to take her young.

From there we rode to the place where Miss Bettie had a very old trail, which we followed for two hours. Not another dog would open on it, and we were uncertain whether it was a wolf or a fox. Becoming discouraged, our neighbors left for home. Mr. Hunter said he would follow Countess as long as she would open. I quit in disgust and rode for a noted crossing—a famous deer stand—hoping that ere long some kind of game would cross and give Miss Bettie a chance to put in her work. I must have been there some half hour, when I was wearied out. I had twisted and turned so many times in the saddle, that I was badly chafed, and no doubt old gray Tom's back was aching. I was actually nodding, when I was aroused by two big guns in quick succession on my right, followed by several ringing lally-hos, and then the roar of the whole pack. In a moment I was in exact position, old gray Tom placed just so that I should have a broadside shot, and Miss Bettie was ready to drop the bridle and saddle at the very instant I should get a good opportunity. Very quickly, gray Tom's one ear stood forward, the other dropped back, while his head indicated that he had seen something. The dogs were rapidly coming nearer and nearer toward me. A minute more and I saw a small red-looking animal which I took to be a dog, and not far behind it was another still smaller, which I thought was my fawn. It was apparent they would either come directly toward me or else run in a circle. I thought I did not see the dog, from the eager cry I knew they were running by sight. "Steady, Tom," I whispered, "don't you move a foot or wink an eye. Steady, and we will have both, as sure as Miss Bettie barks. Heavens! that big postrate pine has turned them, they will pass too far to kill. No, she is turning nearer. It is long shot, my only chance, and" here I cut short my talk with Tom. Jerking up Miss Bettie from the saddle I fired in a bushy place, the smoke rising from the smoke blew in my face, the report reverberated over those hills, and the animal disappeared. My next idea was to give the second barrel to the fawn. But no fawn came in view. Countess, whose color was that of a deer in the red state, followed by the whole pack, jumped the pine, perfectly maddened by my shot. My attention was so much taken up with the running of the dogs, that I proved too obtuse to notice the action of old gray Tom. He had done everything in his power except talk, and had he possessed the faculty of speech, as did Balaam's ass, no doubt he would have shouted, "Look out, look there! why don't you shoot?" as the object at which I shot passed in thirty yards to my left and I did not see it, nor would I have believed it possible had not the whole pack dashed past me, and then come to bay not one hundred yards behind me.

On galloping to the spot, none but a hunter can imagine my intense joy and gratification to see the largest tawny wolf I ever met in all my hunts and wanderings. He was lying with his feet under him, ready to spring if necessary,

the blood was oozing from his left side in several places; his tongue was lying out of his big wide mouth, while fire and fury gleamed from his flashing yellow eyes. Every hound was lying on the ground around him, afraid to attack the lion that he had just slain. I shot as he uttered the she had taught them a bitter lesson, and they were profiting by it. Bear in mind it was near the middle of August and in the afternoon—as hot a day as ever comes in that latitude. It was a picture worthy for some good artist. I sat a few minutes on old gray Tom, then dismounted and approached near enough to put my gun over the heads of the dogs. Just as I did so the wolf gave a sudden spring and bounded toward me. I shot as he uttered a cry, and for fear of striking a dog I fired too high, making beautiful misses. Before he got fifty yards Countess seized him, and by the time I reached them the flock had him stretched full length. I jabbed a pine knot in his mouth for him to bite, and after the dogs had bitten him to their satisfaction I plunged my hunting knife through his heart.

Quickly Mr. Hunter joined me, and after resting I walked back to measure the distance of my shot. It was 112 yards, yet my beautiful Miss Bettie had not lost a single feather, a chamber of three shot in that great wolf's side.

Before we got back to our horses the whole pack were in full cry. Most fortunately we had stumbled upon the hiding place of the remaining young wolves. Rarely ever have we had such sport as we had that afternoon. By the time the sun set we had caught and killed seven young wolves, any one of which was nearly as large as any of our dogs. Taking their scalps we left their bodies to the buzzards, and tying the old one to my saddle, we returned home, getting in by bed time.

I skinned this large wolf, had it tanned with the hair on, and used it for several years as a slipping rug for my setter. On opening the wolf I found part of the leg of a sheep indigest.

The next day was Sunday. We attended church several miles off in the neighborhood, and on inquiry learned that a sheep had been killed on Friday night not less than twelve miles on the air line from where we jumped him. He had eaten a part of it, and had bitten off a leg and carried it to his young. To satisfy ourselves on this point, as we returned from church we rode by where we had caught some of the young ones, and on opening one found the remains of a sheep in its stomach.

The young wolves had not been carried over three miles from where they were reared. This old wolf could have caught a sheep that night. Mr. Hunter's and carried his long trip, over twelve miles there and twelve back, making twenty-four miles, to get food for his young. There was no instinct in this. Instinct would have prompted him to supply his harder from the nearest sheepfold. It was reason, pure, unadulterated reason, founded on the principles of self-preservation. The county court paid Mr. Hunter \$60 for the twelve scalps.

MESSE, IA.

GEO. D. ALEXANDER.

WILD MOSS CREEK.

THE beautiful stream bearing the above title is located in Carroll county, and is about 210 miles west of St. Louis on the Washburn Railroad, and is one of the finest fishing and ducking resorts in the State.

It is a spring-fed stream from 200 to 350 feet wide, twenty miles in length, with an average depth of ten feet, and empties into the Wakarusa River two miles west of Carrollton. The wild moss, from which it takes its name, grows from its bed to the surface, and is the home of a small insect which the fish eat.

Meeting my old friend, the Hon. James F. Lawton, proprietor of the "Wild Moss Mills," situated on the above stream, he suggested that I come up and have a shot, an invitation which was quickly accepted, and the following Saturday evening found me aboard the train on my way to Carrollton, where I arrived the next morning, and was taken in charge by "Bill" and driven to the house, where I found breakfast awaiting me, after which I was shown over the grounds generally, so as to get the lay of the land preparatory to the sport that was to take place next morning. After dinner, we took a ride in the Sarah, a beautiful steam launch, which he had built at a cost of over \$600, and which he says is for the use of his friends.

On our return we sat down to a bountiful supper to which we did ample justice, after which cigars were passed around and during the consumption of which plans were laid for a campaign against the ducks on the morning. When breakfast arrived I was shown to my room, a most one-story cottage some 20 feet from the family residence, consisting of one room about 16x16 feet and an alcove, in which rested a bed fit for a prince, and hid from view by lace curtains extending from the ceiling to the floor, an elegant Brussels carpet on the floor and furniture to match, the sideboard well stocked. I was told that was to be my room while there and to make myself at home, which I at once proceeded to do. Just back of B, where is there another man in this part of the country who builds a house and furnishes it in that style solely for the benefit of his friends?

In the morning, long before daylight, after a hasty toilet, I was on my way to the pasture, in the center of which is located a small lake which is a resort for ducks, and where I made my first bad break by scoring a clean miss, and at the same time scaring all the ducks on the lake, but after a few moments spent in securing a good position to command a view of the lake, I had the satisfaction of getting a shot at a pair of mallards, one of which I brought to bag. After that it was hit and miss until the bell announced breakfast, at which time I had scored five clean hits. After breakfast I again took up a position at my former stand, where I had tolerably fair luck until near noon, when I took a stroll along the bank of the Wakarusa, where I got two more, making in all thirteen for the forenoon. In the afternoon steam was got up to the Sarah, and the steam launch, FOREST AND STREAM ever tried it (have any of the readers of FOREST AND STREAM ever tried it?), and succeeded in getting eleven in about two hours.

The next morning was a repetition of the first, with the exception that a couple of fox-squirrels were added to the bag, also a fine specimen of duck-hawk, the head of which is now doing service on the hat of Mrs. L. On the morning of the third day we took a drive about four miles to the south River bank, where the Sarah was up to the neck in ducks and geese, but not being able to secure a boat until too late in the day, we did not have the good time we ex-

*Yes. See Barr H. Folk's humorous account of "Duck Hunting in the State of Louisiana," Vol. 1, p. 80, and his brother's rejoinder in the number for June 2 following. Also "Potagers' truthful relation of "Duck Shooting by Steam Power," in issue of Nov. 23, 1888.—Ed.

pected to, and from which we returned early to aggrify it with the Sarah on the creek, where we met with good success.

The four days spent at Lawton's will always remain a great event in my memory, for L. is a whole-souled, genial good fellow, and there was the "big thing" always on the outside, as will be attested by any sportsman who has ever hunted along the Wakarusa bottoms.

To Mrs. L., the affable hostess, is due thanks for kind and courteous attention during my brief sojourn, and I trust that the day is not far distant when I will have the pleasure of renewing the acquaintances so pleasantly formed.

ST. LOUIS, Nov. 30.

(VMP-BELL.)

AMONG THE CAPE MAY SQUIRRELS.

THERE are times, election being over, when one desires to get the taste of politics out of his mouth, and there are seasons when the "grasshopper" of business becomes a burden; and it is at such periods of a sportsman's existence when deep-sea fishing fills the soul with joy, if the season is not over. The "croaker" had ceased to croak, the simple flounder had gone beyond the fishing banks, and the mackerel had sought fresh saline flats and piscatorial pastures new. In my despair of a place for two days in which to recuperate my tired energies, as I lunched for a shady spot in which I might review the pleasures of my youth, I bethought myself of Col. J. L. Lansing, the most hospitable and reliable sportsman on Cape Island. I telephoned to the telegraph office, "Messenger wanted." He came on wings. I wired thus: "Nov. 22, 1888.—Col. Lansing: Will you shoot the gray squirrel with me Friday, starting at 6 A. M. The answer came in half an hour: "Col. J. L. Lansing: Come in the first train and 'all will be forgiven'—I. M. Lansing."

I started in the afternoon train for Cape May, and at 7 P. M. last Thursday I devoured a woodcock on toast and a broiled rack, which had been sporting in the briny deep at 12 o'clock noon of the same day, and with a broiled beef-steak and abundant mushrooms, and a fragrant cup of coffee. I cracked the pipe in peace with Col. Lansing till 9 P. M., and then I begged a room for the night, and a window to let in the sweet breath of the sea, for I was tired, "my heart and I," and I slept a long restful, dreamless sleep. At 5 o'clock I heard the stalwart step of Lansing as he approached my door and rapped as if to wake the dead. He exclaimed, "Wake! 5 A. M. and broiled squirrel and stewed rabbit, and the wagon is ready." I dressed on the double-quick, and my appetite for breakfast would have done credit to Falstaff, the feeder and feeder of the men in black.

It had been twenty years since I had peddled the bark around a gray squirrel's head with my old breech-loader, in Floyd county, Ind., and I was eager for the fray. I took thirty shells, thinking we might kill a dozen squirrels, albeit that genial gentleman, Judge Miller, himself an able *et elegant* among the lovers of forest and stream and old gun, had the very morning started doubted whether there were twelve gray squirrels in Cape May county. This nettled Lansing no little, for he is "king pin" among hunters by the sounding sea and "high hook" when the light is for black drum or channel bass.

Looked out of the door, 5:45 A. M., and there stood an open buggy with a little gray pony tacked attached, looking like a Norway "rat." But the gallant colonel insisted that the "rat" was gone, and "rat" Bill Travers (known to fame) wanted Jim Fisk to buy where Fisk's rat ferret ran away from a rat in the rat pit in New York. "Hadn't you better buy the rat?" said the witty Travers. The gray pony made good time, considering that he had "two heavy weights" behind him—220 avoirdupois each. After we passed Cold Spring Laurel, on the right we met Foster with his squirrel dog. This gave new zest to our expedition for if there was a squirrel between the board walk (Cape May) and Foster's house, I knew that dog would scent him out. In the West, hunting squirrels with a dog was a novel thing in the days of my youth. The first two hours were blanks. The dog made no sign, and Lansing's Gildersleeve setter did not make a point. I began to despair. But the gallant colonel, turning to hunter Hoffman, a born squirrel hunter, who accidentally joined our caravan as we neared his log cabin, down-deep in the Riley woods, said: "Suppose we try Maurice Cross's woods?" "That's the spot," said hunter Hoffman, and Foster cheerily chimed in.

One hour's beating through the low timber brought us around to the Maurice Cross farm, near the sorghum factory, where Tom Scott's son has invested some of his surplus thousands in making sugar out of cane; and with successful result.

We tied the wagon, and unloosed Bootie, as hunter Foster called his dog. "But" did not wait a instant, but skipped through the "cupples" and tread a squirrel before we could get our shells into their places. Lansing led the van, followed by the writer, Foster and Hoffman. Wen we reached the tree there was no sign of the frisky rodent. But I spied a fresh-looking nest at the top of a big oak, and led drive with my left barrel straight into the nest. The scared animal slipped out on my side of the tree, and before the coming Lansing could bring gun to shoulder, the squirrel popped to my right barrel, and Lansing fired in mid-air. But I reckoned without my host when I thought I could beat this son of Babelas, for once his eagle eye "hit" on a squirrel, that bushy tail had only to come down like Capt. Scott's "coon," for if the gun didn't kill with the first barrel, the dog was sure to bag the bounding rodent before he could gather himself up for a run, and the shooter's practiced eye was equally fast to the squirrel as he jumped. Foster and Hoffman, with their old-time muzzle-loaders, looked with unbounded admiration and dazed astonishment at the brilliant shooting of Col. Lansing's breech-loader. They did not attempt to interfere with him. A light rain had commenced falling about noon, which made it a perfect day for squirrel hunting. Before lunch we had a baker's dozen. I was ready to quit.

The stalwart Colonel expressed himself ready to halt for an assault on the lunch basket. We repaired to the phaeton, and while the "rat" munched his salt hay at his ease, we devoured sardines, hard-boiled eggs, oyster pie and cold turkey. Lansing insisted that nothing less than twenty-five squirrel scalps should adorn his belt that day. I was content. Lansing quoted Shakespeare thus: "When I ope my mouth let no squirrel dog bark." But Bute sounded the alarm far off to the right, and a great one going skyward in a tree. Lansing, Tom Scott and Hoffman, and his brother, joined and overlapped the trunk of an oak was a huge nest looking extremely "squirrelly." The tip of a gray ear confirmed my suspicions, and a big stick from Hoffman, the

hunter, made the nest-hiders jump and run up the oak for dear life.

Then the fusillade began. Lansing led off with both barrels, and left his game in the tree, only to be brought to bag by my right barrel, while Lansing, in full chase for number two, loaded as he ran for a distant sapling. His right barrel wounded the squirrel, which ran down the sapling. I missing as he ran, and the squirrel disappeared up a hollow tree, only to be drawn out by the tail by the excited Hoffman, who gave the wounded animal a fling into space, and as he dropped Beauty welcomed him with open mouth to a host of gray squirrels.

And now the fun began. The Indian summer rain helped Beauty in scenting the game, and the forty-acre tract of oak timber was alive with the nimble-footed quadrupeds.

Lansing was in his glory, and as the sun began to set we hunted our way back to Hames's Norway rat, only to find him enjoying his fodder. Counting the spoils of the chase, we numbered the slain and found ourselves the joyful possessors of twenty-six squirrels. We will bring these "gray-bags" in sight of the judicial eye of Bremer Miller. But Beauty opens her mouth when the woods again. Here is No. 27. Lansing proposes that we give our breech-loaders to Foster and Hoffman, for they had never ceased to wonder at the No. 10 shell going into our guns from the breech, and they guaranteed to kill the last squirrel with four loads; and presently they returned beaming, and bearing their honors and the dead rodent between them. This closed the case. They had killed a single squirrel between them, not because they could not kill more, but because they desired the scalps to fall before our tomahawks. We gave them all our musket shells, with ample pay for a day's work, for the powder and shot would do them a power of good. The gray rat bounced us home over the quasi-turpnicke with a speed within a few minutes of 2:40. Lansing's supper table (for he is a gourmet) groaned with salt-water eels, woodcock, terrapin à la diamond back. The pleasant intended for my evening meal had disappeared in the hands of some light-fingered habitué of the Hotel de Lausing. I wished it might be a case of damage-fessant to the "concealer" of that pleasant table full of big fox squirrels as President Arthur's Western streams were of trout. I waked refreshed with the sea air that came into my window, like a giant refreshed with new wine. And when I go again to take my pleasure in the Cresse Woods the FOREST AND STREAM shall hear thereof.

CAMPDEN, N. J., Nov. 27.

JAMES M. SCOVILLE.

MICHIGAN NOTES.

IN your able criticism of "Sport with Rod and Gun," you mention Mr. Laffan's claim that deer will not turn aside from a fire on a runway, in rather a skeptical manner. Now, the fact is, in this section fires are often built on runways, as a deer in front of the dogs does not seem to care for such fires. Our Michigan deer may be very peculiar as you imply, but you must remember that as forest fires are common in this State, perhaps no professional deer hunter accustomed to them. My own poor opinion, however, is that deer can hardly "think" of two things at once; with horns after them, their whole thought is to escape from their pursuers. A fire is not uncommon in the woods, so the deer will run or, if in fact nearly over it, as I have seen them do more than once. It might be fair to add that where I have seen such fires kindled they were either close to lakes or rivers, and perhaps a deer making for water would push on desperately by them rather than turn aside from a fire. I do not think that at best it is hard to say what he will or will not do.

The hunt of the Turtle Lake party (mentioned in one of my recent letters) was suddenly broken up by the death of Mr. George Gillman, at Detroit, this last week, Mr. E. H. Gillman being summoned home to attend the funeral of his late partner and brother. The party had excellent sport while they staid, killing fifteen or twenty deer. They report them not as numerous as last season. Strange, isn't it, when we think of the thousands slain at all times of the year.

The only way to save the devoted animals is by preserving the shooting on an immense scale. If our millionaire pine land owners were wise they would at once take energetic steps toward preservation. There's money in it, sure. I believe in less than five years the best deer countries of our State will be preserved, in a crude way perhaps, but still preserved. Attempts at preservation of large tracts could only result in good were they successful or not, for special attention would be directed to wanton slaughter or killing for the sake alone. If some of our sturdy lumbermen once take it into their heads that the thousands of deer slain in their forests are property of value, then heaven help the slayers.

Henry Crane and George Abbott, Madison, Mich., were out over 'coons a few nights since. After shooting one or two, they let their dog have the next 'coon that came down, but the 'coon proving too much for the dog, Mr. Abbott took his loaded gun by the muzzle, and with singular recklessness, clubbed the 'coon with it. It is not to be wondered at that Mr. Abbott is dead. How any man with any experience could think of using a loaded shotgun as a club, I cannot conceive. Even if the gun was not loaded the chances would be that a blow would break the stock of the weapon.

The interest in trap-shooting is decidedly upon the increase in Detroit. One or two coteries of gentlemen are now having their regular shoots at clay-pigeons, and the infection is sure to spread. It's just like boys' games, you know—marbles for instance. We all remember each spring note of a snigger for boy was devoted to that game—so note of it be with the trap.

At a recent meeting of the Lake St. Clair Fishing and Shooting Club, it was unanimously voted to increase the salary of the popular steward, Mr. Dwight Whitney, and a considerable sum was also voted him as an immediate expression of the satisfaction at his season's management. As there are two hundred members in the club, the action is a great compliment to popular Dwight Whitney.

FOREST AND STREAM, you know, wonders "what kind of creature have up in Michigan." Well, possibly, my probably, Michigan deer are peculiar. Their peculiar peculiarity has been discovered by our amiable friend Col. M., of Pennsylvania, who has just accomplished his first deer hunt in Michigan. Fresh from the Adirondacks, this season, where he killed three deer with two shots from his rifle, he gaily comes to this State and goes with the Detroit party to Turtle Lake camp, where he bags a deer by simply cutting off its tail with a rifle ball. It happened thus: The Colonel, not feeling just right one morning, concluded not to go out on the war path with the others, but remained at camp to doctor

himself out of a severe cold. By the way, that's a most comfortable camp that was built for the party referred to, this last summer; some of you from Park Row must come out next season and see for yourselves; the Windsor Hotel is nothing beside it. Well, the Colonel proceeded to doctor himself and was doing well when he heard the hounds firing tongue not far away. Running to the door he saw a fine doe making his way uncertainly across the ice-covered lake, close to which the camp is located. He seized his repeating rifle, ran to the edge of the ice, and began "pumping lead" at her; she was a great distance off, but the Colonel a splendid shot and at the seventh or eighth discharge down she went. The two dogs running her soon came up and held her while the Colonel, well satisfied with his long range shooting, ordered the darkey cook to go and bring her in. The darkey went and although the doe thrashed around considerably, upsetting him two or three times in the glassy ice, he succeeded in cutting her throat and dragged her to shore. There it lay, the poor creature's tail had been cut off close to the rump by one of the bullets and was hanging by a mere shred, but nowhere else had a bullet touched that devoted animal. I am inclined to admire the Colonel's economy and mastery shooting. Of course he claims that he did not wish the bullet to spoil any meat.

DETOIT, Mich., Dec. 1.

A THANKSGIVING GROWL.

THANKSGIVING DAY, and as bright, mild and inviting as the 1st of October. I had planned an extensive day's shooting for this occasion, but a bluish cloud has me in its clutches and keeps me prisoner.

Owing to ill-health and bad weather, I have had but few opportunities to shoot since the season began. I have been out three times with the following result: First trip, out all day, resting from 12 M. to 3 P. M.; bag 2 quail and 1 dove. Second trip, out all day, resting from 12 M. to 2 P. M.; bag 2 quail, 9 quail, 2 quail, 1 dove. Total, quail 64, hares 3, doves 2.

Quail are certainly more abundant this season than they have been here for several years before. However, they invariably feed near the thickets, into which they generally plunge as soon as flushed. These thickets are of the kind described in the clipping from the Baltimore Sun, published in your issue of Nov. 22. "Stiff swamps, grown up with long green brambles, chicken grape vines and blackberry bushes." This is the place in which the correspondent says "a really good partridge shot kills eight out of ten birds every time." I agree with him, but only every time that he finds a bevy of ten luddled under the briars. A man who can kill eight out of ten birds every time in such cover as is here described, would have no difficulty in killing ten out of eight in ordinary cover.

I have had over twenty years' enjoyment and experience as a wing-shot, and in that time have made the acquaintance of many enthusiastic lovers of the gun—amateurs and professionals. I know no professional, and I have never met but one individual who affirmed himself capable of such a feat as to always kill eighty per cent. of the game shot at. This phenomenal shot proved to be a commercial man from Chicago, whom I met on a train on the M. K. and T. R. R., and who betrayed in the course of the conversation that he did not know a pointer from a setter.

No, the place to make such scores is not in the tangled thicket or even on the open stubbles, but in the columns of a daily newspaper, and the arm necessary is merely a well-pointed Faber No.

I presume that I have expended too much bile on this topic, but then remember that I am chained to the house on the only perfect day for quail shooting I have seen this season, and is it not enough to raise the bile after one has been forced to abandon a bevy of plump, well-fed, strong-flying birds because of their taking refuge in a thicket, to be greeted by the statement almost as soon as he opens his paper that in such a place a really good shot ought to kill eight out of ten birds every time.

WILL.

MONTANA GAME NOTES.

The Clark's Fork hunting party are back, and game plenty. There were six of them, Messrs. Hulme, Breuchaud, Webb, Rowley, Wilde and Watts. They have written an account for our local papers from which I make some extracts: "The second day we took up our line up Clarke's Fork, crossing and recrossing the stream nine times. We made 30 miles and camped at the ninth crossing. We saw no game other than chickens, and even at this early stage of our hunt they had ceased to call attention so numerous were they. The third day we took up our journey with the firm intention of going to 'Gray Bull,' the hunting ground of the famous bear hunter, Col. Pickett. But when we reached Bennett creek it was decided by vote to go up this stream. This was a great mistake as we afterward, when too late, found out, for had we pursued the original programme as we had mapped out before leaving Billings, at a distance not exceeding 60 miles from Bennett creek we would have found an abundance of elk, sheep and deer. This we ascertained from Count Du Bore, who has a large horse ranch near the mouth of the Stinking Water. The count brought in eight or ten magnificent heads of elk and sheep; also three monstrous grizzly bear skins. Going up Bennett creek we saw three or four large bands of antelope and several white-tail deer, but did not get a shot. We followed up Bennett creek as far as practicable and went into camp. The first evening in this camp Chas. Watts brought down the largest black-tail buck I ever saw. We hunted from this camp four days with no better success. The second morning we saw an old and a young elk hunter, who enjoys the sobriquet of Red Jack, told us the elk and sheep had not come down from the main range, where we were, and that the deer, whose horns he had come down with the first storm and had gone over on the tributaries of the Stinking Water and the foothills of the Pryor Mountains. We would not have to go 100 yards from our camp to kill more chickens than Tom Mullen's steed could carry. I have been in States and Territories that boast of their fine chicken shooting, but nothing I ever saw is any comparison to the numbers we saw on Bennett and Rock creeks. Reaching the forks of Rock creek, all made camp and here we had our best hunting, each killing a deer and chickens by the dozens. We could have had far better success at this camp only for the Indians who were camped in large numbers near us, probably 100 lodges."

Several other hunting excursions have been successful. Louis H. Borrie and Geo. W. Smiley of Billings, have returned from the Lake Basin. They brought in nine antelope and some smaller game. Messrs. Brown and Luffer are back from the Painted Hole, well supplied with deer and antelope

which are plenty there. A hunter just in from the range reports a herd of Buffalo numbering about 75,000 in the vicinity of the Belle Fourche, and also that about forty lodges of Gros Ventres are hunting them, besides a large number of Milk River hill breeds. A man brought five foxes which he poisoned at Hamlet. Judge Matheson pinched their heads and ears, or rather their ears, and issued the certificate for the bounty allowed by law. *Missoula* county ranchmen are annoyed by the bears. The *Missoulian* says: "A large bear, and a cunning one, has been at work in the Sweethouse district, taking in the different breeds of hogs. Bruin has distributed his calls very generously all over the neighborhood, and one night last week, when pursued, took a full grown sow clear through a fence and off into the mountains, going away with his prize in first-class shape."

BILLINGS, Montana, Nov. 24.

GUN AND GAME IN TEXAS.

OUR shooting season, which at first seemed so bright, has been very disappointing. We expected an immense flight of ducks, geese, snipe, etc., as soon as cold weather set in. No doubt we would have been gratified had the cold weather only set in, but, with the exception of one or two days, it has been as balmy as summer.

At the beginning of the season every one predicted an early winter. I am inclined to think that the birds made their appearance fully two weeks in advance of those of last year. The conclusion arrived at was that they had been driven south by stress of weather. Of course, then, if the weather grew severe so early at the north ours would be corresponding. This idea took root and grew to such an extent that predictions were made, as many imagined, upon a sure thing. And now, well, disappointments have been many, and if any foretelling is indulged in next year it will be at variance with the foreteller's own idea; if he thinks an early season likely he will predict a late one.

Ducks and geese have remained north of us, although I understand that in the rice fields of Louisiana they are unusually plentiful, and are in perfect condition.

In some of the middle counties of this State, mallards have made their appearance in very large numbers, taking possession of the timber and growing deliciously fat upon acorns.

A few canvas-backs have made their appearance at the head of East Bay, but are not in good condition. As a rule they are not so plentiful in November and December can hardly be excelled. The birds then are large and fine, and are eagerly sought for by both sportsmen and pot-hunters. This year seems to be an exception, very few ducks of any variety making their appearance in their usual haunts. I am in hopes of yet getting enough cold weather to bring the birds with us.

Snipe. I am glad to report, are here in fair numbers. They, in absence of other game, have received my undivided attention, and I must confess that although I have been very successful I have missed a great many more times than I have hit.

GALVESTON, Texas, Nov. 26.

The weather has been growing gradually cooler, and the winter season is fairly upon us; already reports are coming in of good bags. We are all looking forward with eagerness for the advent of the first severe norther that will sweep over our sunny State, knowing it will be the harbinger of myriads of wildfowl fleeing southward in pursuit of more congenial feeding grounds.

There is a large crop of mast in the river bottoms, and that will doubt be some rare sport with the ducks and geese. We have already had one or two slight northers, but the game has not as yet appeared in very great numbers. I had a little rare fun a few days ago during the prevalence of a slight norther. Standing at my office window I saw what I supposed to be a brace of canvas-backs fly past very low. After a few circles they settled almost in the limits of the town; they were evidently lost or bewildered by the force of the wind. Procuring a small .32-caliber Remington rifle, and my own weapon loaded, I sallied forth in pursuit, by talking to the woods on the edge of the town I succeeded in getting within 90 or 100 yards. I discovered the object of my search much to my surprise to be two fine wild geese, and at the distance of 90 yards they bore an extreme resemblance to the tame ones as they stretched their long necks high in the air. I took careful aim and fired, but much to my disgust scored a clean miss. The next time I was more fortunate, and had the satisfaction of seeing the feathers fly. Both took to flight and went about 200 yards. By firing considerable crawling and dodging I succeeded in approaching within 60 yards of my game, and discovered then on the ground, one dead. I soon put the fins to the other one, and was in possession of a prize which any sportsman might be proud, inasmuch as they were both in fine condition and very large and heavy.

Accompanied by two friends I took a trip into Milan county a few days ago for partridges. We took our dogs and guns in wagon, with ample provisions for a week's camp-hunt, but for the third morning we had an opportunity to try a kind of sport that I want not many sportsmen east of the Mississippi ever behold—catching jack-rabbits with greyhounds on the prairies. A friend came into camp bringing three very fine hounds, and accepting his invitation, we proceeded to witness the only kind of sport in which the greyhound is useful in this country, its wonderful speed and endurance being the only thing capable of circumventing that of the "mule-eared rabbit," as it is called in this country. Those who are familiar with the habits of this little animal need not be told of its wonderful speed and activity. It is much larger than the common rabbit, and is noted for the extreme length of its limbs and ears, the latter in some cases reaching the extraordinary length of five or six inches. There was plenty of game at the place we hunted, and it was an exciting scene to watch the fleeing animals pursued by the graceful greyhounds. The dogs ran in Indian file, and it resembled a veritable blue streak to see them stretching out in pursuit; the leader on overtaking the fleet-footed rodent would suddenly seize it by the back, toss it in the air, and as this required a very sudden start, the velocity was generally too great for their equilibrium, and the hounds would turn a dozen somersaults in the endeavor to stop, each dog snapping at the unfortunate hare as it passed; and for a few minutes the scene would be rather ridiculous; there seemed to be an indiscriminate mixture of dog legs and bodies on the greensward, with occasional glimpses of hare.

Game laws, I regret to say, are little regarded in this State, but I hope the time will come when sportsmen will recognize the great need of protection, and enforce such law

as will cause the pro-hunter to retire from his ignominious business with disgust. Buffalo are reported as appearing in the northwest in considerable numbers. It is to be hoped that they will be molested for a few seasons, when they may once more appear in their old-time numbers.

Deer are very plentiful, and will no doubt be so for some years to come, as there is little or no market for them, and none are slaughtered except for actual use. Not long ago I saw the unusual sight of no less than five deer feeding together within a thousand yards of town limits.

J. B. SIEGA.

WALKER COUNTY, TEX., NOV. 27.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I fear that "D. M. B.'s" plea for a 40-90 repeater will not meet with a ready response from the manufacturers of repeating arms, at least until some one invents a new system on which to build these very attractive weapons. The present repeaters may be conveniently classified under two heads, namely the lever guns, e.g., Winchester, Marlin, etc., and the bolt guns, e.g., Lee, Hotchkiss, etc. The lever actions have never, we believe, been regarded as specially strong, i.e., capable of standing very heavy powder charges. In this respect they are not for a moment to be compared with the Sharps action. The bolt guns are far stronger than the lever guns, but they are not so adapted for sporting purposes, and I doubt if they ever will be projecting bolts being an eyesore, and liable to catch against other objects. The repeater, therefore, for sporting use is the lever action. The heaviest cartridge adapted to the Winchester measures about two and a half inches in length, while the 40-90-500 demanded by your correspondent could not be made much shorter than four inches. This would require a corresponding lengthening of the cartridge carrier and adjacent parts. I fear, I should think, to require the action to an excessive degree. I fully appreciate your correspondent's desire for a flatter trajectory than is at present attainable in the majority of American sporting rifles. The English have taught us a good deal about this, and I believe that their double-barreled sporting rifles are, on the whole, more desirable weapons than any of our own repeaters. At the recent trial of rifles in London the winning .45-cal. (double barrel) was loaded with 110 grains of powder and a bullet of 291 grains. At 150 yards range the rise of the ball was less than five inches, and the accuracy of the arm was all that could be desired. If American manufacturers would study the lessons to be learned from English experience, and would give us good double rifles, with flat trajectory combined with accuracy, we believe that repeaters would retire from public favor.

New York.

GRESHORN.

A MONTANA INCIDENT.—Helena, Montana, Nov. 24, 1883.—Editor Forest and Stream: Our markets this season have been supplied with moose, elk and deer, to say nothing of the geese, ducks and small game, and our Oregon fish. An unusual amount of game of all kinds has been marketed here this season, and I am pleased to say that I believe skin hunting will soon be a thing of the past. I was one of four who took a five days' hunt in slight of home, and the result was ten deer, nineteen ducks and a nice lot of trout. Since then, with my Baker gun and Horn & Lang's geese decoys, I have placed twenty-one geese to the credit of my game bag. Of all decoys I think these decoys are the most deceiving to the geese. Our old friend and fellow-sportsman, Blackhall, met with quite an adventure lately. Having shot a moose cow and her yearling and summer calves, he put them away for safe keeping, as he thought, and returned home to assist in the disposal of them. When he went back for them with his companions they found to their sorrow that three chimpanzee heads had taken squatter's rights and destroyed all three moose. This brought about an action which resulted in three bears instead of three moose being hung up in our market. Hunting is now over until water fowl return in the spring, and we will, therefore, have to rely on the FOREST AND STREAM for our winter's sport. There is a two-year old moose cow for sale here as tame as can be. Who wants it?—MONTANA.

ANOTHER SIDE-HUNT.—Toronto, Nov. 28.—A grand "squirrel hunt" took place in the neighborhood of Scarborough to-day. It was the season for the yearling of Scarborough, under the leadership respectively of Messrs. A. Thomson and J. Simmonds. Although the hunt was technically termed a "squirrel hunt," it also included besides those rodents the shooting of other species of animals. Small birds (not insectivores) counted 1 point; red squirrel, 5; black squirrel, 10; crow, 10; hawk, owl, partridge and snipe, 20 each; muskrat, 25; and skunk, 50. The day's operations resulted in a victory for the south side by 573 points. The score shows that there is still a little game left about Scarborough, or at least that there was before the hunt. Among the bags were 7 partridges, 25 muskrats, 2 snipe, 2 owls (one of them a monster), 6 hawks, 4 crows, and innumerable squirrels, the greater part of which were red. After the match the contestants enjoyed themselves at a well-served oyster supper at the Leslie House, Scarborough Junction.

THE DUCK NETTERS.—New York, Dec. 3.—Editor Forest and Stream: While examining some very handsome specimens of ducks yesterday in the market of M. Travis, of Barclay street, one of the clerks informed me that they came from City Point, Virginia, and were all netted. He did not remember the name of the man who had netted them, but thought that it was Palmer. The clerk told me that several barrels were received at a time from the duck catcher, and that the birds so caught were very desirable on account of lack of shot holes. Each duck that I examined had its neck broken, and not a shot mark could be found on any of them. I hope that the duck netter will never have his neck broken, but if an accidental discharge of his gun should bring him to the legitimate way, there would be rejoicing among the ducks.—MARK WESS. [This is referred to Mr. Goodwin, the game protector for this district.]

THE MANCHESTER RACCOON REGIMENT.—Manchester, N. H., Dec. 1.—I have not had a chance to pull trigger this season, but hear that the woodcock and ruffed grouse shooting in this neighborhood has been unusually good. Gray squirrels have been correspondingly scarce, but the Manchester "Raccoon Regiment" have been very successful, having captured fifty up to a fortnight ago.—VOX W.

INCREASE OF LYMANIA SHOOTERS.—Fairland, Ind., Dec. 1.—The season just closing has been a good one in this State for quail and rabbits. Quail have increased wonderfully in the past season. This I think is due to the absence of snow last year. If we are spared a deep snow this winter, the shooting next season will be all that a reasonable sportsman could desire. But the most astonishing thing about the shooting season this fall is the wonderful increase of shooters. So great indeed is the number of gamblers hunting over the fields, that farmers have generally become disgusted with the very sight of the rabbit-hunting fraternity, and in order to receive respectable treatment, it has become necessary to see the owner of the land and get permission. Many farmers have posted their lands this season whenever thought of doing so before. This is as it should be, for the privilege of shooting over well preserved land is esteemed very highly by the thoughtful sportsman. He is willing to make some return for this privilege, and one such will be accorded the privilege. Judging from what I see in the State, the gun dealers and manufacturers must be reaping a harvest that bids fair to continue for many seasons.—C. W. W.

WILD TURKEYS IN PENNSYLVANIA.—Foltz, Franklin Co., Pa., Nov. 27.—Game birds are not so plentiful as they were last, although in some localities there are numerous enough to afford a good day's sport. Up to the present time seventeen wild turkeys have been killed by our sportsmen here. Wild turkey shooting has been fair, and if it were not for the violators of the law, who still persist in blinding, feeding and slaughtering the birds in this unsportsmanlike manner, they would be plentiful. We also have pheasants, quail, partridges, ruffed grouse, squirrels and rabbits in sufficient quantities to afford a good day's sport at any time.—STETTINGER.

Sea and River Fishing.

ANGLING RESORTS.—We shall be glad to have for publication notes of good fishing localities. We do not necessarily favor us with notes of desirable points for angling occasions.

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The digest of open seasons, printed in our issue of Aug. 16, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

THE ST. LAWRENCE RIVER.

Editor Forest and Stream:

On the 26th of October last, there was organized in this city The Anglers' Association of the St. Lawrence River. It is proposed to restore the fishing of the St. Lawrence. All old visitors at the Thousand Islands know how very greatly the fishing has fallen during the last few years. The reason for this falling off are well known, and are matters of fact. It has not been caused by angling, but by illegal net-fishing.

In August of this year, a party of gentlemen organized an expedition and destroyed a quantity of nets at a point about midway between Clayton and Cape Vincent. The river was found literally blocked up with trap-nets from the shore to the channel; in fact, fenced out of the river about a portion. For want of time it was possible to destroy but a portion of the nets. It is believed that in those destroyed there were secured more fish than are caught by angling from any watering place on the river during the entire summer season. There can hardly be a doubt but that if all the nets had been destroyed more fish would have been secured than are caught by hook and line in the entire river during a season. The fish were of all kinds and sizes. They are captured in such large quantities that the owners of the nets do not even take time to clean them out, and large numbers of rotten fish were in the meshes of the nets. It is this fishing with trap-nets, in plain violation of the law, which has destroyed or severely injured the fishing of the river, and to stop this and compel the enforcement of the laws is the principal object of the association.

It should be remembered that this was but a part of one day's work, and at but one point on the river. It is well known that from early spring until late fall there have been regularly, of late years, a perfect horde of nets in the river. They have been at the head of Linda's Island, all about Carleton Island, from there all the way to Cape Vincent, and up to the Light House. The whole upper river has been shut off from below as far as the migration of fish is concerned. Wherever the fish are likely to congregate, or to go, there they are met with nets, and will be until the sternest methods are taken to stop the illegal work.

Some three years ago, Mr. Seth Green, said to a gentleman that he could "make the fish so plenty in the St. Lawrence river that they would block the wheels of the steamers?" when asked how he would do it, he replied, "By destroying the nets."

It is intended to offer rewards for the destruction of the nets, so as to give game protector in enforcing the laws, furnishing and advancing money for the purpose when necessary; to secure the prosecution of parties who fish by illegal methods, whether by nets or by spearing on the spawning beds; to furnish means for restocking the river with bass and other desirable fish; to secure the co-operation of Canadian anglers, and to do such other things as will make the fishing what it easily can be made. With hearty co-operation of lovers of the river, the fishing can be restored, and can be made far better than it has ever been.

The association needs members. Thousand Island tourists are joining the association in great numbers. The initiation fee and annual dues have been placed at the small sum of five dollars. It has been arranged, however, that a life membership may be granted on the payment of one hundred dollars. The association needs funds during the next year, and it is for this purpose that it is earnestly requested that those who can afford to do so, will make themselves life members. Application for membership should be made to the corresponding secretary.

The officers of the association have been selected with reference to those who will do hard work; they are all active fishermen. The association has come to stay. Members can rest assured that everything will be done to carry out its object, and it will not be a very long time before the pleasures of a visit to the Thousand Islands will be doubled.

Sections 7 and 8 of the by-laws provide that the president and chairman of the executive committee shall have the power to offer such prize or prizes, of such value and kind as he may deem best, to members of the association for the most successful fishing, as they may prescribe; and that all members of the association shall discourage the killing or retention of any black bass of less than one pound in weight; pike or pickerel of less than two pounds, and of muskallonge of less than six pounds, that may be caught in the river.

In addition to the objects of the association, it is proposed to furnish badges of membership, to be worn by members, if they desire to do so, when they are visitors at the islands. It is believed that this will add much to the enjoyment of members while among the islands, by making them readily acquainted with each other.

Articles of Incorporation have been prepared, the officers elected at the first meeting having been selected as the incorporators; their names and addresses are: President, John J. Flaungan, Utica, N. Y.; First Vice-President, Daniel Pratt, Jr., Syracuse; Second Vice-President, William Story, Albany; Corresponding Secretary, W. W. Byington, Albany; Recording Secretary, Charles H. Ballou, Utica; Treasurer, Gardner M. Skinner, Clayton. Executive Committee: John H. Quilby, Chairman, Albany; Myron P. Bush, Buffalo; John H. Mayne, Syracuse; E. R. Olmsted, Rochester; J. H. Brown, Oswego; John H. Brown, Hamilton; J. C. G. W. Ham, Albany; W. H. Frisbie, New York. Advisory Council, Hon. Franklin M. Dammer, Albany.

The society and its members will be under the full protection of the laws of the State of New York in every regard. W. W. BYINGTON, Corresponding Secretary.

ALBANY, N. Y., NOV. 28.

AFTER CONGER EELS AND DOGFISH.

THE writer has always had a fondness for sea-fishing, but especially for fishing in the deep-seas, or around rocky coasts or foreign shores, as it is practiced by the hardy fishermen who make their living between the lull of storms, and who gather their daily bread from the ocean. It is a great pleasure indeed to sail out far at sea in a staunch smack, to stay for several days, and to watch and help the men cast their big seines, and see the myriad of strange creatures brought to the surface, and to fill one's lungs with the fresh, salt winds, as the smallboat, rapidly makes head-way among the big waves. It is that fondness that has caused me to go out with the herring men at Skye, the tunny fishers in Italy, the swordfish killers of Sicily, and so many others.

I was one summer at Trouville, a fashionable watering place on the coast of France, in a beautiful spot, with the Atlantic Ocean rolling at its feet, and the waters of the English Channel far away to the right. One day I was strolling on the quay where the fishing smacks land at high tide, and where baskets and barrels of fine fish are brought ashore and fast sold at auction, and I noticed especially a small black-hulled cutter from which large basketfuls of big conger eels and dogfish were being brought out. I at once thought that I would enjoy a rip with a smack, and very early my mind to try and go. I spoke to one of the men, who informed me that he was the captain, about my wish. Well, he seemed a little surprised at first, and told me I would be very uncomfortable, and that their fare was poor, and finally he informed me that they would be two days out, or more, and that the weather would be very rough, and last, but not least, he crowned his argument by saying, "Monsieur aura le mal de mer, which means, in plain English, 'you will get sea-sick.' I answered by asking how much he would take me for, and now I perceived that he thought he would paralyze me by saying ten francs, roughly, two dollars. I accepted at once, to his great surprise, and asked when he would start, and I was informed that they were to sail at next full tide, otherwise at three o'clock next morning.

I hurried home, told my folks I was going to be away, bought some tobacco, and a couple of cigars, viz., two top-notch makers aboard with, and made a bed for myself, and I stepped on the plank between the wharf and the boat at about ten o'clock that evening, found two men on board, who greeted me with some French amounting to, 'Well, well, so you are coming after all, are you?' and began trying to make me comfortable. After talking a short while I lay down on a little bunk covered by an old sail, and after removing a few splinting pins, earlocks, etc., that were beneath this hygienic mattress.

I woke up a few hours later, and after knocking my head on the beams managed to find the scuttle, which I lifted, and went on deck. Swiftly the wind was carrying us along between the two jetties, and in the dark we could see the gas lamps at their ends throwing a slim, uncertain light over the water. We passed the jetties, a cold wind was blowing, and the four men composing the whole crew were at work, by means of sails, steering, arranging the long lines on which the hundreds of hooks are fastened that serve to capture the conger eels and dogfish. On our right we could see the powerful light emitted by the lighthouse on the high cliffs above Havre. Both the outgoing tide and the current from the River Seine, which reaches the sea between Havre and a little town called Honfleur, near Trouville, were carrying us fast out to sea. The sky began to brighten a little over the coast, and after awhile the sun appeared, and casting a lurid purple light over the phosphorescent waters, which seemed to fall back a shower of diamonds every time that our dipping bow struck a wave. We sailed on, taking a northerly direction for about twenty-five or thirty miles, still in sight of land, however, and after awhile the captain took soundings, and bearing around, we stopped, and the mizzzen was brought down, then the jib, and finally the anchor was let go, and we were on our way about twenty or thirty miles out.

The day before all the hooks had been baited—no small job, as we had four lines, each with about 150 or 200 hooks, about six or seven feet apart. The small rowboat we had been towing behind was now brought into requisition. I jumped in with two of the men and wanted to row in order to warm up, so I took one out, one of the men took another, the big basket containing the line carefully covered up was put in the stern, the captain attending to that. One end was made fast to the cutter, and away we roved, the captain letting out the line, until we were about 400 yards from the smack, when the end was reached; this was made fast to a good sized cork buoy, with a pole stuck in it, carrying a little white flag. The three remaining lines were also put out in the same way, around the cutter, and we got on board again, cooked breakfast and began to eat, and casting a long stare. I forgot to mention that they used as bait this wonderful moving. A good piece of cuttle-fish was used on each hook. The men get their bait from the

trawling smacks, who bring up barrels of them at each east of the trawl, and the most ugly thing I have ever seen, I think, is a barrel of these shiny, slippery things, consisting of their tentacles about like a bunch of angle worms, and many will, I think, not think I am bereft of all sense of truth, when I say that they are eaten by all the fishermen in the Mediterranean, though the Atlantic fishermen would never think of using them for anything but bait.

After waiting a few hours the lines were pulled in and the fish taken off, big, slippery conger eels, some as large around as a man's leg or larger, and five or six feet long, and voracious, shark-like dogfish, thumping their tails in the boat, after having received and before being lifted into the boat, death blows from an iron spike. About 150 fish altogether were taken, and the next morning we sailed home, all well satisfied. I think I had a great deal of fun; perhaps you don't, but then I like roughing it out at sea. G. V. S., New York.

out any national prejudice, and if the trout of Europe is really a better fish than ours we should not only know it, but report them, and give them a chance to show their superiority in our waters. Trout in the Thames grow to great size, sometimes to twenty pounds weight, and as they live in large rivers they would no doubt be valuable for such streams as the Connecticut, the Hudson, the Delaware and other streams. A few eggs of the *fario* were sent by the Deutsche Fischerei Verein to the Cold Spring Harbor hatchery of the New York Fish Commission, and from there some were sent to Caledonia, but the eggs were not in good condition and but few fish were obtained from them. We will be pleased to hear from such of our readers as have had more experience on both sides of the water than we have, and get their opinions on the merits of the two fish for hardness and game qualities.

MR. SILK AND THE BLACK BASS.

Editor Forest and Stream:

From several letters which I have received from friends in the United States, I see that I am expected to say something about the above affair.

I have known Mr. Silk for some time, and in spite of the strong language used about him by writers on your side of the water, I am convinced that in getting the bass from Greenwood Lake he acted in a perfectly honest and straightforward manner. For my part, I have no objection to the publicity given to his proceedings, provided it does not accuse him, nor refuse to move in the matter or give evidence in a court of law. All friends of Mr. Silk on this side the water, and he is widely known and respected, regret exceedingly that the matter was not taken into court and the true facts elicited. Mr. Silk states that he felt perfectly secure in Mr. Blackford's permission to get the fish. Mr. Blackford states that he never gave Mr. Silk permission to net the fish. I cannot help thinking there must have been some misunderstanding about the right to net and the right to fish with rod and line, but surely the guides who got the fish would be supposed to know if it was legal to net or not. Mr. Silk knew that fish had been netted in large quantities and sold by the guides to Americans. He did not think that because he could only employ some of the guides to get the fish, the others in a jealous mood would cry out that he was stealing 11,000 black bass, when, as a matter of fact, he was only buying 2,100. The fish were bought and paid for by an Englishman, just as previously many thousands had been bought and netted for by Americans. Why did not Mr. Blackford stop Silk? He had plenty of time to do so, and had been warned. My opinion is that Mr. Blackford, knowing the fish were wanted for acclimatization in England, and knowing that 2,000 small fry from a place like Greenwood Lake could not injure the stock of bass in the United States or even in this lake, was kindly careful not to do what he might have done, i. e., stop the fish. He did not think the disappointed guides would set a story on foot to the effect that, while Mr. Blackford's permission was given, he had sold 11,000 fish. Mr. Silk went for 2,000 small fish, he told Mr. Blackford he wanted 2,000 small fish, and he paid for them. If he had employed guides to catch the fish with rod and line the loss to Greenwood Lake would have been appreciable, perhaps, because in that case the fish would have ranged from 1 to 12 pounds each, instead of being fry of only two or three inches. In July last Mr. Silk wrote to the guides asking them to keep for him all the small fish they caught, and to apply to him when they had only kept 500 or 600, and they then went to work with some bits of mosquito netting to get the rest of the fish. Mr. Silk heard that thousands of fish had been netted and sold during the summer. What could an Englishman know of a law which was not respected or observed by those for whose control it was made?

I am convinced that American anglers will by this time be looking at this matter in its true light, and will absolve Mr. Silk of any desire to steal or unlawfully obtain their fish. Mr. Silk has discharged the duty of the Marquis of Exeter, who has taken great interest in fishiculture, and especially in the introduction of this fine game fish, the black bass. I have also, for some years past, strongly advocated the introduction of this fish into such of our waters as are not suitable for salmon or trout. The Marquis, myself and the other gentlemen who have joined to pay the expenses of getting the bass over have not done so with any commercial or mercenary motives. My share of the bass Mr. Silk got over last year cost me, I think, nearly \$4 each fish. I have the pleasure of being acquainted with Prof. Goode, Mr. George S. Page, Mr. Reuben Wood and other American gentlemen who have been over here, and it is what they have told me and what I have read in FOREST AND STREAM, in Mr. Hallock's book, in Dr. Heushall's book, and in other American publications, that has given me a strong belief in the black bass as an angler's fish. There is considerable opposition to its introduction here, and it will take years to make it "at home" in any extent. Mr. Silk knows this, and I ask you, sir, is it at all likely that he would deliberately spoil all chance of getting future supplies by acting as dishonestly as he is accused of having done? I candidly admit I think he was somewhat injudicious in going to Greenwood at all this time, as there was some complaint before when he went there for fish, but until I see proof to the contrary, I will continue to have that confidence in him which is, I know, shared by the Marquis of Exeter and many other English gentlemen interested in fishiculture. The writer, who admits the damage to the stock of black bass is unappreciable, is upon Lord Exeter and myself by name, to return the bass "dead or alive." Now, even if we admitted that Mr. Silk had unfairly obtained them, I regret to say we could not do this, for nearly half the fish died on the voyage and are now in the Atlantic in some shape or other—probably some other. However, to prove to American anglers that we sincerely regret they should have a sentimental grievance against us, if they will accept them, we will undertake to procure, say ten thousand eyed ova, one of each colorated trout and send them out as a present from those gentlemen who sent Mr. Silk out for the black bass; not in any way as a penalty, but purely as a present to prove that our regret at this unpleasant affair is sincere.

R. B. MARSHTON, Editor Fishing Gazette.

No. 12 and 13 FETTER LANE, LONDON, E. C.

[This letter of Mr. Marston's presents the matter in the light in which it is viewed on the other side of the water, and our only regret is that the affair assumed the shape of an international dispute. We can refer to our columns to prove that we have cast no reflections on the gentlemen who wished to obtain bass to take over to their waters. We look

upon the affair as bringing prominently before the public the practices of the Greenwood Lake guides in netting fish for any one who will buy them. Viewed in this light the row raised will be beneficial in checking the netting in future. We are aware that much intemperate language has been indulged in, some of it silly as well, and are also aware that the British lion never even lifted his eyebrows when called upon "to return those fish, dead or alive." These are things to regret. There is much good feeling among the anglers of this country and England and we wish that it had not assumed the shape it has. We have blamed the guides who, living on the lake, know the laws and violate them. We hoped to see them punished, and while their trial resulted in what was practically a verdict of "not proven" it will no doubt have a good result in putting a stop to their using nets. Mr. Marston will see by our later reports, which have reached him ere this, that such a trial was held; also that the guides knew, or should know, that Mr. Blackford had no power to give them permission to use nets, and, in fact, had actually nothing to do with the law or its enforcement, until being dragged into it as a fish commissioner, to whom the game protectors refer, he took steps to stop the shipment of the fish at the last minute, when it became certain that nets had been used. If the fish had been legally captured with rod and line there could have been no objection to ten times the quantity being taken away alive, for a fish thus taken has forfeited its life to its captor. The time was ripe for a complaint against netting in the lake. There had been murmuring loud and deep, and when Mr. Silk called the publicity given to his proposed shipment caused an outbreak of pent-up wrath. It is true that nothing has been done for Americans, but it has been kept comparatively still and has not attracted much attention. On the whole, we think this case will result favorably to the fishing in the lake, which is the nearest good resort for black bass fishers from New York. The kind offer of trout ova which concludes Mr. Marston's letter will, we think, be accepted in the spirit in which it is offered by the New York Fish Commission. In fact, this offer was kindly made by the Marquis of Exeter to Mr. Mather, of the N. Y. Hatchery at Cold Spring Harbor, last year, but floods on the rivers prevented the gathering of the eggs. We would again repeat that we do not consider Mr. Silk as much to blame for buying netted bass as we do the natives who netted them. He was a stranger to our customs, and finding that it was customary to net the fish for other people, relied on the guides to know if the law was enforced or not.]

THE TROUT OF COLORADO.—Cataract Lake, Nov. 22.—In FOREST AND STREAM OF NOV. 8, Senator G. G. Vest makes a very great mistake in asserting that the 44-pound trout taken by him while fishing in the Rio Grande del Norte, in Southern Colorado, was of the species known as *Salmo fontinalis*. For as a matter of fact no such fish anywhere in that stream, but the common black spotted mountain trout, *S. virginicus*, of Gerard, found there, and the fish taken by the Senator was undoubtedly of that species. Neither are there any brook trout in the waters of the Snake River or the Gros Ventre, if by brook trout he means the *S. fontinalis* of Mitchell. But the black spotted trout with reddish fins, and the black leeked trout with yellowish fins are both found there. The first named is widely known as mountain trout and the last as the salmon trout, but they are wholly unlike the salmon trout of the Great Lakes, the *S. gairdneri*, or more properly the *S. entellus* of Pennant. No person need come to the streams of the Rocky Mountains expecting to catch the common brook trout of the East, nor of Virginia, for *S. fontinalis* is not found here, except in such streams as have recently been stocked by the Fish Commission or through private enterprise. I can fully agree with the Senator in the matter of flies for mountain trout, although I would add the black gnat and the grizzly king to my outfit.—GORDON LANS.

CROOKED TACKLE.—The New Brunswick, Me., Telegraph, of Nov. 20, reports: "The Maine game commissioners are waging an active war against poachers. Last week they and their wardens seized several boxes of partridges, containing 50 to 100 birds each, in Franklin, Piscataquis and Piscobosc counties. They also seized a box of 120 trout, in the trout of the trout, valued at about \$100 worth of fishing tackle, consisting of reels, flies, lines, etc. All this property the warden confiscated. The owner is a New York lawyer, and it probably will take the profits of several clients to fix up the matter. Crooked and Songo rivers are full of salmon of very large size. But little poaching has been done. The river is well guarded by local wardens and detectives." Our correspondent "Monabiqui" comments as follows: "I do not know who the unfortunate New York lawyer is, but I am glad that any man who would give up trout and lake and river game and fish regards it as a law, is made to pay the penalty, and I hope the time will come, and that soon, when the breach of the law will be the rare exception, instead of the common thing it now is, in that splendid region for game and fish. Otherwise the glory will soon have departed. The Crooked and Songo rivers named in the clipping are streams which connect Lake Sebago, Me., with lesser lakes on the north. It means therefore that the Sebago is again stocked."

NEW HAMPSHIRE.—Commissioner Hodges is succeeding admirably in his charge of the State Hatchery at Plymouth, and informed me a few days since that he expected to take 250,000 trout eggs, for hatching and distribution this coming season. He is doing a good work in looking after the poachers on Lake Winnepesaukee, who are as usual sparing trout from the spawning beds, and confirms the report of the great abundance of trout in Newfound Lake, where the laws are respected. He tells me that a few of the young "sablefin" which Prof. Baird sent to N. H., and the rest of which were placed in this lake, were saved at the Hatchery ponds for experiment, and are thriving finely. The extreme drought has been very troublesome, and the trout in Sunapee Lake found it almost impossible to get up into the brooks at the spawning season, greatly interfering with the proposed project of the Commissioners, to obtain a large supply of eggs from that lake.—VON W.

THE STANDARD FOR REEL-PLATES.—The National Rod and Reel Association met at the Biological Laboratory, Blackford's, Fulton Market, on Tuesday last. The committee appointed to recommend a standard size for reel-plates for trout and salmon made their report and it was approved. A drawing accompanied the report and will be published in our next issue.

A NEW BAIT FOR BLACK BASS.

FOR several years past anglers for black bass in the Potomac River, in the vicinity of Washington, have noticed with solicitude the increasing scarcity of minnows and other small fish suitable for bait. The small fry become more and more difficult to procure, and the artificial baits, consisting of worms, and other things, are not so successful as they once were. The result proved a grand success. A young carp about four inches in length makes the best bait for bass I have ever tried, and as a live bait has, I venture to assert, no superior. They are attractive in appearance, exceedingly lively in their motions and live longer on the hook than any other species hereabout. As an evidence of their vitality I will state that I have seen a carp which remained on a hook for half a day, and had been mutilated badly, returned to the bait bucket, and when again utilized on the following day was apparently as lively as ever.

Lost some fault-finding individual should declaim against this apparently useless waste of a valuable food fish, I will state that the gentleman referred to by me supplies large quantities of young carp to such of his neighbors as desire to stock ponds, yet still has a large surplus of fish which over-crowd his ponds to such extent that their growth is retarded, and in my estimation he could utilize them no better than for bait for the nobler bass. At the end of a day's fishing, he generally brings to the river such of the bait as he has not been used, thus locking it with a new variety of fish, and is by this means solving the problem so frequently presented: "What will the bass do for food in a few years when the present supply of minnows, sunfish, etc., now nearly exhausted, is gone?" G. A. B.

His original supply of carp—about twenty—have so multiplied within the past few years that his ponds are over-stocked, and the growth of the fish is so slow in consequence that none, save the original specimens, have attained a size suitable for table purposes, but they are just the size for bait. Why not utilize some of them for the care of the noble bass? The idea was a capital one, and was at once acted upon. The result proved a grand success. A young carp about four inches in length makes the best bait for bass I have ever tried, and as a live bait has, I venture to assert, no superior. They are attractive in appearance, exceedingly lively in their motions and live longer on the hook than any other species hereabout. As an evidence of their vitality I will state that I have seen a carp which remained on a hook for half a day, and had been mutilated badly, returned to the bait bucket, and when again utilized on the following day was apparently as lively as ever.

ENGLISH AND AMERICAN TROUT.

IT will be a difficult matter to make the average angler of Eastern America believe that there is any trout which can excel his own native one in any point which a trout is celebrated for. The ordinary brook trout of England is a fish with large scales and without the red abdomen of the American; more nearly like our rainbow trout of California. Our trout belongs to the tribe of the salmon family known in England as charms and in Germany as Saibling, and some very good authority on the other side pronounced the American trout "not a true trout, but only a charr." Concerning the comparative merits of *Salvelinus fontinalis* and *Salmo fario* as game and table fishes we are not prepared to speak. The following is from a late number of the London Fishing Gazette:

"We are strongly of the opinion that it is a great mistake to put the *Salmo fontinalis* into our English trout streams. It is not suitable to our rivers. 2. It will not breed in them. 3. It is not such a good fish as our English river or lake trout. It is a good many years now since this very beautiful fish was introduced into this country, and gentlemen have spent hundreds of pounds in attempting to stock their waters with it, but almost invariably after perhaps a few have been caught for a year or two, they have all disappeared; instead of increasing and replenishing the waters, they vanish entirely. The few that are taken are carefully returned to the water, after giving play which English trout of half their size would not even speak from excitement. One of the best anglers in this country, as far as we know, are in cold Scotch lochs, and the reason of this is, we think, to be found in the fact that they are not trout at all, but char, and char require conditions of living different from those required by trout. We know that *fontinalis* have been grown, and are grown to some pounds weight in this country in ponds, and at one time we hoped great things from them, but we are now convinced that while it is unquestionably a splendid American sporting and table fish, taking every lure that a trout will take, as an English fish it loses its sporting quality, and eventually gets lost when placed in an English trout stream, and left to take care of itself among English trout."

Many of our anglers felt indignant at our trout being called "only a charr," but that it is a charr is true, and the question is now, in what respect is a "trout" superior to a "charr?" Certainly the American charr is much sooner than the brook trout of Europe, and of course a better sporter, makes it particularly beautiful, and its scales, almost invisible, scales give a softness to its skin that is not approached by *S. fario*. We have taken a few small trout in Europe, and have eaten them. As a table fish we do not remember to have noted any difference, and the fish were too few and small to enable me to judge correctly of their game qualities.

We would like to have this question fairly discussed, with-

Fishculture.

SUCCESS OF FISHCULTURE.

BY M. VAN DEM BORNE.

[Translated by Charles G. Allen from the Circular of the German Fishery Union.]

It cannot be often said that the fish that do not every kind of fish thrives in every water, and that we can experiment...

When they undertake to stock the Havel at Potsdam with one or two-year old salmon, bought anywhere, failures to my mind...

Where, however, the appropriate conditions of existence are afforded the fish, and there is no lack of sustenance, success is not wanting.

The success of the fish culture, more readily observable when small bodies of water, brooks or lakes, are selected...

Success of Salmon and Sea Trout Culture. The Rhine, Von Winterstein reports from the Mosel district...

The German Fischerzeitung, No. 24, reports from London, under date of August 15, that the salmon fishery in Scotland...

The United States Fish Commission has been gathering evidence on the habits, qualities, and uses of the carp, and Mr. W. Stanley has collected the results...

THE FLAVOR OF CARP.

The United States Fish Commission has been gathering evidence on the habits, qualities, and uses of the carp, and Mr. W. Stanley has collected the results...

The German method: When young, say two to three pounds, they will do to fry; but when they weigh ten to fifty pounds...

DISTRIBUTION OF CARP.—Although the facilities for the culture of carp have been increased year by year, the supply is not yet equal to the demand.

Something was evidently wrong in the batteries of the Mexican mill yesterday, says the Carson, Nev. Appeal, and the machinery was stopped...

The Kennel.

FIXTURES.

December 19, 20 and 21.—New Orleans Dog Show. Entries close Dec. 10. Charles Lincoln, Superintendent, New Orleans, La. Jan. 2, 3, 1884.—Meriden Poultry Association Bench Show, Meriden, Conn. Secretary, Shubert, Meriden, Conn.

FIELD TRIALS.

December 10.—New Orleans Gun Club's Southern States Field Trials at Canton, Miss. Entries close Dec. 9. J. K. Renaud, Secretary, New Orleans, La.

THE EASTERN FIELD TRIALS.

We have last week the running in the All-AGED Stakes to the close of the heat between Vision and Marguerite II. Below will be found a full report of the remainder of the Derby, also a complete summary of the other trials.

ALL-AGED STAKE.

[Continued from page 354.]

were the next brace. Sue ran in the All-AGED Stake at the Chicken trials last week. Contending with her was the Count Noble and Gertrude; was beaten by Vanderfort's Dot in the deciding heat for first place, and divided second with Dashing Union. In the All-AGED Stake at the National trials last week, she was again the victor, and was again the first of the Louisiana trials a week later, and won her first heat by the withdrawal of Joe Chambers.

DOON JEAN AND HANG BANG.

This brace was then called. Don Juan has never before appeared in public. He is of medium size and can do good work. Bang Bang is of medium size and is quite a good looking dog. He was recently imported and has had but little work since his arrival. He won first in the puppy stakes, and also won the champion pointer puppy up at Shrewsbury in 1882.

GLADSTONE JR. AND MAIDEN

were at once put down. Neither have before ever run in public. Gladstone Jr. is a neat looking dog, and is a very quick animal, but lacks experience. Maiden is rather a pretty bitch of medium size, but is too young to compete with the flyers in an all-aged stake. Gladstone Jr. was handled by Capt. McMurdo, and Maiden by Wanaunaker. They were cast off at 5:40 in the sedge and ran the race, but the latter was promptly backed by Gladstone Jr. We then moved on across the hill into a ravine, where both dogs pointed birds, which were flushed but not shot at. The runner went on up a gully through the sedge and bushes, where Gladstone pointed, but discovered his error and moved on. We then swung around a house and down the fence into a ravine of brush and sedge, where Maiden scored a false point, backed by Gladstone through the sedge, and was now getting into a very tight corner, and was running and whistling in an adjoining field, into which the dogs were worked. Gladstone pointed and the birds flushed some distance ahead of him. Then working on across the field to the edge of the woods, both dogs did some nice work. Gladstone pointed and was backed by Maiden; the birds were flushed, and dogs ordered up at 5:50, and the heat was awarded to Gladstone Jr. Down forty-five minutes. It was now dark and we started for home, but before we had made our way home, we had done a satisfactory amount of work, having run through six heats with the exception of the finish of the one between Vision and Marguerite II.

SCOUT was handled by Haight, and here

MR. W. J. CRAWFORD'S BLUE AND TAN ENGLISH SETTER DOG "GATH."
Winner of First in All-Aged Stake, Eastern Field Trials, 1883.

made his first bow to the public. He is rather above the medium size, and will make, with experience, quite a dog. Trim, handled by Fredmore, is a liver dog of medium size. He ran the All-Aged Stake of the Eastern Trials in 1880, and was beaten by Croxteth in a very good heat. They were put down at 7:45 on Thursday morning, in a large field. They started off at a good easy gait, Scout showing off best in style and speed. As we neared the fence Scout pointed and was nicely backed by Trim. Scout broke his point and roared on when a bevy of birds flushed, and were shot at by Haight and a bird killed which Scout retrieved nicely. We then moved on through the field of sedge into the woods where the birds had been marked down, when Trim pointed a single bird, and was backed by Scout. The bird was flushed, order was missed, both dogs dropping to shot; moving on, Scout pointed where birds had been flushed, and was backed by Trim. We then worked on and Scout flushed two birds and dropped to wing; then swinging round in some pines and out into a sedge field, which was drawn blank, both dogs roared and pointed a good deal where some birds had flushed. After going on some distance through old fields and finding no birds, the dogs were ordered up at 8 o'clock, and put down again at 8:15 in a large field of sedge and sassafras bushes. We worked on down a ravine and up the hill, where Scout pointed, but discovering his error moved on. At this time a woodcock was flushed and marked down, and the dogs were ordered up, and one of the judges made a wonderful shot, bagging the bird, a man and a dog. The dogs were then ordered up, and moved across the hill down a ravine to a branch, where Scout pointed and Trim backed. Scout roared on to the edge of woods, where the birds were seen running through the leaves, flushing some distance ahead of him. They were then ordered up at 8:45, and the heat was awarded to Scout. Down twenty-five minutes.

PRINCE AL AND ROCK.

Both dogs appeared in public for the first time. Prince Al is of medium size, with quite a turn of speed. Rock moves rather poorly, but neither showed the quality of work required in this stake. After a long and tedious tramp of nearly two hours without a find, Prince Al found, but ran in and flushed, and Rock soon after put up the rest of them, when the judges ordered them up and reserved their decision.

LALLA ROOKH AND CHRISTMAS BILL.

Both of these dogs have run before, Lalla Rookh running last year in the Eastern All-Aged, where she beat Lady Dufferin and was beaten by Croxteth, and divided third with Minnie. At the same meeting she ran in the Derby, beating Isabella II. and Lord Scitton, and was beaten by Darkness, and divided third with Byron. She was handled by Luke White. Christmas Bill ran in the All-Aged Stake in the Chicken Trials last year, but was unplaced. He was handled by Vanderpoort. They were put down at 10:35 in the sedge, and worked down a ravine where birds had been marked down. Lalla Rookh moved off at a nice gait, quartering her ground well. Christmas Bill, although a good dog to shoot over, having done some crowd work in the field, has demonstrated on two occasions that he can't stand a crowd, and in this heat did very inferior work. Working on down the ravine, Christmas Bill flushed a bird; when they went on over a fence, where Lalla Rookh pointed, but discovered her mistake, and moved on. Passing on down the ravine, Lalla Rookh challenged, but birds had flushed. She moved on around the hill into some stubble, where Christmas Bill false pointed and was backed by Lalla. We then moved on down the branch, and up a hill to a field of stubble, where Lalla Rookh pointed and as Cavalier and Bill backed, but no birds were found. Going on across the hill, both dogs challenged, but failed to secure a point. Working on down the branch, we then turned up another branch, and swung around the hill to a piece of woods, where Lalla Rookh pointed a bevy and was nicely backed by Christmas Bill. White to order, flushed the birds and killed one, which Lalla Rookh retrieved nicely. They were then ordered up at 11:32, and the heat was awarded to Lalla Rookh. Down one hour and thirty minutes.

VICTOR AND PINK B.

These dogs have both run at previous trials. Victor ran in the All-Aged Stake at the Louisiana trials last year. He scored his first heat owing to the withdrawal of Gordon, and was beaten by Foreman in his next heat. Pink B. ran in the Derby at the chicken trials last year, beating Scott, American Dan and Gilderoy, and was beaten by Prince Noble in the deciding heat; and as Cavalier, his only competitor, was withdrawn he won second place. At the National trials, a few months later, he ran in the Derby and beat Countess Mollie, Gath and Bess A., and was beaten by Carrie J. in the deciding heat. He then beat Gus Bondhu and won second. He also ran in the Louisiana Derby, beating Don, Countess Magnet and Biddy, and won first. He was handled by Short and Victor by Avent. They were cast off in 11:06 in the edge of some woods, where the last brace had finished. Both dogs started off well, Pink B. quartering and ranging in grand

style. They worked on uphill into some pines, where Pink B. when going like a bullet, ran into a bevy and flushed them, dropping to wing. They were then worked down a gully to a branch, where the birds had been marked down, when Victor pointed and was nicely backed by Pink B. Avent failed to flush his bird. They then worked down the branch when Victor flushed a bird in the brush. On a few yards further both dogs pointed at the same time, a bird each, in the alders. Running on down the branch Pink B. secured a nice point. Short, to order, flushed the bird and killed it, and Pink B. retrieved it. They were then ordered up at 11:25 and Pink B. awarded the heat. Down nineteen minutes.

RAB AND DONNER.

Of this brace Rab only has run before. He ran in the Eastern All-Aged Stake last year, beating Bravo and was beaten by Croxteth. He also ran in the Members' Stake at this meeting. He was handled by Luke White. Donner is a good-looking dog of good size, and with more experience will make a killing dog. He was handled by Predmore. They were cast off on the branch, where the other brace was taken up, in a place where they could not show much speed and worked on down the branch for some distance, when we crossed and swung round up the other side. Rab flushed a single bird and dropped to wing. Then moving on up the branch, Donner pointed a single bird handsomely in a thick bunch of briars and weeds and was nicely backed by Rab. To order, Predmore flushed and killed the bird, which was retrieved by Donner. Both dogs dropped to shot. We then moved on up into a ravine, when a bird flushed behind Rab which he should have pointed. We now swung round across the branch and moved up the hill in the pines. Both dogs roared for some distance, and Rab secured a point on a bevy of running birds, and was backed by Donner. The birds were flushed and missed. We moved on out into the open field, when both dogs flushed a single bird, swinging round to the right, Donner roared a short distance and came to a beautiful point on a large bevy. Rab failed to back and was dropped by his handler. Predmore, to order, flushed and killed a bird, which was nicely retrieved by Donner. They were then ordered up and Donner awarded the heat. Down forty minutes.

PRINCESS WARWICK AND LIT.

Neither of these have before appeared in public. Princess Warwick is a very good looking animal, of large size. She is quite a gift of speed, and appears to have a good nose. She is also very stylish, and with more experience and judicious handling, will be fit to run in almost any company. She was handled by Predmore. Lit is rather an ordinary looking animal, of small size. She is fairly fast and appears to have considerable hunting sense. She was handled by Short. They were cast off on the pine knoll, where the last heat was finished, and worked toward the bevy, which had settled near the head of a ravine. Princess ran up to them, and flushed one, which flew up the hill, when she gave chase at a rate of speed that would soon have caught up with it, but her handler whistled before she had gone more than fifty yards, and she turned back. This was a waste of energy, for the judges did not see her, and she got no credit for the performance. She came back, and going into the edge of the brush about the run, she pointed in beautiful style to some running birds, which flushed as she drew on. She then went on a few steps and made a quick point to a single bird, which at once got up, when she made a jump, but at once stopped. They were then ordered up, when Princess came up and scored a flush. Princess then swung round to the edge of a gully, and made a capital point, which Lit refused to back, but went up to her and half pointed. Predmore, to order, put up the bird, which he missed. They were then ordered up, and we went to lunch, which was eaten by.

After lunch they were put down on the hillside in some sedge, and worked down to the run. Both went very well; Princess the fastest, although Lit ranged the widest, when they reached the bottom Princess ran into a single bird. We then worked down the run, where Lit made a beautiful point, and Princess was called up to back, but as she was coming up in front of Lit, Predmore dropped her, and as she went down she saw Lit and backed her. Short was ordered to flush but failed to find. Working on, Lit pointed a bevy at the edge of a bank in some scrub oaks. Princess came up under the bank and half pointed the same bird, which Short, to order, flushed and winged. We then went for one which had been marked down, and Princess whined it, but was called away by her handler, and the bird was flushed by the horses following. She then worked down the run, where Lit pointed very nicely, when Princess coming up, one flushed between her and Predmore. Just then Short, in going to Lit, walked up her bird which he winged and then the rest of them got up. Lit was unsteady. They were then ordered to retrieve, but failed to find, and a bird was thrown for her, which she brought very well. We then crossed over to a branch, and beat out a likely looking piece of stubble, but nothing was found so we crossed to a run, where Short flushed a bevy, which settled in the edge of some

woods close by. Princess got there first and struck an elegant attitude, and Lit was called up to back, but Predmore did not hear the order and flushed the birds, one of which he killed, Princess retrieving it nicely. They were then ordered up and the heat was awarded to Princess Warwick. Down one hour and twenty-one minutes.

LADY ROMP II. AND PRIDE.

This was the first time that either of this brace have appeared in a public trial. Lady Romp II. is a very fair looking animal, of medium size. She moves fairly well, but is fast. She was handled by Hemion. Pride, handled by Tallman, is of good size, and with more experience he will, undoubtedly, do very good work.

They were cast off in the woods beyond the birds, and given a little spin, and then worked back, when Pride ran up one, and a little further on made a capital point, which he held a long time, while Romp was brought up to back, which she refused to do at first, but drew toward him, and stopped an instant and then drew on a little further and backed him. They then worked at the corner, when Pride struck the trail of a running bird, but was not quite careful enough, and scored a flush, and as he turned he ran up another one. Romp now took a hand, and put up one, which she chased up the hill, but at once came back to whistles. We then turned back, and crossing the creek, they were worked down in some tall grass, where Romp made a very nice point to a bird which Hemion to order put up and killed. Romp sent to retrieve failed to find it. Working on, Romp again pointed, close to the creek, Pride backing her nicely. Hemion flushed the bird to order and missed, when Romp broke shot, but at once dropped to order. She then crossed the creek, and got in another point, but nothing was found. A little further on she again pointed, and Pride backed to order. Hemion ordered to flush, put up the bird, which he missed. A bird was then then ordered to retrieve, which she did very well. They were then ordered up, and the heat was awarded to Lady Romp II. Down thirty-five minutes.

FOREMAN AND LUNA MAY.

These dogs have both run before. Foreman, who was then handled by Stafford, ran in the Pennsylvania Derby at Grand Junction in 1881, where he made a creditable showing, but was unplaced. In the All-Aged Stake at the Chicken Trials last year he was beaten by Dashing, Novice in his first heat. A few months later he ran in the All-Aged Stake at the Eastern Trials, beating Buckellev and was beaten by Brock. He also ran the same year in the All-Aged Stake at the Louisiana Trials, beating Blue Monarch, Count Noble and Flossy, and was beaten by Coleman's Lobton for first place and divided with Harrison's London. Luna May, handled by Wanmaker, ran in the All-Aged Stake at the Eastern Trials last year and was beaten by Maids in a very good heat.

They were put down where the last heat was finished and worked down the brook a short distance, when we crossed and took a turn in some woods, and then swung back to the brook and again crossed, when Foreman pointed a single bird, and Luna went in ahead and also pointed the same bird. When ordered to flush, both dogs moved on and Luna caught where the birds got up, and again pointed, and Wanmaker flushed it. We then beat out a stubble field, where Foreman ranged wide and well. We then went through a strip of woods to a large stubble, where a bevy was flushed by the horses. Following them into some pines, where Foreman made a stylish point and then roared out, and located very nicely, a bird which flushed itself. He then moved on, and again pointed. Tallman, to order, put up the birds, but had no shells in his gun. Meantime Luna was pointing and drawing where the birds got up. Foreman got up, and another point to a running bird, which he roared out and located, and Luna brought up to back, did so to order. Tallman then put up the bird and killed it, and Foreman retrieved it well. We then crossed a gully, where Luna made a point, but nothing was found. We then swung through the pines and came back to the creek, which we crossed, and beat through a cornfield to some weeds, where Tallman walked into a bevy which settled in a pine thicket, where Foreman pinned one in good style. Luna refusing to back him, Tallman, to order, put up the bird and killed it, but it fell a long way off. They were then ordered up, and the heat was awarded to Foreman. Down one hour and nine minutes.

HONEST HARRY AND SAN ROY.

This was the first appearance of this brace. Honest Harry is a very good-looking black dog, rather above the medium size. He has considerable speed, and gets around in a grumpy manner, and appears to have a good nose. He was handled by White. San Roy is also a good-looking dog of large size. He is quite speedy, and has a wonderful nose. His way of going and the manner in which he locates his birds reminds us strongly of his sire Count Noble. He was handled by Sunborn. They were cast off in the pines where the last heat was finished. San Roy took a few jumps, and very gracefully sat down on point to the bird which Tallman had killed, Harry backing

him in faultless style. Sanborn ordered to flush went on, while San Roy picked up the bird and brought it in very nicely. Harry then made a capital point to a single bird, which Roy ran into and flushed, both dropping to wing. We then worked out into some stubble, when Harry ran into a large bevy and scored a flush. We then swung into the pines, where Roy dropped to wing, and Harry backed him handsomely. Sanborn flushed the bird, but it went toward the judges, and he did not shoot. Roy then drew on a few steps and again pointed a single, which Sanborn put up and missed. Harry then got up all around us. Harry then made a point, which Roy backed to the woods, and he then drew on, but dropped to order, and White put up a bird which he missed. Roy started off at speed, but stopped to order, and catching scent he pointed a bird, which flushed as White went toward the judge. White also missed his bird. Harry then made a point to a single, which White flushed to order but did not shoot. Roy then pointed, but soon moved on and roared out his bird in capital style, and located it nicely. Sanborn flushing the bird to order, and Harry scored a flush, and they were ordered up and the heat was awarded to San Roy. Down fifteen minutes. This was a short heat, but a rattling good one, both dogs showing off to great advantage.

The setter Lady May and the pointer Cruiser each having a bye, this ended the series, with the following summary:

First Series.
SETTERS.

- Carrie J. beat Gus Bondin.
- St. Elmo V. beat Stuart H.—withdrewn.
- London beat Lady Payne.
- Gath beat Gladstone.
- The best Dr. Dues.
- Gladstone, Jr., beat Maiden.
- Prince Al and Rork, decision reserved.
- Pink B. beat Victor.
- Princess Warwick beat Ltr.
- Foreman beat Lady May.
- San Roy beat Honest Harry.
- Lady May, a bye.

POINTERS.

- Don beat Lord Nelson.
- Ruby beat Flora.
- Croxteth beat Ruf.
- Vison beat Margaret II.
- Bang Bang beat Don Juan.
- Trent beat Dr. Dues.
- Lalla Rookh beat Christmas Bill.
- Donner beat Gal.
- Lady Romp II. beat Friede.
- Cruiser, a bye.

Second Series.
CARRIE J. AND ST. ELMO IV.

This brace was the first of the second series. They were put down on a side hill in a narrow strip of sedge between some woods and a run and worked up to the head of the run where Carrie J. challenged in some weeds, but could not quite make it out. St. Elmo, who was going at speed, jumped the fence and taking a false point the hill crossed the fence and probably the same bevy, which was running up into the woods. He pointed staunchly until he had crossed the fence, when he drew on a short distance and again pointed in a very stylish manner. The birds had their heads up and flushed well before the dogs got there, one of them went but a short distance, a little to the right, and as Carrie came up it got up ahead of her. A little further on she made a very graceful point to several birds which flushed well as Short went toward her. She then took a head and as he came round at speed he dropped flat to several more which flushed themselves a second or two later. He then swung to the left and jumped into a very ganey point to a bird which he held, while Carrie went round to back. She honored the point in a very stylish manner, but caught up the bird and killed it. St. retrieving very well; when ordered on, St. with lightning speed went straight to some more birds, which he pinned in the style. They were then ordered up, and the heat was awarded to St. Elmo in twenty-five minutes. This was a short heat, but a very lively one, and one that will be long remembered by those who saw it. The dogs that can hold their own against Carrie J. among scattered birds in the woods are very scarce, and the brilliant victory which the gallant son of Gallant Stuart drew from the beauty of Queen of the South secures for him an honored place among the famous dogs of the day. It was now night and we started for town.

BOX AND MCBAY.

were cast off at 8 o'clock on Saturday morning in a field near town, and worked down the branch, both showing good speed and style, razing and quartering their ground well. We crossed the meadow and swung over the hill to a ravine where a party of birds had been found on Thursday. The field was drawn blank. We then swung round the hill across a gully into the woods, and down the fence across a marsh through the fence into an adjoining field of short grass and briars, when Ruby made a beautiful point, which was backed by Pink B. The hunters were ordered to flush, but the birds were seen running on the ground and would not rise to order, he shot at them on the ground, but missed, and the bevy flushed and settled about one hundred yards away, on the side of a hill. Both dogs dropped to shot. Ordered on, Don commenced flushing the birds, who were flying over the woods, which were wild, and were worked down in the woods; we then moved on and Don made a beautiful point in the briars near the woods, and was backed by Ruby. The birds were evidently running and the dogs were ordered on when Ruby pointed, and Don backed her, the bird was flushed. Moving on Ruby pointed, and Don backed; Haight was ordered to flush, but failed to get up the bird. Both dogs then roared on, alternately pointing and backing on the trail of the running birds down by a hollow, when several birds dropped on the grass at the edge of some woods. Don pointed where they had flown from, but moved on over the fence into the woods; after going some distance he pointed and roared on beautifully, and established his point in his woods. Ruby then pointed to a capital point, and shot at and missed. They were then ordered up and the heat was awarded to Don at 8:25. Down twenty-five minutes.

LONDON AND GATH.

The next brace, were cast off at 8:26 in the woods. Both dogs went off at a rattling gait, quartering and razing in beautiful style, Gath taking the lead in speed, which he kept up to the end of the woods. We then swung round the hill into the woods, where draw blank. We then swung round the hill into a field of sedge and pines down to a branch and up the hill to an open field, where Gath, going at a tremendous speed, challenged, but moved on and roared on, and worked up to the head of the ravine and moved up the hill into stubble, where Gath dropped on a beautiful point, and was backed by London in grand style. Short, to order, flushed and killed a bird, which Gath retrieved through the pines, and ordered to shoot, but the dog dropped to wing. Moving on up fence, through a field of sedge and along the edge of the woods, London pointed and was backed by Gath. The bird was flushed to order and killed, and retrieved by London, both dogs steady to shot. We then moved on into the woods, where Gath dropped on a capital point, and was backed by London. They on in the woods Gath again scored a beautiful point, and the bird was flushed to

order, both dogs steady to wing. They were then ordered up, and the heat was awarded to Gath at 9:10. Down forty-four minutes.

CROXTETH AND VISION.

At 9:15 the next brace were cast off in the woods. Croxteth by his movements showed that he had not recovered, and should not have been run. Vision took the lead and held it to the finish of the heat. Moving in through the woods Vision pointed backed by Croxteth, the bird was flushed to order, and was killed. Vision broke shot, and stopped to order. Sent on both dogs pointed, the bird flushed in front of Vision and was killed, and retrieved it. Croxteth's handler failed to flush a bird. Moving on, Vision pointed, and Croxteth backed, but no bird was found. Moving on we swung around a fence into an open field and back again into the woods, where both dogs pointed at the same time, a large bevy was flushed, to order by Croxteth, who then dropped to shot. Vision broke shot but stopped to order. Moving on the woods both dogs flushed a single bird, and dropped to wing. Sent on, Croxteth flushed. We then moved on for some distance, when Vision made a nice point, the bird was flushed to order and killed, and retrieved by Vision. They were then ordered up, and the heat was awarded to Vision at 9:30. Down fifteen minutes.

GLADSTONE, JR., AND SUE.

were cast off in a field of sedge, both dogs drew nice work, but Sue taking the lead and quartering the woods. Several birds were flushed by Croxteth, the dog and marker were. We then swung round to the left, and Sue pointed and was backed by Glad, nicely. Short failed to flush the bird. They were then worked up, and Sue pointed a single bird, and was backed by Glad. Vision pointed, and the bird was flushed. We then swung round to the right, and Vision was then thrown into the leaves by the judges and found and retrieved by Sue. Moving on Sue again pointed and Glad backed; the bird was shot at and missed. We then moved on into the open field, and Sue had made a false point. They were then ordered up and the heat was awarded to Sue. Down eighteen minutes.

BANG BANG AND SCOUT.

Bang Bang and Scout were the next brace. They were put down in a field of sedge and pines. Moving on over fence into the stubble Croxteth pointed the front and ran on. Bang Bang doing nice work but keeping near his handler. The stubble was drawn blank, and we moved on across a branch and up a ravine into a field of sedge and pines, which was drawn blank. Bang Bang pointed, and the bird was flushed, where Scout challenged and roared some distance but failed to locate birds. We then moved on into some woods, where Scout pointed and Bang Bang failed to back; to order a large bevy was flushed and a bird was killed, which was retrieved by Scout. Moving on the woods both dogs flushed a single bird in a brush heap, and was nicely backed by Scout, the bird was flushed to order and flushed, and found and indifferently retrieved by Bang Bang. Moving on Scout pointed and the bird flushed. A dog moved on toward the large wood. Bang Bang scored a false point. We then swung round the woods and up the fence, where birds had been marked down, over the fence into the woods, and across the hill into a ravine, which was flushed. A then moved over the hill where Bang Bang pointed, here and was backed by Scout. Both dogs started to chase, but stopped to order. A large bevy was flushed by spectators where the dogs had just been worked. We then moved on to a branch, and beat up a branch to which the bird had just been flushed. Scout pointed, Bang Bang backing, and the bird flushed. Moving on a few steps both dogs pointed at the same time in a bunch of weeds and briars. The birds were flushed to order, but not shot at. We then swung round the woods, where a wood was marked down, over the fence into the woods, where both dogs had just pointed at brush heap, but moved on. We then worked into an open field of sedge and pines, down a hill and across a branch, up a hill and over a fence into the woods, when Scout flushed a bevy and Bang Bang pointed, the bird was flushed to order, and the brush heap and the bird was flushed. They were then ordered up and the heat was awarded to Bang Bang at 11:22. Down one hour and twenty-nine minutes.

PRINCESS WARWICK AND PINK B.

were put down in a field of sedge. Both dogs went off at a rattling gait, the bird was flushed, but the dog was ordered on across a gully, when Princess Warwick ran into and flushed a large bevy; this was a bad piece of work, for which her handler punished her. We then moved on across a branch into a field of pines and sedge, where the bevy had been marked down. Pink B. pointed in nice style, handsomely backed by Pink B, the bird was flushed to order, shot at and missed, both dogs dropping to order. Moving on, Pink B. flushed a single bird and dropped to wing. When several others came up, we then swung around the edge of the woods and into the woods, which were drawn blank; the dogs were then taken up and put down again in a large field near an orchard. We moved on over the hill to the head of the ravine, where Pink B. pointed and the bird was flushed, and both dogs dropped to wing. We then swung around the hill and worked down to where the bevy had been marked. Pink B. pointed and Princess backed; both then drew on, and the dog worked in and flushed a bevy of five or six birds. Princess Warwick was working in the thick briars and brush and several birds flushed but it could not be seen whether she pointed or flushed them. Both dogs did some very bad work. We then worked on down the branch and crossed and worked up the branch and swung around over the hill to a branch when a large bevy flushed, both dogs being out of sight. Moving on both scored a flush near the edge of the branch. Moving on up the side of the fence, Pink B. pointed and Princess backed; the bird was flushed to order, and worked up the ravine. Pink B. pointed and the bird flushed. Moving on Pink B. pointed again and Princess scored a flush. They were then ordered up and the heat awarded to Pink B. at 12:54. Down one hour and twenty-four minutes. They were then ordered up.

LALLA ROOKH AND DONNER.

After lunch this brace was cast off south of the house, near the branch, and worked along the edge of the woods and down to the bridge over the creek, which we crossed and beat up a field of stubble and weeds, and then worked through the woods, where the bevy had been marked down. Both dogs dropped on point to a bevy, two of which flushed as we came up. Rookh then joined him, and both roared the birds, with Rookh ahead. She got a little too close and put them up, but then dropped to wing. This was done in the woods, and the dog shot at and missed. Both dogs then pointed, which Rookh backed, and the bird was flushed to order. A little further on Donner ran into a bird and several more got up, for which the handlers were to blame, as they crowded the dogs on too near the woods. The bird was flushed, and the dog worked in a very nice point to a brace which flushed as we came up. Taking a few steps she again pointed a single, which got up as the handler went to her, but she was determined to have a bird, and soon pointed to a single, which she flushed to order, and the bird was flushed very nicely. They were then ordered up and the heat was awarded to Lalla Rookh. Down fifty-five minutes.

FOREMAN AND LADY MAY.

We have already mentioned Foreman. Lady May is a very handsome dog, and worked up very well, and with a little more experience she will do very good work. She was handled by J. T. Miller. They were cast off in a stubble

field, Lady May at once got in a good point near a thicket, Foreman backing her in good style. The bird flushed as we came up and Lady chased a short distance, but came back to order. When the bird was flushed and made a point, which Foreman at once honored, but the bird had gone before she pointed. Foreman then put up a bird as he was going; at speed. We then swung into into more open ground where Foreman, next a fence, made a capital point with his hand high in the air. Although the dog was over put up the bird but did not shoot. A little further on Lady ran up a single and scored a flush. She then swung into some pines and made an elegant point to a brace under the fence. Foreman's entry up and backed her point, and Miller, to order, flushed the birds, both dogs remaining steady. We then turned back to the place where the first birds had been found, and Foreman while at speed jumped into the woods, where he scored a flush. A little further on he again pointed and held his bird, while Lady was called up to back, but she refused and went alongside and also pointed. Tallman flushed the bird and scored a miss. A bird was then thrown for him to retrieve, which he did only fairly after some little trouble, which was owing to the bird having become cold. We then again swung into the pines, where Foreman made an elegant point to a bird that was thought to be the one that Tallman had last shot at, but both dogs were out of sight. The bird was flushed, and we put up several, one of which he shot at and missed very cleverly. The dogs were then ordered up and the heat was awarded to Foreman. Down twenty-six minutes.

LADY ROMP II. AND CRUISER.

Lady Romp we have already described, Cruiser, who had a bye in the first series, is a good looking dog of medium size. He is said to be a good retriever, and he was very close in her first heat, he appeared to be dazed by the crowd, and did not get to work. He was handled by Luke White. They were put down on a pine knoll and worked round into the open, where Foreman's entry up and backed her point, and she realize that he was hunting, and merely jogged around. Both challenged where the birds had been flushed, but soon moved on. They were then taken where the birds had settled and one dog worked up to the head of the ravine, and Tallman walked in and round on top of a knoll where Cruiser caught a little scent and drew on a few yards, but losing it, he made a cast in the wrong direction and lost it entirely. Lady Romp soon after swung round, just before the place and dropped on point, just as the bevy rose. As she went down and down, Lady Romp ran into a bird, and at the same instant whirled round and made a ganey point which was handsomely backed by Cruiser. Henton to order flushed the bird and missed it. A dog worked up to the head of the ravine, and the dog worked up and some help from her handler. They were then ordered up, and the heat was awarded to Lady Romp II. Down twenty-seven minutes.

This ended the second series with the following result:

SETTERS.

- St. Elmo IV. beat Carrie.
- Gath beat London.
- Sue beat Gladstone, Jr.
- Pink B. beat Princess Warwick.
- Foreman beat Lady May.
- San Roy, a bye.

POINTERS.

- Don beat Ruby.
- Gath beat Croxteth.
- Bang Bang beat Scout.
- Lalla Rookh beat Donner.
- Lady Romp II. beat Cruiser.

Third Series.

ST. ELMO IV. AND GATH. They were put down where the first brace was cast off, and worked back across the hill toward the bevy found by Lady Romp in the previous heat. When near the place where they flushed Gath dropped as if shot to a single bird which had remained. As St. Elmo went toward the bevy, he was ordered to flush, and he did, and killed the bird, which was well retrieved by Gath. We then worked toward the pines where the birds had settled. Both dogs thought at the pines pointed very nearly together at what Short thought was a large bevy. St. Elmo pointed, and Gath went to the fence straight to a bird, which led us to believe that the point under the fence was where the birds had alighted and run into the pines. Gath came over the fence and at once backed him in elegant style. Henton to order put up the bird, and scored a miss. Both dogs then close together stopped simultaneously to a bird which got up almost at the same instant. Gath then dropped to the scent of running birds and St. Elmo pointed, and the dog worked up and backed her point, and when they were ordered on this performance was repeated, and as the handlers came up, a bird was flushed near them. St. then pointed and drew a short distance in grand style with Gath backing him, but the bird ran and Gath then took up and located the bird in the first class style, the bird getting up a second or two later. Gath was then awarded the heat. Down ten minutes. This heat was in the pines where there was no cover, and both dogs kept up a fine style. Vision backing him to order. Vander built so quick and well as the work done, that one would scarcely realize the merit of the performance until he had taken time to think it over. It was remarkable that Gath beat St. Elmo in precisely the same manner that the latter beat Gath's sister, Carrie.

BOX AND VISION.

This brace was at once put down in the edge of the pines, and both challenged where the birds had been and roared in a very ganey manner. They were then given a spin in the open and swung back into the pines, where Vision had pointed, but was called off by her handler; but she was right, for when the spectators came along they put up a bird at the place. We then worked back into the open, where some birds had been marked down. Both dogs flushed near the place. Vander pointed, but the bird was flushed near them by the spectators. Working on down to the corner Don made a very ganey point, which Vision at once backed in elegant style, in moving up to them the judges flushed two or three birds, and the dog worked up to the head of the ravine, and the dog worked up and the heat was awarded to Box at 12:20. Down twenty-six minutes.

SUE AND FOREMAN.

The next brace in regular order was Sue and Pink B., but as both were handled by Short, Foreman was ordered to run against Sue, and Pink B. against San Roy. The dogs were put down on a pine knoll, and worked down to a creek, through some high weeds, where one or two birds were flushed by the judges. We then went toward some pine woods, where Foreman made a capital point near the fence, Sue backing him nicely. Tallman, to order, put up the bird. We then crossed the fence to the model farm and worked down to the creek, where Mr. Goldfroy, doubtless wishing to vary the monotony of the proceedings, and a little spice to the proceedings, put down on a pine knoll, and worked down to a creek to respond, it is, perhaps, needless to add that the success of the scheme was most pronounced. After the wild stampede which ensued had been checked, and the wounded had re-

Pointer Cup of the Eastern Field Trials Club, and also of the Heckscher Cup for the best pointer.

FINAL TEST FOR FIRST PLACE.

Gath (setter) beat Don (pointer) and was declared the winner of first prize and the Hillside Kennel Cup for the best setter.

TESTS FOR SECOND PLACE.

First Series.

Grout Dale beat St. Elmo IV.

Prize: A. best London.

Grout Dale beat Pink B.

Second Series.

FINAL TEST FOR SECOND PLACE.

Don (pointer) and Grout Dale (setter) divide second and third without running.

THE DERBY.

On Monday the 26th, the running for the Derby commenced. There were twenty starters instead of twenty-one as was stated last week, which was owing to the withdrawal of Friar. Following are the starters, and the order in which they were drawn to run:

SETTERS.

MAIDEN.—E. S. Wamaker, Elmwood, N. C., blue belton English setter bitch, February (Darkie—Rosy Moin).

MAY DAWN.—Jess M. White, Chester, S. C., black and white English setter dog, Feb. 19 (Count Noble—May Lavender).

BLUERELL.—Ed. J. Mills, Washington, D. C., blue belton English setter bitch, March 21 (Dashing Lion—Arimida).

SAN ROY.—H. H. Matlock, Riceville, Tenn., lemon and white English setter dog, March (Count Noble—Spark).

RESH GLADSTONE.—J. M. Arent, Hickory Valley, Tenn., black and white English setter dog, July 18 (Gladstone—Donna J.).

KATIE D.—D. C. Sanborn, Dowling, Mich., black, white and tan English setter bitch, May 1 (oumi Noble—Dashing Novice).

COUNTESS C.—I. Yonkers, Jr., Conestoga, Pa., black, white and tan English setter bitch, March 21 (Dashing Lion—Arimida).

PRINCESS HELEN.—J. Otto Donner, New York, lemon and white English setter bitch, March 25 (Thunder—Bessie).

ST. ELMO V.—Dr. S. Fleet Speer, Brooklyn, N. Y., black, white and tan English setter dog, Oct. 12 (St. Elmo IV.—Countess Lemo).

PRIDE OF DIXIE.—C. E. Wallin, Montgomery, Ala., blue belton English setter dog, May 26 (Gladstone—Countess Druid).

FOATER.—J. M. Arent, Hickory Valley, Tenn., black and white English setter bitch, June 3 (Gladstone—Jess).

BOB WHITE.—Louis C. Clark, New York, lemon belton English setter dog, April (Vandy Lavender—Lady May).

POINTERS.

NED.—J. A. English, Mount Olive, N. C., lemon and white pointer dog, July 25 (St. Valentine—Beulah).

JILT.—A. E. Goldrover, Gwynedd, N. Y., liver and white pointer bitch, April 15 (Croxtroth—Lass).

STUNNER.—Westminster Kennel Club, New York, lemon and white pointer dog, Aug. 22 (Sensation—Bellona), a lyc.

DRAKE.—A. E. Goldrover, Gwynedd, N. Y., liver and white pointer dog, Aug. 16 (Croxtroth—Lass).

NELLIE.—J. Byron Crossman, New York, lemon and white pointer bitch, February (Sensation—Lill).

BANGOR.—E. B. Downing, Wilmington, Del., liver and white pointer dog, July 10 (Byoner's Bang—Jean).

BRYAN.—F. R. Hitechack, New York, tan and white pointer dog, June 21 (Sensation—White's Grace).

LONDON BEN.—R. T. Vandover, Pittsburgh, Pa., liver and white pointer dog, April 3 (Don—Luck).

MAIDEN AND MAY DAWN.

This was the first brace to run in the Derby. Maiden was handled by Wamaker, and May Dawn by White. They were cast off at 10:30. Maiden is a nice little blue belton bitch of good style and speed, and quartered and ranged well. She ran in the All-Aged Stake and was beaten by Gladstone. May Dawn is a black and white dog of medium size, not so stylish or fast as Maiden, but she made a good dog. They were put down in a pasture well near town, and worked down a ravine and across the hill to a gully, and on around the hill into a piece of woods. We then moved on across the road, and worked down the hill into a field of pines and sedge, where May Dawn pointed staunchly. Maiden being ordered up to back, swung round to the right and also pointed the bevy. May Dawn being on the back trail, Wamaker to order flushed and killed two birds, which were handsomely retrieved by Maiden. We then moved on down to the branch, where Maiden, catching the scent, leaped for some distance and flushed a single bird, which should have pointed. We then swung around through the pines and back to the branch again, then across through a piece of woods and back to the branch again, where a bird was flushed by the landers. We then moved up the branch, where Maiden made a beautiful point to a single bird through the fence. May Dawn being brought up refused to back. The bird was killed by Wamaker. May Dawn was ordered up to back, which she refused to do. We then moved up the hill and through the brush and woods, which we worked through to a branch. We crossed into the woods, where a small bevy was flushed by the spectators and marked down. The dogs were then worked on down where birds had settled, where May Dawn scored a false point, Maiden refusing to back. Sent on down the hollow, Maiden pointed and was indifferently backed by May Dawn. To order Wamaker flushed the bird and killed it. They were then ordered up, and the heat was awarded to Maiden at 11:52. Down one hour and two minutes.

NED AND JILT.

They were the next brace, Ned handled by his owner, Mr. English, and Jilt by Thurtle. They were put down at 11:55. Ned is a large lemon and white pointer, slow, and rather heavy in movement. He is evidently a good dog to shoot over, and knows how to pick up his birds. Jilt is a liver and white bitch, very pretty shaped, and is easy and graceful in her movements, but neither of them have much speed or style. They were worked down the hollow where the last brace were taken up. We then swung around into the woods, and down a hollow, where Ned flushed a small bevy. Moving on, Jilt pointed, but soon moved on. We then worked on down the hollow, where Ned flushed a small bevy, and then, after finding his error moved on and soon afterward brought to his handler a dead bird which had been killed a day or two before.

We then worked on through the woods to a place where two birds had been marked down in some bushes, where two birds were flushed by the judges. Moving on up the fence, Jilt flushed a bird and dropped to wing. We then crossed over the fence and Ned pointed, backed by Jilt. English, to order flushed a bird, which was destroyed by the bird by Ned; both dogs dropped to shot. Moving on, Ned again pointed, and Jilt backed to order; the bird was flushed, and both dogs dropped to wing. Moving on over the hill to the branch, we turned into some woods up the hill, where both dogs flushed a bird which Jilt was reading with pleasure. We then worked on over the hill to a small ravine; Jilt drew on a point and Ned backed her handsomely. Thurtle flushed to order and killed the bird, which was retrieved by Jilt, both dogs, and an affined dog, which was not being much judgment. Mr. English being very deaf did not hear them ordered up, Ned pointed nicely and did not get credit for it. We then swung around through the woods into a ravine, where a bevy had been flushed. Crossing over the fence into an open field, Ned made a single bird and stopped to wing. We then moved on down the branch, crossed over and swung back up the edge and down through the pines and sedge to the branch again. We then crossed over the road into a large body of pines, where both dogs did some good work, alternately reading and pointing a bevy of running birds, which flushed well ahead of them. Moving on, both dogs scored a point on single birds. They were then taken up at 1:35 to be put down again after lunch. They were then set up on a hill of pines, where both dogs did some fast and more stylish work than before lunch. We worked over a hill for some distance, when Jilt commenced reading, Ned catching the scent soon roared ahead of her, and with great ease and affined dog, which was for some twenty yards and made a magnificent point, backed nicely by Jilt, a large bevy was flushed, and the dogs ordered up and Ned awarded the heat at 2:55. Down two hours and five minutes.

SAN ROY AND BLUEBELL.

They were the next brace. San Roy handled by Sanborn and Bluebell by her owner, Mr. Mills. They were immediately put down at 2:56. San Roy is a race-looking large lemon belton dog, and won one heat in the All-Aged against Forest Jay and was a great deal better than any dog we have seen. It is a nice looking blue belton, of good style and speed, but it is wild and unsteady. They were cast off in the pines and sedge and worked on into an adjoining field, where both dogs commenced to read and San Roy located them and pointed in fine style. Belle backed, followed by Bluebell, which was very unsteady. The birds were flushed and shot at and missed, both dogs unsteady to shot. They were then sent through the field, where both dogs pointed and backed each other, and when they came to a small ravine, San Roy pointed, Bluebell backing nicely, but Sanborn failed to flush a bird. We then swung round by the house, when San Roy pointed and was backed by Bluebell; to order three or four birds were read and shot at and missed. We then beat down to the thicket, where the birds had been flushed, and moved on. We then worked on into some pines near the fence, where some birds were seen to settle. San Roy pointed and Bluebell backed, and when they came to a small ravine, but failed to locate bird. We then moved on over the fence and through the field where two birds were flushed by handers and both dogs dropped to command as the birds flew over the heads, when Ned read and dropped on a beautiful point, backed by San Roy. The birds were then flushed and shot at and missed. We then swung round by the house, when San Roy pointed and Bluebell backed. Sanborn went forward to flush, when Roy commenced to read and draw on followed by Bluebell to the fence, where they were shot at and missed. We then drew to a beautiful point on a single bird, which was flushed to order and missed. Roy dropped to shot and Bluebell very unsteady. This was a beautiful piece of work for Roy and does credit to both, and we next set out for a small ravine, where young dog, which was exceptionally fast and good. We then went up the branch, where Bluebell pointed nicely backed by San Roy, when the bird was flushed. Bluebell broke in and started to chase, but was stopped by her handler. They were then ordered up, and we moved on across the hill to a small ravine, where we worked down the branch where Bluebell dropped on a beautiful point backed by San Roy. The bird was shot at and missed, the judges then threw a bird into the grass and San Roy to order, which she refused to do. They were then ordered up at 3:20, and the heat was awarded to San Roy. Down thirty-four minutes.

STUNNER AND DRAKE.

They were the next brace. Stunner handled by Luke White, and Drake by Thurtle. They were put down at 3:35. Stunner is a small lemon and white beaked dog, of fine shape and speed, but too young a competitor with Drake as Dr. Speer is. He is a liver and white dog of fine size. He ranges and quarters his ground well and in fine style, but is not quite so fast as Stunner. They were cast off in a patch of woods, and both dogs did some good work, and quartered and ranged well, which Stunner took in the style, and at a nice rate of speed. Drake roared on up the fence and pointed; Stunner being called up to back, Drake moved on. We then worked on down hill into some sedge along a creek, where both dogs commenced to read and draw on. Stunner drew on a beautiful point backed by Stunner. Thurtle, to order, flushed a large bevy and killed three, two falling dead, and one winged and falling over the fence. Drake to order, which he refused to do. We then moved on to the winged bird, jumping the fence with it without ruffling a feather, a very pretty piece of work. Stunner sent on retrieved one of the other birds very indifferently, his handler having to show it to him. We then moved on down the branch, to where birds had been marked down, when Drake pointed and roared to a flush, Stunner backing poorly. The bird was shot at and missed. We then went on through the thicket, where Stunner scored a flush. Moving on, Drake pointed, but the bird did not show. Stunner backed, followed by Bluebell, which was pointed. We then moved on up the hill where Drake pointed, but discovering his error moved on. Both dogs then roared on up the hill where Drake pointed and Stunner backed, the bird was flushed and killed, and retrieved by Drake handsomely. They were then ordered up at 3:40, and the heat was awarded to Drake at 3:55. This was a short but very exciting heat, Drake doing some excellent work. Down twenty minutes.

KATY D. AND RUSH GLADSTONE.

They were the next brace, Rush Gladstone handled by Arent, and Katy D. by Sanborn. They were put down at 3:45. Rush Gladstone is a black and white beaked dog, of fine shape and speed, and is neither as stylish or as fast as his competitor Katy D., who is a game little black, white and tan bitch with a very nice way of going. They were cast off in the open field where Drake had found his first bird, and soon began to read and draw on a small bevy, which was flushed to order and shot at and missed, both dogs were steady to shot. We then worked on through the woods, where Katy dropped on a beautiful point. Rush being called up to back came out at a rapid gait, and jumped over her back to the hill, where she pointed and backed by Bluebell, which she brought through the pines and across the hill, where Katy dropped on a nice point, Rush backing her. The bird was flushed, and shot at and missed. Moving on, Katy D. roared on up the hill, where she pointed and backed by Rush, beating a good deal of ground, to a branch and across to edge of a small patch of woods, where Katy pointed nicely

and was backed by Rush; a fine bevy was flushed to order and a bird killed, which Katy retrieved. They were then ordered up and the heat was awarded to Katy D. at 4:45. Down forty-five minutes.

NELLIE AND BANGOR.

This was the next brace in order, but Bangor was withdrawn and the heat was awarded to Nellie. It was now nearly dark and we started for the hotel.

PRINCESS HELEN AND COUNTESS C.

On Tuesday morning both the Derby and All-Aged were continued on adjoining grounds, and that communication might be had with the handlers who had gone in. In order to expedite the running, some of the heats were by consent run out of their proper order. We give the running in its proper order without regard to the change. St. Elmo V. and Pride of Dixie were the first brace to run, following their heat a few minutes after the close of the All-Aged Stake. Mr. Adams then joined Messrs. Smith and Donner in judging. When the heat between Princess Helen and Countess C. was called, Mr. Donner retired, but still resumed his duties as judge after the heat between Foater and Princess Helen was decided. Princess Helen and Countess C. were not run until after lunch. Helen is a handsome animal of medium size, and she is fast, neat and stylish, and bids fair to turn out something. She was handled by Wamaker, and was well handled by Arent, is also a pretty little bitch, with quite a turn of speed. They were cast off in a field, beside the road, where a bevy had been marked. The birds had been scattered in a patch of woods, where Countess dropped very prettily, the bird getting up ahead of her, Helen backing in beautiful style. Both then challenged and drew on, and two or three birds got up near Helen, but the ground was bad and they were very much to blame. We then crossed the road and turned south down the creek, where Helen made a good point to a single bird in the tall grass, Countess backing her in fine style. White to order put up the bird and missed it. We followed on and Helen again pointed it on the side of the creek, which backed by Bluebell to order and again missed it. Turning to the right up a run we passed into a cornfield, where both challenged, and Helen laid pointed just behind a bevy, which flushed as we came up. Following them Countess backed, and Bluebell followed, and a little further on she pointed one and was nicely backed by Bluebell. White to order put up the bird, which he missed. We then swung down to a run, where Helen wanted a bird, but drew too close and flushed it. Countess then flushed one, and a few seconds after the birds were taken up. Countess coming to ward her down wind ran up one, when the bird in front of Countess also got up. Helen then crossed the run, when another flushed near her. Countess then got in a good point, and was backed by Bluebell. Arent, to order, put up the bird and killed it. Countess retrieved with her. Helen swung round in the pines to a small run, and working up to the end a large bevy flushed and scattered in the pines, where Countess ran up one and then made a nice point to one, which she backed by Bluebell, flushed one, and then dropped on a point to a single, which flushed a second later, and as it came to her feet the rest of the bevy got up. Countess then pointed but nothing was found. Helen then made a nice point to a single, which flushed one, and then was ordered to retrieve, but Countess got it first and brought it up. Helen then threw it back and Helen retrieved it nicely. She then made a beautiful point, which Countess at once backed in good style. Helen drew on a few steps and got too close, and the dogs were then taken up. A small bevy was then flushed in a patch of stubble and weeds, which a bevy and roared into them and scored a flush. They were then ordered up, and the heat was awarded to Princess Helen. Down one hour and forty-four minutes.

BRYAN AND LONDON BEN.

This was the next brace in regular order, although they were run just previous to the last heat described. Both are small dogs. Bryan, who was handled by John White, is a very easy running dog with considerable style when on a point, when he moves rather slow, but has a good nose, and is also quite gamey when on point. He was handled by Vandover. They were put down near a creek, and worked up a hill, where Bryan made a nice point, and then drew on down with a bevy, which got up and flushed, but White killed one which Bryan retrieved well. Meanwhile Ben had got scent and was reading another bevy which flushed when the gun was fired. We then crossed the creek and swung back to where the first bevy had gone. Bryan struck them first and pointed very nicely. Ben then joined him and both alternately pointed and roared the birds, which flushed themselves beyond them, both being rigid, when the birds got up. We then went for a small patch of woods, where both dogs were very staunch and proved to be separate bevs. Ben held his birds staunchly, while Bryan roared on, the birds getting up before he had fairly located them. A little further on Bryan made a nice point to a single bird, which White to order flushed and backed by Ben. Ben then challenged and Countess read, but got too close and flushed a bird, and then the bevy got up close to him. Bryan meantime was not doing much better, as one or two birds got up near him. They were now ordered up, and the heat was awarded to Bryan. Down twenty-nine minutes.

PRIDE OF DIXIE AND ST. ELMO V.

This was the first race on Tuesday morning. Pride of Dixie handled by Arent and St. Elmo V. by Raicht. They were cast off at 10:30. Dixie is a black and white dog, of moderate speed, but very little style. St. Elmo V. is a black, white and tan dog of good size but not stylish, nor has he much speed. Neither dog did very creditable work, and the heat was a very poor one. They were cast off in a field of sedge, which was drawn blank. Turning up a ravine we swung around the hill, and crossing a branch moved up a gully along the edge of some pines, where St. Elmo scored a false point poorly backed by Dixie. We then beat on around the hill, where Dixie flushed a bevy, which was shot at and dropped on his haunches to back. A large bevy was flushed to shot, and dividing were marked down in opposite directions. We then swung round and worked back over the fence to the gully, where birds had been marked down. Dixie came to a false point, but it was not drawn. St. Elmo to order, which he pointed, but it was not drawn. St. Elmo to order, which he pointed, but it was not drawn. St. Elmo to order, which he pointed, but it was not drawn. They were then ordered up, and the heat was awarded to Dixie at 9:55. Down fifty-eight minutes.

FOATER AND BOB WHITE.

This was the last brace of the series, but it was the first one run after the All-Aged Stake. Foater, who was handled by Arent, is a black and white beaked dog, of fine shape and speed, but it is neither as stylish or as fast as his competitor Katy D., who is a game little black, white and tan bitch with a very nice way of going. They were cast off in the open field where Drake had found his first bird, and soon began to read and draw on a small bevy, which was flushed to order and shot at and missed, both dogs were steady to shot. We then worked on through the woods, where Katy dropped on a beautiful point. Rush being called up to back came out at a rapid gait, and jumped over her back to the hill, where she pointed and backed by Bluebell, which she brought through the pines and across the hill, where Katy dropped on a nice point, Rush backing her. The bird was flushed, and shot at and missed. Moving on, Katy D. roared on up the hill, where she pointed and backed by Rush, beating a good deal of ground, to a branch and across to edge of a small patch of woods, where Katy pointed nicely

stiffened out, Bob backing him very gracefully. A vent failed to find, and the point was scored as false. Poarter then turned into some pines and was lost. He was soon found pointing a single bird which he flushed to order. We then beat up the creek to east and crossed the creek to a cornfield, when Bob challenged and made his point to a large bevy which flushed as White came up. Following them into some pines both dogs pointed at nearly the same time, Bob having the bird on his side, and drew on a few steps and again pointed. As we came up the birds flushed and both handlers shot, one bird falling to White. Bob was sent to retrieve but failed to find. A few yards further on Bob made a nice point, where some of the birds had got up, and was backed down. Poarter then went to order, flushed and missed, Bob catching a little scent up a short east, and located his bird in capital style, White to order flushed the bird which he killed. Bob when sent to retrieve, flushed birds and drew a few steps and made a good point, from which he was taken, he then retrieved the bird very well, and he swung for it but did not succeed in finding it. We then crossed the brook and beat out a stubble field, and some tall weeds where Bob put up a hare and gave chase but soon came back. The spectators just then put up a bevy in the weeds which we followed, two or three then got up and settled near a creek where Bob made a nice point to one which White to order flushed and killed, but as it fell across the creek the dog was not sent for it. We then turned up the hill where Poarter got in a capital point to a bird which A vent to order put up a nice point, and Poarter retrieved it well. He then jumped a fence and one flushed as he struck the ground, we then beat out considerable ground without a find and went to lunch. After lunch they were again put down and worked toward a field that lay between the woods. Bob pointed to a single bird and made a nice point to some drew on, but the bird flushed well before he could locate it. Meantime Poarter had found the bevy which A vent, to order, flushed. Bob soon after scored a false point, which Poarter backed. Poarter then swung down and Poarter retrieved it well. He then pointed A vent, to order, flushed and killed, Poarter retrieving it well. They were then ordered up and the heat was ordered to Poarter. Down altogether one hour and fifty-four minutes. This ended the first series, with the following result:

- First Series.**
SETTERS.
 Maiden beat May Dawn.
 San Roy beat Bluebell.
 Katy D, beat Rush Gladstone.
 Princess Helen beat Countess C.
 Pride of Dixie beat St. Elmo V.
 Poarter beat Bob White.
- POINTERS.**
 Ned beat Jit.
 Drake beat Stunner.
 Nellie beat Bangor (withdrawn).
 Bryan beat London Ben.

Maiden and San Roy were the first brace of the second series. They were given a turn in the open and then worked back to the pines where birds had been marked; both challenged and Roy came round, but Maiden and Poarter did not find, we crossed into and then several more got up. A little further on Roy pointed one which flushed as Sanborn came up. Roy then took a few strides and very gracefully sat down on point to another which Sanborn pointed to order, and then took a few steps and pointed and a bird had itself near him but he held his point until we came up, when Sanborn, to order, flushed another bird and killed it. Meantime Maiden got in a good point to a bird which flushed as her handler went to her. They were then swung down and Poarter pointed to order, and Poarter eleven minutes. This was a short heat but quite a lively one. San Roy was under no control whatever, he was, however, generally in the neighborhood of the birds and ran through his heat in a style that completely won the hearts of all who saw him.

Ned and Drake were at once cast off in the run just below the finish of the last beat. Ned at once pointed a winged bird and retrieved it very nicely. They then beat out a thicket and turned into some woods. Working toward the west, we crossed into a field of sedge and pines, where Ned at the heart of a run swung round and made a gamey point, which Drake backed handsomely. Ned soon moved on and roared out a bevy which he retrieved. They then went to order, and Poarter, to order, flushed the birds which he missed. Following them into some woods, Ned pinned one which Drake flushed as he came up down wind. Ned then ran into one and pointed as it rose. Drake then put up one and took a jump or two after it, but they were not seen. They then beat up the sedge, where Drake made a gamey point to a single bird. He soon drew on and the bird flushed before he had fairly located it. He then took a few steps and pointed. Ned backed a moment and then went on and flushed the bird. A little further on Ned pointed, but very soon after he was round then and also pointed and then commenced roading and was joined by Ned who roared a little too fast and the bird got up just ahead of him. Thurtle killed the bird as Drake tried to retrieve, but failed to find. Ned then challenged and commenced roading. Drake came up and also roared, both doing some very pretty work. Ned got too near his bird and it flushed and soon another got up just ahead of him. Drake drew very carefully and located the bird, which he flushed as he was about to go forward before the handlers got there. They were then ordered up and the heat was awarded to Drake. Down one hour.

Katy D. and Pride of Dixie were at once put down in the sedge and pines. Pride at once flushed one and then several more got up near the judges. We then beat up the hill, and in a capital style, and were nearly dark they were ordered up to go down in the morning. Wednesday morning the weather was delightful. It was just cool enough for comfort, with a slight breeze from the north. As the birds were not sent for until half past eight, and a few minutes later the dogs were cast off just east of the Towal. Mr. Adams had been excited from serving any longer and the stake was finished under Messrs. Donner and Smith. We beat over considerable ground without a find. At last the bird was flushed and Poarter pointed to order, and was followed into some woods where Pride flushed them a long distance and drew toward them with his head high in the air. Katy did not appear to strike it but went on and flushed one, when both dropped to wing. Katy then made a nice point to part of the bevy which Sanborn to order, flushed and missed. Katy soon had another one fast, but she drew on a step or two and it got up. We then turned back to some woods, where Poarter pointed to a winged bird, which Katy retrieved very nicely. Pride then pointed a single bird. Katy backing him and Poarter did not find, but he held his point until we caught the body scent he jerked up his head and made an elegant point. A vent put up the bird and killed it. Pride retrieving very well. Katy then pointed where a bird had been part of the bevy which Sanborn to order, flushed and missed. That Pride ran into two or three birds and drew down very gracefully as they got up. After more tramping we rode into a small bevy which went into some woods where we followed them, but nothing was done except by the judges, who flushed two or three birds, which went over the edge of the woods, where Katy found one and dropped very readily on point; Sanborn, to order, flushed the bird, and they were then ordered up and the heat was awarded to Katy D. Down two hours and two minutes.

Princess Helen and Poarter. After lunch we drove a mile to new ground, and spent a long time without result. Finally Helen put up a bird in a capital point, which Drake to order, flushed. We then beat up near Nellie. She then pointed a bird which flushed as Haicht walked toward her. One or two more then got up, and White killed one which Nellie, after some time, retrieved, but not very well. They were then ordered up and the heat was awarded to Nellie. Down one hour and fifty-two minutes. We then went to lunch, which was awaiting us at the house close by.

Princess Helen and Poarter. After lunch we drove a mile to new ground, and spent a long time without result. Finally Helen put up a bird in a capital point, which Drake to order, flushed. We then beat up near Nellie. She then pointed a bird which flushed as Haicht walked toward her. One or two more then got up, and White killed one which Nellie, after some time, retrieved, but not very well. They were then ordered up and the heat was awarded to Nellie. Down one hour and fifty-two minutes. We then went to lunch, which was awaiting us at the house close by.

San Roy beat Maiden.
 Katy D, beat Pride of Dixie.
 Poarter beat Princess Helen.

Drake beat Ned.
 Nellie beat Bryan.

San Roy and Poarter were the next brace in order, but while waiting for Poarter to get his wind, Drake and Nellie were run, and at the conclusion of this heat they were cast off down in the pines. Poarter ran one up at almost the first stride. Roy then pointed and roared a short distance, but could not carry it. We then swung round the head of the run and beat up the side hill, where Poarter scored another flush. Roy made a capital point soon after that, Sanborn flushed the bird, and Poarter then made a good point, and was handsomely backed by Roy, but nothing was found. We then beat up to the road, where Roy, while going like a ghost, dropped as if shot to a large bevy, which flushed as we came up. This was a capital piece of work. Followed after them we failed to find them, and as it was dark they were ordered up to go down again in the morning. Thursday morning ushered in another beautiful day. Leaving the hotel at 8:15, we rode about three miles to the farm of Mr. Hobson, where the dogs were cast off. Roy soon challenged, and we rode into a large bevy which scattered in the briars and sedge, where Roy soon had one fast. Poarter came up and backed indifferently, and a second or two later the bird flushed itself. They were then ordered up, and the heat was awarded to San Roy. Down altogether fifty-four minutes.

Drake and Nellie were at once put down where the heat between San Roy and Poarter was finished. They were given a spin in the open and then swung back to the corner where the last heat was finished. As we neared the place both dogs were beating the sedge at full speed when Roy suddenly sat down very gracefully to a single bird. One half just passed near the place and as he has a well merited confidence in his nose he seemed to doubt the correctness of Roy's very positive position, and only partially backed and was drawing toward him when his handler ordered him to stop. The point was taken, however, and Sanborn, to order, flushed the bird, which he missed very readily. Roy retrieving it in good form, Sanborn, unable to keep step with Thurtle, at the suggestion of one of the judges, mounted a horse when Thurtle scored a capital point by jocularly accusing him of violating the rules, whereupon he says that the handlers shall walk together. We then turned down the hill to a run, where Roy dropped as if shot to the scent of a portion of the bevy we were in search of. Drake backed him in grand style, Sanborn, who had dropped from the saddle nearly as sudden as Roy had, was enabled to find the branch, near which Drake dropped to a large bevy. Roy, who was near him, also dropping to back. The birds flushed themselves a second or two later, both dogs remaining perfectly steady. This was very well done. We then worked toward the birds, which had settled in a thicket along the branch where one got up near Roy, who stopped to wing, and as we came up several more flushed wild. Roy then crossed the branch and went up the hill and finished the heat in grand style, with a very gamey point to a brace of birds, which Sanborn, to order, flushed. They were then ordered up, and the heat was awarded to San Roy, who was declared the winner of the first prize. Down thirty-three minutes.

This was a beautiful heat. Both dogs performed their work in a masterly manner, and covered themselves with glory. Roy showed up in his heat a phenomenal dog. He had steamed down and was under better control. As Sanborn well remarked, "his nose is full choke, both barrels." Should nothing befall him we shall look for him in the front rank next year. Drake was not badly beaten, and his owner may well feel proud of him. This ended the second series. Following is the summary:

- Second Series.**
SETTERS.
 San Roy beat Maiden.
 Katy D, beat Pride of Dixie.
 Poarter beat Princess Helen.
- POINTERS.**
 Drake beat Ned.
 Nellie beat Bryan.

San Roy and Poarter were the next brace in order, but while waiting for Poarter to get his wind, Drake and Nellie were run, and at the conclusion of this heat they were cast off down in the pines. Poarter ran one up at almost the first stride. Roy then pointed and roared a short distance, but could not carry it. We then swung round the head of the run and beat up the side hill, where Poarter scored another flush. Roy made a capital point soon after that, Sanborn flushed the bird, and Poarter then made a good point, and was handsomely backed by Roy, but nothing was found. We then beat up to the road, where Roy, while going like a ghost, dropped as if shot to a large bevy, which flushed as we came up. This was a capital piece of work. Followed after them we failed to find them, and as it was dark they were ordered up to go down again in the morning. Thursday morning ushered in another beautiful day. Leaving the hotel at 8:15, we rode about three miles to the farm of Mr. Hobson, where the dogs were cast off. Roy soon challenged, and we rode into a large bevy which scattered in the briars and sedge, where Roy soon had one fast. Poarter came up and backed indifferently, and a second or two later the bird flushed itself. They were then ordered up, and the heat was awarded to San Roy. Down altogether fifty-four minutes.

Drake and Nellie were at once put down where the heat between Poarter and Princess Helen. They were put down in a field of wheat, and worked along the edge. Drake ran up and beat up to order, where they were cast off. Drake then pointed to order, and Poarter flushed the bird which he missed. Poarter then made a stylish point at the edge of some pines; Nellie backing him nicely. Thurtle, to order, flushed and killed the bird, which Drake retrieved in good form. Following up the bevy, both dogs went out of sight, and we were found on point; both handlers claimed the point, but we thought that it should be awarded to Drake, as when he moved she at once went on. Drake went on and soon pointed again, and Nellie backed him; Thurtle, to order, flushed and killed the bird, which Nellie retrieved. They were then ordered up and the heat was awarded to Drake, who was declared the winner of the Hillside Kennel cup, for the best pointer in the Derby. This ended the third series with the following result:

- Third Series.**
SETTERS.
 San Roy beat Poarter.
 Katy D, a bye.
- POINTERS.**
 Drake beat Nellie.

- POINTERS.**
 Drake beat Nellie, and won the Hillside Kennel cup for the best pointer.
- Fourth Series.**
 Drake (pointer) beat Katy D. (setter).
 San Roy, a bye.

FINAL TIE FOR FIRST PRIZE.
 San Roy (setter) beat Drake (pointer) and won first prize, also winning for his breeder, Mr. D. C. Sanborn, the President's cup.

FINAL TIE FOR SECOND PRIZE.
 Poarter (setter) beat Drake (pointer) and won second prize Drake winning third.

PACIFIC COAST FIELD TRIALS.
 FOLLOWING are the entries for the First Annual Field Trials of the Pacific Coast Field Trials' Club, to be run at Walltown Timbers, commencing Monday, Nov. 26. The judges will be Crittenden Robinson, Esq., F. W. Dunn, Esq., and Judge John Gale.

- ALA-GADO STAKE.**
 CARL—J. Y. Ross, black, white and tan setter dog (Leicester)—Dart.
 ROYAL—(Gus) Bennett, black, white and tan setter dog (Royal Duke)—Thot.
 SYBIL II.—Dios Bennett, black and white setter bitch (Dan Sybil).
 DASH—J. G. Edwards, black, white and tan setter dog (Belton II)—Belle.
 MAX GREGORY—F. N. Aldrich, black, white and tan setter dog (Bob Hoy—Queen Mab).
 DOER—F. A. Taft, black and tan setter dog (Don—Lady) winner of 3d at Nebraska Field Trials, 1881.
 BELLE—H. H. Briggs, red setter bitch (native) winner of 2d Prizes at Greyhound Trials, 1882.
 NELLIE—Henry Brown, black, white and tan setter bitch (Belton II)—An Irish setter bitch, red and white.
 DIDD—C. N. Post, red setter bitch (Ben—Jesse).
 BILLY—Wm. Golcher, orange setter dog (native).
 BEATRICE, QUEEN—J. M. Bassford, liver and white pointer bitch (Ditley—Kunger—Queen).
 SPURT—D. K. Come, light red setter dog (native).
 DON—J. M. Bassford, Jr., black and white setter dog (native, English)—Irish.
- PUPPY STAKE.**
 BOV, Jr.—G. B. Cosby, liver and white pointer dog, whelped Aug. 15, 1882 (Ranger Boy—Josie Bow).
 BUTTE BOV—H. A. Bassford, liver and white ticked pointer dog, whelped Aug. 15, 1882 (Ranger Boy—Josie Bow).
 DUKE—C. V. B. Kidding, red setter dog, whelped July 19, 1882 (Colgate's Fat—Howe's Gypsy).

BEATRICE.—H. C. Chipman, red setter bitch, whelped April 5, 1882 (Shooko—Clarke's Nellie).

KENO BOW.—J. M. Bassford, Sr., liver and white pointer dog, whelped Aug. 15, 1883 (Ranger Boy—Josie).

BEAUTIFUL SNOW.—W. M. Sherry, orange belton setter bitch, whelped March, 1883 (Dan—Sybil).

THE NEW ORLEANS DOG SHOW.

THE show promises to be a very interesting one, judging from the large number of applications received and the numerous inquirers who daily visit the office. Sportsmen are prepared to give every one a grand welcome.

The building where the show is to be held is simply perfect, the hall proper being the finest in Louisiana, well lighted and well heated. In the rear hall of the building daily exhibitions will be given of yard and hot broken dogs for special prizes, which will be offered. Mr. James Mortimer of New York, will act as judge of spaniels, foxhounds, fox-terriers and all the non-sporting classes.

There is no doubt that if this show is successful it will be the pioneer of yearly bench shows in this State. What the sportsmen and other fanciers here desire to see is the best representative dogs of their respective breeds, and I am sure good will find them here. A general deservier is expressed to see the field trial winners here, and I can assure you they and their owners will receive a warm and hearty reception. Special prizes are offered as follows: Sole leather gun case for best foxhound, silver-headed cane for best pointer, silver cup for best setter or pointer placed in an 188 field trial, silver cup for best liver setter dog puppy, Venetian silver pin for best black and tan toyterrier owned by a New Orleans lady, silver mounted hunting knife for best foxhound owned in New Orleans, \$200 worth for best dog or bitch English setter, silver medal for best bulldog or bitch, instead for best pointer owned in New Orleans, 1 doz. decoy ducks for best beagle, 1 doz. decoy ducks for best sporting dog of any strain owned in New Orleans, gold-headed cane for best setter puppy owned in New Orleans, \$200 worth for best dog or bitch with best 188 field trial record, sporting paper subscriptions are also given.

The following railway companies will carry dogs free to and from the show, to be accompanied by their owners or caretakers: Missouri Pacific Railway Company, Wabash, St. Louis & Pacific, Chicago, Burlington & Quincy, Mobile & Ohio, Lake Shore & Michigan Southern, Pennsylvania Company, Pittsburgh, Cincinnati & St. Louis, Chesapeake & Ohio, Vicksburg & Meridian Railway, and the Illinois Central Railway Company have issued the following instructions to their baggage masters: "One or two dogs in charge of owner will be entitled to free transportation in baggage car. On each dog and above the dog, a heavy, frost proof bag or cover of one size, containing the following charge may be made: For any distance up to 99 miles, 25 cents; 100 miles to 249 miles, 50 cents; 250 miles and over, 75 cents. Baggage masters will collect only to the end of their run." The Adams, Southern and Pacific express companies have agreed to return dogs free.

CHAS. LINCOLN, Sup't. NEW ORLEANS, La.

THE NATIONAL FIELD TRIALS.

(Special to Forest and Stream.) GRAND JUNCTION, Tenn., Dec. 3.—The fifth annual meeting of the National Gun Club commenced today under favorable auspices. There are many noted dogs entered, and the work done to-day promises a very successful meeting. There is a good attendance and the weather is all that could be wished. The day has been frosty, but we have had a gentle breeze from the northwest, making an almost perfect hunting day.

THE ALL-AGED STAKE closed at eight o'clock last night, with twenty-one entries, which were drawn to run as follows: Gus Bonwith against Clyn, San Roy against Grant Dale, Coleman's London against Nellie B., Maud W. against Pink B., Gath against Kinicknick, Major Croxteth against Sue, Don against Flossy, Victor against Foreman, Dogwhip, Jr. against Countess Rake, Harrison's London against Phyllis H., Carrie J. a bye. Eight heats were run to-day with the following result:

Clipper beat Gus Bonwith. San Roy beat Grant Dale. Nellie B. beat Coleman's London. Pink B. beat Maud W. Gath beat Kinicknick. Sue beat Major Croxteth. Don beat Flossy. Foreman beat Victor. This closed the racing for the day.

(Special to Forest and Stream.) GRAND JUNCTION, Tenn., Dec. 4.—The weather to-day has been delightful. Birds are very plenty, and the running has been very good. Many spectators are present who appear to be deeply interested in the running. Good ground was made today, the heats run as follows: Coleman's London against Countess Rake beat Dogwhip, Jr. Harrison's London beat Phyllis H. Carrie J., a bye. Second Series. Carrie J. beat Clipper. Nellie B. beat San Roy. Don beat Pink B. Gath beat Foreman. San beat Countess Rake. Harrison's London, a bye.

(Special to Forest and Stream.) SAN ROY.—H. H. Matlock, Riceville, Tenn., lemon and white dog, March, Count Noble—Spark, against. PAUL GLADSTONE.—Charles Tucker, Stanton, Tenn., black and tan dog, June 19, Gladstone—Lavalette.

NELLIE B.—E. Odell, New Orleans, La., black and white bitch, Feb. 6, Rake—Meg Merlies, against.

KATIE D.—D. C. Sanborn, Dowling, Mich., black, white and tan bitch, May 21, Count Noble—Dashing Novice.

FRED H.—J. Hayward, Jr., St. Joseph, Mo., black and white dog, June 6, Dash III.—Countess Tru.

SHOT.—H. M. Short, Atoka, Okm., black, white and tan dog, April, Prince Lavalette—Native bitch.

COUNT LOFFY.—C. K. Drape, Burnside, Ky., lemon and white dog, March 2, Prince Phyllis—Bunny Kate, against.

RAIN BOW.—E. Odell, New Orleans, La., liver and white dog, Aug. 16, Bow—Roxie.

MAJOR CROXTETH.—L. J. Pettit, Milwaukee, Wis., liver and white dog, April 15, Croxteth—Lass, against. GLADSTONE'S BOY.—Dr. G. W. Ware, Stanton, Tenn., black, white and tan dog, Jan. 19, Gladstone—Sue.

GRACE GLADSTONE.—Chas. Tucker, Stanton, Tenn., blue belton bitch, June 19, Gladstone—Lavalette, against.

COUNTESS C.—I. Yersky, Jr., Contestville, Pa., black, white and tan bitch, March 24, Dashing Lion—Arnida.

PRINCESS TECK.—Geo. C. March, Sycamore, Ill., black and white bitch, Druid—Princess Draco, against.

DON QUIXOTE.—F. Huntington, Memphis, Tenn., liver and white dog, March 20, Pat. Cleburn—Mug.

LADY C.—B. M. Stephenson, La Grange, Tenn., black, white and tan bitch, July 11, Coleman's London—Heile of Batheie, against.

FOARTER.—J. M. Arent, Hickory Valley, Tenn., black and white dog, June 3, Gladstone—Kess, against.

LEORA.—Dr. G. W. Ware, Stanton, Tenn., blue belton bitch, June 19, Gladstone—Lavalette.

RUSH GLADSTONE.—J. M. Arent, Hickory Valley, Tenn., black, white and tan dog, July 15, Gladstone—Donna J., against.

COUNTESS HOUSE.—J. H. Trezevant, Houston, Tex., black, white and tan bitch, Aug. 10, Gladstone—Juno.

COUNTESS GLADSTONE.—J. R. Henricks, Pittsburgh, Pa., lemon and white bitch, April 23, Gladstone—Countess.

BRAVO.—E. W. Condon, Honna, Pa., black, white and tan dog, Gmos, Brussels—Jenny Lind, a bye.

POINTERS AND SETTERS.

THE dogs that ran at High Point were, as a whole, far in advance of those which have been seen at any previous meeting, and some of the work done was fairly phenomenal. We think it doubtful if so many first-class animals have ever been brought together anywhere as were collected at High Point. The setters were, as a rule, far better than the pointers. Although there were among the latter many good dogs, yet the class was a weak one by comparison with the setters. The system of running the pointers and setters separately is strongly to be condemned, as being fair to neither class. They should be drawn indiscriminately, as has been usual until recently. To say nothing of the fact that, as was the case this year, two dogs had, in the drawing, each a bye, which in itself is an absurdity, it is plain that where of two classes one is weak and the other strong, the former will have the advantage. The weak class will go along all right, while dogs in the strong class will very likely be thrown out which might defeat the best dog in the other class. The whole aim and object of field trials is to discover the best dog, and there should be no fear or favor shown in the manner in which we go to work to find out this. If the setters cannot stand competition with the pointers, or the pointers are unable to run satisfactorily against the setters, we want to know it, and the relative merits of each individual dog and of the two strains can be determined far more satisfactorily and surely, by the old method of drawing. The setters, at this last meeting, made a very strong class, and Gath stands at its head. We believe him to be the very best setter in America to-day, and the work which he did during the concluding heat of the All-Aged Stake was marvellous. San Roy, who won the Derby, is one of the most promising young dogs that we have ever seen and may, with care and proper handling, equal his now famous half brother. The performances of these two sons of Count Noble, taken in connection with the winnings of his get last year, stamp this dog as one of the best sires that the world has produced.

THE LIT—GROUSE DALE MATCH.—Grand Junction, Tenn., Dec. 4.—Editor Forest and Stream: The Lit—Grouse Dale match will commence Dec. 20.—D. C. SAXBORN.

The Ohio & Mississippi Railway is the shortest and quickest route between St. Louis and Cincinnati and between St. Louis and Louisville, and the best route between St. Louis and New York, and between Cincinnati and New Orleans. Sportsmen desiring to transport their dogs over this road may get an order to have them passed free by writing to W. S. Babine, General Passenger Agent, Cincinnati. Of Kennel affairs ready, so that there is no chance for losing a dog or having him hurt by baggage.

Answers to Correspondents.

H. E. B. Worcester, Mass.—Florida has no game law. BLACKSTONE.—There is a letter at this office for the correspondent who wrote under this name in the issue of Nov. 5.

"ANY BOW" is requested to send his address to this office. Letter directed to the address given before has been returned "unclaimed."

A. S. Fort Plain, N. Y.—A correspondent writes that he can tell you where to find the cartridges for your gun. Send us your address.

G. H. B.—Touch the sore spots with oil of tar; the other portions rub thoroughly with soft soap, then apply sulphurous acid diluted with three parts of water, and repeat 4 or 5 times in two days.

PICKEREL, Brooklyn, N. Y.—Will you please inform me the best way to fish for perch and pickerel in Sullivan county, N. Y., during the month of June; also the greatest weight attained by pickerel? Ans. For perch use live minnows or worms; for pickerel use minnows live or dead. Let the live minnows swim and troll or skitter the dead ones. Gangs of loeks are used for pickerel. Frogs are also good bait. The pickerel of Southern New York seldom exceed four pounds; they are a different species from the great lake pickerel or Northern pickerel.

H. A. B. Philadelphia.—Can you tell me the scientific or technical name of the sea duck, shot in the Delaware River, there known as the "stuffy." It is also called by some "steedhead," and I think on the Chesapeake is called "reg's" or "reg's" duck. It is a plumed, rather slender sea duck, dusky or brownish in plumage, with a bill broader at the end than at the base, somewhat similar to the shoveler or broadbill; it has also another I should also like to know the scientific name of the wild or bell-bivver? Ans. The stuffy is, no doubt, the ruddy duck (Erismotus ridgwayi). It is also called "reg's" or "reg's" on the Chesapeake and in Virginia. The name "bell-bivver" is applied to several species of birds. The Carolina jay (Psaltriparus pallidus), the horned grebe (Podiceps cornutus), and two or three species of small ducks, as, *lucifera alberta*, are called.

Seven cardinal virtues should be found in a pen. It must be elastic, well tempered, durable, even-pointed, easy writing, well shaped and neatly finished. Esterbrook's have all these qualities in perfection.

Rifle and Trap Shooting.

RANGE AND GALLERY.

A NEW METROPOLITAN GALLERY.

NEW YORK has now probably the finest gallery for rifle shooting in the world, and on Saturday evening last the opening of the same in a large gathering of advocates of off-hand shooting. The new place is in the upper part of the building at the corner of Forty-second street and Vanderbilt avenue, where for some time the gallery is a spacious apartment, now occupied by the Metropolitan Club. The new gallery is a spacious apartment, now occupied by the Metropolitan Club. The new gallery is a spacious apartment, now occupied by the Metropolitan Club. The new gallery is a spacious apartment, now occupied by the Metropolitan Club.

A special effort has been made to secure safety in the flight of the bullet, and for this purpose a small cylinder has been placed in the large one. This supplementary cylinder is about a foot in diameter and five feet long. It is placed in the target end of the large cylinder, and at each end of the cylinder is a small rectangular opening. This slit or opening is about the size of the target, and the target alone is visible through it. A bullet which does not pass through the slit will be stopped by the face of the cylinder, or is stopped by the face of the diaphragm and scores a miss. Every bullet passing through the opening reaches the paper target and scores something. The targets are small paper ones reduced for the range, shot over from the regular 300 yds. target.

The precautions for safety seem to be very complete. As the target is drawn down for the replacing of the aid by a new one, an iron plate, worked by the same movement, slides over the shooting end of the tunnel, leaving only darkness for the shooter, and a shot fired into the target would be stopped by the iron plate. As the new target slides up into position, the iron plate passes from in front of the tunnel end and the range is ready for use again. There is no prospect of any person being in the range of a firing bullet, unless the crosscut carelessness is exercised. For the accommodation of those wishing to see the shots as made upon the target, he is seated through the 80 lock opening into the gallery of the cylinder, or is stopped by the face of the diaphragm and scores a miss. Every bullet passing through the opening reaches the paper target and scores something. The targets are small paper ones reduced for the range, shot over from the regular 300 yds. target.

The precautions for safety seem to be very complete. Every bullet passing through the opening reaches the paper target and scores something. The targets are small paper ones reduced for the range, shot over from the regular 300 yds. target.

It is said that the New York Rifle Club will become the lessees of the gallery upon their removal from their present quarters in Fourth street, and, if so, they will find less objection to a permanent establishment, and one which may be made one of the most popular resorts in the city.

SKILLFUL NEVADA MARKSMEN.

GOLD HILL, Nev., Nov. 21.—These scores below were made by members of those companies, named, viz., A. B. C. and F. First Regiment Nevada National Guard, for a gold medal, which is conferred annually by the winning company in the range of a flying bullet. Each company to shoot 30 per centum of its membership, the minimum number allowed each company by law being fifty-four men. The bullets used are Sharps, Remington's patent, 40 grains of powder and 40 grains of lead.

The following is the score made by the different companies in the company, the medal being won by Company B (Emmett Guard), of Virginia City, with a score of 85.9 per cent.

Table with columns for company name, shooter name, score, and percentage. Includes companies A, B, C, D, E, F and their respective members and scores.

SARATOGA, N. Y., has a rifle club under the supervision of Capt. S. P. Wells.

The range is on the old race course at Glen Mitchell. The week 34 was not a very favorable day for scoring high. The light was changeable. Last week the best score for 10 men was 1,033. This week it is 1,043, an improvement of a point per man. We append Saturday's score and the total score of the week.

Table showing Saturday's Score for various shooters (S P Wells, H W Wheeler, etc.) with columns for individual scores and a total score.

from the crude and ill-digested notions prevalent among yacht builders and among the general run of newly fledged sailors. We have hitherto given most prominence to pronounced cutters in order to enforce sound logic and exact knowledge. With the possibility of attaining the highest speed on large displacement with "shoulder" reduced to second rank in importance once fully conceded, the time will come for applying the same principles to boats of moderate draft. But it is above all things necessary that such a concession should first be forced from all sides, so that ancient dogmas and quackery about light displacement shall not interfere with sound design in boats of any class suited to any special requirements. To bring about such an end, the present war in favor of cutters has been waged. The choice of type may be left to each individual as soon as he is in possession of a full understanding of the principles involved. But as long as builders and amateurs blindly insist upon light displacement simply because they know nothing else, we have considered it our business to instruct them to the contrary for their own benefit. That we have been on the right tack all along has now been proven to the satisfaction of every one open to reason and facts. It is not likely that any intelligent student of events will so far stray from common sense as to build another yacht of light displacement, whatever his draft may be. The object of the modern school has been to compel attention to the other side of the story. Every one had been inoculated with the very foolish and wholly unsupported notion that big displacement and speed were inimical and that only traps could be expected to sail. The exhibition of the heavy cutters have recently made of our most famous skippers is exactly in accord with what we have all along been preaching. These victories, with the more than probable loss of the America Cup next season, will lift the new school into such ascendancy, that the course of Tommaso Lux Stream will be fully understood, and its disinterestedness valued in the light of the prolonged fight we have made single handed against overwhelming numbers and deep-rooted prejudices. We to our personal loss and suffering in many respects. We have labored to rescue American yacht building from the dry rot of ignorance and the poison of prejudice, so that Americans may be saved the future disgraceful collapse which this season has witnessed in the conspicuous disaster to a new vessel, built to eclipse everything afloat, but which met the shallow conceptions of her originators, and, notwithstanding her sinking in a summer puff, and which in spite of her light displacement, reaches only mediocrity in point of speed. Such a vast field as naval architecture applied to yachts is widely varying in purpose, cannot be covered in all its bearings every time we write. If our attention has been engrossed with cutters of deep draft in the past, it has been with a view to creating a sharply defined issue, the results of the trial to serve as our lever for prying the scales from the eyes of somewhat incompetence, so the community might benefit accordingly. In response to many inquiries, we will during winter offer designs for moderate draft, which shall embody "cutter principles," and not be despicable traps because of their light draft.

A NEW SINGLEHANDER.

WE have had numerous inquiries asking for the publication of plans for a small all round boat of about 24ft. length. Our intention to offer a design of our own has been forestalled by the receipt of the plans for a new yacht to be built for Boston owners this winter. These plans are so commendable in their general aspect and so well considered in all details that we produce them as almost an exact counterpart of our own ideas. They were executed by Messrs. Burgess of the Eastern Yacht Agency, and are entirely original with them, being the outcome of their diversified experience and mature study of the whole subject. The yacht promises to be a good sailer on all points, safe, able, roomy, dry and buoyant, and serves as an excellent example for an all round boat wherever there is five feet of water. This yacht is intended to be the longest one man can work with convenience as a yawl, and large enough to make a comfortable draft for two when rigged as a cutter. Beam and displacement have therefore been kept moderate. One chief feature is the absence of any separate or plank keel, the outside iron ballast being wide across the top and so molded as to be part and parcel of the boat proper, which prevents the twisting or wrenching off of the keel upon grounding.

Length over all	24ft.
Length on W. L. L.	24ft.
Beam extreme	6ft. 3in.
Beam on W. L. L.	6ft.
Draft	3ft.
Least freeboard	2ft. 3in.
Displacement, 189 cubic feet	5.4 tons.
Iron on keel	5,250 lbs.
Ratio of ballast to displacement	.055
Area midship section	14.5 sq. ft.
Area immersed longitudinal section	33 sq. ft.
Area loadline	39.68 sq. ft.
Area wetted surface	205 sq. ft.
Ratio longitudinal to midship section	1.45
Ratio longitudinal section to loadline plane	1.45
Midship section from end L. W. L.	14ft.
Center of buoyancy from L. W. L.	13.12ft.
Center of lateral resistance from L. W. L.	13.44ft.
Center of effort from L. W. L.	12.82ft.
Center of effort forward of C. L. R.	7.5in.
Area three lower sails	650 sq. ft.
Area per sq. ft. wet surface	3.25 sq. ft.

We will soon publish sail plan and accommodations.

RIVAL—The stories concerning the Rival and her owner's recent supposed conversion to light draft, which were published in a daily paper, turn out to be devoid of all truth. The Rival is offered for sale, not because large displacement has been found a failure, but because she was always intended to be sold after trial, having been put up to give mechanics occupation during the dull summer season. The light draft now building by John Mumim is for shooting on Great South Bay. We learn that the Rival was found to work well, and that she is built in the thorough and conscientious manner for which John Mumim's work is noted. As for the sweeping challenges and disparagement of cutters ascribed to her owner in the public prints, they are fictions. Large displacement in the Rival has not been found a failure. Her weight and draft make her an able and safe boat, and if her speed is an open question, it is because no opportunity was taken to put her to a test, having come out in September, and not being in condition before other boats of her class had been laid up.

HELEN—The World of Monday informed its readers that this cutter had been caught in a gale off Hatteras, had returned for shelter, had sprung her mainmast, and was going to lay up for winter, being compelled to abandon the idea of further cruising. There is not one grain of truth in the report of the World. It is a fiction of an unscrupulous reporter seeking to traduce cutters before the public by the circulation of such falsehoods. The truth is simply this: Helen left for a short trial spin at sea before clearing with the roving commission for Hampton Roads, Bermuda, etc. Her compass was found quite true, and upon her return to port last Sunday the adjustment was made. She at once put to sea again for a protracted cruise. All hands are delighted with her behavior. The World takes good care not to correct the false impressions it spread, but that is to be expected from such an unscrupulous source.

ROSIE—This little steamer has been sold to go to Florida. She is the Rosie was built by Jas. Cole of the Boston Fire Department. She is a neat little specimen 16ft. long, 3ft. beam. Frame is of bent oak, spars to be mahogany, skin of 3/16 in. plate. Boiler 14x22 in. made of steel, contains 199 brass tubes. Cylinder 2x3. Weight of engine and boiler 200 lbs. Screw two-bladed, 20 in. diam., 40 in. pitch. Makes 10 miles on one peck of soft coal. Carries three hands.

DAISY—Mr. M. Van Rensselaer, Jr., of this city, has purchased the handsome little Daisy cutter, 7 tons, well known to Southampton waters. She will be shipped for this port next spring and will be a creditable addition to the growing fleet of cutters. Daisy was built last year by J. J. Fay & Co., of Southampton, England, with sails by Raszscys & Laphorn. She is 26ft water-line, 8.5ft. beam and 5.2ft. draft. Will fly Seawanhaka Corinthian burgee.

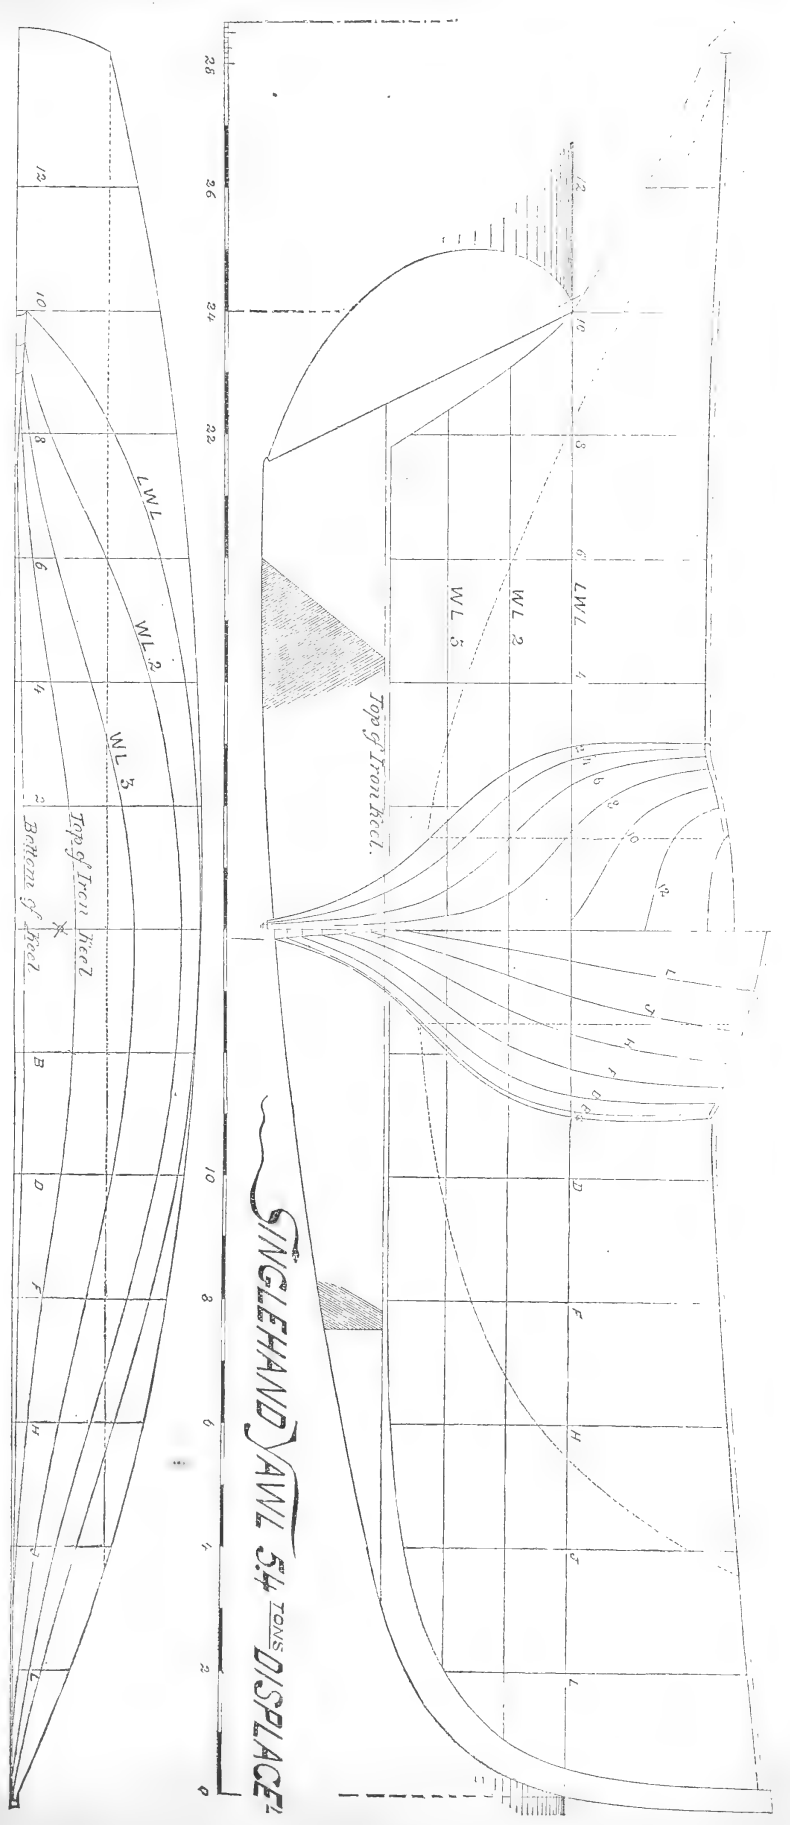

SHEEPHEADS—Mr. Clapham is busy with a number of models. Two for 33½ boats have been sent to Nova Scotia and Florida, and two more models are to go to France. Another for a yacht of 23ft. destined for Quebec. Mr. Clapham writes that he has never entered a race with a sharpie, because all the boats so far built were intended for cruising only. The racing sharpie is still a thing of the future.

MERMAID—This steam yacht ran short of fuel on her recent passage from Norfolk to Wilmington, N. C., and after burning up chairs, tables, stanchions, etc., fetched the Flying Pan Shoals lightship and came to anchor, all hands boarding the light vessel. She was subsequently towed into Smithville for a harbor.

LIST OF RACES—Add one race, sailed Nov. 5, from Harlem, by the Harlem Y. C. First class, 3 starters, Little Dean 1. Second class, 2 starters, Bezzine 1.

RIPPLE—Mr. Clas, Cheseborough arrived in the side-wheel yacht Ripple at Baltimore last Wednesday, and was to remain a day or two before re-ascending South.

THE PAST SEASON—A continuation of the summary of last season will be found, as last week, upon the editorial page.

HUMPHREYS HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, AND Poultry.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Raisers, Veterinary Surgeons and Carpenters, Horse Railroaders, Manufacturers, Coal Mine Companies, Trays, Hippodromes and Menageries, and others handling stock, with perfect success.

Humphreys' Veterinary Manual. (250 pp.) Sent free by mail on receipt of price, 50 cents.

277 Pamphlets sent free on application. HUMPHREYS' HOMEOPATHIC MED. CO. 109 Fulton street, New York.

NERVOUS DEBILITY

HUMPHREYS' Vital Weakness and Prostration from over-work or indiscretion, is radically and promptly cured by its. Been in use 20 years, SPECIFIC No. 28, fully remedied known. Price \$1 per vial, or 5 vials and large vial of powder for \$5 sent post-free on receipt of price. Humphreys' Homeo. Med. Co., Mgmt., Catalogue free, 109 Fulton St., N. Y.

"THE FAIRY" MINNOW.

This is by far the best artificial minnow ever made. It is a great improvement on the "Phantom," which has long been considered the best of all minnows. When put into the water it almost immediately becomes as soft as velvet and as tough as leather, besides having the exact appearance of a real minnow, even in the matter of scales. Our Phantom has been imitated, and so, no doubt, will this be. Anglers will find our name on every box containing one of these minnows, and our well-known trade mark on the card to which each minnow is attached.

The above minnow is No. 7. The following are the various sizes we keep in stock.

Nos.	4	5	6	7	8	9
Inches Long	$\frac{3}{4}$	$\frac{5}{8}$	$\frac{3}{4}$	$\frac{7}{8}$	$\frac{1}{2}$	$\frac{3}{4}$

Orders received from anglers residing where the dealers keep a full line of our goods will not be filled at any price.

ABBIEY & IMBRIE,

Manufacturers of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, NEW YORK.

JAS. F. MARSTERS,

55 Court Street, Brooklyn.

MANUFACTURER AND DEALER OF

Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75¢, \$1.00; 120¢, \$1.25; 150¢, \$1.50; 200¢, \$2.00; 250¢, \$2.50; 300¢, \$3.00. Any of the above Reels with Drags, 25 cts. extra; nickel plated, 50 cts. extra. Brass Click Reels, 30 yds., 50 cts.; 60 yds., 75 cts.; 80 yds., \$1.00; nickel plated, 70 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sprout, Curle's, Chestertown, O'Shaughnessy, Kinsey, Aberdeen, Sneak Bent, and all other hooks, Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 50 cts. per doz. Black Bass Flies, \$1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, \$1.25 to \$5.00. Trout and Black Bass Fly Rods, 10ft long, \$1.50 to \$10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for Catalogue.

Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

Register your dog in the "AMERICAN KENNEL REGISTER," and train him according to the precepts laid down in Hammond's "Training vs. Breaking." The "Register" is published every month; and new editions of the "Training vs. Breaking" are issued from time to time to supply the demand.

Paper Shot Shells, Breech-Loading Cannon, &c.

Our Shells cannot be excelled by any in the country. Our Cannon is an entirely new thing, and the most complete yacht Cannon in the world.

SEND FOR PRICE LIST

KYNOCH'S Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base, are adapted to either Winchester or Wesson No. 2 primers. Can be re-loaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and clatter, and admit of a heavier charge, as owing to the thin metal, inside of water is nearly two spaces larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectively crimped with foot (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in cases lots only, (2,000), and crimpers not less than one dozen, by

We are obliged to have more room in our factory and greater facilities for manufacturing our goods to meet the increasing demand. We have received the highest award and silver medal at the Massachusetts Charitable Mechanics' Association Fair for our superior rods. Send for catalogue.

First International Clay Pigeon Tournament

UNDER THE AUSPICES OF THE

LIGOWSKY CLAY PIGEON CO.

A Five Day Programme, to be held at Chicago, Illinois, May, 1884.

PRINCIPAL CONTEST:—INTERNATIONAL CHAMPIONSHIP MATCH.

CONDITIONS:

(Club team shooting (5 to a team) third notch of trap, 10 and 12-bore guns allowed, 10 single birds, 18yds. rise; 5 double birds, 15yds. rise; Kanelagh Club Rules to govern (excepting: use of single barrel only allowed), and such changes as managers may determine to meet wishes of shooters. Five traps screened, 3yds. apart. Special prize donated by the Ligowsky Clay Pigeon Company:—To the winning team, \$750.00; to the best individual score, \$250.00 Diamond Badge. Entrance fees, \$25.00 per team. Entrance fees and gate money, less cost of birds, grounds and advertising, to be distributed as Second, Third, Fourth and Fifth Team Prizes—40, 30, 20 and 10 per cent. Should there be less than fifty duly organized clubs entering this match, then clubs may enter as many teams of five as they may see fit.

A series of "Sweepstakes" will be interspersed with and follow the preceding. Headquarters in Chicago at the Palmer House. Arrangements will be made for reduced railroad rates and hotel charges. Clubs should enter at once, by remitting \$1.00 to the undersigned. Balance of entrance money payable on the grounds at Chicago on first day of shoot to the General Manager and representative of the Ligowsky Clay Pigeon Company.

Copies of the Rules can be obtained by applying to the Ligowsky Clay Pigeon Company to whom communications on the subject should be addressed. Further detailed list of matches, prizes, donors, etc., will be subsequently announced, together with exact date, grounds, etc. (Signed.)

ANSWERS TO CORRESPONDENTS.

DOG STEALING.

TOPSY and Dixie are gone, and two New York families are deeply in grief and actively in search. The columns of one of the great dailies are also thrown open to aid in the finding of the little truant, but thus far there has been no success beyond the unearthing of any quantity of false clues to lead away from the main search. Topsy is a wee bit of a pug, while Dixie is a small black and tan dog. They are both choice specimens of their respective breeds, and they are also highly prized, far beyond their intrinsic worth, as household pets. Hundreds of dollars are offered for their return, yet they remain away, and serve as a text for much talk and comment on the subject of dog stealing.

Enough is known of the circumstances surrounding the loss of each of these dogs to point to the conclusion that there is a systematic plan for the capture of valuable dogs. The city is patrolled by an army of men and boys who are not above this petty crime, and in the aggregate their work amounts to a vast deal of loss and annoyance to a great many dog owners. Now and then some special case reaches the notice of the public and there is a momentary discussion of the subject, perhaps a lull in the trade of dog stealing, and then it goes on as briskly as ever. It seems to be the one form of crime which goes unpunished and generally without detection. The hundreds of advertisements appearing each month in the morning papers show the disposition of those bereft of their dogs to treat the thieves leniently if their pets are only restored. There is a constant disposition to temporize with the rascals, and owners become participants in vice by their readiness to compound the misdemeanor committed. It may be natural for those who are without their favorites to secure the smaller personal benefit, even though they encourage a greater general evil, but it would not be out of place if a society was organized for the special extermination of the pest of dog stealing. One curious phase of the recent cases is the part played

by the private detective. He is not in much favor his at best, and many people claim to have good reason for looking upon him as more of a nuisance than a blessing. He now comes to the surface as a clever worker upon the sympathies of those deep in grief over the loss of a pet. When Dixie's return was sought for through the papers, the private detective appeared with an introductory note, telling the owner that just such a black and tan was in the office of the detective awaiting an owner. Of course a visit is made, and then the cute detector of crime is shrewd enough to frame a lie for the occasion. The dog spoken of in the note was claimed by its owner but an hour before, and he was very grateful for the services of the detective. Would not the present visitor secure his services? There is a trilling matter of a registration fee, \$10, and then reports will be made of progress. Very soon will come a mysterious intimation that a clew has been discovered. This, to be followed up, means a seemingly endless system of fees and expense bills, until the patience and the pocketbook of the victim are one or both exhausted.

Like every other form of larceny, dog stealing can only be carried on through a system of "fences" or receivers of stolen goods. Those who take dogs from the street do not keep them, but they are disposed of at the shops of fanciers who in many cases are not particular in knowing or seeking to discover the history of the animal they are buying. A reputable dealer knows from whom he takes any dog purchased. He does not get it at a ridiculously low figure, and then in confession of his guilt send it away to another city for disposal by a brother fence, or perhaps give it a few months' rustication at a quiet suburban kennel until the noise of search for the missing pet has quieted down.

There is a continual procession of disconsolate searchers for lost dogs going from shop to shop over this city. The quest is a useless one, for a honest dealer would either not have the dog sought, or watching the advertisements, as all of them do, would have promptly returned it. While a dishonest dealer, of course, denies all knowledge of the dog, though it may at the moment be whining piteously in the cellar beneath him.

A few convictions for dog stealing would do an immense amount of good in clearing the city of this nuisance, and if the Westminster Kennel Club, for instance, could accomplish something, it would earn the good will of a great number of owners.

TO SUBSCRIBERS.

SUBSCRIPTIONS TO THE FOREST AND STREAM are payable in advance. The names of persons who do not promptly respond to the notice sent them on the expiration of their subscriptions, are dropped from our books.

These statements seem called for by the fact that a number of letters from aggrieved readers have recently been received at this office complaining that they no longer receive their papers. In almost every instance these letters come from people who have failed to remit for the renewal of their subscription.

It must be clear to every one that the business of a newspaper can be carried on only in a business way. If we were selling houses, or tables, or guns, or hoes, or pen handles, no one would expect to obtain these articles from us without rendering an equivalent. Why should he hope, or desire, to receive a paper on any other than the ordinary commercial basis?

If our subscribers will promptly remit, on receiving their first notice that their subscriptions have run out, they will save us much trouble.

AMATEUR PHOTOGRAPHS.

WE have received a number of photographs in exchange for the two views taken from our office windows, and find them very charming and suggestive pictures of camp life and pleasure travel. We repeat that we have taken, with amateur outfit, two views from the windows of the FOREST AND STREAM office, and shall be glad to exchange one or both of them for amateurs' photographs of camp scenes and other pictures made by the sportsman tourist. The views are 5x8 in. No. 1 is an instantaneous picture. It shows the north side of the Post Office, Mail street, a strip of the City Hall Park, and a varnish sign over on Broadway. There is also a pic wagon delivering pies to the stand on the Post-office corner, with a fat pedestrian in close proximity. No. 2 shows the front of the old City Hall, with the roof of the new County Court House, other public buildings, the top of Stewart's old wholesale store, and a slice of the American News Co.'s building in Chambers street.

SAVE THE ADIRONDACKS.

THIS is another age of the Vandals; not the barbarians of old times who overthrew the cities, but ravagers of a new type, who would destroy to the last vestige the grand forest preserves of the East and the West. Every reader of this journal is familiar with the scheme, prompted by unconscionable greed, that recently threatened to lay waste to the National Park; and now the people of the State of New York are alarmed at the threatened destruction of the Adirondack forests.

The lumber supply of this country is now so reduced that it will be profitable to cut down the trees on Adirondack lands and send the lumber to market. As the land is owned by private individuals, there is no way to stop the cutting of the trees, unless the State assumes control of the region by purchase. The reasons why the forests should be preserved are not sentimental, but very practical. If the Adirondacks are cleared the Hudson River will dry up; in fact, with the gradual cutting away of timber lands, it has been gradually drying up for years. This means that navigation will be interrupted; commerce will suffer; the city, the State, the nation, will be involved in such a calamity. The practical business men are taking up the subject. The New York Chamber of Commerce has prepared a memorial to the next Legislature asking for State interference.

OUR CHRISTMAS NUMBER.

THE next issue, that of Dec. 20, will be the Christmas number of this journal. We have so many papers on hand for publication at that time that it will be quite out of the question to find room for all of them in a FOREST AND STREAM of the usual size. As announced elsewhere, we shall issue a four-page supplement, and in addition to that there will be four more extra pages, making altogether a thirty-six page paper. We shall not particularize the attractions of the number. The subjects will be varied, and somewhere in the thirty-six pages, we are quite confident, will be found a story or a note to the liking of each of the forty or fifty thousand persons who will scan the columns.

CAMP-FIRE FLICKERINGS.

WITH our next issue we will publish a four-page supplement, into which will be gathered all the "Camp-Fire Flickerings" printed since the column was begun last year, and the particulars will be given of a "Camp-Fire Flickering" competition for 1884. This will be something in which every reader of the FOREST AND STREAM can take an active part.

DEER IN BELGIUM.—A paragraph now going the rounds of the papers says that "stag hunting is now the favorite amusement in Belgium. Game of all kinds is so plentiful that it is necessary to destroy it. During the war of 1870 numbers of the deer fled from Ardennes and took refuge in the Belgian frontiers at the St. Hubert side, where they multiplied enormously. Baron Hoogroose, a rich Belgian landed proprietor, is almost overrun with Canadian deer, which he imported into his domain some years since, and is now anxiously desirous of thinning his herds." It would be interesting to learn on what this statement is based, and further, to what species the so-called Canadian deer belong; that is, whether they are the common Virginia deer (*C. virginianus*) or the elk (*C. canadensis*). It is well known that large numbers of the last named species have been exported from this country for European deer forests, where in many cases they have done well, and have proved valuable additions to the native game. With the red deer of Europe they freely interbreed, and the greater size of the American elk makes the cross a very desirable one. We have heard of hybrids which exceeded in size the largest of the two parents. It is thought that these hybrids may prove fertile *inter se*, and it is, we believe, well established that they will breed with an animal of the pure stock of either parent. What a biting satire it would be on American laws and customs, if fifty years hence the naturalist who might wish to study *Cervus canadensis* alive, should be obliged to visit Europe to find subjects for his investigations. And if we may judge the future by the past, this is what is likely to happen. The days of the elk—at least in public hunting grounds—are numbered.

THERE IS A VAST DISTINCTION between a "sporting man" and a sportsman, and between a "sporting" paper and a sportsman's paper.

THE MICHIGAN SPORTSMEN'S ASSOCIATION will hold its next annual meeting at Jackson, Jan. 9, and following days,

The Sportsman Tourist.

AMONG THE MOOSE.

"Shepherd, * * * But Diana tell me that you have lost your passion for the art; for we never lose our passion for any pastime at which we continue to excel." — *Nuttes Ambrosiolar.*

IN the fall of 1874 my friend, Mr. L. J. Peck, then of Lockport, N. Y., but now living in St. Clair, Mich., came down to my place to kill a bear. Having succeeded in this laudable undertaking, he asked me to pay him a visit and take a hunt with him. This I have been unable to do until this year, as it seemed impossible for us both to get leisure at the same time, but early in the past summer we agreed to arrange our business so that we could go off in the fall and look up a moose.

After picking out a place for our hunt we wrote in September and made all the necessary arrangements as to guides, tent, provisions and birch canoe, and fixed the night of Tuesday, Oct. 10, as the time when our Indians should meet us at the railway so as to start for the woods next morning. I left Washington Thursday, Oct. 4, at 9:30 P. M., and went by Baltimore, Harrisburg and Elmira to Buffalo. At Buffalo I got a ticket for Huron and Ridgeway to St. Clair, but got off at Sornia and took the boat down the river, by which plan I got to St. Clair at 8:30 A. M.; whereas, had I stuck to the cars I should not have reached there until noon.

Saturday and Sunday passed so pleasantly that I would have liked very well to stretch the two days to weeks, but we had ordered a variety of things, animate and inanimate, to be ready for us Tuesday night, and had no time to countermand the arrangements, and we agreed to go. Then, too, we felt restless and began to sniff the air as though to catch a scent of the spruce and balsam thickets, and our talk was much of grubs, camps and moose. We left St. Clair Monday morning and arrived at the end of our railway journey about 11:20 Tuesday night. Wednesday was a rainy dismal day, so we concluded to put off our start until next morning. This gave us time to arrange all our supplies and equipage, about let Langwin—commonly Aleck—one of our Indians, sober up, for he was too tight for his good Wednesday.

Thursday morning we started, with a two-horse wagon carrying all our traps, and in which Mr. Peck rode, while I and Joe Lavigne, our other Indian, walked. Aleck joined us about noon, and about an hour after we reached a farm and depot of supplies belonging to the lumber firm whose timber limits covered our proposed hunting ground. There we finished and afterward on some five miles farther, making twenty in all. As this was as far as it was possible to take the wagon we camped near a small creek, pitched our tent, and passed a comfortable night. Friday morning we started the wagon back early and then traveled on foot to our intended camp ground, on the outlet of a small nameless pond, one of several lying near each other, all surrounded by more or less bog, and much frequented by moose in the warm weather. Notwithstanding the big logs which Joe and Aleck carried with their portage straps, or tump-lines, they called them, we had to leave some of our provisions to await another trip, and these we hid away carefully where they would keep dry. After eating our dinner and putting the camp in order, we took Joe and paddled up the nearest pond and through the inlet to a second one, frightening a few ducks as we passed. The Indians had killed an old crane moose on the upper pond about ten days before, and Joe showed us the place, saying, "Right there, we kill a moose, me an Aleck. Big cow moose."

"Where did you shoot from, Joe?"
"When we come round that point, then we see the moose, an' then we begin to shoot."
"And where do you say the moose was?"
"The moose was standin' right there in the bog; an' then when we began to shoot we was all the time paddlin' along, and then we fire all times, and then the moose fell down."
"Nine times! Why, gracious, Joe, the moose wasn't more than a hundred yards off when you first shot. What in the world made you shoot nine times?"
"We shoot as long as he was standing up, an' then, when we shoot nine times, then he fall down."

We found out, by questioning, that they killed this moose with a single breech-loader, but of what make they did not know. All they could tell about it was, that when we shot then we put in another cartridge. "With your hand?" "Yes." They had hung the moose hide near our camp, where also was the meat on a scaffold, smoked.

Saturday morning we started out to look for moose. The leaves were somewhat damp and not very noisy; still in the hardwood timber we could be heard much further than we could see. We struck a hardwood ridge about half a mile from camp and followed its top looking for fresh tracks. We found one in about an hour, and in a few minutes got a glimpse of the moose as it left an opening a little to our right, but got no shot nor could we see what kind of one it was. As it ran it scared out an old bull within a hundred and fifty yards of us, which went off with a bellow or two. Half an hour after, Aleck and I turned aside to look at a track we crossed and caught a similar glimpse of another moose, but got no shot, as it was standing at the brink of a steep hillside, and on the step took it clear out of sight. On our way home we stopped a few minutes to get the Indian's tent which was pitched on the side of the ridge on which we hunted, where they had killed an old cow and two calves on the same trip on which they killed the one before mentioned. They showed us where the moose stood and where they were when they opened fire. Joe shot first at about a hundred yards, and without any idea as to where his shots went, kept on until he struck a small tree in front of them and the moose fell. Then took the gun and after a while got the cow down, when of course the killing of the calves was only a matter of time. They fired twenty-nine shots before they got all three down. The hides were hung on poles and all the meat smoked.

Sunday we spent quietly about camp. Monday we found the leaves dried so much that there was no chance to stilling with any reasonable likelihood of success, so we concluded to move to another camp, about half mile or so away, where we could camp in an old deserted lumber shanty and wait for a change in the weather. Tuesday I took Aleck and went out to where we left our extra provisions and brought them into camp. On our way we sat down to rest on the bank of a small pond, perhaps 500 or 600 yards across. As we sat idly gazing at the water I said: "Aleck, if I was in a canoe anchored in the middle of this pond I could kill a moose anywhere on the bank."

"You think you hit him that far, eh? That's long way across that pond. Maybe then you don't hit him at all."
"Why, it can't be more than 250 or 300 yards to the shore. This little gun ought to kill one that far certainly."
"S'pose you try a shot," suggested Aleck; "you shoot at that white log stickin' in the water up there."
"Why, that is a good deal further than the middle of the pond," I replied, "it must be 350 yards."
"Well, you try him anyhow. We not hunt here any more and won't scare him in."

I told him I would fire one shot for range, which would probably be short, as it was, and to notch the second one. The second shot hit it.

Aleck was amazed. "I couldn't do that," he exclaimed; "you kill a moose then when you shoot at him, sure." Evidently he and Joe had had doubts as to what Mr. Peck and I could do with our gun, a 28-inch '73 model, and a 20-inch '73 model Winchester. The bullets, as far as he was concerned, were no removed, and he began to talk about getting a gun like one of ours for his own use.

Wednesday was, as the preceding days, clear and pleasant. Mr. Peck and I took a hatchet and marked a line some mile and a half east of camp to a hardwood ridge, where he thought he might go next day and loaf about, while I went off a few miles to look at a lake said to be full of trout, and which I wanted to take a sketch. I asked Joe how far it was to the lake.
"Oh! 'bout five miles."

"What is the name of the lake? What do you call it?"
"We call it 'Cochon Lake.'"
"Pig Lake! That's a nice name for it. What sort of country is there around it? Any hills, or is it flat and boggy like this pond?"

"No bog. Mountains all around the lake. Big mountains."
"H-n! I must go and see it if there are mountains about, but by the time we get there the wind blew so that we only waited long enough to take one sketch, when we started back and got to camp by noon. Joe's "big mountains" turned out, when seen, to be nothing but little hills; still, they made broken outlines against the sky, and framed the road quite picturesquely. As we found out at the shanty, we concluded that Mr. P. and Joe had gone off to the hardwood ridge to sit about for a while, for Mr. Peck was too unwell to go far or long at a time. Just after we had finished our dinner they came in, Joe carrying a full pack, and Mr. P.'s buckskin suit showing fresh blood stains. I supposed, as did Aleck, that Mr. Peck had killed a moose, but we said nothing, and after a while the story came out. They had sat down on the hardwood ridge to look about, when Joe saw a deer move its ears, and calling Mr. P.'s attention to it, the latter at once shot it, smashing the shoulders, and they had brought the meat and hide to camp. The killing of this deer had a salutary effect all around. What we were after was a shot at a moose, and as we could clearly see that it was not much to the interest of these Indians to show us moose, or to disturb the game on this hunting ground of theirs, where they proposed to spend the winter, for \$2 a day apiece, when one moose if killed by them would bring them a number of dollars, we had told them we would take only the head and horns, and give them the meat and hides of any we might kill. Joe saw by the effect of the '76 model on the deer's shoulders what a moose might expect, and Aleck had seen my '73 model shoot, so now they spent most of that evening in discussing the best way to get a moose, using the barbarous patois common to their class, in that part of Canada.

Mr. Peck, who is not as young as he was more years ago than I can remember, was far from well, and probably would have been contented to have started home from where we were encamped had it not been for the dislike of going back without a shot, and after hunting only one day. Killing the deer was a small matter to an old hunter, but still it was an incident which broke the monotony of watching the spring and weeding the beans and we felt rather encouraged. I got plenty of fresh meat, and, being well fed, felt equal to most anything in the way of a tramp. I do not get low-spirited in camp, no matter what the weather or success.

We took some part in the discussion as to what we had better do, and decided to start the next morning and move our camp some miles to a creek, where there was a big bog, and where, as the country round about was burned for miles, and therefore open, so that we could see as far as we could be heard, we thought we could do better still-hunting during the dry weather when the leaves were so noisy. I had been telling Aleck and Joe that if they would show either of us a moose anywhere within a quarter of a mile we would kill it, and not let it go fifty yards. While we were waiting for a change of weather, each morning at breakfast and each evening as we sat and smoked, I would say, "Never mind, Joe, have patience; it is I who will kill the 'big buck,'" which was what he called an old bull. "Wait until we get to the burnt country. It is then that the glory will rest with me. I shall kill the old bull; seven feet high, Joseph!" "Maybe then when you shoot at him then you don't hit dam one, eh?" exclaimed Aleck. "One time I was huntin' out there an' I shoot at an' ole bull. Big buck! Big horns! Great big moose! An' I shoot a lot of times, an' I couldn't get him down, an' then I had no more balls, an' I went up above us far as this shanty," indicating its length by a gesture.

"Why, you certainly ought to kill one that close, Aleck."
"What! You think I go any closer with just a little hatchet? An' the moose was standin' there—moving his hand to show how he pawed—an' ain' 'gin' 'Wood' wood' an' all his hair turned up. I tell you I don't go any nearer to him, an' I come away an' left him there in the snow and went away off to a shanty and stayed all night. An' in the mornin' I was whole lot of moose had been there, an' the ole bull was gone an' I never get him."

This seemed to amuse Joe, who evidently thought our remarks about shooting, when measured by their standards, sounded like "blowing," so he suddenly began:
"Once there was a man. Once there was a man. An'—An' he was goin'—An' he was goin' with a lot of men. An' they was all goin' into the bush; away up into the bush; Tennessee, Tennessee, Tennessee, Tennessee, Tennessee, Tennessee; they was going to stay in a shanty and cut logs in the bush all winter. An' they was all goin' along. An' this man had a gun, an' they was goin' along, an' this man he would all the time tell them to show him a moose; an' he would say, 'they would show him a moose and then he would kill it,' he would shoot the moose. So then they was goin' along and they came to an old shanty, an' they stayed all night in the shanty, an' then in the mornin' they was startin' out,

an' there was snow on the ground, an' they was all startin' out, an' they was goin' by a pond, an' it was bog an' along the pond, an' they was all walkin' along in the snow on this bog. So then they showed him the moose walkin' out of the bush. Big moose! Old buck! Great big horns on him! Walkin' out on the bog. Three moose; five moose; whole lot of moose; all walkin' out on the bog in the snow. An' then the man he took his gun an' he went up by the moose, an' there was all walkin' along in the snow, an' then he began shootin' at the moose.

"How close did he get before he shot, Joe?" Mr. P. asked.
"Oh! forty yards; fifty yards, maybe. An' then he begun shootin' at the moose, an' he shot four times, six times, a lot of times, an' the moose was all the time walkin' along in the snow. So then the moose was all gone, an' they had all walked away. An' then the man he laid down his gun an' he took his butcher knife and he was going to cut the throat of the moose—he had shot the moose. So then he came up where the moose was all walkin' along in the snow, and then there wasn't any moose, an' he didn't hit dam one!"

"That is a pretty good story, Joe," said I, smiling. "I know one that begins almost the same way. Listen: Once there was a man—imitating his voice and manner—and he was going into the bush with another man to get a shot at a moose, and he had two Indians going with him, too. And he was all the time asking about the country, and where the lakes were, and what they were like. And then if there were mountains around a lake, then he would say he would go see the lake. So one day he asked about a lake and it was called Cochon Lake, and he asked one of the Indians what kind of banks the lake had, and he said, 'Mountains! Big mountains! Big high mountains!' So then the man went to look at the lake, and he came to the lake and looked for the mountains, and then there weren't any mountains at all, only little bits of hills. So then he came back and he told the Indian, 'I did not understand you this mornin'. I thought you said 'big mountains,' but you must have said 'pig mountains.'"

Aleck grinned at this. "Eh, Joe! What you think of that? Pig mountains! Show us the Cochon Mountains, Joe! Big mountains! High mountains!"
"As a matter of fact I do not believe Joe had ever been to this lake; all he knew about it he had been told by Aleck."

CHAS. CLAY,
WASHINGTON, D. C., November, 1883.
[TO BE CONCLUDED.]

EGERIA PARK.

SECOND PART.

BEFORE we start for the hills: let me tell you how I came to be making this trip; as it is one of a chain of interesting events which lead up to, and culminate in, one of the most frightful massacres ever perpetrated by Indians; to the death of a gallant officer of the United States Army, the defeat of his command, and to the final removal of the Ute Indians from their beloved haunts in the mountains of Colorado.

Ed. McCook, then Governor of Colorado, had made arrangements with the Seven Tribes to meet in council at the Southern, or "Los Pinos" Agency to discuss the treaty, by which it was proposed the Utes should cede to the United States that part of their immense "reserve" since known as the "San Juan country." Agents were sent out to summon the different bands, and my own mission was to hunt up and bring in the band then known as the "Rovers," under the leadership of the notorious and since deceased "Colorado." My instructions were to bring the entire band, if possible, and if that could not be done, then to induce ten of their "head men" to come to the grand council. I had with me an excellent interpreter, Uriah, Mr. Curtis, and a frontiers man named Jefferson, or "Jeff" Lee. Our outfit was a stout cow-pony for each man and two pack-horses well laden with "grub," two pairs of blankets and a buffalo robe apiece, and a car of wagon shot, double size. Of course I had a new rifle—a Remington, 44-70, with a heavy trigger; and I carried what I would recommend to all sportsmen in this region, a good field glass.

At Hot Sulphur Springs, half way from Denver to the Park, we found "Plah," a sub-chief of the Rovers, and "Black John," his half brother, who spoke good English for a Ute. Our ride was uneventful, beyond the killing of a gray old buck antelope at Moody Creek, till we struck the camp, where my horse, after being shot for which was the scene of my first real good hunt in the Rocky Mountains. Blacktail Creek first just above where we had made camp; the east fork rising, as I have said, but a few hundred feet west of the source of Pass Creek. The west fork rises some five miles further west, on the main ridge of the Gore, and in a country of alternate glades, strips of pine forest and quaking aspen thickets—one of the prettiest spots I ever saw for still-hunting. It was for this ground that John and I "pointed," leaving Jeff to go down stream and "catch a handful of fish," as he expressed it, while the other two went up the east fork. It is a good three-quarters of an hour's climb to the top of the first ridge, through first dense willows along the stream, then a thousand feet or so through standing and over "downy" pine; but when the top is reached the going is easy, and the careful hunter may move almost as silently over the pine as he could over ground along one of the immovable deer trails as cut on a house track. Our ascent to the summit was quickly made, for the Indian seemed to know the ground, and I let him take the lead.

On reaching the crest he simply said: "You stay here, me go dis way," pointing to the west, whence the wind came, and making a sweeping curve with his left hand, as much as to say, "I'll surround the game and give it the 'wind,' in running away from me it will come your way, and you can't get away from me." I took in his meaning, and down on the granite boulder. It seemed as though I had hardly got seated when thump! thump! I heard the jumps of a startled deer, and, coming straight toward me, with head high up and one eye over his shoulder, I saw a very large buck. He stopped "dead" within a hundred yards, turned his head back for a moment, looked all round, dropped his nose to the ground, and then, as I satisfied that he was not pursued, went to cropping the wild pines and deers' tongue that grew abundantly there. I waited till he was within sixty yards, and broadside, when, from a knee rest and with a most deliberate aim at the region of his heart, I fired. When the gun cracked I think that buck jumped ten feet straight toward the tree tops, and before he struck the ground I felt for my knife, expecting that he would fall a bleeding carcass, and I would in the next fifteen minutes be on my way back to camp with his hind quarters on my back. Well, he didn't come down that way; he just lit square on his foot,

day, say 312 cents, and this sum must supply him with food and other luxuries.

When the company camps the men separate into little squads of five or six members for mess purposes, and the members of each mess contribute their mites to buy green corn, watermelons, or whatever the nearest ranch can afford.

I saw several men trying to make a strong drink out of *chiltepunas*, a little round wild pepper as large as a cranberry. These berries were put into a soda-water bottle, and the bottle, filled up with water, was hung at the belt during the march, so that besides getting the heat of the sun it was well joggled. The resulting liquor I did not taste.

The soldiers, when in camp, had a striking look. The fires shining on the dark, often savage, faces, the flash of the bright muskets, the strange cloths or want of clothes, and the free, careless postures made one think rather of a robber band than a disciplined army.

Under the Doctor's energetic, but ill-directed guidance we wandered over a good deal of country that was not directly in our line of travel, and everywhere we went we found that the men at the different ranches were in hiding in the woods, and had taken their horses and mules with them to avoid the press-gangs and requisitions of the government. Only in the towns had the crimps been able to find any victims at all.

Don Carlos Ortiz, the very unsatisfactory governor of the State, was involved in difficulties with General Reyes, comandante of the federal troops in the district. Reyes thought Ortiz had better leave, and began concentrating his forces. Ortiz, counting upon the patriotism of his subjects, or the virtue of his impressment, tried to make head against his foe by a levy of State militia. But this "cheap defense of nations" refused, and neglected to serve the State. The few men Ortiz could gather had none of the spirit of the fighters of Gattara and Pestequin, and at last, deserted by all but an unreliable handful of troops, Ortiz, fearing the violence of a mob, laid his case tearfully before his rival, and borrowed money enough from him to get out of the country.

So ended this mock revolution, and commerce and industry, checked by the fear of war, resumed their lazy progress. The ranchmen straggled back to their lives of indolent poverty, and visiting foreigners went home in peace.

H. G. DUTTON.

Natural History.

THE PURPLE FINCH AND HIS COUSINS.

BY DR. ELLIOTT COUES.

Carpodacus Purpureus.

MARK CAESBY, the first edition of whose memorable work on natural history was published between 1731 and 1748, is the first person known to have described the beautiful bird which forms the subject of the present sketch. That zealous and successful naturalist gave it the name it has ever since borne, albeit one none too appropriate, for the color is far from being that combination of red and blue of which we think when we hear of the "purple robes of royalty," being a rosy red obscured in places with brown, and with a blue. Caesby's figure is very wrongly colored, though his description is unassailable, and so was this misapprehension of the tint carried by Brisson, that the latter faithful writer speaks constantly of the "dark violet" plumage, and actually names our rosy bird the "Bouvreuil violet de la Caroline (*Pyrrhula carolinensis violacea*). But there has never been any difficulty in identifying from such accounts, upon which the inveterate compiler, Gmelin, established his *Pringilla purpurea*, the bird which will doubtless continue to be called "purple" to the end of the ornithological chapter.

There is but one other point in the early history of this bullfinch to which I wish to allude, in clearing up the only dubious synonym with which the bird has, to my knowledge, suffered. For it seems that in 1785 Thomas Pennant described this already well-established species, basing his account upon a specimen in the Blackburnian Museum, said to be from New York. He called it the "crimson-head finch," and speaks of it in the following terms, more exact in fact than those he employs to characterize his "purple finch" itself.

"F. With a crimson head and breast; the first faintly marked with dusky spots; space behind each eye dusky; back, coverts of the wings, primaries, and tail black, edged with crimson; belly white, tinged with red."

None can doubt what bird the accurate author intended by the description, especially as we are told that it inhabits New York, where it arrives in April, and is very frequent among the red cedars. It is, in fact, a better description than that given of this bird by Caesby or Brisson, the last of which is copied by Pennant; for those birds which the English naturalist described from actual inspection of specimens are, as a rule, much more faithfully set forth than are those the accounts of which he borrowed from his predecessors. Pennant's notice happens not to have been acted upon by Gmelin; but Latham, in 1790, based upon it a certain *Pringilla rosea*, L., wrongly considering it a variety of a bird described by Pallas, from Lake Baikal, under the name of *Pringilla rosea*, being apparently misled by Pennant's suggestion that such might be the case.

I think that still a third name may be found for our pretty bullfinch among these same early archives. For Latham described a certain *Lavia hudsonica* in terms strongly suggestive of the self-same bird in the humble garb of the female or young. He says it is from Hudson's Bay, with short, stout bill like a bullfinch's, dark brown above, the feathers of the back and rump, as well as secondaries and rectrices edged with reddish, the wing coverts with two bars of the same, the breast and flanks white with lengthwise dusky streaks, the middle of the belly and the crown of the head, the latter of a length five inches. On the principle of extension, at any rate, it is difficult to surmise what else this can be meant for, though it is too uncertain a description to be referred with confidence to the present species.

As to the *Pringilla canubiana*, or humpbird, of Bartram, which I left undetermined in my essay on the ornithology of that interesting writer, I find that Wilson, whose relations to Bartram were such that he would be likely to know, says positively that this is this species, and that Baird makes the same conclusion without hesitation.

It may often be thought by those of my patient readers

*Pallas's bird is indeed closely related, yet different; it is the *Carpodacus (Pyrrhula) rosea* of our present list, No. 1752, said to be figured on p. 207 of the "Annales du Muséum," and on p. 19 and 20 of "Bonaparte's Voyage" of the Monarch of the Loxians.

who do not sufficiently appreciate the need of this kind of writing that I am in the habit of giving too much of any time, and of asking too much of others, to dry details like these. But it is always desirable to identify and account for the species described by the early writers, as a matter of orderly ornithological housekeeping. If I am willing to undertake the drudgery of such menial service, let them look charitably upon the street sweeper who thus enables them to pass on dry-shod to more inviting places. Those long dismal lists of synonyms, the exhibition of which has more than once laid me open to a charge of pedantry, or a desire to display the extent to which I have played book-worm—save the mark!—are intended to be at once a guide to others in the labyrinth of nomenclature, a warning to keep off the premises, and a protest against the wanton making of books. They will have subserved their highest and most useful purpose if they shall alleviate any one's itch for writing by showing how much, and what, has already been written on

THE PURPLE FINCH.

the same topic, and by narrowing the possibilities of desirable addition to the list of the subject to those persons who have not only something new to say, but also something worth saying. For it is, or should be, a cardinal rule of authorship to let the pen alone until the entire literature of the subject under consideration has been examined and digested by the intending author. If the person who has faithfully done this still believes that there is anything left for him to say, or that he can say anything better than it has been said before, let him then proceed, ever though, as will probably be the case, he is mistaken in such belief. The only late synonym of the purple finch, to my knowledge, is the *Carpodacus carolinensis* of Baird, described in 1858, and which the authors of the "History of North American Birds" still distinguish as a separate race of this species. It may be that they are quite right in so doing, but I scarcely feel the necessity of recognizing by name distinctions so slight as those upon which *californicus* rests are acknowledged to be. In any event their life-history cannot be different enough to merit separate notice; and shall not hesitate to treat of both forms, if such they really be, as one, in all that remains for our further consideration.

The purple finch is distributed at large over all those portions of the United States where there is woodland, excepting, perhaps, in the Southern Rocky Mountain region, where it appears to be replaced by *C. cassinii*, and throughout the temperate wooded portions of British America. It is a migratory bird, but I have no record of its presence south of our country, over the greater portion of which it may be found in winter. It was early observed by Nuttall and Townsend to inhabit the Missouri River, Fort Randall. Other naturalists, as Sir John Richardson and Captain Thomas Blakiston, have extended the known range of the bird in that direction into the country of the Saskatchewan.

The actual movements of the brilliant songster within the broad area of its dispersion are less easily determined with precision. We know that it is a thoroughly migratory bird; yet the limits of its winter quarters so far overlap the boundaries of its range during the breeding season that it may appear in some places to be stationary—or at any rate it is in some regions to be found during the whole year. It is hardly enough to endure without inconvenience the winters of our middle districts, and is occasionally seen during the same season as far north as New England. The great body of the birds, however, betake themselves late in the fall to the Middle and Southern States, extending their leisurely autumnal flights in many cases to the Gulf States. Thus it is one of the common winter birds of Pennsylvania, Maryland and Virginia, as well as of localities further south. On the opening of the year following, the entire body of the birds has northward, and in the regions just mentioned, the species is even more abundant than during the settled state of affairs in winter. Some linger through the summer in Pennsylvania, as attested both by Audubon and by later observers, among whom Turnbull may be mentioned; and there is no question of their nesting, occasionally at least, in such latitudes. But the majority press on to New England and Canada, while others that have taken a route further west reach the borders of the United States in Wisconsin and Dakota, and even press beyond in some cases.

Such a state of the case as I have sketched is illustrated if we consider some convenient central locality, say, for example, the District of Columbia, where I became very well acquainted with the birds in my boyhood. There it is a common feature of the winter scene—like the snowbird, the thistle bird and other interesting *Conirostris*—in flocks in the noble forests that skirt the city of doubtful politics, and even occasionally in bunches in the market place, along with shore larks, jupils, and such small game brought in for sale by the farmer boys. It comes from the North with the white-throated and the Savannah sparrows, early in October, about the time when the snowbirds begin to descend from the mountains west of us; and it remains in full force until the following May. During this month the swelling buds of numberless trees invite to a dainty repast, and numbers daily by the wayside before making up their minds to be off; but so many of the purple finches are prompt to remember their

engagements for the coming summer, that they take their leave by the time when the formation of the woodland is accomplished. Hence they make with us no part of bird life sheltered in foliage, but of scenes in which their trim forms are displayed against a background of naked, rustling branches, and their melody is borne upon uncertain gusts of wind, before the anxious, thinly-clad forest has ceased to sigh. The voice of the purple finch has always seemed to me one of the links of the year, binding the new to the latest traces of a vanishing order of events. For the constant birds, that answered with encouragement the rustling of seemingly lifeless blossoms, and then away, to return with the fall of the leaf whose birth they greeted with acclamation.

Enter, at such time, any piece of high open woodland in the outskirts of Washington, or one of the cedar groves still preserved near the city, and you will be likely to find a troop of purplefinches whose familiarity will permit you to watch their movements at your leisure. Very probably there is a flock of twenty or thirty, just alighted and scattered to feed on yonder maple trees, where they are to your hourly gaze and their operations on the ground before your approach. They have settled after a devious undulatory flight from some depth of the forest, very suddenly and in a compact heap, like so many cedar birds; and after looking about for a few moments during which they stood motionless and silent, have given some reassuring chirps, and separated with alacrity to their repast. Now when a purple finch does anything he does it with a will and decided purpose, and becomes entirely absorbed; so you may see the whole number, apparently oblivious of each other's presence, each as of your own, intent upon destroying as many buds as possible within a given time. They cling to the ends of the branches where the buds are crowded most, creep or flutter from one to another of the smallest twigs, stretch out in various attitudes, and even hang downward for a few seconds for some specially coveted morsel, altogether demeaning themselves not unlike crossbills under similar circumstances. They are not quarrelsome birds, and the meal is likely to be decorous enough, but that they are quick-tempered and quick ready to stand up for their rights you probably satisfy yourselves before many minutes are over. If two of them happen to fancy the same bud, there is sure to be a spirited discussion on the instant. Up go two crests, a defensive attitude is taken, some words pass, and the weaker of the two is quickly forced to fly. In any such gathering as this, you will observe that the plain brown streaky birds, by far outnumber the bright-colored leaders of the band; for half the flock consists of females, and there are among them also a large proportion of young males; for the latter do not acquire their full plumage the first year. Selected now the best dressed one of the lot, and fired away go many more fortunate companions, frightened out of their wits, while he falls a prize at your feet. If he be killed outright, you will observe, as you smooth the plumage and flick off the blood stains before consigning the specimen that he has become to your game-bag, that the edges of the bill are covered with the soft, greenish substance of the buds upon which he was feeding, leaving no more doubt of the nature of his repast than if you examined the well-filled gizzard. Should he fall with a broken wing, you find it difficult to follow the purple finch; for he will raise his crest in defiance, and fight with the determination of despair against such hopeless odds—biting, scratching and crying out at all once—not a kingbird or a vireo would make a braver effort in self-defense. Had you refrained from molesting this proud and handsome finch, doubtless a still more engaging exhibition of his accomplishments might have been witnessed. For, his repast concluded, he would most probably have betaken himself to the topmost twig of the tree, where, with his form clearly outlined against the blue sky, his throat swelling and his head thrown up, he would have delighted you with the earnestness, the variety and the melody of his song. The most enjoyable purple finch concerts you are likely to attend will be those given just before sunset, in those delightful, quiet moments when nature seems to pause before she withdraws the last golden rays from an illumined landscape—when the slanting sunbeams light up a rooster tint on the breasts of the emulous birds, who vie with each other in the expression of their tenderer emotions. The spectacle is one setting with contentment, inspiring to their humble bed in the shrubbery at our feet; the cow-bells are tinkling from the homestead yonder; there is just a shiver in the air as a damp breath from the brook below steals along the hillside, and the purple finches are still.

As I have said, we have Audubon's authority for the statement that these birds nestle at least as far south as Pennsylvania, and it should surprise no one to discover that the mountains furnish them with congenial homes still further remote from their accredited winter range. He discovered them in the great pine forest, where they were attending to their young, then not fully fledged. The statement is indorsed by other observers independently. Dr. Turnbull remarks that a few remain every summer in East Pennsylvania. Mr. Gentry's experience, however, is to the contrary. He never saw purple finches in that State during the breeding season, though he does not deny that they may nest among the Wissahickon hills. A recent contributor to the *Naturalist*, Mr. R. F. Pearsall, notices one of our present species occupying breeding stations of this sort in the Southern States. Brewer, the great pine forest, where they were attending to their young, then not fully fledged. The statement is indorsed by other observers independently. Dr. Turnbull remarks that a few remain every summer in East Pennsylvania. Mr. Gentry's experience, however, is to the contrary. He never saw purple finches in that State during the breeding season, though he does not deny that they may nest among the Wissahickon hills. A recent contributor to the *Naturalist*, Mr. R. F. Pearsall, notices one of our present species occupying breeding stations of this sort in the Southern States.

Brewer, who has been very successful in following up the subject. Neither Wilson nor Audubon appear to have known aught of the matter; and we doubtless owe to the Massachusetts ornithologist just mentioned our first description of the nest and eggs, contributed by Dr. Brewer to Audubon's page. It is there stated that Mr. Cabot was the first naturalist to discover them. In the account, however, the eggs are stated to be "of a bright emerald green," which

renders the matter open to suspicion; for the greenish ground color is now well known to be normally spotted. The writer in mention has, however, latterly furnished an account based upon ample observations—one which, in default of any personal experience of any one, I take pleasure in transcribing:

"They nest generally in firs, spruces, or cedar trees, though occasionally on the upper branches of a high apple tree. Their nests are usually placed up in a branch, rather than interlaced between its forked twigs. I have known them not more than five feet from the ground, and at other times on the highest part of a lofty fir tree. The nests are, for the most part, somewhat flat and shallow structures, not more than two and a half inches in height, and about three and a half in breadth. The walls of the nest average less than an inch, and the cavity corresponds to its general shape and form. The framework of the nest is usually made of small denuded vegetable fibres, stems of grasses, strips of bark, and woody fragments. The upper rim of the nest affords a curious intertwining of dry herbaceous stems, the ends of which project above the nest itself in the manner of a low palisade. The inner nest is made up of minute vegetable fibres, closely interwoven. There is usually no other lining than this. At other times the nests are largely made up of small firm, woody models of evergreen plants, lined with fine materials of the same kind. Occasionally I find the down of birds and the fur of small animals. The eggs are described as varying in size from 0.81 to 0.92 of an inch in length, by 0.60 to 0.70 in breadth, their color being a pale emerald green, spotted with dark brown, almost black, chiefly about the larger end."

"How familiar with these agreeable birds the writer of the above paragraph has had the means of becoming may be judged from the following facts: For some six or seven years he resided one summer in his grounds at Hingham, Mass., and two had nests in the same tree, one of which was at least sixty feet from the ground, on the very top of a tall fir. These several pairs, as a general thing, lived together very harmoniously, save only when one would approach too near the favorite station of another; then the latter would begin to bristle up its crest, and give very evident hints that its presence was not agreeable. The extreme southern end of the ridge pole of the house had been, for several seasons, the favorite post for the patriarch of the flock, from which at morning and at evening he made the neighborhood vival with his melody. If in his absence any other of these birds ventured to occupy his position, there was always sure to be a disturbance on his return, if it was not instantly vacated. These encounters were frequent and always very amusing. The distraction usually took the place of voice on the part of the intruder."

"I cannot deny that I am inclined to give my birds the best possible characters, and to put them, as it were, on their good behavior when they sit to me for their pen portraits; and no one, I presume, would desire or expect me to do otherwise. It is my hearty endeavor to do them full justice, and if possible to render them as attractive to others as they are to me in every one of their versatile aspects. Yet my treatment of the English sparrow-crow, for instance, is by no means just; but I permit generosity to take a picture beyond fidelity to nature. And in the present instance candor compels me to admit that the purple finch is not the most desirable bird in every respect. In spite of his elegant appearance, his engaging address, his musical ability, and that spirit "of a gentleman of the old school" which he undoubtedly possesses, his fondness for fruit "of the bird" kind is a serious drawback at certain times and in certain places. So long as he remains in the woods his operations are of little moment from an economic standpoint; but he habitually visits the orchard in spring, to feast upon the blossoms of the apple, pear, peach and cherry, attacking the fruit in embryo with such effect that the hopes of the horticulturist are not seldom striven on the ground below, in evidence of irretrievable mischief accomplished. Such intrusions, however, are confined to a very limited period; purple finches are not among the most abundant of birds; they feed their young to some extent upon seeds which may be injurious, so that it is doubtful whether, after all, they seriously diminish the revenues of the nation. During most of the year these birds have certainly no appreciable effect whatever upon the interests of husbandry. They feed largely upon juniper berries, upon those of gum trees, wild hollyhuckle, and many similar small hard fruits; upon the seeds of tulip trees, on those of the white pine, and of the fir, as well as upon those of a long array of weeds and grasses, to obtain which they often forage in low shrubbery, or even upon the ground. In short, if we could accurately balance the whole ledger, purple finches would doubtless still be found worth having, even if not clearly entitled to the title they take from the orchard in spring."

"My history of this finch were incomplete did I not take note of its ways and manners in California, where it acquires the name, if not the character, of a different bird. For this purpose the pages of the *Natural Bulletin* may be sought with confidence that Mr. Brewster and Mr. W. A. Cooper have left us desirable information."

"The first-named of these gentlemen describes with care two nests taken by Mr. C. A. Allen, at Nicasio, in Marin county. One of these contained five eggs on the 10th of May, 1870. It measured nearly five inches in diameter, by nearly three in height, and was four inches and a half inches in the corresponding directions. It was built in a garden, in the fork of two limbs, about eight feet from the ground, and was firmly woven of fine weed stalks and coarse grasses, lined smoothly with some lump-like fibrous material. The eggs of this set seem to have been unsexed by pale color, and quite like those of *U. frontalis*, being described as white, with a scarcely perceptible bluish tinge, only marked with a

few dots and lines of dark brown or black, and measuring 0.73 in length by 0.55 in breadth."

"This account of Mr. Brewster's was so at variance with Mr. Cooper's experiences that the latter soon sent to the *Bulletin* a more extended notice of the same subject, fearing that Mr. Brewster's collector might have gotten hold of a nest of *U. frontalis*, though the parent birds sent with it were positively "californicus." Expressing his doubts on this score, Mr. Cooper continues: "About ten nests of this bird have come under my observation during the last two years. Of each of these the frame work was loosely constructed, a portion of each nest being formed of pieces of *Scrophularia nodosa*, some of these being entirely of this plant. I have never found a nest in a fork, and they are usually placed at a considerable distance from the ground. Favorite situations are the tops of tall willows, alders, trees covered with climbing ivy and horizontal branches of red-woods. The var. *californicus* is as abundant around Santa Cruz as is the *U. frontalis*; but while the latter has nests in the garden throughout the city the former retires to the wooded river bottoms, or to the hills back of the town."

"I give an abridgment of Mr. Cooper's detailed notice of four nests and sets of eggs: 1. May 30, 1875; nest with 5 eggs, incubation a few days advanced. Nest 6 inches across, 2.50 deep, cavity 2.50 across, 1.88 deep, frame work of fine dried twigs of *Scrophularia*, lining of fine vegetable fibres, and lined with a few hairs. Nest on top of a vertical horizontal limb of an alder, 40 feet high. One egg broken, the other four measuring 0.80x0.58, 0.80x0.55, 0.96x0.55, 0.77 x0.54. Eggs bluish green, marked with spots of brown and dull purple, chiefly around the larger end. 2. Same date, nest with 4, a few days incubated, from one of the topmost branches of an alder tree, 50 feet high. Frame work of fine stems, among them *Scrophularia*; also a few pine roots; lining of wool and hair. Eggs 0.82x0.57, 0.81x0.56, 0.81x0.56, 0.80x0.54; ground color as before, but markings different, being dull brownish purple, minute and confluent, forming a ring around the end of two of the eggs, and a large spot on the end of the other two, one of the latter being also speckled all over. 3. May 3, 1876, nest with 4 fresh eggs, in a willow bush, 20 feet from the ground. Frame work entirely of *Scrophularia*, inner nest of roots and bark, lining of fine bark and hair. Eggs 0.78x0.57, 0.82x0.56, 0.79 x0.57; light emerald green spotted like those of set No. 1, the markings forming a more decided ring around the larger end; ground color, deeper than in either of the foregoing sets. 4. May —, 1875, nest with 4 fresh eggs; from horizontal branch of an apple tree in an orchard, similar in structure to those already described. Eggs 0.80x0.59, 0.77 x0.58, 0.77x0.58, 0.78x0.57; emerald green with fine markings on the ends of Nos. 2 and 3, and darker, some being almost black; a perfect wreath of spots around the larger end of each, and the whole surface of one spotted; these eggs more pointed than any of the rest."

"The way that Mr. Cooper induces the birds for their operations on budding fruits is positive: "I may here add that *Corporalis porporicus* var. *californicus* is the most destructive bird we have, visiting our orchards and destroying young buds, blossoms, and fruit. I have swept up a basketful of cherry blossoms after a few hours' work in single days. The heart of the blossom being the food sought." I fear that the charge is only too well-founded. Among the curious analogies of nature, there is one upon which I have often speculated, when thinking of the way of feeding in which some of our most elegant and accomplished songsters indulge; for the most famous vocalists of the modern stage, both male and female, are notorious for their voracious, indiscriminate and unfeeling habits. One of the most exquisite birds from Northern Europe, is said to be peculiarly gross at the table; and I have heard it whispered in dramatic circles in Washington, that the proprietor of a hotel complained of having to "scrape up the carpets" after the midnight suppers in which a celebrated American contralto was wont to indulge with the members of her opera troupe."

STURGEONS ON DRY LAND.—Portland, Ore., Nov. 24.—*Editor Forest and Stream:* In September last while superintending repairs to a dam across Peary's Slough, a minor channel which connects the Willamette and Columbia rivers at medium stages, but is bare at low water, I observed a number of slides, such as would have been made by dragging heavy, smooth, cylindrical bodies up the banks of the slough, which are five feet high and very steep, and across the low level island between the slough and the Columbia into the latter. The soil of the island and its banks, consisting of sandy loam formed by the annual deposits of the summer floods of the Columbia, with a scanty covering of grass and young willow sprouts from one to three inches high, was plainly marked with these slides, which seemed to have been made by bodies from six to eighteen inches in diameter, all leading in direct lines to, and terminating on the bank of the Columbia. At first I thought they were made by beaver or seals, which penetrate the sloughs along the Columbia during the summer run of salmon, but the large size of one of the slides showed that it could not have been made by either seal or beaver. I inquired of the men employed on the work, one of whom, a fisherman, said: "That is sturgeon trail. They get among the sloughs when the river is up, and when the water begins to fall they strike a body for the first time. Sometimes they die before they get their trail on this suggestion. I sometimes looked carefully among the young willows, near the bank of the Columbia and found at the end of the largest slide, and within six feet of the bank, the carcas of a sturgeon nearly seven feet long, with its head pointing toward the river. Its strength, exhausted by crawling eighty feet overland, had failed when almost within reach of its native element.—R. A. HABERSHAM."

RECENT ARRIVALS AT THE PENNSYLVANIA ZOOLOGICAL GARDEN.—Received by purchase.—Two rodentia bats (*Pteropus medicinalis*, one gray-browed Iruvakee (*Myotis myotis masoni*), three male and one female (*Myotis virginicus*), and one *Myotis virginicus* (*Glyptotis astensis*). Received by presentation.—One Mexican agouti (*Dasyprocta mexicana*), four parakeets (*Myiopsitta lutea*), one blue-backed *Colaptes auratus*, one *Tyrto ruficoris*, one *Screech owl* (*Scops asio*), one blue goose (*Anser carolinensis*, one male Virginia rail (*Actitis virginiana*). Born in the Garden.—One meadow lark (*Sturnella magna*).

"Dog."—Father Daniel He-fer, of Savannah, Ga., clubbed a dog with the butt of his loaded gun. Valentine Spigelmeyer, of Tyrope, Pa., used his loaded gun for a walking stick. A Pennsylvania hunter near Dingman's Ferry saw a bit of fur, shot at it, and put a charge of shot through the hat and head of a small boy.

Game Bag and Gun.

GAME RESORTS.—We are always glad to receive for publication such notes of desirable game resorts as may be of help to the readers of FOREST AND STREAM. Will not our correspondents favor us with such advice?

To insure prompt attention, communications should be addressed to the Forest and Stream Publishing Co., and not to individuals, in whose absence from the office matters of importance are liable to delay.

OPEN SEASONS.

The digest of open seasons, printed in our issue of Aug. 16, has been published in convenient pamphlet form, and will be sent to any address, postpaid on receipt of 10 cents.

STORIES OF THE EARLY DAYS.

L.—AN "AFTERNOON MAN'S" LUCK.

WHILE reading some accounts of the early history of Dansville, N. Y., as chronicled in your issue of Nov. 22, I was reminded of many incidents of pioneer life which occurred in the sparsely-settled country lying south and southwest of the above-mentioned town. The old road, or I might say thoroughfare, from Northeastern Pennsylvania to New York, in this section, thence to Rochester, N. Y., from which place many early settlers immigrated, some stopping in Allegany county, N. Y., while others pushed on to localities in different places in the then isolated regions of Potter, Tioga, McKean and Elk counties, Pa. Here was a paradise for hunters. In fact, hunting became a necessity; the scattering inhabitants could not subsist without it, and during several years it was a source of some revenue. Buyers were on hand every winter who were ready to buy up venison at a rather low figure, as they had to run it through to Rochester by sleighs. Venison generally kept frozen through the winter in that high latitude, and sleighing generally remained good until the middle of March, and so it was not unusual to see deer that were killed in November and December hauled into market in the last of February or possibly in March.

By means of a young gun hunter, that patience and perseverance found a sure road to success. I will mention a circumstance in demonstration of that principle. Bill Akers was a man, slow of speech, slow of step, and one who might properly be styled an afternoon man. He, like his neighbors, depended on his success in hunting for winter's meat, but while they had been laying in their supplies he had been engaged in building a log stable to shelter a cow and a yoke of steers. In process of time the stable was finished, and on Monday morning Bill made ready for a start, determined to hunt through the week, and also determined to procure meat enough during the week to last through the winter. Bill was poor, had a large family, and of late had been rather short of provisions, consequently he had nothing to carry for lunch but a piece of corn bread. Monday night came, and with it came back Bill, tired and hungry and nothing killed. It was rather late in the season, the snow about eight inches deep, was a little crusty and littered with white traveling. Tuesday's hunt was a repetition of Monday's, so was Wednesday, and also Thursday. I don't know that any one ever learned the particulars of that four days' hunt, but certain it was that the lunch was duplicated every morning, and that he came home weary and empty-handed every night.

The result of the fifth day's hunt was somewhat different. After pulling a short season, the Akers shot eight inches deep, which he followed over a circuitous route for several miles, when he discovered two of their standing broadside with their necks crossed, each one looking over the other's shoulders. Nearly every deer hunter has at some time during his life seen deer standing in the same position. Bill took in the situation at once. There was no "buck fever" in his make up. He deliberately drew up, and having both necks at the same level, he observed the small circle and came around in sight, about the time he had reached, when he halted up just as deliberately and shot it dead in its tracks. They were large deer, and it required some effort to hang them up out of the reach of wolves; and so the day was pretty far spent when he started direct for home.

Having gone not more than one-half mile, passing near the saw of a large hollow basswood which had broken a new cut of a large tree, he found a log lodged on some other timber, he saw a bear's track, and as it was getting nearly dark, he supposed at first the bear had been in and gone out again. But on closer inspection he found that it had come out and walked around a few rods and then gone back again. Here was a dilemma, but Akers was equal to the emergency. It occurred some two hours labor to barricade the entrance of Bill's temporary retreat, or in other words, to plug up the end of that hollow basswood in such a manner as would insure the keeping of that bear until a more convenient season. This he accomplished by inserting broken pieces of dry staves, wedged in with small poles, which he cut with his hatchet. Once more he shouldered his rifle and started for home.

It was late in the evening, but a full moon had risen, and he found no difficulty in keeping a direct course. He had by this time become very tired, and made good time until he brought up against his own fence, which was adjoining the woods, and inclosed a small turnip patch which he had neglected to harvest before the snow fell. Over the fence he climbed and chucked himself down into the snow, leaning back against the fence, with his gun standing between his knees, and the muzzle leaning against the fence also. Bill was thoroughly exhausted, or as he said, was about used up. The night was bitter cold, the temperature down somewhere about zero, but he said that he did not feel the cold very much while sitting there, only a sort of numbness which came over him, and he felt very sleepy what; and it is very possible that he would then and there slept his last sleep had not a providential occurrence aroused him from his stupor.

While sitting in the posture described he was sure that he heard steps of some animal walking through the crusty snow, and also heard it leap the fence. This of itself, would perhaps have quickened the pulse of any natural bred hunter. It seemed to raise him out of the dull lethargy in which he was fast sinking; his senses were sharpened and on the alert in a moment. He saw at once that it was a large buck, and as it walked out from the shade of the wood to the moonshine, it began pawing about the ground, and then came on the green turnip-tops. Being then about six rods distant,

feed on partridge berries and chicken grapes until their flesh is unsurpassed in "gaminess" and richness of flavor.

There are two ways of hunting the ruffed grouse. The first is real sport and is practiced by those who hunt for excitement and recreation. The second is a pot-hunting method in which there is no sport except the pleasure of killing the birds.

One who would get a day's sport out of pheasant shooting will go either to Westary, Maryland or to the mountain districts of Virginia. Either the North or South mountain, near Hagerstown, or the Bull Run and the Blue Ridge mountain in Virginia, afford fine fields. Virginia is of course the best, as it is not so thickly populated and the grouse shuns civilization. The Bull Run mountains about Thoroughfare Gap, in Prince William county, is about the ideal place to go.

There are places either at Broad Run, Gainesville, or Thoroughfare, where the sportsman can get a carry of hundred shells and enough powder and No. 6 shot to load them with. With an ordinary gun 3/4 drams of powder to an ounce and a quarter of shot is about the right load. Start out on your hunt early in the morning, and if you have an old setter, very staunch and very careful after single birds, take him along with you. The mountain is your place. Not necessarily a rocky cliff with pines, but a ridge where there are areas of wild cherry bush and laurel. Strike along the backbones of the ridges and in the accidental draw through the bushes. When you get well into the mountain your dog will soon show decided symptoms of drawing on game. He will carry his tail low, and creep and sniff around carefully. If you are as watchful as your dog and step along without unnecessary noise, you may walk right up on your bird. He will be lying low under a tuft of undergrowth watching you. Your dog will root him out, and he will rise at first with a front view. He never gives the dog a chance to stand him unless the weather is very warm and murky. If the air is clear and cool he will be up and away before you can say Jack Robinson. Now, you must be a quick snap shot if you would stop him. The undergrowth is thick, the pine saplings are numerous, and the ground is uneven. When the pheasant is once started he will go in a direct line, but that line is very hard to catch. It is a whirl and a buzz, but that line is almost inexpressible, he rises from the bushes or out of three or four of them may get up. Then your nerves are severely tried. A quick, cool shot, however, can often cut the ruffs from his king's lip's neck and make him fall with a tremendous thump and flutter.

A hunter who bags ten or a dozen pheasants in a day may consider himself very successful. In the Blue Ridge mountains a good shot has been known to bag twenty in a single day's tramp. The labor entailed, however, is tremendous.

Another way to kill the pheasant, however, is when the snow is on the ground and they go into the grape-bushes to eat chicken grapes. When the snow is deep the birds cannot find enough hips or partridge berries, and of course they must go to the grape-vines that are trellised up the trees. The pot hunter who finds a good bush "stocks" it every day. If there are any pheasants feeding in it he takes up his position secure from the sight, and picks off the bird that is the lowest down in the bush. The others will be startled, but will not fly. He may then kill them all from the lowest up to the topmost. This is, however, quite an uninteresting sport as shooting corn-fed turkeys from a blind. Pheasants are served in restaurants for \$1.25 apiece. Hunting them for the market is, therefore, lucrative.

PHILADELPHIA NOTES.

IT is estimated that fifty deer have been killed in Atlantic county, N. J., during the season ending Dec. 1, 1883. Several black bears have been seen in the same county, and last month a female with two cubs were seen crossing a road near May's Landing, which is only about fifty miles from Philadelphia. Jessie Reeves, a hunter of Port Elizabeth, Cumberland county, N. J., killed an alligator about a fortnight since, which makes the second one shot in this vicinity this year.

An application will be made to the New Jersey Legislature at its next session for the organization of "The Farmers and Citizens' Game Protective Society of Atlantic County," to act independently of the West Jersey Game Protective Association. It is becoming a great shame that even the non-fishable sea and shore birds along our coast are killed in such great quantities. The prevailing race for stuffed birds for bait ornamentation has placed a value on everything that flies. Especially are the gulls and terns persecuted. Last summer two taxidermists settled themselves at Long Beach, N. J., one at the Barnegat Inlet end, and the other at the Beach Haven point, and were kept busy the whole summer and a part of the autumn skinning and mounting birds. Fifteen cents apiece was given for terns, ten cents for strand snipe. In fact, everything was bought. Several market gunners made a good wage the whole season, and found it more profitable to give up their boats and attend to the new business. I learned from reliable sources that one shooter shipped to New York fifty dollars' worth of terns in one week. The consequence was, that long before the season was over the gulls and terns, which ordinarily could be easily approached, became very shy, and seldom came near the beach. Even the nesting places of the birds on the islands in the bay were sought out, and the half feathered young were secured and sold. Everything that could fly had a value. It is a satisfaction to know this rage will have its run, and that our sea birds will be allowed to live in peace. They are a great ornament to seaside watering places if nothing else.

Many of our sportsmen have been postponing their quail shooting trips until this month. The weather setting in cool and reasonably has had the effect of starting a number off. Ducks have not been so plentiful as they were last year. They would be at Havre de Grace, and box-shooting has been poor lately. There has been some fair pot shooting, but the days have been few even when the wind suited. We have some marsh ducks down the Delaware River, and the fowl have been using on the Slaughter Neck and Prime Hook marshes on the Delaware State side of the bay. At night the ponds in these marshes have lately been visited by wild geese. We have many so many new gun markets for years, and western mallards and prairie chickens shipped in refrigerating cars are numerous and cheap.

I am told by Capt. A. H. Clay, who has just returned from Potter county, Pa., that ruffed grouse are getting very scarce in his section of the county. He attributes it to there having been so many frozes under the snow where they frequently "burrow" for shelter, and a crust forming on the surface confines them. There has been no beach

masst in his region this year, and wild pigeons did not show themselves.

Quail have been plentiful in New Jersey this fall, but warm weather thus far has been against successful hunting. The West Jersey Game Protective Society is now having a great deal of trouble. Early in the fall at a regular meeting of the association, held at Gloucester City, N. J., after a stubborn fight, Postmaster Chas. H. Bernard, of that place, was elected secretary but has refused to give a bond for \$2,000 because he claimed that his predecessors had not done so. The former secretary, Judge R. T. Miller, consequently refused to deliver over to Mr. Bernard the books of the society, and the latter then threatened to procure them through the aid of the courts. President T. W. Walker and Secretary Miller have now resigned. It is claimed by some that the last monthly meeting was not properly advertised, and that a number of members have received certificates for the purpose of sustaining the original organizers. The report mentioned above, that Senator Gardner will at the next session of the Legislature introduce a bill to incorporate an Atlantic County Association so as to prevent the West Jersey Society from exercising any further control over that section, will make the trouble more complicated. In closing I learn that a stormy meeting of the West Jersey organization was held at Camden last night. After much debate, it was finally decided that the election for secretaries until the next annual meeting, and Mr. Bernard was asked to serve until that time. Mr. B., still refusing to give bond. Mr. Wm. Risley was elected a director from Atlantic county, and Mr. Larry Peterson from Cape May county. The trouble is not ended yet.

PHILADELPHIA, Pa., Dec. 7.

GUNPOWDER NECK.

THAT portion of Harford county, Maryland, embraced between the Gunpowder and Bush rivers, near the headwaters of Chesapeake Bay, and forming a peninsula, with an area of about eighteen thousand acres, is perhaps not excelled, if equaled, by any other section of country of no greater dimensions, in the abundance and variety of the luxuries abundant here and wanting elsewhere. The outline is bounded by water, the shores of which are intersected or indented by numerous creeks, coves, estuaries and lagoons, each of which furnish numerous varieties of marine plants suitable to the different species of waterfowl which annually migrate hither to feed. The soil contiguous to the margins of these waters is exceedingly fertile; this, in connection with the humid atmosphere, the natural concomitant of an ocean shore, bears annually a mass of vegetation truly astonishing, and nearly equal in magnitude to the products of a tropical swamp. The excessive productiveness of this paradise for game, furnishes indubitable evidence that nature provides and preserves a correct balance in animals, as well as inanimate matter.

I will not risk a statement with the view of approximating to the number of waterfowl we often see in one flock or bed on their feeding grounds. If I did, those who never witnessed it would pronounce me a liar. The different species are almost innumerable. All from the mountain swan down to the diminutive teal, and the delicate bluewing, find an abundance of food suited to their different natures. Here the patriarcal among the waterfowl, the stately canvas-back, obtains the wild celery, which imparts to the flesh of the fowl that peculiar flavor which tickles the palate of the epicure. In fact, this is the favorite feeding ground of all the different families, tribes and clans of waterfowl. Here they revel in luxury and grow fat.

Then the sportsman's booming gun Is heard along the sandy shore, From early dawn till set of sun In one incessant, echoing roar.

This being the favorite feeding ground of the game, it necessarily follows that it is the favorite resort of the sportsman, numbers of whom come from a distance as far north as Boston. Many of these have been organized under various names, one of the most notable of which is the St. Domingo Ducking Club; it is located on the Gunpowder River a short distance below Magnolia, and is composed of gentlemen from Baltimore and New York. All the members are professional or business men, with ample means to sustain the most elaborate style they may desire in the enjoyment of their recreation. They have erected a commodious mansion in a suitable distance from their gunning points, and equipped it with all the modern conveniences necessary for social enjoyment during leisure time. The nightly meetings, at which they discuss the incidents and circumstances in connection with the sport and trophies won, are exceedingly pleasant, and constitute an important factor in the enjoyment of the gunning season.

They also entertain their friends (ladies and gentlemen) at various times during the season with elaborate dinner parties gotten up in *recherché* style. In addition to the house servants they employ three or four men to assist in handling the decoys and building blinds. The club also keeps six or eight of the purest-bred Chesapeake Bay retrievers, one of which a short time ago followed a wounded canvas-back three miles and finally captured it. Their principal employe, John Swetzing, is one of the two best duck slots on the waters of the Chesapeake; Edward Lynch, the superintendent of another celebrated ducking point, is the other. Messrs. Swetzing and Lynch are men of high character and habits of the wildfowl to such an extent that they are considered reliable authorities on the birds and also on the weather, which they predict by the movements which instinct gives the fowl. We who live in this section prefer their judgment to that of "Old Prob." Some of the gentlemen who compose this club, though they only come down occasionally, are remarkably fine shots. Messrs. Wells and Stewart particularly. It is a pity that these gentlemen are in the blind the fowl that approaches within a circle of ten yards leaves them behind. I believe Mr. Wells is the next best member and president of the club, and in the exercise of his prerogative in the enforcement of the rules he is an accomplished martinet. Among the specified rules we find that gunning on Sunday is prohibited, no snipe boxes nor tuis are used, and all game must be shot on the wing unless it is wounded. They also keep a record of the different species and number of fowl killed each day, with the date and name of member who kills them. In short they enjoy the sport, and social assemblies in connection therewith, in a style commensurate with their means, yet perfectly exempt from objectionable practices which sometimes prevail in other clubs.

Maxwell's Point Club is located below St. Domingo and near the mouth of the Gunpowder, and is composed entirely of a few wealthy gentlemen from Philadelphia. Maxwell's

Point is said to be the finest ducking point in the State, particularly for bar or overhead shooting. One of the gentlemen belonging to this club is nearly eighty years old, and has become so much infatuated with the sport that he migrates as regularly as the fowl; and, notwithstanding his great age, is a dangerous competitor for any of the crack shots. Occasionally some young man has the temerity to enter the lists with him, but the old man invariably trims his feathers, and retains his laurels:

With crouching form, and upturned eye The old man marks, in rapid flight, The canvas-back—doomed to die Before his keen, unerring sight.

The favorite feeding ground of the swan and geese is located on the bay shore in the vicinity of Legoc's Point, near the mouth of Bush River. Hundreds of swan may be seen here almost any day during the season, either feeding along the margin or brooding peacefully the billows of the Chesapeake, with their snowy plumage glistening in the sun. This point was purchased a short time ago by John S. Gittings, Esq., a wealthy banker of Baltimore, who is, although a young man, one of the ablest financiers in Maryland. He frequently visits it in company with his friends to enjoy the rare sport.

I might continue and indubitate, in describing the various products and treasures furnished by this prolific country, but find it would occupy too much space, therefore I will specify close with a slight introduction of another style of luxuries, equally as abundant as the wildfowl, the departure of which about the last of March is the signal of the advent of the fish in the waters of Gunpowder and Bush rivers, which literally swarm with rock, perch and pike; in fact, there are as many different species of fish below as there had been fowl on the surface of the water. The natural fertility and productiveness of the land is equally as remarkable as that of the waters surrounding it; a description of which may be condensed in the single but comprehensive word—MAGNOLIA, Md.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Your correspondent, "Greenhorn," who is evidently much better posted than he would have appear from his selection of a signature, has raised the objection to a 40-90 repect which I, of course, had expected.

I regret that I cannot in all points agree with him. His objection, though very reasonable, is not conclusive. He takes it for granted that the breech work, being elongated, would necessarily be too weak to stand the heavy charge 40-90-50.

I am willing to confess that my object has been to raise this discussion in order that this question might be settled by test.

From looking over Winchester's catalogue we find that their rifles are subjected to tests wherein much heavier charges are used, and I see no reason why, if found to be necessary, the machinery could not be made stronger. I would admit that I have the same fear that by reason of the "carrier block and adjacent parts" being lengthened to an extent necessary to accommodate the four-inch cartridge of the 40-90, the breech work or machinery in the line of fire will not, as at present constructed, be strong enough; but I am not willing to take this as an accepted fact until it is proven.

If it be found from experiment that such a repeating rifle (never action) can be made as safe as the best repeating revolv in use, I am confident that it would be the most effective and consequently the most popular of all sporting rifles. For not only would we have therein a repeating rifle with a trajectory as flat almost as any express rifle, but also we would have, which is far more important (judging from experience with a 40-90-50), a rifle which would do the necessary amount of execution when the bullet arrives at its destination. It is an striking contrast to an an inextimable advantage over, for the purpose of game shooting, the majority of English express rifles, at least over those which I have tried.

Far be it from me to attempt to raise the old discussion as to the relative merits of the express as compared with other rifles. The most of us have pretty well made up our minds one way or the other upon that subject, some insisting that the express, with its lighter and shorter hollow pointed bullet, is the most correct; others like myself claiming with equal vehemence that a heavy, solid bullet is preferable, being one which will not fly into a dozen pieces almost as soon as it strikes the game, and which will always reach and penetrate the "hollow" from whatever point it be fired, i. e., no matter what the position of the game may be.

Par parenthese, I may as well say that I am a convert from the other side, being at one time a strong adherent of the express rifle and hollow pointed bullet theory. From a large number of experiments (sometimes with a blank .22-cal. cartridge inserted in the end of the bullet, thus making it explosive, generally, however, without this), such as firing into soft woods, old logs, boards, clay banks, etc., and into such living bodies as rabbits, cats, and a few small deer, I was made to believe that a .50-cal. express was the most deadly rifle made.

Many were the arguments I would adduce in its favor, and many were the would I discourse about the "terrible shock" imparted owing to the velocity of the bullet, and the "terrible wound" inflicted owing to the spreading or expanding of the same, and the consequent flow of blood and derangement of the vitals. All this and more did I advance in favor of the express principle.

But alas, like many of our cherished illusions, all this was ruthely dispelled when, several years ago, I came to test the same upon the larger game of the Rockies.

It is rather mortifying to shoot an old bull elk in the "yellow patch" on the rump (ordinarily a dead shot) and have your ball fly into six or eight pieces in the ham before even it reached the bones, doing, therefore, very little damage, and then afterward see the same elk "broken down" by a bullet from a '73 model Winchester, the ball having penetrated near the same place. Or to shoot, as I have said, a bull elk below the shoulder a little higher at thirty paces with a 13-lb. double express, 16-bore, 15 grains powder, 14 oz. hollow pointed bullet, and although it staggered him, to find upon examination that the bullet, flattened until it resembled a saucer as much as anything, had fallen down into the hollow of the body, having done no more execution than to slightly blacken one lung which it penetrated an inch or two. The whole force of that heavy charge had been expended upon flattening the bullet, breaking a rib and

Sea and River Fishing.

OPEN SEASONS.

TROUTING ON THE BIGOSH.

SECOND DAY.

It looked like rain in the morning, and a long consultation was held on the subject of the weather, and the chances of getting caught in a storm. The Colonel, a retired army officer and the father of our youthful friend Jack, had twinges in his Gellishy legs, as he always called the rheumatism—a and feared that a wetting might give his enemy—the rheumatism—a that to trench himself he had thrown out a skirmish line, and so he decided to remain near the house where he could retreat in good order in case of need. The Doctor had discovered a new fly on the water, and being a firm believer in a close imitation of nature, thought he would sit by the window and make some imitations of them. "I tell you," said he, "if I make this fly it will be the most killing one on the stream, and will make up for lost time when I go again.

"Nonsense," replied the Colonel: "the less a fly looks like anything in nature, the more killing it is. Color is what you want, shape is of no account. Flies attract trout by their colors, and if they are the right size, they may be of any shape. Go on in the boat, a little sprinkle does you no harm and the fish will rise at almost any bright fly this dark day. What is your opinion, Mr. M?"

"What you say accords with my own views, but my good angles think differently, and there is no harm in having flies made to a form as well as to color. If the Doctor prefers to stay in to make some new flies, there appears to be no good reason to object. As for myself, the threatened storm may come or not, I will try it alone, as Uncle Ben is going to mill."

Jack had been an attentive listener, and now broke in with a request to go. His father objected feebly, but gave in to the argument that Jack had no rheumatic leg, and besides the waterproofs were going along. When the boat was fairly under way, Jack opened with: "I wanted to go with you alone because you promised to show me how to cast a fly. Father never has time to bother with me, and says it will come natural in time. I want it to come natural now, and I can't cast the best about here how it can be done. All our fishing last summer was done with bait and beam, poles, and the first fly I ever cast was thrown yesterday, and you saw how little there was of it."

"But you took a couple of small trout."

"Yes, but I can't get out over twenty feet of line and it slips down on the water like a pancake. Say, what did father mean last night when he asked the Colonel and you if you would take Paul's advice?"

"I don't know, Jack. I don't remember it."

"O, no, your memory is short on one end. I heard the Colonel say, 'Don't care if I do, and you all went in and locked the door; you needn't take too much trouble on my account. What's that o. er there?'"

"Something has risen in the water, probably a trout. Try and see if you can make him rise again. Wait till the boat gets a little nearer. You splash your flies too much on the water, and you strike at the spot, but you don't. Cast as though you wanted the flies to strike in the air ten feet over the place where you want them to fall, and then let them settle down. That's good, for a short cast; give your line more time behind you and don't use so much strength; let the spring of the rod throw the flies. Now reel off more line and start it slowly from the water, and as it is about to leave it give it a quicker motion and a spring backward and stop the rod when it is about perpendicular. Very good; only give it more time; the quicker the cast and the flies will not be whipped off, as the stretcher was on this last cast."

"I think I cast thirty feet!"

"All of thirty, but if you will practice, with the rules given, for half an hour, I will guarantee that you will cast twice that distance. Bear in mind that you must start the line slowly, stop it at the perpendicular, and give it time to straighten out behind by allowing as much time for this as it takes to go forward. Count the time, and make the back cast up in the air and not in the water behind you. The stopping of the rod at the right angle does this. There! you had a rise; try it again."

"I've got him! No, he's gone."

"The fish took the fly, but had it sideways in his mouth, and when he closed on it found that it was not what he thought it. If you had struck when you saw the swirl you might have hooked him. Always strike from the rod by leaving the line free from pressure of the fingers, and then you don't strike too hard. Reel up, the storm is coming and we must get the boat on shore and turn it up for a shelter."

The rain-drops began to patter on the water and by the time we had the boat turned up against a log and were safely stowed away under it in the waterproofs, the music of the shower on the bottom of the boat was worth listening to. First it came in a regular tap-tap, a kind of rhythm suggestive of the old time, "Essence of Old Virginia," then quickened into a corn-busking jig, in which a trained ear could distinguish the light touch of the thin sole on the sanded floor as it "wedged corn," and "kivered taters;" increased to a rattling cluck, hurried on until a full drum corps was beating "triple lob majors," and finally settled down into the long roll.

All this took more time than it was required to tell it, and while the two under the boat each used one ear to catch the varying intensity of the storm, they had a reserve doing duty in conversation. Here it might be well to warn all enemies that the jokes on cars doing duty as fans, flyscarsers and blankets, have been long in the service and refuse to do duty on account of the law which exempts all those over forty-five years of age from conscription.

Jack said: "The rain comes harder and harder, do you think it will last long?"

I answered: "Ask me an easy one, Jack; for instance, who will be the next President, or if the approaching comet will knock the world out in one round, then I can tell you truly that I don't know and don't care, but on the question of the storm I can only say that I don't know but do care, for it is a problem that concerns our immediate welfare."

Said Jack: "You won't give me away to the old man if I light a cigarette while it rains, will you?"

Jack, don't get slazy, 'give me slazy' is a low form of

SALMON AND STRIPED BASS REEL-PLATE.

TROUT AND BLACK BASS REEL-PLATE.

expression in use among the policemen and the men whom they hunt. Who do you mean by the 'old man'? if you refer to your father, I would remind you that he is my friend, and you must speak of him more respectfully. I shall insist on having pure air under this boat, and shall object to cigarettes. In fact, I object to that vile compound of paper and old cigar stumps in all places. A reasonably fair cigar is not unpleasant to most people, if not smoked so close to the wet end to be disagreeable, and a pipe is a legitimate mode of burning tobacco, but the cigarette is a nuisance on all occasions. Stop to look into a shop window on the street, and the odor of burning paper rises in your nose, and you look down and find an eight-year-old boy on the end of one of the vile things. Bah! the offense is rank and smells to Heaven. Now, Jack, if you will smoke in defiance of your father's orders, get a pipe or a cigar, but do not injure your health with those opium soaked things that are called cigarettes. Pull the waterproof up to the side of the boat more, so that the water will run under it. The rain is coming heavier, and may pour itself out soon. It stops by noon you can practice casting for an hour or two, and later in the afternoon there will be flies on the water, and the trout will rise."

"Does rain have any effect on fish?"

"It seems to have. After a rain they usually feed better; perhaps there is a little wash of mud and some worms into the river; perhaps the rain water raises the temperature of the stream slightly and so hatches out flies that otherwise would have remained in their pupa cases until another day. It has put a slight edge on my appetite already. Pass the creel."

It was two hours past noon when the rain stopped, and we crawled from under the boat and launched it. Jack tried to cast for practice again and soon was able to get out fifty feet of line. "Now," said I, "don't try to cast further, it is not necessary at present, but aim to deliver the flies lightly. Cast as though the flies were to rest on that white cloud above the distant tree tops and let them fall from there by their own weight, never mind the water, they will find it. Many good casters lay the line out on the water and the flies go on to strike fast, but this mode is easy and can be done after you get the knack of bringing the flies down first, or at the time when the line straightens and falls. You will read of casters make where the flies 'hung a moment suspended in the air and then settled on the surface, lightly as a thistle-down,' but that is a bit of poetic fancy that is never realized."

After an hour's practice the pupil became quite proficient and we moved down to the pools and he took a dozen fair trout before sundown, I only taking three, just to illustrate to him some precepts that can better be shown than told.

Returning to the house we found our friends waiting to see the result of the day's catch, and Uncle Ben, who had returned from the mill, most anxious of any. When he saw the creels emptied of fifteen good fish, and was told that Jack took four-fifths of them with the fly, a smile broadened his face and his favorite exclamation came out with lengthened emphasis.

[TO BE CONTINUED.]

WHAT FISHES EAT.—The New York Association for the Protection of Game held a meeting Tuesday evening. The association has been incorporated. Gov. Cleveland has elected an honorary member. A committee of three was appointed to confer with the committee selected by the Chamber of Commerce for the preservation of the Adirondack forests. Prof. H. J. Rice, of the Fulton Market Biological Laboratory, was the guest of the evening. Prof. Rice was called on to talk about his work, and said that all fish are cannibals, in the sense that they eat each other, and their own eggs or young. For the past year he has been investigating the general economy of fishes in order to learn what their food is and also to determine their breeding seasons. He had examined over 6,000 fishes, and had found that the cod and the bluefish are the most omnivorous. Young striped bass feed mainly upon crustaceans, and the older ones on alewives and menhaden. In the stomachs of cod a little of everything that is in the water was found, stones, sticks and food of all kinds; from one codfish a piece of wood seven inches long and an inch and a half square was taken. New York city needs a type collection of fishes, where students may compare specimens. The professor thought that fish do not eat much in spawning time.

THE HERRINGS OF CENTRAL LAKE.—Central Lake, Mich., Nov. 22.—Joe Minnie came here a week ago to-day, and began catching "herrings" a day or two later with a dip-net. He could not tell me when they first appeared. He fished night and day, and left this week with a barrel or more of the fish. I think that in all, between two and three barrels have been caught. They are taken in large dip-nets made from mosquito bars.

THE "STANDARD" REEL-PLATES.

At the meeting of the National Rod and Reel Association held at the biological laboratory, Fulton Market, New York, President Endicott in the chair, the only business transacted was the adoption of a standard for reel-plates which would, if accepted by the large manufacturers, relieve anglers from the necessity of having to file and fit a new reel to their different rods. The Association has held that only two sizes are necessary, one for light reels used for trout and black bass, and the other for heavy reels used for salmon and striped bass. As if to show the necessity for such a standard, one rod manufacturer sent to the Association five rod-butts each with a reel-seat of different size. The committee appointed to investigate this matter reported as follows:

"The committee appointed by the National Rod and Reel Association to report for their adoption a standard for reel-plates and reel-seats, respectfully report:

"A letter was sent to all the noted rod and reel makers throughout the country, asking their views and requesting their cooperation. Almost all of them responded to the circular, and some sent sizes of reel-plates and seats, one large manufacturer sending five different sizes, and all signified their willingness to conform to the standard adopted by the Association.

"Your committee would recommend the following as the proper sizes for trout and black-bass reel-plates: Length, 2 1/2 in.; width, 1 1/4 in.; diameter of circle, 3/4 in.; thickness at the ends, 3/16 in."

"For salmon and striped bass: Length, 3 1/2 in.; width, 1 1/2 in.; diameter of circle, 1 in.; thickness at the ends, 1/8 in."

(Signed)
L. W. WINCHESTER, President Restigouche Club.
JAMES L. VALLOTTON, President Pasque Island Club.
C. VAN BRUNT, Willowemoc Club.
H. B. MCGOWN, Cullybank Club.
JAMES BEXTER, President South Side Club.
J. C. McANDREW, Restigouche Club.

Mr. William Mitchell moved the adoption of the standard as recommended, and Mr. Levison seconded the motion.

Mr. Thomas Conroy moved to amend the standard by making the diameter of the circle larger, and that the diameters of the quarter and half dollars be adopted for the two sizes.

Judge McGown said that as there are two sizes to be adopted, and Mr. Conroy's amendment covers both, he would say that he was a striped bass angler, and was unfamiliar with trout reels, but others on the committee were. The committee had spent much time in examining reel-plates, and found that there was but little difference between those made for salmon and those for striped bass. They had averaged the sizes and had considered Mr. Conroy's proposition, which he had before made in writing, and thought the diameter of a half dollar too large. They had also thought it necessary to give any recommendation for the thickness of the plate in the middle, merely giving the thickness at the ends where it affects the fitting of the reel in the seat.

Mr. Mitchell remarked that a half dollar was larger than any rod made, and a reel-plate which was a segment of such a circle would work loose. If the plate is the segment of a circle which is smaller than the rod, it will bear upon its edges and remain firm; a reel-plate which fits a seat of small diameter will fit any rod.

The question was called for and the amendment was lost. The original motion of adopting the report of the committee, was then put and was carried unanimously. Judge McGown moved that the committee be directed to address circulars to manufacturers of fishing tackle, and that the clubs be printed on it, also that extra copies of the plates be furnished to those wishing them. Carried, and the meeting adjourned.

STRIPED BASS IN CALIFORNIA.—The *Greaser and Gunner*, speaking of the bass imported into the waters of California a few years ago, and which were placed in the bay near Martinez, says that a fish of this variety was taken in the Bay of Monterey recently, which weighed about seventeen pounds and was about three feet in length. The largest caught on this coast previously weighing about four pounds. The fish was a female and full of spawn, indicating that those waters are favorable to the propagation of this fish, which is extremely palatable, making very desirable acquisition.

ANGLES' ASSOCIATION OF EASTERN PENNSYLVANIA.—This association held its annual dinner at Lauther's restaurant, Philadelphia, on the evening of the 6th, and about sixty members were present. The dinner was composed of fish entirely, and was finely served. After dinner many speeches were made. Mr. John Gillingham, the chairman, said that during the year the association had been the means of stocking seven streams; had destroyed 100 nets, bringing as many "fish poachers" to justice, and had entered into an

MESSERS. P. H. & D. BRYSON'S BLACK, WHITE AND TAN ENGLISH SETTER BITCH "SUE."

agreement to take fish from the various reservoirs supplying Philadelphia with water and deposit them in the streams in the suburbs. Among those present were A. M. Spangler, Prof. Moses True Brown, of Boston, and Dr. Joseph H. Schenck, U. S. N.; James E. Salter, of the Sheriff's office; Dr. W. W. McClure, Frederick Brown and Thomas M. Dixon. The association numbers eighty members, and is a live working organization.

Fishculture.

BREEDING HABITS OF CATFISH.

PROF. J. A. RYDER has been breeding one species of catfish, *Ameiurus abdoles*, in an aquarium and thus records their habits. A pair were placed in a glass tank and one morning he saw a mass of ova about eight inches long, four inches wide, and from one-half to three-fourths of an inch thick, at the bottom of the aquarium. One of the parents hovered over the eggs, fanning them with its fins. This fish was proved by dissection afterward to be the male. The young hatched in from six to eight days afterward, the female taking no notice of either eggs or young.

A measurement of the eggs showed that each was about a fifth of an inch in diameter after it had become distended with water (as is the case always with eggs laid in water), and the mass contained about 2,000 eggs. Their surfaces were adherent, but were not enveloped with gelatinous material, so that, lying loosely like a pile of shot, they were conveniently placed for aeration by the efforts of the male. An experiment was tried with eggs taken from the mass, but proved that the circulation obtained by the fanning of the male was necessary, as all eggs so removed died, while those left in his care hatched. On the fifteenth day after the eggs were laid the young were able to feed, and were found to relish greatly pieces of liver that were thrown to them. This they would tug at in a way that proved their possession of teeth. The parent fishes would frequently take into their mouth pieces of the liver thrown to their young, and in so doing would also apparently swallow the young fish hanging to them, but it was observed that, though the liver was eaten, the young fish were always rejected uninjured, showing that by some delicacy of touch the parents recognized the presence of their offspring previous to swallowing the morsel. The barbels appear very early in life, the pair which proceeds from the angles of the mouth commence to bud on the third day of development, and the two pairs of chin barbels on the fifth. On the fourteenth day the rays of the fins were already formed, and the young had fairly passed through the larval state, and were quite similar to the adults, the more so as they commenced to feed they began to disperse through the aquarium, and the male abated his habit fanning them with his fins.

The Philadelphia Record in commenting on this says: "It is now in order for fishermen, amateurs and others to tell the newspapers that they knew all this before, but did not suppose it was not generally known." Thereby showing its knowledge of one of the weaknesses of human nature, and of fishcultural human nature in particular.

ANSWERS TO CORRESPONDENTS.

BEAGLE, Buffalo, N. Y.—Why is it there are so few beagles for sale or advertised in your paper? I know of at least five gentlemen in this city who would buy beagles if they could be found, and at reasonable prices, to be used only for hunting rabbits. Ans. You evidently fail to read the advertising columns, or you would not ask such a question. Our last issue contained several advertisements of beagles for sale, and we presume the advertisers could supply fifty gentlemen as well as five.

BUFFALO.—For yawl rig in square stern boat, use iron tiller, split open in middle, the mizzen-mast passing down through the elliptical opening, having the major axis athwartship or simply elbow the tiller in wake of the mast.

CRUISER.—For building a yawl on the lines published, refer you to Burgess Bros., 13 Exchange place, Boston, or to any of the advertisers in our paper.

FIXTURES.

BENCH SHOWS.

December 19, 20 and 21.—New Orleans Bench Show. Entries close Dec. 10. Charles Lincoln, Superintendent, New Orleans. Jan. 2, 3, 4, 1884.—Meriden Poultry Association Bench Show, Meriden, Conn. Joshua Smit, Secretary, Meriden, Conn. April.—1884.—The Cleveland Bench Show Association's Second Bench Show. Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

THE EDINBURGH DOG SHOW.

THE Scottish Kennel Club held their third show of sporting and non-sporting dogs in the Waverley Market, Edinburgh, on the 6th, 7th, 8th and 9th of November. The total entry being 565, making a very good exhibition in one of the best buildings for the purpose in England. The attendance was pretty good and the weather favorable. The Rev. W. J. Mollor judged St. Bernards, mastiffs, Newfoundland, bulldogs, bull-terriers, Irish terriers, toy terriers, toy spaniels, Italian greyhounds, pugs, any variety classes and non-sporting puppies; Col. Cowan judging sporting class and fox-terriers; Pamure Gordon, Esq., and David Sward, Esq., judging collies; A. Dodds, Esq., Bedlington; I. A. Mather, Esq., dandies; and Wm. McLeod, Esq., skyes, black and tan, smooth-haired terriers and Scotch terriers. Their awards gave general satisfaction.

The well-known Cadwallader won in St. Bernard dogs, and second place was taken by a very nice young dog we have never seen out before, his litter brother being equal third. In St. Bernard bitches, which was a very good class, we were very favorably impressed with the first prize bitch. She is very large, stands well on her feet, and moves well. She is also a very well marked bitch, her faults being rather narrow across the head, and no dew claws. The second prize, Queen, was by many considered the best, and we quite agree with them, although she is much smaller. She is a remarkably good one in every other respect, and is sure to stand first on the list before long. St. Bernard puppies were an indifferent lot. The first prize mastiff is a very promising young dog, and succeeded in beating the well-known Crown Princess. We could not agree with this decision, as although the dog was a very good specimen, he can not hold as good a position against stuff dogs as Crown Princess can in bitches. But it only goes to prove that in the large varieties a good dog can beat a good bitch in classes where they are competing against each other.

Newfoundlands were a good class, but we fancied the second prize dog as best, being much better in feet and legs, and more strong and active altogether, and in good condition.

Deerhounds, with the exception of the first and second prize dogs, were, taken as a class, only moderate. Mr. Joplin's Chieftain winning, but closely pressed by Lord Arthur Lionel Cecil's Bruce, who was deficient in size, but better in color, and in hard and better condition than the winner.

Bloodhounds had only three entries, they were a moderate lot. Greyhounds—the three winners were all good ones, the first a very handsome black and white dog.

Retrievers were a small class, and contained nothing extra in quality. Pointers, first and second, went to Mr. Shortnose with a pair of liver and white; first in bitches also went to the same gentleman.

Black and tan setters contained some dogs of very good quality, the winners were all good, with grand color and coats. In bitches we liked the third prize bitch best, but she was rather out of form. She was good in style, with a good head, good color and coat, while the second prize was rather fine in face, short of coat, no feather, and rather hollow behind the shoulders.

In English setters Royal IV, scored another win, and we noticed Mr. Garland showed three young ones by him out of one litter, which got third, etc. and c.

Clumber spaniels were a very good class, but not the equal in quality we see at some of the Kennel Club shows. Black spaniels were a very good class, with that grand dog, Solus of Kennel with Zulu. Second prize went to President. We saw him for the first time and were very favorably impressed with him, but do not think that he will soon be fit to compete with such dogs as Solus or Zulu. The third prize, Kidnapper, is good spaniel also, but too leggy. We rather thought Beverly Blackie, unnoticed, ought to have been before Kidnapper, Shamrock II, vice, was a fair Irish water spaniel, rather leggy, and he carried his tail too high.

Fox-terriers. First went to Ruby Tyrant, who was looking as well as we ever saw him. Mr. Kaper also won in the open dog class with a very nice one and well marked, but a trifle high on his legs. He won also in the bitches with a very good wire-haired one. Bull-dogs were only a moderate collection, the first prize dog standing clear away from the rest. The bull-terriers were poor. Irish terriers were a good class, the first and second much the best. Scotch terriers contained some very good specimens, the majority of which were too large in ears. Capt. W. W. Makie showed two very nice dogs, getting first and second, and we consider them well worthy of the position, being much better in head and quarters than any of the others. Their coats were hard and dense.

Black and tan terriers. Mr. Koyle walked away in both classes. Nothing can near his exhibits. There was a very good class of white English terriers, but we fancied the vhc. Juno best of the lot, and the second prize, Mistress Tru, about the worst, having a butterfly nose, short face, thick skull, and a thick, cobby, bull-terrier-made one. Skye terriers were a good class, in which the well-known Heather could not get more than vhc. Bedlington and Dandie Dimont terriers were strong classes and competition keen. In toys Mr. Trougher won two equal first with a pair of very nice York-shires.

In spaniels, first went to a very nice little King Charles spaniel; second and third, went to King Charles, but they were indifferent specimens.

The Italian greyhounds were good, and we thought Mr. Bruce's Banksie Flower and Banksie Beauty much the best. In pugs, Lovat, the first prize, was a long way ahead of the rest.

In sporting puppies, first went to a very good black spaniel, but from his age we think he will be much too large. In non-sporting, first went to a very promising young bulldog with a rather coarse tail. In a class for a litter of puppies, first went to a pen of three very promising young collies by Tramp II. The show was held under the Scottish Kennel Club rules. We think the English exhibitors have to be very particular in reading prize lists and rules of every show, as scarcely two shows follow each other which adopt the same rules. Following is a list of the awards:

ST. BERNARDS.—Dogs: 1st and special, H. C. Joplin (Cadwallader); 2d, W. Miller (Hummer); Equal 3d, James Low (Turk) and Mrs. V. Mackay (Mistgrave). Bitches: 1st, Chas. B. Droyer (Millient); 2d, Thos. Everett (The Queen); 3d, H. C. Joplin (Chieftain). Puppies: 1st, H. Gray (Alp of Summersdale); 2d, Geo. Sowersby (Shreckhorn); 3d, Miss Nellie Taylor (Duke).

MASTIFFS.—1st, Alex. Morrison, Jr. (Hampton); 2d, Joseph Royle (Crown Princess); 3d, Rev. Edward Sykes (Zeno).

POINTERS.—1st, R. V. Ford (Leo V.); 2d, W. C. King (King Bruce); 3d, Thos. Snellic (Leo).

DEERHOUNDS.—1st and special, H. C. Joplin (Chieftain); 2d, Lord Arthur L. Cecil (Bruce); 3d, Dr. John Hadden (Roy).

BLOODHOUNDS.—1st and special, Mrs. S. W. Mackay (Murdock); 2d, B. C. Knowles (Oscar); 3d, Miss Nellie Taylor (Duke).

GREYHOUNDS.—1st, Mrs. R. Clark (Casselo); 2d, H. C. Joplin (County Member); 3d, George Raper (Royalist).

RETRIEVERS.—SMOOTH OR WAVY-COATED.—1st and cup, V. Kitlingmas (Boston); 2d, Owen Lilcock (Ruth); 3d, William Telfer (Corra).

CLARK COATES—1st, Robert Chapman (Black Pearl); 2d, Walter Irvine (Coral); 3d, T. C. Jackson (Master Trust).

POINTERS.—Dogs: 1st and cup, John Shortnose (Quick Shot); 2d and 3d, John Shortnose (Don Pedro); 4th, J. J. Pollock (through). *Hares*: 1st, John Shortnose (Lucky Break); 2d, J. A. Pollock (Forest Lily).

SETTERS.—BLACK AND TAN.—Dogs: 1st and cup and 2d, Jas. Dryburgh (Wallace and Pind); 3d, Robert Chapman (Charlie). *Hares*: 1st, J. Henderson (Dial); 2d, Thomas Anderson (Monte); 3d, Robert Chapman (Earl IV.). ANY OTHER VARIETY.—1st and special, John Shortnose (Royal IV.); 2d, Henry Dundas (Belle of the Isles); 3d, Thomas Garfield (Lion).

SPANIELS.—SUSSEX AND CLIMBER.—1st, J. Pollock (Castor); 2d, John Elends (Blossom); 3d, E. Walling (Duke E.). ANY OTHER VARIETY.—1st, Joseph Royle (Solus); 2d, Joseph K. Kaye (President); 3d, W. Hutchinson (Kathleen).

SHEPHERDS.—CHAMPION.—1st, Robert Haig (Chance).—OPEN CLASS.—1st, J. D. Richardson (Type); 2d and 3d, Robert Haig (Lady, Lonsdale and Elm); 4th, Alex R. Hay (Lady Bella).—TAR HEAVEN WOLF.—THREE FIRST PRIZES.—Dogs: 1st, W. W. A. James (Highland Chief); 2d and 3d, Robert Chapman (Bob and Trump II.); medal, George Raper (Royal Rover). *Hares*: 1st and cup, Dr. W. A. G. James (Marble); 2d, Robert Chapman (Samuel); 3d, Wm. Cowie (Yellow). 4th, W. D. Inman (White Blossom). *Puppies*: 1st, C. D. Nairn (Chance II.); 2d, Dr. W. A. G. James (Pocah II.); 3d, John Coaldston (Lion).

FOX TERRIERS.—CHAMPION CLASS.—1st, George Raper (Roly Tyrant). OPEN CLASS.—Dogs: 1st, George Raper (Roly Pickle); 2d and special, 3d, George Raper (Roly Pickle); 4th, George Raper (Roly Pickle). *Hares*: 1st, George Raper (Roly Pickle); 2d, Frank Blairhead (Bluebonnet); 3d, R. Murray (Gyp).

BULLDOGS.—1st, George Raper (Bron II.); 2d, Wm. Miller (Tipton); 3d, Wm. Miller (Tipton).

BULL TERRIERS.—1st, Alex. Patman (Galliard); 2d, Wm. J. Smyth (Belly II.); 3d, Wm. Raley (Sirling).

IRISH TERRIERS.—1st, George R. Krehl (Pagan II.) 2d, Wm. Graham (Garryford); 3d, J. D. Lumsden (Griffep).

SCOTTISH TERRIERS.—1st, Joseph K. Kaye (2d); 2d, W. W. Mackay (Dunara and Donohy); 3d, Ludlow & Bloomfield (Ramble). *Hares*: 1st, John D. McCall (Jan); 2d, Ludlow & Bloomfield (Bitters); 3d, Lord Arthur Cecil (Bitter).—BLACK AND TAN.—1st, Joseph Royle (Bruno); 2d, Samuel Cameron (Bruce); 3d, Z. & R. B. Strongman (Prince Arthur).—UNDER 14LBS.—1st, Joseph Royle (Fairy Queen).

SMOOTH-HAIRED TERRIERS.—OTHER THAN BLACK AND TAN.—1st and 2d, W. B. Baintyne (Diamond and Juliet); 3d, F. J. B. Douglas (Distress Prime).

SKYE TERRIERS.—PRICK-EARED.—Dogs: 1st and special, Robert H. Christie (Sir Garmar); 2d, James Kidd (Young Robt); 3d, Helen Angus Stewart (Young Robt). *Hares*: 1st, John D. McCall (Jan); 2d, Frederick Tupper (Empress); 3d, John F. Fisher (Tyrer). *Deer*: 1st, James Kidd (Young Robt); 2d, John Steele (Bobby); 3d, Samuel Cameron (Fairy Queen).

DANDIE DUMPT.—CHAMPION.—Dogs: 1st, A. Steele (Lionet). OPEN CLASS.—Dogs: 1st and special, W. A. F. B. Coupland (Border Prince); 2d, John Coupland (Cromwell); 3d, S. Brewster (Turpin). *Hares*: 1st, Wm. B. Baintyne (Duchess II.); 2d and 3d, Charles Cook (Jeany and Ginger II.).

BEDLINGTONS.—Dogs: 1st and special, Henry Essdale (Jane Something Bona). *Hares*: 1st, Joseph K. Kaye (2d). *Projectiles*: 1st, H. Burnett Watson (Jafford); 2d, G. A. Coch (Ode); 3d, John Cornforth (Topsy II.).

TOY TERRIERS.—UNDER TEN.—Equal 1st, Mrs. Trougher (Lancashire Star and Companion); 2d, Joseph K. Kaye (2d).

KING CHARLES OR BLENHIM SPANIELS.—1st and special, Miss Maggie A. Gilchrist (Jewet); 2d, Robert Barr (Tasso).

ITALIAN GREYHOUNDS.—1st, Mrs. Mary Trougher (Little Gem); 2d, Wm. Bruce (Glanville Beauty); 3d, Wm. Street (Toby).

PUGS.—1st and special, J. H. Howe (Loyalt); 2d, Wm. Street (Toby).

MISCELLANEOUS CLASS.—OVER 20LBS.—1st, A. Steele (Lionet); 2d and 3d, Peter Munro (Wallace and Bruce).—UNDER 20LBS.—1st, Joseph K. Kaye (Scott); 2d and 3d, Mrs. Mary Trougher (Fairy Queen and Lancashire).

PUPPIES.—SPORTING.—1st, E. Eichels (Thyra); 2d, Robert H. Christie (Ouleigh Bheag); 3d, Robert Chapman (Charlie).—NON-SPORTING.—1st, George Raper (Rayon d'Or); 2d, Wm. Lander (Romper); 3d, William Baintyne (Duchess II.).—LITTERS.—1st, Robert Chapman (Coloss); 2d, Colin D. Nairn (Coloss).

Six hundred and sixty-eight.

NEW ORLEANS BENCH SHOW.

Editor Forest and Stream:
I have just returned from the field trials held at Grand Junction, where I was to receive some entries for our club dog, and am glad to say, met with success. Mr. Bryson has promised to send the grand Gladstone, Mr. Sainborn (the sage of Michigan) will send Gus Bondini, Mr. Tallman (if possible, send London and Foreman, and a great many more were promised, but owing to the Southern States Field Trials, held at Canton, immediately following the National Trials, they expressed their desire to have a little more time given them in which to make their entries, so it has been decided to extend the time for taking entries up to the 24th inst. This will give all ample time to enter their dogs. Major Taylor, the appointed judge of setters and pointers, addressed a letter to Mr. D. Bryson, secretary of the Kennel Club, saying that he would allow for want of coat and feather in all dogs that have been hunted by owners, so that owners need not fear for their dogs being out of condition.

In order that exhibitors from a distance may have the opportunity of returning home in time for the Christmas holidays, they will be allowed to take their dogs away on the evening of the third day of the show.

All telegraph entries should be addressed to me care of Cardona & Cook's gun store. CHAS. LINCOLN, Supt.

Six hundred and sixty-eight.

AN INVALUABLE RECORD.

IN the December number of the *American Kennel Register* is this very gratifying report of the success of that publication. As announced last month, the first volume of the *American Kennel Register* closes with this number in order to start each succeeding volume with the year. We cannot let this number pass without a few lines, however, another year is promised, but owing to the Southern States Field Trials, held at Canton, immediately following the National Trials, they expressed their desire to have a little more time given them in which to make their entries, so it has been decided to extend the time for taking entries up to the 24th inst. This will give all ample time to enter their dogs. Major Taylor, the appointed judge of setters and pointers, addressed a letter to Mr. D. Bryson, secretary of the Kennel Club, saying that he would allow for want of coat and feather in all dogs that have been hunted by owners, so that owners need not fear for their dogs being out of condition.

four page monthly can best attain that end by endeavoring to add to our list of subscribers.

The Register might have further explained that while its publication is a matter of private enterprise, it was not undertaken as a "speculation" for the purpose of making money. The pecuniary end, even with the success already assured—can never amount to enough to pay for the trouble of publication. Indeed, when the Register was first talked of it was thought that the enterprise might prove a constant source of expense, but the Forest and Stream Publishing Company assumed the task because it naturally fell to them to do so. They do not expect to "make anything out of it" directly in cash, but they do expect that this first successful kennel register ever published in America, will add something to the prestige of the FOREST AND STREAM.

Six hundred and sixty-eight.

PACIFIC COAST FIELD TRIALS.

THE entries for these trials were given in our last issue. We publish below a summary and will give in our next issue a detailed account of the running.

ALL-AGED STAKES.—First Series.—Beautiful Queen beat Sybil II.; Dido beat Dash; Dorr beat Belle; Don was a bye.

Second Series.—Beautiful Queen beat Dido; Dorr beat Don. *Final Tie for First Prize*.—Dorr beat Beautiful Queen and won first prize.

Final Tie for Second Prize.—Beautiful Queen beat Belle and won second prize.

Tie for Third Prize.—First Series.—Dido beat Sybil II. *Final Tie for Third Prize*.—Belle beat Dido and won third prize.

THE DERBY.—First Series.—Beatrice beat Bow Jr.; Butte Bow beat Beautiful Snow; Duke was a bye.

Second Series.—Beatrice beat Duke; Butte Bow was a bye. *Final Tie for First Prize*.—Butte Bow beat Beatrice and won first prize. Beatrice won second prize, and Bow Jr. won third prize.

Six hundred and sixty-eight.

THE NATIONAL FIELD TRIALS.

OWING to some unexplained delay, our report of the field trials at Grand Junction has not come to hand, and we must ask the indulgence of our readers until next week. We give below a complete summary of the running in both the All-Aged and Derby, with a cut of the winner in the All-Aged Stake. The running was the most successful one that the club has ever held. There were a large number of spectators present, and the work of the dogs was of very superior quality. She appears to have recovered from her indisposition since she ran at High Point, coming out in rare good form and running through her heat in first class style, beating among others Vandevort's Don and the incomparable Gath. She also divided with Gath, the other entry, in Champion Stake. The judging was very satisfactory except that considerable fault was found with the throwing out of some of the dogs in the Derby after the running of the first series of heats. Under the rules the judges have the power to order up any dog that has not sufficient merit, in their opinion, to win a place, and we fail to see that the grumblers have any just cause of complaint. There was but one pointer in the All-Aged stake and three in the Derby, the latter dividing the special prize for the best pointer. Following is the summary:

ALL-AGED STAKE.

Following are the entries in the All-Aged Stake and the order in which they were run:

GUS BONDINI.—D. C. Sainborn, Dowling, Mich., black and white English setter dog (Dashing Bondini—Novel).

CRITTEEN.—Tucker & Wasp, black and white English setter dog (Gladstone—Frost).

SAN ROY.—H. H. Matlock, Riceville, Tenn., lemon and white English setter dog (Count Noble—Spark).

GROUSE DALE.—Wm. A. Buckingham, Norwich, Conn., orange and white English setter dog (Walter's Grouse—Daisy—Dale).

LONDON.—W. H. Coleman, black, white and tan English setter dog (Gladstone—Clip).

NELLIE B.—Edward Odell, New Orleans, La., black and white English setter bitch (Rake—Meg Merrilies).

PINK B.—W. B. Malloy, Memphis, Tenn., black and white English setter dog (Gladstone—Countess Key).

MAUD W.—Dr. Geo. G. Ware, Stanton, Tenn., blue belton English setter bitch (Gladstone—June).

KINKINKINCK.—Geo. Knowles, Jr., Milwaukee, Wis., black, black, white and tan English setter dog (Lead's Druid—Bessie Lee).

GATH.—W. G. Crawford, Memphis, Tenn., blue and tan English setter dog (Count Noble—Peep O' Day).

SEE.—J. H. & D. Bryson, Memphis, Tenn., black, white and tan setter bitch (Druid—Ruby).

MAJOR CROXTETH.—L. J. Pettit, Milwaukee, Wis., liver and white pointer dog (Croxeth—Seitner's Lass).

FLOSSY.—J. K. Renaud, New Orleans, La., black and white English setter bitch (Rake—Daisy).

DON.—R. T. Vandevort, Pittsburgh, Pa., liver and white pointer dog (Price's Bang—Peg).

FOREMAN.—C. Fred Crawford, Pavytucket, R. I., black, white and tan English setter dog (Dashing Mourach—Fairy II.).

VICTOR.—J. M. Arent, Hickory Village, Tenn., orange belton English setter dog (Gladstone—Frost).

WHIP, JR.—Dr. J. B. Alexander, Henderson, Ky., black, white and tan English setter dog (Whip—Maggie R.).

COUNTESS RAKE.—Edward Odell, New Orleans, La., black, white and tan English setter bitch (Rake—Phyllis).

PHYLLIS II.—M. D. Walter, Indianapolis, Ind., black, white and tan English setter bitch (Rake—Phyllis).

LONDON.—H. Bailey Harrison, London, Ont., blue belton English setter dog (Paris—Lill).

CARRIE J.—W. B. Gates, Memphis, Tenn., black and white setter bitch (Count Noble—Peep O' Day), a bye.

SUMMARY.

Clipper beat Gus Bondini. San Roy beat Grouse Dale. Nellie B. beat Coleman's London. Pink B. beat Maud W. Gath beat Gladstone. Victor beat Major Croxteth. Don beat Flossy.

Foreman beat Victor. Countess Rake beat Whip, Jr. Harrison's London beat Phyllis II. Carrie J., a bye.

Second Series. Carrie J. beat Clipper. Nellie B. beat San Roy. Don beat Pink B. Gath beat Foreman. See beat Countess Rake. Victor beat Harrison's London, a bye.

Third Series. Harrison's London beat Carrie J. Gath beat Nellie B. See beat Don.

Fourth Series. Gath beat London. See, a bye.

FINAL TIE FOR FIRST PRIZE. See beat Gath and won first prize.

FINAL TIE FOR SECOND PRIZE. Gath beat Don and won second prize.

FINAL TIE FOR THIRD PRIZE. Foreman beat Don and won third prize.

THE DERBY.

In the summary of the starters last week, owing to a mistake, we gave Dr. Ware's Leona the place belonging to Mr. K. Drake's Lady Elmore, lemon and white English setter bitch, March 2 (Prince Lofty—Bonny Kate). After the first series of heats the judges ordered up for the second series only such dogs as, in their opinion, stood a chance to win. Following is a summary of the result:

First Series. San Roy beat Paul Gladstone. Katy D. beat Nellie B. Shot beat Fred H. Rain Bow beat Count Lofty. Gladstone's Boy beat Major Croxteth. Countess C. beat Prince Gladstone. Princess Teck beat Don Quixote. Porter beat Lady C. Rush Gladstone beat Elmore.

Countess House and Countess Gladstone (decision reserved). Bravo, a bye.

Second Series. San Roy beat Bravo. Katy D. beat Countess C. Porter beat Gladstone's Boy. Rush Gladstone, a bye.

Third Series. Rush Gladstone beat San Roy. Porter beat Katy D.

Fourth Series. Rush Gladstone beat Porter, and won first prize. San Roy beat Porter and won second prize.

Final Tie for Third Prize. Paul Gladstone beat Porter and won third prize.

Six hundred and sixty-eight.

THE SOUTHERN STATES FIELD TRIALS.

[Special to Forest and Stream.]

THE Southern States Field Trials, held under the auspices of the New Orleans Kennel Club, commenced here yesterday. The weather was all that could be wished, and the running has been good. There are a large number of the members of the club present, as well as many spectators. The grounds over which the trials are run are very good, and the weather is just the purpose. They are nearly level, with no woods or thickets in which the birds can escape. The Members' Stake closed with eight entries, which were drawn and run as follows: Mr. Humphrey's lemon and white native pointer dog, Tyler, against Mr. E. W. Condon's English setter dog, Dick Condon; Mr. John Scannel's red Irish setter bitch, Biddy, against Mr. W. H. Coleman's English setter dog, London; Mr. J. K. Renaud's English setter bitch, Flossy, against Mr. John Scannel's red Irish setter bitch, Biddy; and Mr. E. W. Condon's lemon and white pointer, Lehigh, against Mr. E. W. Condon's Bravo.

In the first series of heats, Tyler beat Dick Condon; London beat Biddy; (withdrawn); Lehigh beat Bravo; (withdrawn); Flossy beat Scannel's entry, (not present). In the second series, Tyler beat Lehigh, and in the final tie, Coleman's London beat Tyler and won the cup.

There were eight entries in the Derby, which were drawn and run as follows: In the first series, Porter beat Jack; Victor beat Gath; Don beat Flossy; and Countess C. beat and Countess C. beat the remaining entry (withdrawn). In the second series, Countess C. beat Porter, and Rush Gladstone beat Pride of Dixie. In the final tie, Countess C. beat Rush Gladstone and won first prize. Rush Gladstone's London beat Dorr; Jack a bye (withdrawn). This ended the running for the day. Birds are plenty, and much of the work has been of a high order of merit.

Six hundred and sixty-eight.

AMERICAN ENGLISH BEAGLE CLUB.

Editor Forest and Stream:

The first essential to the success of the club is harmony. We must each be willing to give our part to further the success and not allow ourselves to be governed by petty prejudices to promote our own selfish ends. Second, to give the beagle its proper place we must have a standard. I think the only successful way to accomplish this is for us to profit by the experience of others and avoid their mistakes. Look at our friends, the breeders of the Gordon setter and cocker spaniel. The former's admirers have three standards to accommodate three kennels, the latter have four for the same purpose to accommodate four kennels. This is wrong. To give the owner of such dogs satisfaction on judging, the dog must be judged by the standard adopted to suit that kennel. If beagle admirers want standards to accommodate certain kennels or packs, it can be done without the formation of a club simply by each adopting his own. But if they want a standard in America for the advancement of the breed and that alone, it cannot be done without the help of all by a club. The way therefore to avoid such standards is to let the club appoint a committee of competent gentlemen from among its members, those who know what a beagle should be and are free from prejudices of any kind, who will give the standard thoughtful consideration, do their duty in forming it and for the benefit of the breed and for any particular kennel, breeder, or owner. Such gentlemen I know can be selected. To show the value of united effort in forming a high standard, take the fox-terrier. Breeders and owners are united and have such a

Six hundred and sixty-eight.

THE INTERNATIONAL TOURNAMENT—Louisville, Ky., Nov. 24.—J. E. Bloom, President Ligovsky Clay Pigeon Co., Cincinnati: Yours of 23d, inst. to hand and in reply, will say you are at liberty to use my name in connection with any contest at Chicago, and I have a certain interest. I will be glad to help you make it a success. We expect to follow your tournament with the most important event in the way of a bird-shooting arrangement, and the particulars of which will soon appear. There could be no conflict between clay and live-bird shooting, and I am now satisfied you have no disposition to fight the latter; though at one time I have been misled by a report to the contrary. JOHN M. HANCOCK, President Louisville Sportsmen's Association.

Dachting.

To insure prompt attention, communications should be addressed to the *Forest and Stream* Publishing Co., and not to individuals, in whose name from the office matters of importance are liable to delay.

A SLANDERER REBUKED.

THE *World* of Monday, Dec. 3, publishes a column of diatribe on yachting. To the article itself I will not refer. The direct charge is made distinctly and repeatedly in the *World* that a public "advocate" has been hired and is paid for "writing up" cutters. As I am the only "advocate" of cutters before the public, and the only person engaged in publicly writing in their favor, these charges refer to me in person, and to me they will be attributed by the readers of the *World*.

I answer the charge made in the *World* as a malicious slander, proceeding from contemptible motives. I have never received one cent nor any reward whatsoever, directly or indirectly, to influence a single line, or word, or sketch, from my pen.

I have, to avoid even the shadow of any insinuation, refused the personal acquaintance and discouraged all advances of a friendly nature from gentlemen of my own belief and views. I have labored untiringly, wholly disinterestedly, moved by no other purpose than that of the honesty of my convictions. I may be all wrong in the stand I have taken, but one thing shall not happen: The honesty of my work and the integrity of my character shall not be assailed.

I ask the *World* to put its slander in a form specific enough to make it amenable to the laws of the country. I cannot prevent the *World's* sneaking insinuations, carefully planned to elude responsibility, and yet direct and sufficiently plain to drive to the quick the poisoned arrows of malice and vilification. But the *World* shall either be specific enough to be held accountable, or else, in its failure to accept the issue, it shall be convicted of aiding and abetting a common liar.

C. P. KENDRICK.

CRUISE OF THE ILEEN.

THIS cutter, with Mr. Arthur Padeford on board, arrived off the Delaware Breakwater at 4 A. M. Wednesday, Dec. 5. She left the anchor age off Stapleton 8 1/2 A. M. Monday, Dec. 3, at 2 P. M., in the first fair N. W., which lasted until evening when it came on S. E. and veered to S. S. W. very fresh, backing up a nasty sea in very short time. The cutter put in at the Breakwater Wednesday, 4 A. M., and laid there until Thursday, 9 A. M., when it was blowing nicely from N. E. Toward evening it grew very light, and during the night there was scarcely any wind. The cutter anchored in Norfolk harbor on Friday, Dec. 7, at 2 P. M., after a most charming run from Henlopen. A gentleman on board writes that the cutter did all and more than could be asked of any yacht of her size, and that everybody is pleased with her performance in a way no words can express. The owner made a visit to Baltimore on business matters. It has been reported in the *World*, the *Herald*, and proposed to sail at ones for the South coast and the West Indies. During the heavy weather the main trysail was found a most convenient sail, the big boom of the regular mainsail being stowed. The same letter winds up with the following: "We all trust, after our experiences in the Ileen, that you will continue your efforts in behalf of the only boat to go to sea in, win races with, and be comfortable in."

SHARPIES.

I HAVE BEEN intending to give a fuller account of the true qualities of sharpies as they have come out in my experience, but I have been so busy getting out a 3rd edition of my sporting works that I have not had time to do so. I believe all the long-boated cutters of the Ileenseize I would promise that I built her for comfort not for speed; it was only when she seemed to develop unexpected speed that she gave me a little more than I expected. I remember well that she made her one foot wide and two feet shorter than her builder allowed. She is 38ft. instead of being 40ft. as he wished. For her movements in her motion in filling her to fall the cutter he wishes. No boat can be comfortable which is less than 1ft. beam, to give room to sit in an arm chair at table. We do not sit on the berths all day long, they are used as berths, but are generally under the deck, and so pleasant that when Mr. Seth Green is with me he utterly declines to stay in his room so long as there is anything to eat on board the *HELEN*.

STEADY.

I don't mean any reflection on the cutters when I say that it is the nature boat which is the terror to slow-going pleasure craft. When the party gets underway it passes to windward the sensitive yacht and, with a party of ladies on board, as is usually the case, some other style of naval architecture. Well, I found not only that it was safe from the manure sloop, but that Heartsease could pass all the working vessels, even to windward, which was her worst point of sailing. As for the brush with the *Hesperus*, of which a good deal more has been said than was necessary, it was like most inappropriate races, far from conclusive. Finding that Mr. Massey would like to test the two types of rig, we ran over to *Hesperus* as soon as we saw her, and, rounding up in her wake, kept after her, jannimed close on her bow. Heartsease held her in spite of it, but I have said she dropped slowly to leeward. Then we kept off a little, thinking she would follow and try the boats at all points, and not supposing that we had made any impression on her. Her crew were so much surprised at seeing that *Hesperus* was bound to Fire Island, and as we had to return to Sayville, we put about. I freely admit that the yawl beat the schooner on that course, which is the latter's worst point of sailing, and in that breeze, but that she is the faster boat I do not consider at all settled. Two sail ops passed us both, and I afterward caught the *World* and the *World's* little cutter, which was a very heavy cutter, and passed her so fast that the party on board gazed at me with surprised and depicted in their faces. As to thrashing in a sea to windward, she does nothing of the kind, she might as well be on land in any ordinary weather. Nothing which we ever have in the South Bay troubles her in the least. She was in commission and I was aboard of her nearly every day for four months, and she was built, and she required no repairs. We never had a superior while cruising, except that, feeling of unfitness, the only serious danger we encountered on the cutter's South Bay trip being from getting around in spite of the little water she drew. I don't believe she would sail with racing as the length measurement continues and the course is to windward and back.

SAFETY.

I never was tripped by a sea and I do not wish to be. There are enough other things to trip a man up in this life without the ocean carrying him, and I believe that such accidents happen, and probably a sharpie is peculiarly liable to them. The sea does not hold by catching under the sharp edge of the bilge, but I have held her down all the water came up to the cabin deck and did not dislodge me, but I was so much in the water that I could not get my capsize could only be brought about by a very sudden and severe roll or great carelessness. If caught in a gale at sea and unable to get home, it is better to run to port than to starboard, and if you prefer to run for harbor before the gale got under wayward, and Heartsease would run a long distance before she came to grief. There will always be people, however, provided our coast remains as it is,

SAIL PLAN SINGLEHAND YAWL.

THE NEW SINGLEHANDER.

And I doubt if there is any one going to improve it much. Indeed, I would be glad to see Heartsease on the ocean in a gale as in a cutter of twice her size as she would live longer I think and get out of the trouble sooner, I know, but then so liberal am I that I would rather let any one else be there in my place on such an occasion. If Heartsease fills she will float, and there is a good deal of comfort in that; a raft is better than nothing by a large majority.

WE produce in this issue the sail plan for the singlehanded yawl, whose lines appeared in last week's issue. The rig is a large one, but owing to the extreme handiness of the yawl, a liberal area was supplied to enable the boat to work well as a cat with jib and mizzen stowed or under those two sails only, without casting aboard the mainsail, or upon lowering the latter to the squall. We should add that the displacement, 3,4 tons, is given in long tons of 2,240 pounds, and that the accommodations and deck plan will be published next week.

The Roslyn yawl rig does not seem to me to present advantages enough to justify its existence. So great is the strain on the gaff that the iron stays fit into the wood quickly, besides the simpler plan is to have a pole mast and lee-of-mast sail, or a small gaff with a winch, so with the Nonpareil arrangement in the forefoot, that is a plain which prevents caulking without pulling your boat's bottom to pieces. Why cannot the forefoot have six planks cut either half or wholly in two, and thus brought to the necessary wedge shape? As to the balance rudder, its only excuse for being is dire necessity, if that exists. No one seems to be able to tell me whether there is any such necessity, and I shall have to find out for myself. So it comes down to where I started. Heartsease was not built for speed, but if any one wants a comfortable, safe, good, and able vessel for shoal water work, the Ileenseize is the boat for him. As I seen to have spoken rather against Mr. Clapham's inventions, and the stern doors would be open and strut just as well when she is heeled away down as when she is on an even keel, and if he keeps on trying he may get the exact improvement which is wanted, but which does not seem yet to have been obtained. In reference to the "bug-eyes" of the Chesapeake I never could find out anything more about them, although I wrote to the man to whom I was referred. In cruising it is very probable that a sharpie would make as good time as any yacht of her size, and as for accommodations, a forty-foot boat will give you two staterooms and four berths in the cabin, besides the fore-cabin for crew and cooking.

ROBERT R. ROOSEVELT.

ILEEN A GRAND SEA BOAT.

WE have collected such evidence as could be got, bearing upon the performance of Ileen. That we are not investing the falsehoods to which currency has been given with any undue importance appears from the following letter we have received from a gentleman deeply interested in the question:

"I've been in to see you about six times to congratulate you on the great success of the Ileen. The trip South busted up, boat unseaworthy, unmanageable and a dead end, almost every way. Her owners are afraid to go to sea in her again."

The gentleman quoted is sincere enough. His "H's" were picked up in the performance of Ileen. That we are not investing the falsehoods to which currency has been given with any undue importance appears from the following letter we have received from a gentleman deeply interested in the question:

"I've been in to see you about six times to congratulate you on the great success of the Ileen. The trip South busted up, boat unseaworthy, unmanageable and a dead end, almost every way. Her owners are afraid to go to sea in her again."

We have no personal reference to him when we insert the statements in the foregoing quotation as lies each and every one of them. Lies without the faintest trace of truth as their foundation.

The Ileen was never within three hundred miles of Hatteras. She was engaged in cruising off and on outside the Hook to test her gear and shake things down before clearing for a southerly voyage. During those tests she struck into the ugly weather and sea, the disastrous effects of which filled the columns of the daily papers at the time. We now offer evidence of how the Ileen performed from sources which certainly cannot be accused of partiality.

Lewis Towns, well known to New York sailing circles, writes as under:

"We have tried the Ileen for the last four days in pretty bad weather about fifty miles S. E. of Sandy Hook, and she worked to my entire satisfaction. She is a perfect deisy; she will do anything but talk. She is as dry and easy as an old shoe and the pilots who saw the Ileen in company with their boats at sea, are perfectly in love with her, and so much so that when building again, they propose to have a boat like her."

The Ileen returned from the experimental trials, adjusted compass and after waiting till Monday P. M. to enable Mr. Padeford's brother to join, she left port on sea bound on a cruise to Bermuda and the West Indies. Mr. Arthur Padeford, the owner, cannot find words of praise enough for the behavior of this vessel. He is as good as dry as an old shoe and the pilots who saw the Ileen throughout. Upon Ileen's return, it is proposed to sail her across to England and tackle the crowd of forty's in the liveliest boats and run so much faster as ever seen.

Not, however, until she has given the flat fished tribe a two or three home waters. With these disposed of, bigger game is to be hunted.

We are promised the log of the Ileen as her cruise proceeds.

SHAMELESS FALSEHOODS BRANDED.

THE New York *World* of Dec. 3 published the following: "The new cutter yacht Ileena, owned by Mr. Frederick Padeford, of Philadelphia, put into the Stapleton basin yesterday, some what the worse for boisterous weather at sea. Mr. Padeford intended spending a season in Southern waters, but a very heavy gale-blast from Cape Hatteras forced the cutter to put into the harbor, where it is thought she will remain all winter."

"There is no truth in the foregoing. The Ileen never was anywhere in the vicinity of Hatteras. She did not strike in a very heavy gale. She did not return from stress of weather. She did not tax her mainmast. She was none the worse for her trip. Mr. Padeford has not given up his contemplated cruising. The Ileen will not remain here all winter. The only semblance of truth in the *World's* paragraph is the bare announcement of Ileen's return to port, and upon this the unscrupulous reporter hangs a long tale, to the detriment of Ileen's performance at sea, utilizing the occasion to get in an insidious ding at the expense of his country, but even this blundering swindle was surpassed by a comic miscarriage in the *Herald's* three days later, when the following bit of news was paraded with dignity as fact information:

"The cutter, Ileen, S.Y.C. Mr. Arthur Padeford, is lying off Stapleton, S. I. She returned to port on Monday, and it is said that her owner has abandoned his intended Southern trip."

This was announced in the *Herald* of Thursday last, just three days after the Ileen had left Stapleton and put to sea again upon a cruise to the island of a sort of little-peace-hunt, with all idea of going to sea in the cutter abandoned, she was actually merrily covorting down the hundreds of miles away!

The hidden animus and the absurdity of the *World's* fabrications were easily enough detected, and the blunder of the *Herald* was equally as patent. No one but a lunatic would think of steering a course of hundreds of miles about the club rooms might know no other than a trained English skipper, or a skipper of any nationality, is not the green as the *World* would imply. The very stupidity of the reports can, even in the most trying wind and sea, give us no one on our mind, but in the anxiety to trump up some kind of a case against the cutter, sense was sacrificed from its throne, and prejudice gave wild scope to his imaginations and fabrications, which heaped upon falsehood piled up a mountain of desperate and definite falsehood against Ileen, enough to sink such yachts out of sight ever just, but for the exposure of these shameless falsehoods and untruths for which they are worth those columns.

The facts concerning Ileen are these: She left harbor for a few days' trial at sea preparatory to undertaking a cruise of some length to Hampton Roads and Bermuda. She returned from her trial sail Sunday, Dec. 2, and adjusted her compass. After taking in some fresh provisions she got her anchor and put to sea again, bound for Hampton Roads on a roving commission. Her owner sailed in his yacht, is highly pleased with her performance, and the crew speak of her behavior in every respect. In the nasty weather she ran into her behavior was admirable; she proved easy, dry and powerful boat to windward. It is never a joke to poke out into winter gales in a small vessel of 33ft. length, but the safety and comfort of Ileen in the most trying wind and sea gives us no one on our mind, but in the anxiety to trump up some kind of a case against the cutter, sense was sacrificed from its throne, and prejudice gave wild scope to his imaginations and fabrications, which heaped upon falsehood piled up a mountain of desperate and definite falsehood against Ileen, enough to sink such yachts out of sight ever just, but for the exposure of these shameless falsehoods and untruths for which they are worth those columns.

THE COMING PILOT BOAT.

THE superb seagoing qualities of the new cutter Ileen are the talk among the pilots along the States' coast. "Why, sir, she was as dry as a bone, and going along stiff and comfortable, when we were plunging about and scarcely could keep the schooner to her course. And the way that cutter worked up to the windward in a heavy sea, why, sir, we started at her in amazement." The Ileen has become the pilot's ideal of a powerful, dry and weatherly sea boat. As so much has been said of her, we think it is not far from being famous, our pilot schooner, may be that day is not far distant when a cutter will be off our coast with a big black number in her main all as a welcome signal to the fresh instants of aldermen, policemen, and voters pouring in upon these shores.

reputation as an offering to the vulgar prejudices they fawn upon and lightly represent. The lace and cut, speedily taken up by libel mongers in the clubs and in Wall street, magnified and supplemented and circulated with an industry born of ignoble interest.

The Ileen represents no startling innovations at all, though she may be the only newspaper reporter and to club room larks. The whole dot of racing yachts, tried in their utmost making forced passages about the British shores, and a host of cruising craft.

A TALE OF THE SEA WITH A MORAL TAIL.

BABY in the spring the reading public of not only Buffalo, but of the world at large, was thrilled with an account of the adventurous voyage from San Francisco to Australia of Bernard Gilboy, of this city, his privations, sufferings and hair-breadth escapes from...

This was not his first venture on the waves, he having made a voyage from British Columbia to the Sandwich Islands, a much longer and more perilous one, in a small boat, without remarkable incident or accident.

Arrived in San Francisco, he at once contrived for his ideal of a boat for a private excursion, to the waves and winds between the Golden Gate and Australia. The name selected for the little craft that is to live in history was the Pacific, and she is thus distinguished...

This little clipper was equipped and provisioned as follows for her voyage: six boxes of canned goods, fifty-two tins of condensed milk, two dozen roasts, one pound cans, ten dozen cans of evaporated milk, one box containing 35 pounds of coffee...

On Friday, August 18, 1882, the Pacific, thus rigged and provisioned, set sail at noon from the pier at San Francisco.

The Pacific had sailed for a few days of the voyage, but Gilboy was promptly confronted with the problem, "How did I like to sleep?" He made a sea-drag of canvas, about four feet by three feet, fastened to a spar, and fastened to the mast, the other two fastened to the lower corners of the canvas...

"To depart, which reached Buffalo via the Toronto and the Atlantic, he was well received by his friends and relations, and the first message sent by Mr. Gilboy to his family after his departure, which reached Buffalo via the Toronto and the Atlantic, he was well received by his friends and relations...

It is a popular delusion that narrow boats are wet and dive through the sea. The opposite is the truth, and for three reasons.

It once more emphasizes the imperative necessity of proper planning and fitting outfit for general work as a cruiser. Gilboy got along so far as he intended for general work as a cruiser. He was not originally capsized and rolled over several times in succession.

WHY CUTTERS ARE SAFE.

THERE is less danger of a narrow boat being "overwhelmed" by a sea than a broad boat, for the reasons:

First—A narrow boat has a narrow broad flut, a minimum of deck forward to ledge upon, and the consequent weight of a superimposed weight, which the boat has to struggle in itself to support.

Second—The trifling sheer of narrow boats, and the greater angle of the gunwale, tend to diminish the amount of water on board an impossibility.

Third—The greater readiness with which a narrow boat rises and falls in the water, with a narrow broad flut, and a narrow broad flut, the greater the readiness with which a narrow boat rises and falls in the water...

Fourth—Following sea will lift a broad boat by the launches and depress her stern, as the fine bow offers little opposition.

It is a popular delusion that narrow boats are wet and dive through the sea. The opposite is the truth, and for three reasons.

First—A narrow boat has high freeboard, and the spar built to be drawn upon for buoyancy is there as much as in a broader boat with correspondingly less freeboard.

Second—A narrow boat has sharp ends and no shoulder. It requires less effort to lift a boat whose after end is easily depressed than to lift a broad boat with flaring bilge, full stern lines and apocryphic ends.

Third—In a narrow boat, the radius of the hull is not measured by the amount of beam or bulk above water, but by the projection of the hull below the water line, and due to the position of the boat's center of buoyancy, it is not so high as in a broad boat...

INTERNATIONAL.

Lively racing is international in all its bearings, San Francisco, London, Kiel and Newport are prominent examples.

It is a popular delusion that narrow boats are wet and dive through the sea. The opposite is the truth, and for three reasons.

THE BATTLE IN THE BALTIC.

Editor Forest and Stream: Your article on the world-wide circulation is studied here with much enthusiasm, and we watch with the utmost interest the developments in favor of the cutter going on in America.

Editor Forest and Stream: Your article on the world-wide circulation is studied here with much enthusiasm, and we watch with the utmost interest the developments in favor of the cutter going on in America.

Starboard shrouds broke, and to save the mast the lead had to be lifted to every pulley during the long thrash to windward. A mile or two from the shore the cutter shrouds parted, and the crew finished the course with great difficulty. These boats are far more nimble than the winner, Lolly, a sister boat to the Anza, built in the same way as the other boats in the fleet.

A MOUNTAIN OUT OF A MOLE HILL.

Editor Forest and Stream: I thought any statement of facts relating to a theory of yours or an argument that did not stretch your opinions would be likely to reach the same eyes that read your eminently just and infinitely satisfactory comments on my correspondence with your editor. I might be well enough to expect this contribution would not be crowned out by "more practical material" and sundry sort of speech best known to yourself.

This is equivalent to Mr. Noah, now dead, of Noah's ark, who lis-tened against the O'Hooligan ark for use to be asserted the O'Hooligan ark was not afloat, and to be asserted the O'Hooligan ark was not afloat, and to be asserted the O'Hooligan ark was not afloat, and to be asserted the O'Hooligan ark was not afloat.

Most people believed the famous Mrs. Harris had perished when Harry Gamp died. It would appear, though, that lady is still in her grave, and that she is a poor old woman, and that she is a poor old woman, and that she is a poor old woman.

In the mouth of many yachtsmen, verily, truth is stranger than fiction. Behold a statement of facts concerning the Irish through the Oriva and the Lolly R. to every line of which I am writing to make affidavit.

We first published Mr. Gartland's side of the story. We then published the version of gentlemen on board the Oriva. A third letter published the version of gentlemen on board the Lolly R.

DAUNTLESS.—During the matches around the Isle of Wight for the Queen's Cup, in August, the schooner Dauntless got under way to race around with the fleet.

GRAND TRANSFORMATION SCENE.—First like the cake all round the edge to find out where the big hull lies.

OCEAN CHASING.—Schooner Fortuna, H. S. Rowdy, of Boston, made a record run for the Queen's Cup, sailing from the Mediterranean.

THE FUNNY SIDE.—A gentleman just returned from a visit to England, upon hearing the slanders about Allen, could scarcely find words to express his astonishment and indignation.

Editor Forest and Stream: I thought any statement of facts relating to a theory of yours or an argument that did not stretch your opinions would be likely to reach the same eyes that read your eminently just and infinitely satisfactory comments on my correspondence with your editor.

Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 30 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

KYNOCH'S Patent "Perfect" Brass Shells, MANUFACTURED BY KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and clatter, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using traps say two sizes larger than gauge of shells. Or can be effectively crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO.,

---	--

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

A VOTE ON THE FLICKERINGS.

"I REPEAT it," said the visitor, "that is the best of the lot."
"And I say again," returned the editor, "that any one of these three is a better story."
The visitor and the editor were looking over the FOREST AND STREAM'S Camp-Fire Flickerings, which the editor had collected into a scrap book, and the two had fallen into a warm dispute over the merits of some of the stories.
"I'll betcher," said the visitor.
"No, we won't bet on it; that is no way to determine the excellence of a literary production; besides, who would decide it for us?"
"Leave it to any ten men you've a mind to," replied the visitor, "Let each one pick out a story, and if they don't all choose this one—"
"No two of them would select the same one," interrupted the editor, "each man would pick out a different story, then we would have a dozen, and be six times worse off than we are now. No, ten men would decide nothing. What do you say to ten hundred, or ten or twenty thousand?"
"Whew!" said the visitor, "How would you do it?"
"In the FOREST AND STREAM, of course. Come in tomorrow, and I'll tell you what we'll do." The visitor went out with a parting shot, "That's the best one anyhow;" and the printer's boy just then coming in for copy, the editor gave him the whole scrap book of "Flickerings" and sent word around to the printer to have it in type for December 20.
On the following day the visitor came in and took the editor out to lunch, and there the man of the pen explained his "scheme," as he dubbed it. This was nothing less than to refer the entire lot of "Flickerings" to the readers of the FOREST AND STREAM and ask an opinion respecting them.

The visitor was pleased with the plan. Both he and the editor confessed that what they might think of the stories amounted to little after all, but what the readers in general thought of them amounted to a great deal; to find this out, as the visitor expressed it, "would be grand."

Accordingly, the FOREST AND STREAM contains to day, in a special supplement, the entire series of Camp-Fire Flickerings from the beginning of the column in July, 1882. The ninety-six stories are given in the order in which they were printed, and each one is numbered. Of these ninety-six stories every reader is asked to select the ten which he thinks the best; to write down the numbers of these ten, one below the other, in their order of merit, putting the best first, the next best second, etc., and then to send the list to the FOREST AND STREAM. Each list should be signed with the name and post-office address of the voter. It is requested that the lists be sent on postal cards; if in envelopes they should be written on slips of paper the size of a postal card.

To send in this list of ten stories is all that the reader is asked to do.

There is no entrance fee. All who wish to do so are cordially invited to put in a vote. The balloting is not limited to subscribers, nor to those who buy the paper—the privilege is extended to the neighbors who borrow; the friend to whom it is sent after the subscriber has read it; yes, even to the postmaster who keeps it over Sunday and puts it into the subscriber's box Monday morning (and who is hereby warned to desist from this trick, for we have his name, and by and by the time will be ripe for civil service reform in that village); in short, this is an opportunity for those to vote who never voted before, and may never have a chance to vote again; without respect to age, sex or previous condition of non-sportsmanship.

Two sets of seven prizes each will be awarded, one to the writers of the winning stories, the other to the voters who send in the best lists. The method of determining the winners in each class will be as follows:

STORY PRIZES.

When a ballot is received each story named on it will be credited with a certain number of units, determined by its position in the list. The story named first will be given the highest number, 10; the next one 9, the third 8, and so on to the tenth or last, which will receive 1. Then each of these credits will be transferred to the accounts of the respective stories, and the story receiving the greatest aggregate of credits will be adjudged the winning story, and to its author will be given the first prize. The story receiving the next highest aggregate will take the second prize, and so with the others until the total credit of each of the stories has been ascertained, and the seven prizes for stories awarded.

VOTERS' LIST PRIZES.

Opposite each story, in every list, will be written the total number of credits that have been awarded to that story by all the voters. The credits of all the stories on each list will then be added together, and the list showing the highest aggregate will be adjudged the winning list, and to the voter who sends it will be awarded the first prize. The list showing the next highest aggregate will take the second prize, and so on until the seven prizes have been awarded.

As already stated, the voter is requested to simply put in a list of the ten stories he or she may select as the best.

The prizes for the writers and the prizes for the voters will be the same. They will be for each class as follows:

FIRST PRIZE.

A copy of the book "Sport with Gun and Rod," in embossed leather binding, or any other book or books of same value (\$15), at option of winners.

SECOND PRIZE.

"Sport with Gun and Rod," cloth binding, or any other book of same value (\$10), at option of winners.

THIRD PRIZE.

Norris's "American Angler's Book" (price \$5.50), or Stonehenge's "Dog of the British Islands" (\$7.50), or Coues's "Key to North American Birds" (\$7), or any other book or books of same value, at option of winners.

FOURTH PRIZE.

THE FOREST AND STREAM for one year.

FIFTH PRIZE.

THE FOREST AND STREAM for six months.

SIXTH PRIZE.

"Training vs. Breaking," by S. T. Hammond (which, by the way, contains some capital stories).

SEVENTH PRIZE.

"Angling Talks," by Geo. Dawson.
In case of a tie the prize will be divided. No person will be awarded more than one prize. If two prizes are voted to the same individual he will be given the highest of them, and the other will pass to the next man on the list.

It will be seen that the prizes aggregate in value \$80. The writers' prizes will be given by the Forest and

Stream Publishing Company; the voters' prizes by the editor.

Ballots should be sent in as soon as is practicable. To give distant readers an opportunity to vote, lists will be received up to February 1, and as the editor of the *American Kennel Register* so often says, "none can be received later." The polls are open.

A WORD IN SEASON.

HEREWITH our greeting—not on an illuminated card, as the fashion is nowadays, but in our own way—eight extra pages, brimful of memories and suggestions of forest and stream. We extend to every reader the compliments of this glad season, and wish a Merry Christmas to everybody—to him who takes the fleeting pleasures as they fly, and to him who pots them on the ground.

THE YELLOWSTONE PARK.

A RESOLUTION, introduced at Washington by Senator Vest, seems likely to bring to light some interesting facts in regard to the management of the National Park. The trip made last September by the President, Senator Vest and other gentlemen to this region, is already, as we predicted last summer would be the case, resulting in action for the proper preservation of the Park. Senator Vest, during his trip, did not travel with closed eyes and ears, and his visit gave him some information as to the methods of the Superintendent, which led him to make further inquiries into this person's care of the reservation. It appears that Secretary Teller has also had reason to believe that the Superintendent's duties were not being satisfactorily performed, and a Special Agent was dispatched to the Park to investigate the matter. From the report of the Agent it appears that the assistant superintendents are a curious lot. It is stated that they are, for the most part, Eastern men, wholly unacquainted with life in the mountains, and so, perfectly useless as protectors of the Park. They appear to have spent their time loafing about the resorts of travelers and collecting and selling specimens of geyserite, fossil wood and other minerals, which are especially forbidden by the regulations of the Park to be collected or sold. It is said also that they permitted hunting and allowed game to be killed in direct opposition to the Secretary's order. On the whole, if the report is at all to be trusted, the assistant superintendents have proved themselves wholly incompetent and generally worthless. If all this is true, what shall be said of the Superintendent, who appointed and continued in office such men.

As long ago as last March we referred to this subject, and warned the Superintendent of the Park that his action in the appointment of his assistants would be closely watched. Writing of the law protecting this pleasure ground we said:

By this law the responsibility for the care of the Park is placed where it belongs, that is with the Interior Department and its servants. The public will look with interest on the action of Superintendent Conger, who has now been furnished with money and means to patrol the Park. If he does us full duty, the work of destruction which for ten years past has been going on in this beautiful region will be checked, trespassers and butchers will be promptly dealt with and punished, and the game, soon recognizing that it has here a safe abiding place, will increase and multiply. If the superintendent is careless and slothful, if he appoints as his assistants a lot of Eastern men who know nothing of the mountains and the habits of game, the old style slaughter will be kept up. We have every reason to think that the Superintendent will do his duty by the Park. He has already shown a deep interest in it, and this interest will no doubt increase rather than flag. We warn him against falling into the mistake of appointing for his game keepers and police incompetent men. Let him make his selection of these officers from among the mountain men of Montana, whom he can easily find. From among them he can select good men, who will be honest, reliable, faithful and fearless in the performance of their duty. If the care of the forests, the game and the natural wonders of the Park be placed in such hands, we have no fears for their future.

Any failure to act up to the provisions of the law will readily be learned of in a region such as this will soon be, and the assistants who fail to do their duty must speedily be removed and make way for better men. The responsibility of the Park thus resting on one pair of shoulders, it is certain that it will be well cared for, and the country looks to Mr. Conger to see how its Park is to be looked after. The people's temper has been somewhat aroused by the monstrous attempt to take from them their rights, and they will look sharply after this reservation for the future.

If in the face of this warning the Superintendent has been guilty of permitting the acts with which his assistants are charged, it is clear that he is by no means the man for the place which he holds, and his prompt dismissal is certain. The Special Agent who made the report alluded to, recommends the removal of Mr. Conger, and unless some satisfac-

tory reply is made to the charges the Superintendent "must go."

It is a well-known fact that game was served on the tables of certain hotels in the Park last summer, and it is difficult to believe that the Superintendent could have been ignorant of this fact. If he did not know of it, he could scarcely have been attending to his duties or else must be himself incompetent; while if he was aware of it, he should have taken prompt measures to stop the hunters, and to bring the offenders to justice. Moreover, all such violators of the law should have been promptly reported to his superiors.

It is encouraging to see that Senator Vest's zeal for the protection of the Park is as undagging as ever, and we trust that the time is not distant when all the measures which he has so ably advocated for its proper care will have the cordial support of Congress.

SAVE THE ADIRONDAKS.

PART of the Adirondack territory is State land; the rest is private property. The most of the land is valued only for its timber. After the timber has been cut off, in many instances, the owners refuse to pay taxes on their property, and the land reverts to the State.

Now the forests of these Adirondack Mountains are worth vastly more to the people of this State than they are to the lumber dealers. This tree-sheltered region is a great natural reservoir, where the rainfall is collected and stored for the supply of the streams and rivers and canals of the State.

The lumbermen, who own a great part of the Adirondack wilderness, propose to cut off the trees and convert them into boards. This means that the Hudson River and the other streams which flow from the Adirondack watershed must dwindle away to insignificant rivulets, for it has been amply demonstrated in the history of other countries, and other parts of our own country, that if the natural forest reservoirs are destroyed, the water supply will cease. The people of New York State cannot afford to shut their eyes to this fact. The Legislature at Albany this winter will be called upon to take some action respecting the Adirondacks.

Years ago, in the columns of this journal, we urged that the State should assume control of the whole Adirondack region. The press has taken up the subject in earnest, the business men of New York recognize the gravity of the danger that threatens if the forests are destroyed. The Chamber of Commerce has prepared a memorial on the subject, which will be presented to the next Legislature. It is proposed to obtain as many signatures to this petition as possible. It has been sent to us for a very practical purpose, and we print it here for that purpose. It is hoped that every reader of the FOREST AND STREAM in this State will clip out this memorial, and having affixed it to a sheet of paper, secure as many signatures to it as possible. Then return to us and we will hand them to the committee.

Now, let every man who wants to see the Adirondack forests preserved do something to help secure their protection.

To the Honorable the Legislature of the State of New York, in Senate and Assembly convened:

May it please your Honorable Body:

The Chamber of Commerce of the State of New York is alarmed at the dangers which threaten the water supply of the rivers in the northern part of the State through the destruction of the forests which protect their sources.

The Chamber believes that the preservation of these forests is necessary to maintain an abundant and constant flow of water in the Hudson, the Mohawk, and other important streams; and that their destruction will seriously injure the internal commerce of the State. As long as this forest region remains in the possession of private individuals, its protection from fire and lumbering operations will be impossible. Believing, then, that this matter is one of very great importance, and that the necessity exists for immediate legislative action, we humbly pray your Honorable Body to adopt such measures as will enable the State to acquire the whole territory popularly known as the Adirondack Wilderness, and hold it forever as a forest preserve. And your memorialists will ever pray.

SUMMER AND WINTER RIFLE PRACTICE.

THE cold weather has practically brought to a finish the outdoor sport of the rifleman, and with the coming of Thanksgiving Day there was a general clearing up of all matches and a putting away of rifles for the season. Here and there are ranges where there is much off-hand work. Winter houses at the firing points may assist in rendering the range such a pleasant resort that the popping of the rifles may be kept up all the year round. In such cases the shooters get a very different set of elevations from what they were accustomed to use during the hot days of summer, and there is just as much enjoyment in firing through an atmosphere with a temperature of 20° as there is in having one of 70°.

The season for outdoor shooting in this latitude, however, has really finished. It has been a profitable one, and some capital scores have been shown on many ranges, and upon the whole it may fairly be said that the art of rifle shooting is in a flourishing condition. There is no great boom on the subject, and in the mind of the public the defeat in England has placed the rifleman rather under a shadow, but the art generally has been well patronized, and we are ahead of the point reached a year ago. Our National Guard is better acquainted with its arms and in a more fit condition to do service for the State if called upon. Many interesting matches have been fought by our civilian marksmen, and while we

occasionally are called upon to chronicle some pretty tall shooting in the way of figures on paper, yet there is reason to think that some very accurate hitting has been done.

With the winter there does not come a season of neglect. Especially is this the case with organizations where shooting is a part of the special work for which the body meets. Shooting clubs and military companies may spend the winter very profitably in learning, not merely in theory, but as an art, something of rifle shooting. We have always been of opinion that the full benefit of this quiet, inexpensive armory drill has never been gained by our National Guardsmen, and every season's exhibits by certain of the regiments before the butts have only served to convince us of the correctness of our views. There is a double wrong done if a man is ordered out to an open air range for ball practice before he has earned the right to that sort of instruction by proficiency in the drill room.

The holding of the rifle in off-hand shooting is a matter which may and ought to be attended to indoors, and a clumsy manipulation of the piece is very good proof that there has been previous neglect and that the man is out of his place on the range, wasting his own time and squandering the public money because of the incompetency or neglect of some superior officer.

It would not be a bad idea to have a careful examination of the members of the several city regiments at the close of the winter's drill season, with special reference to these points. Let a careful system of armory drill be arranged by the Rifle Inspector General, and then let it be understood that a test will be made so see how far the instructions have been followed. If it is seen that the men are fit to take a trip to Creedmoor with profit to themselves and the State, then let them go. But the present system of haphazard orders is at least extravagant if not positively hurtful in that it imposes tasks upon the men for the performance of which they have not been previously properly qualified.

SUNDAY SHOOTING.

IT is a very discouraging sign to see the perfect disregard shown the law intended to prevent Sunday shooting. A year or so ago it was not an easy matter to get a layman to go out with one for a day's sport on Sunday; but now very few obstacles stand in the way, and Sunday shooting becomes one of the leading attractions of some places along our coast, where there is very little to see and much less to shoot.

Beyond the prohibition of law, there are other strong reasons which should prevent this thing. Birds that are shot at every day of the week (Sunday included) will become wild, and, with their method of staying far out in the open water, where they can closely observe the approach of the sportsman, is as bad as no shooting at all. It is like killing the goose that lays the golden egg. For sporting hotel proprietors and gunners to encourage Sunday shooting, and thus rob themselves; for let a person visit a particular locality and fail to shoot or hardly see any birds, no more money of such a one will be spent there. New grounds will be looked up, and only such places will be visited where game abounds, offering the sportsman a chance for a shot.

Birds that are allowed one day of the week to rest and feed will become sufficiently tame to be drawn to the stools. If kept constantly on the wing, they will leave for a more hospitable neighborhood. Many complaints are made by professional gunners of the scarcity of game, and especially the small birds, which in years past have flown in cloud-like flights over the coast of Long Island.

How could one expect anything different when seven days of each week are given up to the indiscriminate slaughter of young and old—sparing neither the setting meadow hen, the lonely sandpiper, nor even the little grass bird—but with interminable shooting from early spring, throughout the summer, midsummer and autumn, it is not strange that the birds should be so scarce. The true sportsman should denounce this business most emphatically, and even if not led by conscientious scruples as to trespassing upon the seventh day, his desire to respect the Lord and protect the game should be enough.

In these days of fishculture, protective game laws, game preserves, etc., it would seem as if indeed a backward movement had set in, and all advantages derived from these would be more than counterbalanced by the nest-destroyers of the North, improved breech-loaders and Sunday shooting. There are other considerations which should affect the man who wishes to do what is right, and give others the same opportunity. To those who regard not the restrictions of Sunday, we would say, that what you may see fit to inflict upon yourself you have no right to bring upon others. To take advantage of half-starved birds—when the very stillness of the day would suggest their protection—is almost as bad as robbing a hen roost. The grounds that would be covered with birds if left undisturbed will soon become a vacant waste. The bayman who for six days of the week has not seen the break of day from his own cottage door, will find that he cannot deny nature this seventh day of rest with impunity. The seventh day was intended to recruit the over-taxed muscles and denied rest of the week, and nature will have it or something must give way.

The Sunday law should be strictly enforced, and no one should be more diligent about its enforcement than those who depend upon these sports for a living.

The Sportsman Tourist.

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Part I.—Introductory.

THE story which follows is a small painting of the author's recent expedition in the far-off territory of Alaska. The picture is tinged with the hues of hunting adventure, but unless time and mosquitos are considered legitimate killings, our score, as will be seen, was rather small.

The party, seven in number, left Portland, Oregon, in the latter part of May, 1883, on one of the regular monthly line of steamers that ply between this port and those in the southwestern part of Alaska. Stopping at Astoria, near the mouth of the Columbia, a large salmon cannery was visited, and as our vessel was loading material from it for another in Alaska, we were kindly received and "showed around." The salmon are caught mostly by gill nets (the size of the meshes regulated by State law), stretched across bars, bottoms and shoals that experience has shown to be the best, and these nets are examined mornings and evenings. The salmon, once worth from two to five cents apiece at the canneries, now bring from fifteen times that amount when the corresponding increase in the value of the canned fish in the English markets (for these marks consume the greater share of the dozen million cans annually produced on this river alone). This shows what immense profits were formerly made.

When the boats have brought the salmon to the canneries and the two interested parties checked off the number, they pass into the great barn of a building, and are loaded under a morgue-like hydraulic apparatus to keep them cool until cleaned by Chinamen. Then they pass to the cutting machine. This is a series of knives that at one revolution divide the fish into a dozen sections, one of which may be eaten by European royalty, another by the gentle American backwoodsman, and another—especially if there be any fault in its canning process—may be used to supply our great and numerous army. (Chinamen buy these sections into two-pound cans, with a certain amount of salt, and they then go through a boiling and steaming process. It requires a couple of sober men and a half a dozen well regulated clocks to do this part of the business properly. The cans are then headed and soldered themselves as they roll down to the place where they are tested and labeled with a modest American label, that gives an exact portrait of the particular fish in that can. Two dozen (48 lbs.) cans in a box make a "case," the cost of commerce and market reports. More than half a million cases were shipped last year from the Columbia side. The cannery men are mostly Chinese, the fishermen largely from the Mediterranean, a jolly lot of drink-destroyers that would pawn ten yards of blue ribbon for four fingers of "Cayuse claret" (to use the Oregon vernacular), rather than for a bed or a supper.

I can remember nearly thirty years ago when the Chinook Indians fished these waters with spears and canoes, a night scene with the lighted torches in the bows forming a beautiful sight. To the utilitarian, however, whose comprehensive sight does not extend beyond the circumference of a dollar, the present pictures are much the prettier in their gold frames. These salmon, while running up a river to spawn, will not rise to a fly nor even descend to a bait, and a story was once current in these parts that many years ago when this fertile country was in dispute, parties were sent out by the respective governments to see if it was really worth anything more than splitting on their hands and shaking their fists at each other. Sir Anonymous Somebody, K. C. B., on the part of Great Britain, visited it and investigated it thoroughly with a hook and line—having heard of the famous salmon of these regions—and because they would not bite as they did in the Shannon, he is said to have received that it wasn't worth an obstruction placed across a river to raise its waters. Lewis and Clarke represented our government, I believe, and as they were here only two years and a half, and therefore had no time to spare fishing, in order to read the instructions prepared for them at the seat of government, the salmon question did not enter into our consideration; and Oregon is to-day a prospective star of the first magnitude in the constellation of the American Union. It is not strictly correct to also name the salmon of the north or rise to a fly. Where they meet a serious obstruction to their spawning migration, as a perpendicular fall too high for them to leap, they will not turn back to seek a better channel but persist in their attempts to ascend until the lateness of the season drives them back to sea. At these places salmon fishing with a rod and line is not wholly unprofitable, and during the last year or two several fishermen caught these speckled athletes at the Williams Falls of the north side of the Columbia. So persistent were they in their leaping at this cataract, and so numerous, that boats anchored out below the falls have been known to catch them in varying quantities, according to the size of the craft and the person that told the story.

Leaving Astoria behind we plunged into the broad Pacific, and most of the passenger row took advantage of this time to get the rest that had been denied them in the hurry of the preparation for the voyage. At least we had some word for it as explanations for absence from meals. Rounding Cape Flattery, a few hours was spent in Neenah Bay, lightening a few tons of freight ashore in Indian canoes, while the weary passengers came crawling from their rooms, pale with refreshment. The voyage through the Strait of Juan de Fuca, if the day be clear, is very picturesque. On the north is the high rolling pine-covered hill-land of Vancouver's Island, with here and there a pretty open prairie showing in white hamlet or two, and on our own country's side is a duplication of the shore, backed by the snow-covered peaks of the Olympian range. Mt. Olympus, the highest of the group, has never been ascended by white men, I understand, and its impenetrable girdle of dense timber makes it an undertaking of no small magnitude to even reach its foot. The Indians are said to avoid the mountains, with religious determination believing they are the abode of snakes, demons, ghosts and other evil spirits in general. Ahead, Mt. Baker of the Cascade range, 15,000 feet high, breaks in on the scene.

We arrived at Victoria in the forenoon of the Queen's birthday, and every one of the bristling poles was flaunting bunting from its peak, and below every one was making hilarity the duty of the day. Not a pilot was to be had for all the inducements that could be given, all of them joining in the general joy, although the Victoria (such as our vessel's name) was blowing her whistle hoarse for three or four hours to bring them on and pilot us in. Well along in the afternoon a small boat put out having on board a pilot so

well acquainted with the Victoria bars that he had evidently been able to find all of them that day. There was no time for temperance lectures, however, and the Captain understanding the channel well (with the pilot on the bridge to try on the Victoria bar) the vessel was swung around (and the safe insurance) to the westward head of the bar, so that, according to our pilot, the buoys were all displaced, and even the granite channel itself had changed during the last few hours, we managed to get to a dock.

Victoria, almost a dead city of 5,000 or 6,000 inhabitants since the Fraser River and adjacent mines have died out, is now reviving under the prospects of the Canadian Pacific Railway. It has the finest drives of any city on the Pacific coast, and is rivalled by few on the Atlantic side. Back in the adjacent country the hunting has been good for many years, and even now, bear, deer and other large game are to be found in readily accessible districts. There was no time for hunting however, and our next journey was to Port Townsend, the custom-house port of Puget Sound, where we cleared, and were soon on our way for Alaska in dead earnest.

From Olympia, at the head of Puget Sound, to Chilkat in Alaska Territory, a distance of over 1,000 miles of coast-line, the most fragile river steamer could run, so well is the passage protected by outlying islands. It is known as the "inland passage" to Alaska, and is really more like steaming on a large river, with open banks here and there to the ocean, than any open water navigation. In many places the channel is not more than 300 to 400 yards wide, and at one place in the passage separating Yancouver Island from the mainland it is proposed to bridge the water, to allow the Canadian Pacific Railway to have its western terminus in Victoria, the metropolis of British Columbia. These inland passages are picturesque beyond description, and although somewhat monotonous in their constantly recurring scenes of the same character, however grand, there is no doubt that when the Pacific becomes more thickly settled, they will be great traveling resorts, their exemption from sea sickness being one of the strongest recommendations to the tourist of the above stomach.

The shores of these salt-water rivers are precipitous and rugged, and covered to the snow limit with dense forests of spruce and pine. Here and there avalanches from their tops have heven great wrinkles though this timber from the very clouds to the water's edge, and the lighter green foliage of the large rivers, with open woods and there to the great, the sombre colors of the old trees. From the lake high on the hills of snow come down many a pretty cascade and waterfall, that gives a pleasant relief to the everlasting green of the mountain sides. As one reaches further north, these snowbanks on the top grade off into glaciers, and in many places the ice accumulations are so great that the resulting glaciers reach far down to the water line, giving off diminutive icebergs that often reach above the ocean steamer's deck, and add another novelty to the tourist of temperate climes, whose sea knowledge has been confined to skating ponds and mint juleps. It is almost impossible to plod through this thicket of timber, not only on account of its thickness but also the marshy, boggy morass that it covers even on the sides of the steepest hills. Once on the top, however, an occasional opening is found, where only the mossy bog has to be taken into account in walking, and here one is likely to find deer, bear or mountain goats, if there be any in the country. Saving hickory cord wood at fifty cents a cord, and finding a better quality of wood is a much less laborious method of procuring deer meat than to hunt in the mountains of Alaska and British Columbia. Winged game is not scarce, but for wood birds as grouse, quail and so on we have said enough in describing their country. Ducks and geese are much easier to get in the numerous passages, and are sufficiently abundant to tempt sportsmen, or if the tourist be a sportsman, to break the monotony of his trip.

On the 29th of May the Victoria crossed Dixon Entrance, the dividing channel between British Columbia and Alaskan waters, and we felt that our labor had really commenced. That same forenoon we entered Bucide Quadra Inlet in order to leave freight for the Cape Fox Salmon Cannery, an infant industry of that year. This place was picturesquely situated in one of the many thousand picturesque arms of the sea putting into Alaska from the Pacific Ocean, all of which are merely cauals or fjords cut through steep lofty mountains and clothed with dark green verdure of the large spruce and fir trees to their tops, or of the fjords of Norway as depicted. Mr. Wainwright, of Oregon, was the superintendent, and had some forty or fifty Tsimpsen, Cape Fox and Tongas Indians about him. Engaging him in conversation I found that game was very plentiful in his locality, consisting mostly of mountain sheep, blacktailed deer and brown and black bear, despite the fact that the extremely rugged and mountainous character of the country, with its dense, compact growth of timber, would, at first sight, appear otherwise in every sense. Not a great many days before we arrived he and a hired Indian at the cannery had taken their guns, his being a double-barreled shotgun loaded with buck or ball, and the Indian's an old Hudson Bay musket, and had clamored up the narrow valley of the little creek that here flows into the inlet from the mountain snows yet visible in great banks on their tops, and during the day had seen eight black bears, securing three with even their imperfect weapons for special game. This particular valley and its adjacent hills he said was alive with this sort of game, and now that he had a fine rifle he hoped to be able to do good execution.

There is another sort of bear in this general vicinity called the brown bear, nearly as large and very closely resembling the grizzly. A curious fact is that the brown and black bears never inhabit the same valleys or mountains, so the Indians here say, although these vicinities of each may be mingled in a general locality like the black and whitesquares in checkerboard, and each staying in his own color. The particular valleys and the special localities held by the brown bears are sacred spots, and now that we know of them with unerring accuracy, and they cannot be induced to visit or hunt in them under any circumstances. They say they are unusually savage, and while the Indians have the reputation of being brave when bravery is needed, they are not very prone to display it simply for that purpose, and accordingly, the brown bear with nothing but his robe as a reward, is not much of an inducement for them to seek. They call them in their own language "the crazy bear," and from his ungovernable ferocity I afterwards found this dread of the brown bear to be co-extensive with the Alaskan Territory wherever Indians could be found.

Wainwright was reached on the 30th, and it is the seediest looking town in the whole territory of the United States. Such it seemed to be from the steamer, and when I visited the rickety mass of broken-down buildings I was surprised

to see so much business going on, there being four or five fair-sized backwoods stores. The principal display was of dog-skin rugs covering the floors, the animals not yet dead. Wainwright is the principal depot for miners for the Cassiar and Stickeen Indian curiosities were quite numerous, and some of them were elaborate, especially their war knives, which looked formidable enough to kill an elephant, although I doubt if they have ever been used in anything more thrilling than slicing salmon. One splendid piece of savage workmanship was a carved ladle from the horns of a mountain goat, for which the possessor had been offered \$60, and this cup showed in its wholesale capacity for fluids that the mouth of the Stickeen Indian and Stickeen River must be nearly the same size.

In order to reach Sitka, the "inland passage" must be abandoned, or the route be very roundabout; and no sooner had we reached the swells of the broad Pacific than the passengers commenced seeking rest. Sitka has been synonymous with Alaska to the greater majority of the people of the United States so long, and so many have described this one spot so often, that any person who has traveled a few hundred miles in Alaska proper can afford to drop it as written to death. Killisnoo is another steambout port in Alaska, and here is a large coal-burning and packing establishment and it is owned by the Northwest Trading Company, most of their capital being invested in cod, salmon and whale fisheries, instead of fur-trading, which has been overdone until furs are getting scarce. This policy of fisheries, it is reasonably supposed, will give a needed rest to the fur interest by withdrawing the Indian hunters as employes in the canneries, etc. Such has been the result in number of frontier mining districts, where the more energetic Indians found lucrative employment in various capacities, and when the mines had "played out," to use a miner's phrase, the fur-bearing animals were found to have increased considerably.

At Killisnoo I saw many Indians with their faces blackened with tar and pitch. In a very few cases this is a part of the fashion for mourning for dead relatives, but in a greater majority of the cases it is simply to protect the face from violent sunburn, and the eyes from the dazzling reflections while fishing on the water. It does not increase their beauty in the least, especially when it is about half peeled off, but as they haven't much beauty to mar, it should hardly be counted against them. On the 2d of June we arrived at Pyramid Harbor, in the Chilkat Inlet, this being the point where I should disembark for my contemplated inland trip to the head of the Yukon, using Indians as packers for my effects across the 40 or 50 mile portage that intervened. There are two canneries in this inlet, and the salmon "run" was expected to commence every day. I unloaded my effects at the cannery of the Northwest Trading Company on the west side, and for many kind efforts in procuring Indians for my trip, I am indebted to its superintendent, Mr. Spuhn, who placed me under many other obligations as well. Indians could be had in profusion at a dollar a day, or a dollar and a half with a canoe if I wanted it. I wanted them for a month or so, and some few were hired, but to cross the mountain portage to the lake on the head of the great Yukon they had charged \$8 and \$10 each, and did not care to lower their prices, for so rich a man as Uncle Sam. In vain did Mr. Spuhn argue that it was a wholesale transaction that would require 60 or 70 of them, that was twin brother of the Great Father, that would catch a timber wolf to be the governor of Alaska, and so forth, and so on. They remained inexorable, and right here I will say in advance that I had more respect for them for it after I too had traveled the trail and saw the terrible thoroughfare that would have tempted a mule to commit suicide.

Chilkat is particularly rugged and capped with glaciers, with a few open places on the steep, heavily timbered mountain sides. In these open spots bears are frequently seen picking berries and gathering for food. It was no unusual occurrence for a number of us, armed with telescopes and field-glasses, to sit down on the cordwood piles or lounge around on anything that would give us resting room, and watch the movements of bruin. It was a sort of bear garden on a grand scale. These "bar" spots were 2,000 to 2,500 feet above the sea level, and while we no doubt looked like a hive of ants to bruin himself, his movements could be watched closely with the help of a fine glass. The usual time for these displays was during the clear, quiet evenings, when it seems, his own beauty is most agreeable to the evening an Indian, stimulated no doubt by the large number of spectators that he would have for an audience, determined to kill bruin with all the necessary display incidental to a true theatrical performance, and with an old smooth-bore musket started up the side of the hill. He was gone nearly an hour, the bear having pronounced backward and forward in his limited space during all this time, when the Indian was seen on a little break not far from bruin, crawling directly for him. A true, genuine bear hunt, with the spectators occupying private boxes, dress circle and pit (or rather, salmon boxes, cordwood and the ground), was a genuine novelty, and I think a good score of glasses followed the Indian and the bear in all their movements. The Indian got within thirty or forty yards of the bear, as we estimated from our standpoint, and when it looked to all as if both were in full sight of each other, the Indian suddenly halted, stretched his neck up in the air, turned around and ran backward in the bush, and we never saw him again until he was coming, when he reported that he had seen nothing of the bear. After the Indian disappeared the bear, a good-sized specimen of the black variety, "nosed around" for a while and then suddenly vacated, having evidently gotten "wind" of his antagonist. The whole thing seemed to be a grand farce, in which no fault could be found, at least, with the scenery and settings.

On the fourth of the month, some fishermen in the inlet brought in a sting ray that measured five feet six inches in length by four feet four inches in width. They told me it was nothing unusual to catch the rays in these waters.

Here, too, I found the Indians blackening their faces until they looked like a lot of darkey minstrels, to keep the sun from blistering their faces, and I could not help but think that the prospects for a blonde white man were not very encouraging.

Indians were very hard to procure in sufficient numbers to transport my party across the portage in one body, requiring some fifty to sixty, as one of the principal chiefs had died at the head of the portage, and the tribe wanted to attend his obsequies when he would be buried. I was invited to see was sent an invitation to be present as a means of delaying me, but as the ceremonies threatened to be a week long I declined with thanks, and when they saw I was obdurate many decided to forego their pleasure (for it is one grand free

lunch during the time) and promised to be on hand to help me along at \$9 per help.

These Chilkats once owned slaves in large numbers, and I am not quite sure that the practice has been wholly abolished yet, despite the belief of many that it is, and certain amendments to our constitution. However, many of the unnecessary cruelties and barbarities of the institution that they formerly practiced have disappeared, they knowing our opposition to the system, and willing to forego these for the more palpable benefits of work and labors conducted *sub rosa*. Mr. Spuhn told me that these Indians used to celebrate important events by killing slaves in the most horrible manners; tying them in sacks and stamping them to death while singing a death ballad, and then joining about ten or fifteen miles from their village, came over and informed me that they were ready to go with me as packers. These, with my forty or fifty Chilkats, made me feel safe in designating the morning as the time to start.

AMONG THE MOOSE.

IN TWO PARTS—PART II.

North.—James, you are a good shot.

Shepherd.—I seldom miss a haystack, or a barn-door, standing at twenty yards; but war they to take wings to themselves and flee away. I should be shy o' takin on any big bat that I should bring them down—especially w' a single barrel.—Niles Ambrose.

ANOTHER story Joe told had an air of respectable authenticity about it, but as he told it was quite amusing: "Once there was a man, an' he lived in the bush, an' he had a farm in the bush, an' one day he went to a town to get a dollar. So then he got a file to file his saw, an' he gave a half a dollar for the file, a file about so long, an' then he was goin' home, an' he was goin' to ride home on his horse through the bush, an' he had his file on his saddle. So then he rode along, and after a while he looked for his file, an' it was gone, an' he didn't have no file, an' he had lost his file. So then he turned back an' rode along an' he was all the time lookin' for his file, an' after a while he found it in the road. So then he said, 'I'll carry the file in my hands so I won't lose it any more.' An' then he rode along an' he was carryin' his file so he won't lose it again. So then he came to where it was green bush, an' there was a partridge sittin' by the road on a log. An' then he thought he would get the partridge, so he threw his file at the partridge, an' then the partridge flew away. An' then he went to look at the log an' get his file, an' his file was gone, an' he couldn't find his file, an' then he didn't carry his file in his hand no more so he won't lose it."

Wednesday afternoon I had gone with the Indians to the ponds, near which we first camped to get some traps they had set which they wished to take along when we moved camp to the burial country. As we came back, we saw on the bog near the head of the pond, by our slanty, the tracks of a very large moose, and he walked by there the night before within 500 yards of me. I pointed out the place, which was in plain sight from the beach in front of the camp, to Mr. Peck, and he told the Indians that if they would put a moose there, he or I could kill it before it could get to the timber. Friday morning we were ready to start for our new camping ground in good time, with heavy loads, but before we left, Aleck got at Mr. Peck to shoot his gun at something so he could see how much to believe about what was to him long range. He was soon satisfied, and seeing a number of shots at 300 to 500 yards, and we tramped out to where we had first come by wagon, but eased the trip some by using the birch to cross a couple of ponds instead of walking around them. After eating a lunch, we took a new direction and reached an unoccupied log camp near a beautiful pond surrounded by bold hills where we passed the night. Our journey from this to our intended hunting ground was without any particular incident—we passed an occupied camp of loggers, where we had a lunch of bouas and carried with us some fresh bread and doughnut. On the big bog we had several miles of good paddling in the birch, stopping only to cut out a couple of trees, and a tramp of a couple of miles after leaving the canoe brought us to an old and long disused lumber shanty, where we made ourselves as comfortable as we could, intending to begin hunting Monday.

My companion, to whose kindness and companionship in camp I was indebted for two-thirds of the pleasure of my trip, had not been very well before we started from St. Claire, and caught a bad cold just after we got into the woods. Sunday night was even colder than the two or three before it, ice half an inch thick freezing in the tins in the shanty, and Monday morning I saw that he looked and felt unwell. After breakfast he said he did not feel able to hunt any, and to avoid the risk of getting worse he would go out to the railroad, taking Joe with him, and suggested that I should carry out the object of the expedition by hunting Monday and Tuesday, and should then come out, join him Wednesday night, and we would start home Thursday morning. After some argument—for I did not like to see him go off alone—I agreed to this, and by 9 o'clock he and Joe had gone. This was so long after breakfast that Aleck could not start out, of course, until he had eaten something and drunk a quart or two of tea, then we started on our hunt, I in my shirt sleeves, with only my gun to carry, Aleck bringing some provisions and an axe. The leaves were very noisy and the day altogether a bad one for still-hunting.

As soon we halted, got in a hollow, where we would be out of sight, sound and wind, and dined. We had seen fresh tracks of an old bull and two smaller moose in the two or three miles we had traveled, but had not very much idea that we should see any of the animals themselves. The afternoon was even worse than the morning. There was a dull, leaden, cloudy sky overhead, and not a breath of air stirring, not a leaf moved; it was so still that the traditional pin would have moved to drop but a little way to be heard.

The only chance lay in seeing a moose before it saw us, and when so the moose was all that we saw, we were sometimes, there was a possibility of our doing this. We went as quietly as we could, and very slowly, stopping every few paces to look and listen. About half-past 4 we

came in sight of our shanty, some third of a mile away, but did not for that relax our vigilance, but started over the last small rise between us and camp as carefully as though we were ten miles from home, and expecting to see a moose every minute. Out patrolled and we were around as we came to the brow of the little bluff overlooking the shanty, then only 950 yards away. I saw below us a mysterious something, which, in the then rather uncertain light, was so near the color of the brush in which it stood, that it looked exactly like a big brownish bush, with a wisp of dry grass on either side of it.

"Don't that look like an old bull moose standing there looking right at us?" whispered to Aleck. He slowly nodded assent, that that moose—the one whose horns we were the horns of a moose—the of the "big buck" whose death I had been prattling to Joe about for a week past. I jerked off my mitten with my teeth, and as the moose turned broadside, clapped the gun to my shoulder and fired, instantly pumping in another cartridge. Two steps to the right took him out of sight behind a clump of green spruce and balsam, but a moment after he appeared again, having turned back, going from right to left, when I gave him a second shot, and just as he entered a thicket of brush fired a third, which had little chance to reach him on account of the mass of stuff intervening. Hardly had he got out of sight when down he pitched with a crash. "He's down! Now you got the big bull, eh?" cried Aleck, his dark eyes wild with excitement. "I hit him the first shot," I replied, "he wouldn't have gone fifty yards if I had fired no more."

Aleck looked over the ground. "That's a long shot. I couldn't do that. You kill him more'n two hundred yards off," he exclaimed.

"I don't think it is that far," I said, "it may be a hundred and fifty," but when we had gone about half way to the moose, I looked back and said we had already come a hundred yards. Afterward I measured the distance, and found the first shot two hundred and ten yards, one foot; the second two hundred and twenty yards. When we reached our moose and examined it, we found out that it was just what I wanted, a big bull, which the horns were not too unwieldy to hang up, spreading only three feet two inches, but were heavy, very even, and handsome.

"You don't get 'em any bigger than that," Alex said after looking him over; "You hunt a long while to see another one so big." I measured him as he lay and found his height at the shoulders 6' 8"; girth of body, 7' 7"; length from base of horns to rump, 7' 4". On opening the moose to clean it, I found that the first shot had hit him on the opposite side of the hump, and had lodged under the skin on the right side; the second had entered the left side, gone clean through and out near the entrance of the first. The aorta was cut and the animal fell dead without a kick. We could not have devised a better ending to our day's hunt, for our game lay within a hundred and fifty yards of camp, to which we presently repaired to cook, eat, smoke and sleep, careless as to what the weather might be next day.

The morning after the hunt, breakfasted and packed up our things, leaving some in the shanty, as Aleck had the head and horns to carry. I had the head unjoined from the neck, and as much flesh cut from the back of it as we could get at, but it made a good load; then put a tent and blanket under it to make it soft to Aleck's back, for when I weighed it next day at the railroad station it weighed 78½ pounds.

We got out to civilization that evening and my friend Mr. B. was delighted to find that I had obtained a shot. "Could he have kept well he might have had one too, which would have completely rounded off our trip. As it was, we could say much more truthfully than was often said in the army, 'The objects of the expedition having been accomplished, the whole command returned safely to camp,' and so left for home the next (Wednesday) morning, Oct. 24. I took a short cut by Albany and New York, and reached Washington at 8 A. M., Friday, the 29th.

And now let me say a word about hunting. I have sometimes been laughed at by friends whom I happened to have in the woods with me for insisting so strenuously upon silence; upon doing things quietly, not only while actually out hunting, but in and about camp. I invariably shut down on the whistling, singing and hallooing creature, if I stumble across one, and if I could build a shanty and keep up a fire without the stroke of an axe, it would please me. I set that in my mind about the time I set out as an apprentice to get all the chances. Due regard being had to the handiness of wood and water, I like to put my camp where it will least disturb the game, but while this may not put it in the most likely spot for seeing game, the site is just as wild as any other part of the woods, and if I keep quite I may see any of the various beasis or birds that belong to the region.

I remember well camping on the Old Stillwater of the North River in the Adirondacks, on Mt. Mitchell, on Aug. 15, 1875. We got up to camp about two P. M., and although we went several times to a little run, which emptied into the river some thirty or forty yards from our fire, to get water, wash, etc., yet we were so quiet, that when it got dark enough and we started out to float, intending to cross the river, there was an old buck standing at the mouth of this run where he could not help but see our fire light, although I think it would have puzzled him to hear us. After we had done laughing at the sudden way he came off he was so near us that we could see his eyes as he crossed the river. I killed a buck not over 300 yards from camp, and we were back at our fire in less than half an hour.

On another occasion, half a dozen years ago, I went with a companion to a "Rock Camp" to lie out and look for bears. It was after dark when we got near it, but instead of going noisily and carelessly we went so quietly that our little shepherd dog roused out a panther from our bed when we were not twenty steps off. I was camping last year with some friends in the same region and we killed a deer within forty yards of camp. If I and my Indian had relaxed our vigilance and stopped hunting when we came in sight of our shanty, we should have got no moose that day.

To the beginner who wishes to become a still hunter, I would say therefore, be a still hunter; make no more noise in the woods or about your camp, than the deer or moose do about their haunts; get in the habit of doing everything quietly and you will never regret that you do not like to hear two or three fellows singing or laughing and "going on" when I am half a mile from camp, or perhaps twice that far across a pond, but I do like to feel, as I step across the threshold of my shanty, that the day's hunt is not quite over until I have turned and taken a last look around, to see that an old buck is not standing on the opposite hillside, watching me.

If I were advising one who wished to kill a deer but did not know what sort of a hunter he ought to be I would say:

"Do not grow. Do not carry a cannon into the woods when an ordinary rifle will do." A very little experience will show the reason for the first prohibition; the second is given because it is much better to depend on one's shooting than on the gun. There is just as much sense in sulking the gun to do the game in sulking the gun as there is in sulking the gun to do the game in sulking the gun. I don't want a gun that will kill a deer if it shoots anywhere within ten feet of it, all that I care for is one that will kill it at any ordinary range if I hit it in the right place.

C. CLAY.

WASHINGTON, D. C.

THE WILD BULL OF BIG TIMBER.

A Christmas Yarn.

BY SENECA.

WAS there ever a township so poverty-stricken, so utterly worthless and good-for-nothing as that of Meadow-marsh? For the sake of the human family I hope not. Its marshes and bogs, partially submerged each spring by the river, would grow no crops but the bright green grasses and the tall reed-tails; its river was too small for commerce and too sluggish for water-power mills; its Big Timber swamp was as inaccessible for lumbering purposes as if it had been in Patagonia, on account of the treacherous bogs, and as far as trade was concerned, bless you, there wasn't any money to purchase with. How, then, did the Meadowmarshers employ themselves?

Well, for one thing, they fiddled. From Big Tick to Meadoobasha, all along the river, at every festive occasion—from a husking-bee to a real shake-out, the entertainment was considered incomplete unless a "Meadow-marsh" and his home-made fiddle composed the orchestra. The women even were performers, and the first playing put into the hands of the young was a violin.

For another thing, they fished. Some aver that fiddling and poverty go hand in hand. Others declare that fishing and poverty are twins. But when both fishing and fiddling are combined in the same person, woful, indeed, must be his indigence, if these authorities are to be credited. And I am bound to say that the Meadowmarshers were a living proof of the soundness of the doctrine.

Besides these occupations they cut flag from the marshes in autumn, which, when dried and bundled, was floated down the river to Nazareth and sold for making baskets and chair bottoms, and occasionally they hunted, but only when they needed meat for fur, and in this latter pursuit the women were as valiant, if not as skillful, as the men. You might meet in the Big Timber the father of a family, tall, gaunt, his sunken cheeks and yellow skin telling of perpetual agony, his long, matted hair surmounted by a greasy 'coon-skin cap, his body encased in a hickory shirt and tattered homespun that was always too brief in the arms and legs, and his feet shod with heavy cowhide boots; and in a minute's walk you would perhaps encounter his better half, also tall and gaunt, with the same sign of age, the same long, matted hair, the same greasy 'coon-skin headgear, the same tattered and brief homespun, the same cowhide boots, and maybe the same hickory under-garment. Each would certainly be possessed of a formidable "smooth-bore" of astonishing caliber, and each would surely be puffing smoke through the elder stem of a corn-cob pipe.

Now to our yarn. The snow was drifted in huge, odd-shaped masses on the Meadowmarsh flats, and lay on a level in the Big Timber, where it was protected from the wind. The river presented a plain surface of ice, with only occasional drifts of snow and frequent protruding fyke-poles to break its monotony. It was the day before Christmas, the sun shone warm, and old Joel Doubleday, as he ploughed through the drifts toward his shanty, removed his 'coon-skin cap, wiped his perspiring brow with it, and remarked that he considered the state of the weather a "plum good sarnin' 'thaw, only too airy in the season." Reaching his own bark-tatched log shanty, Joel kicked the snow from his boots, pushed open the door, stooped low and entered. A single ray of light that struggled through the one pane of glass that served as a window revealed the sole room of the domicile in its indigent nakedness; the stone fire-place, so awkwardly constructed that it was almost impossible to kindle a fire, was the only square table, the two or three flag-bottomed chairs, the ancient bedstead, and the home-made affair dignified by the name of "lounger," and in remarkable contrast to the general poverty of the equipment, in the brightest corner, with shining, varnished case and glittering keys, a melodeon. A woman, thin, angular, with deep, sunken eyes and lowering brows, lifted a blazing bough from the fire to light her coil pipe as her long dress of tynpene over. "She'n Brother Simplestweed is gone to berry Minewy Jones's sam book."

"Is that chicken-livered, funeral-faced missionary here again?"

"Parson Simplestweed is here, Joel Doubleday, an' what's more, he's goin' to stop over Christmas," answered his wife severely.

"An' what is Parson Simplestweed a-goin' to put into his deer-deleat stomick, Bebecky?"

"Ellyah was fed by ravens," said the wife.

"But there ain't no ravens in this 'ere deestrick, Bebecky; an' a man that set still a-waitin' for ravens to feed him hereabouts wouldn't look very chipper at the end of the fast week. The pint is just here: we've at the last tater, the 'lasses has gin' out, the corn an' 'grease is all gone, an' all's left is some cold sump to feed four on Christmas day, you might as well make up our mind to go to the county house. I know that to-day a week there's got to be five dollars paid on that 'ere music trap,' pointing to the melodeon, 'an' where them said five dollars is comin' from Lord only knows. Bebecky, that 'arnal piece of foolishness has ben our ruination. Why couldn't Tilly be satisfied with a fiddle, like the rest of the gals, instead of wantin' that pesky box, that won't play nothin' but sam-tunes, anyway? Here I feed us on best-meat a year. Kin we eat a melodeon? No, feed us on can't pay the five dollars on it next week, anyway. An' when we can't pay the five dollars on it next week, anyway, an' tell him plump straight that his room is more agreeable than his company."

"You'll do nothin' of the kind, Joel Doubleday," interrupted Rebecky. "Brother Simplestweed'll be told that our supplies is gin' out, but I shan't welcome him to sheer with us when we're here."

"Here comes the varmint," said Joel, turning from the

window. "I do hope Gruff is loose soon 'round the shanty."

"I had to turn the soap-kittle over onto the dog, when Brother Simplestweed come," said Rebecky, having her pipe alight. "If I hadn't, I believe he would have ate up the parson."

"An' he," chuckled Joel, "that purp's a wise un. 'Parlaver can't come it er his own un'."

"Good evening, Brother Doubleday," said a meek-looking man of about thirty, dressed entirely in black, who just then pushed open the door and entered. "I hope that your bodily health is good?"

"'Tol'uble, parson," growled Joel.

"Oh, pa'," cried a very freckled, but buxom young woman who accompanied the parson. "We seen the wild bull. The old man, the old man, turned to his daughter, his little gray eyes dancing with excitement. Then striving to appear calm, he said, in an indifferent tone of voice, "Yes, did ch' An' how do ye know it was the bull, Tilly?"

"'Cause it was coal black all over, pa', an' only had one horn, that was shaped exactly like a letter S. It stood in the snow right on the edge of the Big Timber, an' looked at us. An' then it give a snort like, an' 'took to the Timber with its own 'orn' un'."

"Oh, Joel," said his wife, "'won't ye try onst more to kill that critter? Think how we need that money. An' think of the meat, an' the hide, an'—"

"Rebecky," interrupted the old man. "ye don't know what ye say. Since the day when Square Bristow's boy was found gored to death in the Timber, an' the Square offered twenty dollars to the man that'd fetch him the crooked horn of that bull, every ch' in Meadowmarsh has tried to kill the critter. An' in my opinion," remarked Joel, "that this 'ere is the identicle beast mentioned in Scrip'ter, fer he's sartinly so used ter fire an' brimston that he don't mind powder and lead."

"Wal, Joel, ye're so set in yr mind that there's no use o' arguyin' with ye," said his wife, "so light the candle; and your brother Simplestweed, draw up a cheer. We hoist nothin' but cold sump ter eat, an' that's the truth; but I s'pose there's some 'd be glad to hev even that, so we order be thankful."

"Verily, Sister Doubleday, I would I were able to offer you the material aid that my heart desires; but I can at least send up the prayers of my very soul in your behalf," responded the parson.

The simple meal dispatched, and the actual indigence of the family made fully known to the parson, this good man endeavored by every argument to induce Joel to attempt once more the capture of the bull, even offering to accompany him in the hunt, but the harder the parson plead, the stronger was Joel's negative, till, out of all patience, the former said:

"I, then, will strive to slay this beast to-morrow. Unsolicited by my calling as is the bearing of arms, to relieve the distress of two Christian women thereby is no sin, I am sure."

"All right, parson," said Joel, "there's three guns hangin' in the pegs—mine, Rebecky's, an' Tilly's. Ye kin take yer pick, I hope ye'll fetch yer hide back on yer bones."

"Very well, my good but perverse friend. And now those who wish to will unite with me in a final prayer for heavenly aid before retiring will prepare. We will first sing a hymn."

"In this Joel muttered something about "chores to do," lit his pipe and stepped out in the air. Here he sniffed the breeze, looked at the stars and sky, and then lifted the huge iron knife that confined the dog. "Gruff," said he, as an attenuated, nondescript cur crawled forth, "Gruff, it strikes me that it's a-goin' ter freeze harder'n a brick house to-night. An' if it does, Gruff, there'll be a crust in the mornin' 'till he'll hold up you an' me, but it won't hold up no wild bull. D'ye get my drift, Gruff, eh?"

The cur wagged his tail, rubbed up against Joel's leg, and uttered a low whine. "An' Gruff," resumed Joel, "I'll do it. I'll shower Bull, an' we see any two-legged varmint an' store 'clo's an' wearin' a funeral face traps'n' through the Timber, ye jist see that said varmint, will ye?"

To this Gruff answered by a joyful bark, and jumped up in the air in evident glee.

When Joel re-entered the shanty a blanket was hung across the room, dividing it in half. On the one side the two women preparing to retire, and on the other the parson sat gazing. "I'm drinking the help man to turn in on the lounge, Joel rolled himself in a blanket on the floor before the fire, and was almost immediately snoring a bass solo.

The first streak of dawn had not appeared when Joel rose carefully to his feet without waking the parson, settled his 'coon skin cap firmly on his head, pulled the strap about his waist tighter, reached his long-barreled "smooth-bore" from some place, and quietly stole out of the shanty. The frost seemed to bite and consume his nostrils as he breathed the morning air. He tried the crust with his heels, and found it would bear his weight. "Here, Gruff!" he called in a low tone, and the great skeleton of a cur crept from beneath the shanty and followed at his heels. Like two dim ghosts the two sped over the level meadow toward the black mass of forest. The crust was firm, and the distance was covered quickly. "No use lookin' fer tracks, Gruff," said the old man. "It's snowed right smart since Tilly seen the critter; an' the varmint won't go far away from the open as long as there ain't no fodder here in the Timber, so you keep yer eye pulled, purp, an' we'll run gin him afore the sun's an hour high."

It was yet dark in the dense forest, but Joel knew the Timber well and the cur scoured the brush like a trained hunter as they moved along near the baskets. Every bush and uprooted stump loomed up in the darkness like a gigante bull, but Joel knew the old dog would give tongue as soon as the beast was sighted, and held his gun in readiness for instant use, while he devoted all his energy to avoid tripping over the trailing vines and thick underbrush. On, on they went, the surroundings becoming more distinct as the sun appeared, but still Gruff was silent. "Caw! caw!" caw!" hoarsely cried some Frighteneea crows disturbed from their roost in a tall tamarack. "Dod! dod!" muttered from the old man, "that's bad luck," began on. Here purp!

Joel was sartin, an' that's bad luck, he begun on. Here purp! Joel was a come a mile, and the critter must be deeper in the Timber. "We'll break fuder inter this wildness an' take a back track."

Back again over a deeper belt of forests they went to the

starting point, and then beyond toward the river, beating carefully every rod of the ground. Then, still deeper into the brush they plunged, and after a short distance, but still still in the same direction, they reached it, and with a start and not a noise met their ears save the distant "caw! caw!" of the disturbed crows. The sun was now well up in the heavens, the dog hunted with a dejected air and the quails of hunger made the old man wince.

"Here, Gruff!" he cried, "there must be wind enough on the 'Hog's Back' to lay bare the fodder; an' though it's a smart ways off, we'll try it," and he plunged off in a new direction toward the only piece of high ground in the swamp. It was fully half an hour before they reached it, and continuing toward the last hog Joel exerted the utmost care. "Hog's Back" was cleared on all sides but one, and on this latter slope the timber was left standing to the very summit. Carefully guarding his priming from the snow that was jostled from the underbrush, Joel crept slowly up the wooded slope, reached the summit and peered through the bushes. The bull was not there! Then the old man sank down on a log, and I blush to say, swore. The dog looked solemnly at his master for a moment, then slunk away to the left till between his legs, and quietly gnawed an old stump. Suddenly a piercing yell, as of some one in agony, rang through the silent forest.

Joel leaped to his feet. There was a crash in the brush directly opposite, and a figure in black, hatless, the long hair standing up straight, and the long arms waving wildly, leaped over a fallen log, and came tearing up the slope at a pace that only the longest legs and the most abject terror could inspire. A broad grin distorted Joel's face. Then came a loud crash, and out of the forest, directly behind the person, rushed the Wild Bull of Big Timber! At the same moment Gruff leaped out into the clearing, and the bull, distracted from his pursuit for a moment, stopped to inspect the new comer. The person caught sight of the dog, and stopped too. Between his old enemy and the new, he gave himself up for lost. He hesitated, however, and turning at right angles to his former course, person, dog and bull tore down the hill at breakneck speed. Joel could contain himself no longer. Dropping his gun, he uttered a stentorian guffaw, slapped his thighs, and jumped off the ground in place. "Grub him, pump! grab him!" he cried. "A dollar to a doughnut on the bull! Hoorny!"

The infuriated bull was gaining on the poor person, and was making such bounds as would soon cover the distance between them! "Save me! save me!" shrieked the flying man, as he fell headlong in the snow. At the same instant there was the sharp report of a gun, the bull plunged forward on his knees, rolled over, made one effort to rise, and fell back, dead. And out of the timber ran Tilly, the barrel of her gun still smoking. The person had fainted. "His run is ended." The Christmas dinner at the Double-day shanty was such a feast as its walls had never before witnessed, and the courses were chiefly of beef. The bounty offered by Squire Bristow was promptly paid. The last installment on the melodeon was met, and there was still something left to keep the demijohn full. The person was very grateful to Tilly for her timely interference in his behalf, and it is whispered that his gratitude is father to a tenderer sentiment. I hope Joel's antipathy to his future son-in-law will be dissipated, but—in the strictest confidence—I have my doubts.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

FOURTH PART.

THE Blackfeet divide the year into two seasons, winter, a *stó-yé*, meaning "closed," and summer, *né-pés*, meaning "open." These seasons are subdivided into months, a month being the length of a moon—about twenty-eight days. Different phases of the moon are termed:

- Half moon—*An-núk-núk*, or "in sight."
- Half moon—*Stuk-íst kya-núk-núk*, or "half in sight."
- Full moon—*K-íst-to-s-tin*, or "round."

Last quarter—*E-ne*, or "dead."
 The different seasons of the year are termed: Spring—"grass stalks up," summer—"make lodges," midsummer—"berries ripe," autumn—"beaver droppings," early winter—"water freezes," midwinter—"very cold." The people have no idea how many months constitute a year. One old fellow told the writer that winter has seven months and summer nine. It is customary to note the duration of any important event by counting the days with sticks.

The cardinal points of the compass are named: North—*App-út-ús-úts*, "behind direction," South—*Am-skip-úts*, "ahead direction," East—*úts-úts*, "low direction," West—*Al-né-úts*, "up direction." Intermediate points such as Southwest, Northeast, etc., are not recognized. Speaking of the wind, it is said to be going to a certain direction, not coming from.

The class names for animals are exceedingly interesting. Three great classes are recognized: First, *Spiúts-ah-pé-kséks*, or "above animals," including everything which flies, swims, or crawls; second, *Só-úts-úts-pé-kséks*, or "beyond animals," including all strictly land animals to be called "little animals." West—*Al-né-úts*, "up direction." Intermediate points such as Southwest, Northeast, etc., are not recognized. Speaking of the wind, it is said to be going to a certain direction, not coming from.

Animals are named from some peculiarity of habit, motion, color or shape which they possess and some from the sound which they make. Antelope and deer are collectively named *Al-wa-kas*, meaning "runners." Distinctively, the antelope is called "prairie runner," the white-tail deer "swaying tail," and the black-tail "black-tail." The beaver is called "the tree biter" and the otter "wind hair," the latter being used to wind around camp locks. Buffalo are termed *e-né-úts*, which is very nearly the same as *e-ne* the word for death. Ducks generally are called "red feet." The owl is named "all ears," the bull bat "fighter." The chickadee (*Parus atricapillus*) is called *né-pó-múk-í*, for does it not always keep saying *né-pó-múk-í! né-pó-múk-í!* "Summer is coming; summer is coming." There is not a single quadruped to be found in the country for which the Blackfeet have not a name. But many of the birds, especially the migratory ones, are not named, and the animals are called "little animals."

All birds and quadrupeds are supposed to have languages as well as men. Of all the above animals, the geese are said to be most intelligent. "They have chiefs who go ahead and watch out for good camping grounds, where is plenty of food, and where no enemies are to be found." Of all quadrupeds, the beaver is considered the most intelligent. He works in the summer and in the winter he has a warm hole, plenty of food, and does nothing but eat, dance, sing and sleep.

The Blackfeet profusely decorated purple-sacks, robes,

skins, etc., with brightly painted designs. Figures having sharp angles are the most common. Many note the history of their brave deeds in pictographs on large cow skins. Battles, war expeditions, the number of scalps taken, are represented, and the whole is interspersed with pictures of the different "medicine" animals the person has seen and killed. When the Blackfeet make a picture of a mammal, bird or reptile, they generally draw a line from the mouth to the center of the body and then make a triangular figure to represent the heart. In the February number of the *Popular Science Monthly* is an article on prehistoric cemetery. Fig. 20 representing part of the drawing of an animal, has the line extending from the mouth backward. Unfortunately the piece of rock on which the animal is drawn, has been broken; were it complete, the triangular figure at the end of the line would undoubtedly be seen. According to some illustrations by Mr. Frank Cushing, in the February *Century*, the Zunis of New Mexico also represent the hearts of animals in their photographs; thus it will be seen that the Blackfeet, the Zunis, and a tribe which was extinct several hundred years ago, had a common method of picturing animals.

The Blackfeet have a great many different songs. They are, however, songs without words, save one drinking song about the old man. The writer has endeavored to sing these songs and to repeat them on the violin, but has wholly failed. Nor has he ever met a white man who could repeat one of them.

The musical scale of the Blackfeet is quite different from ours, only a few of the bass sounds can be produced on the piano, the higher ones not at all. As the songs are nearly all of a sacred nature, they will be particularized in another place.

CAMP FLOTSAM.

VI.—WHAT LUCK?

A RIPPLE on the lake, a whispering among the pines above the white tents, a shimmer of golden heat on the brown hillside and over the dozen lonely graves on its crest, a woodcock running across the path which leads to the boat, a brindle dog winking contentedly, with an eye cast now upon her sleeping mistress in the hammock and then upon the lord of the manor before the tent, whose open folds display the well-ordered folding cot, an array of rods, reeds, clothing and all the other paraphernalia of the angler, these make up the background of a picture whose memory, as Sidney said of the old song of Percy and Douglas, moves the heart "more than with a trumpet." In the foreground the smoke from the remnants of last night's camp-fire ascends in feeble wreaths, an incense to the great god of nature, bearing the adoration of his children whom no church-going bell has summoned here to worship in the wilderness on this Sunday morning. No hymns break the mountain silence, no roll of organs, no creed venerable with its centuries, no litany with its mournful, prayerful cadences suggest the pomp and pride of life, yet above and around an Absolve Te, a Te Deum, a chorus of *alleluias*, murmured by no human priesthood, chanted by no human voices, breathe and swell upon the pine-laden air, a mightier absolution and song of adoration than that which in a thousand sanctuaries, beyond the line of mountains there below, is making glad the hearts of other worshippers. The challenging "good-by" of the owl, which has not long been sounded across the lake, is stilled, the gourd has been relieved, and now, from his sentry-box on the point of rocks above the top-most branch of a dead pine, a great bald eagle keeps his watch and ward. Behind and beyond stand, with steady gaze, other sentinels, to whom no relief ever comes, the frowning, beetling cliffs and crags, whom nothing of storm or whirlwind moves from their posts. Across the blue sea of the sky, with their shadowy counterparts coursing along the green mountain sides below, float the white cloudlets, ships of myth and song, the fleets of Alkinoo's, ever bearing the toil-worn Odysseus to his bride of the dawn; pursuing their daily journey, with never a sail nor oar, without rudder or pilot, over these heights and over all the meadows and cornfields of the earth. Along the stretch of yellow sand the wavelets are playing, loitering away their happy youth, reluctant to join "their mother, the sea," to sing with her the refrain of the time when she should give up her dead. In front open to the wind, the perpendicular white granite rock, along the base of which lie mighty forms, gigantic torsos; here stretched in repose, there piled in heaps, as though in some wild, Titanic conflict on the cliffs above, the final charge, driven on by thunderbolts, had swept hither the rebels to the gods, or, as if that pinnacle were

—The steep Tarpeian, fittest goal of Treason's race. The promontory whence the traitor's leap Cured all ambition."

While the sunlight glints through the foliage and the breeze rustles the leaves overhead, dreams and fancies come and go, until, like the prince under the sorcerer's spell, we scarce know the shadow from the substance. Ghosts of flowers, of foliage, of shadows that were, murmurs of breezes and windraps that have died, songs that have ceased, but of which we dream on forever—who would not be a barbarian for a month with these?

The dream fades, the spell weakens, civilization lays anew its burden at our feet. Our ears, so lately dead to all human calls, begin to drink in the world's song of labor and our hands stretch out, almost involuntarily, to find that which they may do, but ere we put our hand again to the plow, we turn to gather what we may, and perchance in places where we have not strewn.

From the tide of the summer days comes the query, protracted spasm-like, not from the mortal of the city whose generations are to wait the stroke of the pestilence, but from one whose answer is to bring you upon his house and his lineage to an end in blood, but a call ringing in the dawn across the waters of the mountain lake, coming from the lips of earnest anglers, the old, old query, "What luck?" It has come to us through the mists of the morning, in the glare of the noon-day sun and amid the mountain shadows at evening, the greeting which, even in a stranger's voice, is the open sesame to the treasure of the angler's heart. It has been the hall of the youth, the child, the man, the woman, of uncouth beings, in dugouts, engaged in beating the water as though it were a threshing floor; of the swill, twirling his Leonard; and of oily-looking individuals, whose string of two, three and four pounders set one reflecting whether, after all, their day has been one of luck alone. The same breezes have ruffled the water, the same casts have been used, the same bait secured by each, but not the same result.

What luck? None, brothers, none, we gather not grapes

from thorns nor figs from thistles, nor does the cast of a die or the toss of a copper make our fortunes. Success to the angler comes not thus. Luck may be result attained by a net or cartridge, but by the devotee of the rod, never. The answer of the angler, "I have had four strikes and I have four fish in my basket!" is the true solution.

What luck? Ask the youth upon the rock there, whose enthusiasm has already given place to listlessness; inquire of the threshers in yonder dugout, who will leave us they can't, empty-handed; ask the broad hat over there, the graceful, curly and springy of whose Mitchell tells us that even now he is playing a three-pounder, to what extent luck is responsible for their ill success.

However it may happen, luck has come to be the measure of the angler's success, so let us not quarrel over words, for the good old term means much more to him than what goes into his reel. For it is not that alone which accompanies him as he trudges homeward with his well-filled basket, nor that which only comes with the flush of victory as the lordly victim is brought to gaff, but that which is ever upon him, by mountain stream as he hears the rustle of waters among the rocks, by silent pools beneath dense coverings and along flashing brooks with the orchestra of the meadows beating a ceaseless measure, though not a break responds to his casts. Truly has one of our brothers written, "It is not all of fishing to fish;" he might well have added, it is not all of luck to be lucky. Who has not gone home happy from his day's fishing without a scale? Who can ever forget the hours passed in floating down the broad stream, now lingering to cast off the edge of a golden sand, now pausing at the foot of the "riffles," then anchoring abreast of the big rock, now pulling up against the overhanging branches of the old oak, where we spread our lunch, the quiet noonday nap, inhaling the breath of the meadows laden with the odor of lilies, the dreamy splendor of the afternoon sunshine—who has not had days with these which stand out in memory from all the rest as though, beside them, those others were nothing? What luck? Perhaps there was an involuntary wince as we answered the too material inquiry of the loungee by the door of the room by the roadside; perhaps we cast about for an excuse in reply to the home greeting, but was our day out one to be set down among the wasted? Then there was that glorious day on the Binneck, when borne down to our cars, from the gray barns along the hillside, came "the dull thunder of alternate flails," as luckless without a bite, we sat and watched the tide of restless lunacy come and go over the old, long, quaint, covered bridge to and from the older, quarter city beyond, and listened to the tale how, on a mid-winter night, some twenty years ago, the glow of the flames, kindled by savage hands, the tomahawk, did its work, how Adrian Yrooman beat back the foe with slaughter from his door and left a name to live through all these years. The old heroic story roused the bronzed Rector in the bow of the boat and brought tales of deeds done on other fields, of Arthur, of Roland, the Cid, of Roncevalles and Tours, of the struggles between the world's civilization and her barbarism. Ere we lifted the anchor the sun was low in the west; from the square windows in the ancient gables of the city came a fiery glare, which reflected across the water, suggested the "midnight burning red" of her long ago when her pride went down in blood, and, as we keel grated on the sand and we disembarked with empty baskets, we answered the query of the boatman with "never better."

We all remember, too, that other day, so long looked forward to with eager anticipation, which was to be a day of days, in our calendar, a day which came at last when every sign was right, when the gray dawn saw us far on our way to the resting place, where, through the rocky hours, until water was quiet, clear as a mirror, we came and baited in vain, until tired, we drew our boat upon shore and, throwing ourselves about our lunch-baskets, we entered upon the feast of the gods. To one the craps and peaks brought back memories of his own Auld Scotia, and forth came tales of casting on the Tweed, intermingled with folk-lore and legends which outrivaled Tam O'Shanter. Our typical Yankee, not to be outdone, rehearsed his boyhood tales of Salem and of one whom a great, grand grandeur condemned to death because she cast no shadow; then Professor hrested the tide of superstition with a disquisition on tradition in history, from history we passed to letters; from the king maker who, with his sword, made the red rose "redder than itself, and York's white rose as red as Lancaster's," through a century and a half—the grandest of all the years, years of Plantagenet and Tudor, of Ariosto, Titian and Michael Angelo, the age of Spenser, of Raphael and Tasso, of Bacon, Kepler and Copernicus—down to that mightier king maker, the sun, who for four days and nights, crowned with jeweled diadems and another day with a white, white star, made throneless, homeless, not by a lost Barnet but by that crowning we which was "sharper than a serpent's tooth." From tragedy we drifted to song, and under the spell of the Professor's mellow voice more than one floated away into slumber, with the droning in his ears—

"No more, no more
 The worldly shore
 Upraiseth me with its loud uproar!
 With dreamful eyes
 My spirit lies
 Under the walls of paradise!"

Late in the night we rolled into town; the streets were silent and deserted save a little group in front of the post-office, from one of whom came a discordant cry of "What luck?" The reply of the Professor was lost in the rattling of the wheels, but we had more than we knew.

So, in that camp of ours, planted here to-day, there tomorrow, by the side in the solitude of the forest and by lonely tale upon the day of the next, the angler's luck has not been that alone which comes with the merry ring of the reel or the electric spring of the rod. As we gather the flotsam which is ever floating about that peripatetic canvas and call the treasures from the drift, we find not only the victims of fly and line, but those other riches which are always to be found under the open face of the sky, and in the silence of the forest, and that greater luck which is never denied to those who are fishers of men. For into our net which is ever drifting in cove and inlet, on bar, on island, channel, and by the campfire, wherever the angler's will of humanity resort, have come specimens, rare in their oddity, and endless in their vagaries, a group of motley characters who have "strutted their brief hour on the stage" and made their exit with the summer days. Experts there were, too, and philosphers in their own fields. Here was an authority on camping who had never pitched a tent; here one on trout and bass who never angles for anything but bullheads; another was a fishculturer—in theory—who had evolved the

friends, I was at McKenzie on my return home, and remained over one day at the request of Ed. Russell, who keeps a nice hotel there, to see how "his dog Trim" could find birds and he and I could shoot them. Trim did well; Russell shot his 10-bore Parker well, and I my 10-bore passably well. Several squabs of damp shells disgusted me and reduced my score, and at the end of the afternoon's sport he had seven shot. Bob Whites and I only nine and a hawk. He is a good shooter, can beat me, I think, but justice demands that I say he had, owing to his more agile limbs, several more chances than I did. Besides, he is a princely fellow and knows how to be hospitable.

Thus the tour ended. The next train to Nashville bore me away to a point nearer the rising sun. The following morning the smoke of Chattanooga was seen; at midday Atlanta was in sight; at 4 A. M. Charlotte was reached, and that day "the wit bit ingle, blinkin' bonnyly," greeted me in a spot where, in law at least, "I am monarch of all I survey."

I hope before many days to find time to send you a personal communication, in which the peculiarities of my friend Mud will be delineated. He is a gentleman, a man of high moral characteristics, and a believer in the doctrine that "a little nonsense now and then is relished by the best of men." In the goodness of his heart—for nothing else than "the milk of human kindness" moves him—he often gives his friends ample opportunity to "relish" his weaknesses, his eccentricities and his follies.

WELLS.

A BIT OF HOME LIFE.

Some of your bachelor sportsmen, who have ample time, means, and all that, so you can enjoy the open seasons fully as they come about, shooting often and at your will, can perhaps scarcely appreciate such pleasure as I have had during the last few hours; I have simply been getting my traps together for an early start to-morrow after birds; it's to be my first shoot this season. We are only going to drive a few miles out from the city, to a locality we know of haunted by a bevy or two of quail, but my anticipations are bright, and our game are good ones, and my proposed companion is a noted shot who always "finds his luck." Directly after dinner was finished this evening, I tied myself to the attic, which is in part relegated to my use, whither a certain curly-headed little rogue of a three-year-old girl followed, neither waiting or caring for an invitation. That bright little piece of humanity has an irresistible way of making herself free with me or anything belonging to me. Chide her I cannot—for is she not her father's first friend?

As she came climbing up the stairs, she shouted out "What are you doing, papa?"

"Loading shells," I replied. Although the witch had not the remotest idea what was meant, having never seen the interesting process, her reply was quick as thought, "I'll help you, papa." Well she did—in an enthusiastic manner—between us, we loaded fifty shells; I hope they will shoot well. I swept the powder up carefully, but the considerable quantities of number nine shot we spilled over the floor are still there. She thought the shot were funny little things, and hoped that Santa Claus would put some in her stockings. Her delight when discovering, when she stepped on a number of the spilled pellets, that her feet would shoot out from under her as the pellets rolled, was intense. Of course she got a fall or two, but she is full of pluck and not given to tears except on special occasions. It came near one of those occasions upon the appearance of the nurse to take her to bed; it was very hard for her to leave all the newly discovered joys; however, the brave little lady kissed me good-night and was soon asleep.

I have an apology for writing of such little children for such a paper as the FOREST AND STREAM? No! I think not. Did you ever know a typical sportsman who did not love the little ones? I should not wish to "tie to" a professed sportsman, who disliked them. I will wager, if you will select the one among your friends who comes nearest to your idea of what a sportsman should be, that you will find he has a good-sized corner in his generous heart for the children. Among the pleasantest memories that I shall have of a genial sport-loving friend of mine, with whom I have made several hunting trips, are pictures in memory's gallery, of a big man sitting with little children on his knees, to whom he was unknown an hour before; and again the same large-hearted old boy picking the banjo, and singing some jolly songs to the unspeakable delight of an audience composed of several little girls and boys, away up in the pines of Michigan.

DELTA.

DEARBORN, Mich., Dec. 12.

Natural History.

THE WHOOPING CRANE.

THE whooping crane is, to say the least, a fantastic fowl. When marching about on terra firma he appears awkward to the last degree. Judging from the length of his stiff-like legs, one would suppose he was made to run rather than fly; but in spite of his clipper build and striding abilities, he is only a moderate pacer. His manner of taking flight is peculiar. Spreading his wings and stooping down, he apparently runs up an inclined plane of air until his feet no longer touch the earth, then stretching them out behind him, he floats away as gracefully as a racing yacht before a steady breeze.

In fine, calm weather he delights to mount up, in great undulating spirals, to the height of a mile or so, and take a quiet float, while he whoops at his neighbors in the adjoining counties. After airing himself to his heart's content, he descends, sometimes spirally as he arose, at other times with great plunges and wild, reckless dives, until within about fifty feet of the earth when he hangs himself upon the air with his long, spindling legs down, gently settles and alights. During the summer months he subsists chiefly on frogs, worms, snails and roots of various kinds, but during his migrations in the spring and autumn, he develops a decided fondness for corn and the tender blades of winter wheat. At this time he becomes an object of hate to the farmer by relieving his broad acres of sundry bushels of these cereals; thus assisting the elements in keeping this would-be Cressus down to his proper level.

The open prairies and large wheat fields of the Western States are the favorite resting places and feeding grounds of this species during their migrations north in the spring and south in the autumn. In the spring they are rigged out in bran new wedding suits, and then is the time to secure speci-

mens for the taxidermist. In the autumn, after feeding on corn a few weeks, their flesh is quite toothsome and they are considered desirable game.

The hunter who has not slain his dozen cranes is regarded by the native Nimrods as a very cheap affair, a common three-center. As to what kind of animal or fowl he may have done to death previously, he is not entitled to hold the horn of an expert until he wears on his belt the scalps of a round dozen cranes.

In the cool, hazy days of October, they come down from the north in flocks of all sizes. Let one flock alight upon an open prairie, or broad wheat field and more will soon follow, until a congregation of one to five hundred are gathered. Then there is fun in the air. Cautious are held resulting in great excitement and sometimes blows. Old jokers swap lies, and their shouts and whoops wake the echoes for miles. The "heely" crowd hilariously dance the latest crane fandango, with variations *ad infinitum*, and do their utmost to out-whoop the old jokers.

Judging from the noise they make, and their apparent indifference to their surroundings, an embryo Nimrod might suppose he could, by exercising a little caution, approach near enough to do some fatal work among them. Let him try it! No matter how much fun is going on, or how great the noise, keen-eyed, watchful eyes sentry sentry are ever on the alert to give instant warning of approaching danger. A single *car-r-roo* from one of the wary wits will silence the whole flock in an instant, and hundreds of eyes, keen as those of an eagle, are scanning every object near and far. If satisfied it was false alarm, the revelry begins again, but the number of sentinels is more than doubled, and it is an utter impossibility for the hunter to get near enough for a shot, unless he can keep himself entirely concealed from view.

I have sometimes endeavored to approach a small flock, under cover of a bush, but one of the sentries would be morally certain to elevate his head high enough to see me. A warning *car-r-roo*, a few long strides, and the flock quietly sails away.

The flesh of a young crane is good. It is juicy, tender, has a fine gamey flavor, and is, in my opinion, far superior to most venison. The flesh of an old bird is similar to old boot sole, and about as palatable. If, however, the breast alone is used, well cooked, treated with pepper, salt and onions, and served with hot corn bread, butter and coffee, no hungry hunter will turn up his nose at it. I have been hungry enough to hold the thigh of an old crane over a fire until cooked, then gnaw the meat off and think it was equal to the finest beefsteak I ever tasted.

Cranes generally build their nests in the open swamps. They are made of grass, rushes and roots, stuck together with mud, and stand about six inches above the surface of the water. Two eggs are laid, and the female does the greater part of the hatching. She spends about half an hour each day swallowing frogs, worms, etc., during which time the male obligingly takes her place on the nest.

Soon after the chicks are hatched they leave the nest and follow their parents over the swamps and prairies in quest of food. They may occasionally be seen at a distance, but let a person approach and they vanish like the "little joker." I once succeeded in catching two on the open ground. They are covered with a dingy yellow down, and look like great overgrown chickens.

Though the crane is a very shy bird, and carefully avoids all suspicious objects, he is not a coward by any means, as any person will discover if he wounds one and brings it to bay. Rather than come to close quarters with one, I prefer to reload and give it another shot.

I once broke the wing of a very large one, and sent a green Dutchman to bring it in alive if possible. It was upon an open wheat field, and as the man approached it assumed a defiant attitude and cleared its decks for action. The fellow came to a halt about ten feet from it, and stood there shaking his fist and swearing at it. I called to him to bring it along, and he dashed in, a cloud of dust arose, and there appeared to be considerable difficulty in the midst of it, but presently Tony appeared holding the crane by the legs and neck and smiling triumphantly. Three deep scratches on his cheek and a hole in the back of his hand testified to the crane's prowess.

At another time I crippled one of the large white species by breaking a wing. As it was marching off rather rapidly, I sent a little rat-terrier to bring it to bay. No sooner did the dog come up with it than it turned about, and quick as lightening drove its long sharp bill clean through him, killing him on the spot.

One of the best methods of capturing them is with a steel trap. The trap is set on the highest part of the wheatfield, securely fastened to a stake, entirely covered with the mellow earth, and shelled corn scattered plentifully about. When one is caught it should be attended to at once or it may twist its toe off and escape.

One day I told a small boy to take a stick and drive a large flock of cranes off the wheatfield, and if there was one in the trap to kill it. Good half an hour afterward he returned blubbering like a good fellow. "What's the matter?" I asked. "That-th that crane hurt-hurt me!" "How did he hurt you?" "He picked me!" Upon examination I found the crane had "picked" him severely on the arm. After having it bound up he told me how it happened. Said he: "When I got there, he was sittin' on the trap, an' lookin' tame like; so I walked right up, an' just as was going to hit him, he come at me quicker'n lightning, an' hit me 'awful whack on the arm with his picker, an' on the head with his wings, an' knocked me down." "What did you do then?" I asked. "I got out o' that mighty quick an' then threw my club at him an' hit him in the stummeck, an' you oughter heard him hiss! He just fized, an' his eyes looked like sparks of red fire!"

On going to the trap, I found the captive was a very large male bird, and a formidable antagonist for even a man to attack.

Cranes have such a great fondness for corn that they sometimes seem to forget their customary wariness in their desire to obtain it. That which has been cut and put in the shock seems to suit their taste the best, and a flock of them will destroy as much of it as a drove of hogs.

One season I had about a dozen shocks in a field near a swamp. The winter rains having made the ground a bottomless mire, I was unable to haul it off, so the cranes levied upon it. One day I took my little single barrel gun and went down to the shocks. I was leaning against one of them trying to invent some story by which I could keep the cranes away, when I was suddenly startled by a loud rustling on the opposite side of the shock. I started quickly around, and a crane bounded fully fifteen feet into the air. I fired on the instant and shot both his legs off short. He wobbled

about considerably, but managed to keep up until he passed out of sight.

After resorting to all the plans I could think of to save these shocks, without success, it occurred to me that I might try a new trick, so going down before daybreak one morning, I concealed myself inside one of the shocks, then stripped the husks from a large ear, still leaving it attached to the stalk, and placed it where I could easily cover it with my hand.

Soon after daybreak a large flock came to the shocks for breakfast. Three or four of them—one a whopper—espied the ear I had husked and displayed so temptingly, and they went for it. My hand was close by it, and in an instant I felt the whopper by the neck. Then was there a great tumult! The crane was game, and he apparently knew how to do better. Had I stayed inside the shock and worked on his neck, all would have went well with me; but in an unfortunate moment I came out and kicked him in the breast. The ground being miry, I got my legs tangled and went down on my back, and the crane boarded me. I yanked, and jerked, and yelled. The crane seemed to be all legs and wings, every one of which hit me like a pile-driver thirty times a second. I soon cried "sufficit," and let go. He eggs and a few struts, shook his head a few times, looked about in a bewildered manner, then spread his wings and quietly sailed away, and I went home and applied arnica to my bruises.

MORRISONVILLE, Ill.

A DECEMBER TRAMP.

IT is a bright, glorious day in December—all nature seems in repose—no part to a cloud is to be seen overhead. Such days are sometimes saddening when we look abroad to old winter will soon be on hand. Our city friends have long since left us for the pleasures and comforts of the town. I stand contemplating and thinking of the rambles and pleasant excursions of the past season.

Why should there not be pleasure in such a day as the present? and, although I am alone, I determine to try it. Grasping my breech-loader call I to Ponto—no, I'll not leave him, I'll go alone. So I sneaked out the back way, dodging behind haystacks and barns, and succeeded in getting away without my poor Ponto seeing me.

In passing a heap of old brush, just back of the barn, I hear the loud, quick note of some bird. I stop and listen; once again, and there right before me hopped out a wee little brown bird, with the smallest tail bird ever had, which it throws up so cunningly, and don't it scold loud! How saucy! Who ever would think such a noise could come out of such a wee thing. How it jumps in and out of the brush heap. Now it's gone; no, there it is again. It is the winter wren, one of our very small birds, only seen with us in early winter. It is much smaller than other wrens.

After passing over grain stubbles and pasture fields, I reach an open wood lot. Those active little friends, the snow birds, have accompanied me so far, dinging their pretty white tails and twittering loud and musical. They seem to be happy birds, and only appear with us after the leaves have fallen, and return north to their breeding haunts in early spring. Presently I hear another sound and now I see with the snow birds their winter companions, the tree sparrow, with its rufous head, and white bars on its wings, and which comes to us from the north some time after its companion. With the flock I notice one or two sparrows, with pure white throats, brown and black striped plumage and yellow and white stripes over the eyes. It is the white-throated sparrow, with us spring and autumn, and one of the handsomest of our sparrows. What is that loud noise of leaves rustling? I go on tip-toe and under a thicket, see quite a large bird, jumping and scratching the leaves behind it, and picking up some handy worms—what a beautiful rufous-red rump it has, and its breast looks somewhat like that of a thrush; a twig snaps under my feet, and my pretty scratching bird flies from me glistening in the sunlight, I recognize it as the fox-colored sparrow.

I now hear a distant cawing of crows, and, while walking through the open, I see far up overhead for five or six of our black friends attacking a hawk. How they dive at him, uttering their hoarse cry. Now the hawk comes downward, followed by all his pursuers, and as he sails by I see that it is the red-shouldered hawk, a cousin general to the red-tailed hawk, but somewhat smaller. He pre-emptly alights on a tall hickory, and the noisy crows soon leave him in his dignity.

I saunter on, looking upward and about. Hark! What hammering is that I hear? It comes from that dead tree ahead. Ah! I see. Is it possible such a little bird can make such a racket? It is looking for insects. He is gayly dressed in black and white, and has a brilliant red cap on his head, and so soft that his name is the downy woodpecker. On the same tree I see, peeping round from the other side, a bird much larger, but with the same gay cap and marked with the same plumage, and as often as I walk around to have a view of him, around he goes about the trunk of the tree. With a loud cry he flies off in a wavy manner to the wood beyond, and I see it is the downy's big brother, the hairy woodpecker.

I now come to a steep side hill facing the sunny south, and there I sit on a fallen tree and dream of past scenes; a little rivulet is rippling by my side and a witch-hazel bush is still in bloom nearby; far off rise the hills, and I see a black to twig, heads up and tails up, in all kinds of positions—regular little acrobats—all the time calling out their own names, "chickadees." Every one loves them, and in warm, sunny places, in open wood lots, you will see them all winter.

But I hear a different song, so very low and sweet, it cannot be our little chicks, who are now all about me; so close are they, that I could touch them with my hand, not at all timid. There again I hear that sweet, gentle note, and there I see a little fellow much smaller than the chickadee, a bird in olive shades of plumage and a bright red crown, and so active, here, there and all over. He is generally with the chickadees, and is one of our smallest birds, and is called the ruby-crowned kinglet. Every thing is suddenly still, and my little friends are motionless. The cause is soon told, as I recognize the beautiful little sparrow hawk darting among the bushes after his prey. I seize my gun, instinctively put my hand in my pocket for a cartridge, when I make the discovery that I have none with me. I am helpless, but my motions are so slow and so silent to my little pets, as I see their unsuspecting enemy sailing away in the distance.

What a noise the bluejays keep up!—still they have a dreamy kind of a bell note these sunny days, and what a beautiful bird they are, with their splendid blue and white

plumage, and their loudly crest—how they courtsey and dance while uttering their harsh cry. "Hark! now they, but dreamy" and pleasing in a little distance. I now come to a piece of heavy timber; the ferns are still green and beautiful, and how handsomely are the mosses and lichens on the trunks. How perfectly still everything seems, the summer leaves by thick on the ground, damp and moist. On a distant treep I distinguish a yellow-bellied woodpecker, not a very common bird in our neighborhood. It is one of our handsome woodpeckers, having a brilliant scarlet throat and crown, yellow on the sides of the back and shoulders. It is very noisy in the breeding season.

What distant pulsations is that I hear? Ah! it is two years since I have heard you before! The drumming of the ruffed grouse, a sound delightful to the sportsman's ear, and strange and mysterious to others. I stop and listen again. It is repeated, you cannot tell where it comes from, whether near by or afar off. I wander on, thinking and dreaming, until startled by a whir of wings close by my side, and I see Mr. Grouse making for a thicket ahead. Bringing up my breech-loader in position for a snap shot, but remembering its innocent condition, confine on sadly until I meet a pair of antelopes in their quaker costume, running up and down an oak oak. What snaky little fellows they are, looking at you with their heads down! What pleasing recollections they recall of childhood—the little sap-sucker as we called them. How often in midwinter, when the ground was covered with snow, they would fly about the garden, and I now come to another open spot beyond the timber, cedar trees with blue berries thickly scattered about, and feeding here and there I notice a small flock of waxwings (cedar birds). What can be more beautiful than one of these birds in full plumage—how soft and blended are the colors, with the tips of the tail and wings finished with scarlet—with a band of bright yellow on the bill, and a black velvet hood about the head and a little crest. Thus no song, but simply a twittering whistle. Just after leaving the woods, and I notice some small birds flying about on the bushes, keeping together more than birds generally do. I soon see their heads glistening with crimson, and know them in a moment to be the redpoll linnet, and as usual, I see the goldfinch with them—not in his splendid summer plumage of yellow and black, but in more sombre gray with white-tailed wings. Cheerful little fellows, they have the same note as in summer, but they sing as they fly.

As I approached better habitations I hear our sweet bluebird, the American bird, dressed in our national colors, red, white and blue; and what beauty is that flashing red in the sunlight of about the same size? It is feeding on the seeds of some tall weed. I creep up softly, and there I find a male of the purple Finch in full plumage—"crim-on-inch" would have been a better name.

I am homebound across the meadows, and the short day is coming to a close. Ahead of me, skimming over the field, is a large hawk of a bluish slate color, whitish underneath. It flies quite close, darts on the ground and immediately raises with a mouse in his claws. It is the marsh hawk, one of the few birds of prey that breed on the ground. There goes a meadow lark over the meadows. How bright is his golden breast and black crescent. Now and then one or two will remain with us all winter, but most of our summer birds migrate, leaving us a single pair of white throats on a bunch of wild grass, and with a whirl of wings drops from the bushes beyond. Poor bird, have all your companions been slaughtered? Take care of yourself until the New Year, when your season of rest is at hand.

I hear a loud clear note high up on that ash in the fence row—clear and bell-toned—there it is again. I stand perfectly quiet. It is again repeated near. I walk carefully to the fence, and there up in that slender oak, I see a small golden colored bird, with a very pronounced pointed crest. There, he sings again—how clear and loud. It is a tufted titmouse—not a common bird with us, but a few remain all winter, and in the spring their beautiful clear whistle is heard for a long time. It is of the same family as the chickadee, but very dissimilar.

It has now become dusky: one of our old familiar friends, the song-sparrow, starts up with a chirp from the fence corner to welcome me home. Just before I enter the house, I can distinguish in the gloaming, a little thrifted owl silently flying past. I put up my gun, sit up to the fire, and think of the beautiful world we live in.

OLD TENNEY.

NOTES BY A LION TRAINER.

Editor Forest and Stream:

In your issue of Oct. 18, I saw an account, signed "Eye Witness," of the way in which I have tamed and trained lions, tigers, etc. The account is interesting enough, but fails in detail, and really gives no accurate information as to how the training is accomplished. Not every man can succeed in this work, for it not only requires a quick eye and steady nerve, but also a peculiar sympathy with animals, which is inborn and not to be acquired. I began as a boy in teaching tricks to small animals, and tried my hand upon a bear which, as a cub of six months, was procured in Canada, and succeeded very well. "Jack" was the wonder and delight of the neighborhood.

My first experience in lion training was in Hamburg, Germany, where I became intimate with a professional man, owner of a "Handels Menagerie," where all the animals are for sale. He had a group of five lions and a bengal tiger which he was training for a circus. The animals were all young, varying from eleven to eighteen months. Yielding one day to my urgent entreaties, but with the warning to keep close to him, he let me enter the cage with him, and from that hour dates my personal experience with the "king of the forest." After my first trial, I went in several times with Mr. H., and began to understand the art, and when, soon after, he was called away to Berlin on business, I undertook to keep the beasts in working order by myself, and brought them on very successfully. The animals were all groups, one of six lions and a leopardess, and the other consisting of four lions, one tiger, and one jaguar.

It is less dangerous to train lions bred in freedom than those bred in menageries or zoological gardens. This may seem at first very improbable, but when one remembers that the animal in his wild state is utterly unacquainted with man, whereas his captive brother from his birth has been stared at, teased and tormented by him, one can well understand how much more readily the latter "contempt" in this case as stand how "friendly" he bred. Lions born in captivity learn their tricks more easily, as they are more accustomed to their cage and to being looked at, and their attention is not so easily diverted from the trainer.

The cage in which one tames lions is from fourteen to

sixteen feet long, nine and a half to 10 feet in width and eight to ten feet in height. It is a mistake to have the cage too large, as it easily increases the danger to the trainer. The great danger and the one most to be avoided is letting the animals get a chance to spring at you, and to prevent this, one must keep as close to them as possible. Of course, being so near, the trainer is often clawed, that is, hit at with the paw, but this makes only a flesh wound, whereas, if the lions have room to make their spring, the man receives their weight as well as the blow, which being nearly always directed at the head, is generally fatal.

There is very little truth in the popular idea that the human eye has great power over lions. It certainly makes him uncomfortable to be looked at steadily, and he will turn away his head, but this is only for the reason that his eyes being further apart than ours, the concentrated effort at sight makes him squint, which, as we all know, is strained and unnatural. How is it possible for a trainer to keep his eyes fixed at the lion? It is generally fatal, and only upon the power of our eye we should soon make for us, for the lions, a chance they would not be slow to avail themselves of. No, the whip is the trainer's chief reliance, and it cannot be used too freely. It is made of plaited leather, without lash, and is from two to two and a half feet long. I have tried the effect of electricity upon animals as a means of training, carrying a small battery in my pocket and running the wire down through the middle of the whip so that when the whip touches the animal he receives the shock; but this did not succeed, it excites them so much and they are so afraid of it that they cannot steady down to their work.

Before entering the cage I generally throw in a few handfuls of sawdust to prevent slipping. It is important to enter as quickly as possible and to have a man ready to open and shut the door. The most dangerous part of the whole performance is in making one's exit, which must be done very quickly. To prevent the lions trying to get out with you when they see the door open, they must first be driven to the far end of the cage, and this gives them the opportunity to make a spring, a chance which they are not slow to improve, and many a life has been lost at this final moment, when to outside eyes all dangers have been overcome.

To make a successful exit, after driving the animals to the further end of the cage, the trainer grasps the door and toward the door, cracking his whip and keeping his eye fixed upon the animals. As he touches the door, the attendant, who is waiting outside quickly throws it up; in one backward step he has passed through, and it drops again, and only just in time to clear the advancing foe who comes with wild spring to take his revenge. It is difficult to make the spectator believe that in this, apparently the easiest part of the entire performance, really lies the greatest danger of all.

In performing a "group," it is better to put the animals together while still young so that they may grow up together. The first trick taught is to jump over a hurdle at the word of command, then to spring through paper-covered hoops, fire hoops (covered with cotton wool, soaked in spirits and ignited), to lie down together, forming a couch, upon which the trainer stretches himself at full length, opening their mouths with a stick, and, finally, to do other tricks. Those of the fire hoops are the hardest to teach and involve the most danger to the trainer, for if a drop and the burning fluid falls upon an animal he is wild with pain and rage and turns upon his tormentor. My three most serious accidents have happened in this way.

Lions need very careful handling, and it may also be of interest to some of your readers to know some of the details. The temperature of the lion's cage should always be kept at 14 to 18 Réaumur. Straw should be put in the cage at night and taken out again in the morning, and replaced by a few handfuls of sawdust. Great care must be taken to keep the cage clean and perfectly dry. It is better to feed the animals twice a day, giving them at each meal about seven pounds of meat and bone, horse flesh is generally used for the purpose. They should also be given from three to four quarts of lukewarm milk every day.

Lions have a calving cycle of a year, and from two to five cubs in a litter. Two or three days before the cubs are born it is better to put the lioness by herself, and to close up the front of the cage with planks, or by simply covering it with a rug, so that she may be as little disturbed as possible. The young lions will already, at six weeks, begin to try to chew at the meat given to the mother, and at two months can eat the softer parts of it.

There is little to be said about the young lions until they have reached their ninth month, when they begin to shed their teeth, which is the most trying time for them. In some cases the first teeth need to be removed, but by giving them hard bones at this time they generally can bite them out by themselves. They reach their full growth at about two years, although the mane of the male takes four to five years to come to perfection.

J. S. W.

NOXIOUS INSECTS.—Bulletin No. 3, issued by the Division of Entomology of the U. S. Department of Agriculture, is at hand. The very excellent work done by this Department under the charge of Prof. C. V. Riley, entomologist, has commended it to agriculturists throughout the United States, and it cannot be doubted that the publication and dissemination of papers like the present one is of the greatest benefit to the country at large. The first article in this number of the Bulletin treats of the adaptability of the army worm to diverse conditions, and of the damage done by this species to cranberry vines in New Jersey; the results of a series of experiments with *Pyrethrum* (insect powder) on a number of different species show that while certain insects are speedily killed by the application of the drug, others survive for considerable periods of time, and others still are not in the slightest degree affected. The second article, by Dr. W. B. Davis, is an article in the present number treating of certain insects which are injurious to forest trees, and gives some interesting information in regard to the spruce bud worm, the ravages of which have been so severely felt in certain lumbering districts. To the cotton worm two articles are devoted, one by Dr. E. H. Anderson on the Cotton Worm in South Texas, the other on Experimental Tests of Machinery designed for the Destruction of this Insect, by Dr. S. B. Murray. The observations of both these gentlemen were mainly devoted to the discovery of the cheapest and most effective method of destroying the worm. The article on the tree-borers of the family *Cossidae* is an unfinished report of the late Dr. James S. Bailey of Albany. In Dr. William McMurtrie's Tests of Silk fibre from Cocoons raised at the Department (of Agriculture) the interesting fact is brought out that the fibres taken from the larvae fed exclusively on

orange are somewhat finer and not less strong than that obtained from specimens fed wholly upon mulberry leaves. Some beautiful plates adorn the Bulletin: two of them being devoted to figures of different species of *Cossidae*, and the third to photographs of the silk fibre.

HETEROLOGOUS PLATHYRHINUS NIGER IN SOUTHERN NEW YORK.—On Oct. 8, 1882, I was fishing for black bass with Mr. Geo. Ayles in Crotan Lake, Westchester county, N. Y. Some two miles north of Pine's bridge, where the lake is about one hundred and fifty yards wide, we saw a snake swimming toward the east shore. At first I thought it was the common water snake (*Tropis*), but its appearance was somewhat strange, so we landed after, and succeeded in catching it with aid of our wading net. It was a large specimen of the black variety of the flat-headed adder. The color was of a uniform black, resembling closely that of the black snake (*Batrachium*).—A. K. FISHER, M. D. (Sing Sing, New York.)

LABRADOR NOTES.—The last signature of the Proceedings of the United States National Museum contains a paper entitled "Notes on the Natural History of Labrador," by W. A. Stearns. The notes consist of very slightly annotated lists of the mammals, birds, fishes and plants of the region referred to, and represent the observations of a year's residence and two summer trips along the coast. Of the mammals forty-four species and varieties are noted, with brief comments as to their abundance or scarcity. The polar bear is given as very rare, and occasionally seen on blocks of floating ice in the extreme northern portions. Two reported instances of the capture of the walrus are given. The barren ground and woodland caribou are both conjectured to occur, though it is perhaps doubtful if the former does so. One hundred and eleven species of birds are reported, some of them, like the wood thrush, on what is apparently insufficient evidence. The nest of the king eider duck is said to have been seen by an acquaintance of the author.

Game Bag and Gun.

THE "OLD CLUB."

THE last thing I did before sitting down at the desk was to take my gun out of its case for the first time this season, in order to oil it for the morrow's sport. 'Tis such a gun! You ought to see it! The mere sight of the ungainly thing would probably make a modern, aesthetic gun connoisseur give up his snicker. I could tell you of my friend, who is a blunderbuss. Ten years since, when new, it was a symmetrical, 10-gauge, 9 1/2-in. piece, with 22-in. barrels; it shot well, better than any other gun it has been my luck to own. Nine years ago I ousted it near the muzzle, necessitating the cutting off of six inches, making the barrels twenty-six inches long. Some one advised me to have this done as I was about selling the apparently ruined arm, for a ten dollar note: the barrel was cut off and choked by an expert, and the ungainly, clumsy-looking, big-little, ill-balanced weapon stood as hard, may harder, than ever. I am and have been ashamed of it for years; have abused it always; have ridiculed it, but, notwithstanding, have all along had a sneaking regard for the honest old, never-failing, saved off gun. It is as light to-day as it was ten years since; there is not a harder shooting piece in town, but I suppose the old friend will have to go, for I had told an old friend of mine, a Richardson man, the other day that fitted me perfectly. The old gun did not fit at all. Now could it fit anything with such a shape as it is? Still it throws shot wickedly and has faithfully served me. It was no fault of material or make that it burst. It was my own fault primarily in allowing others to load shells for me, mainly, however, it was the fault of a certain gun concern who were extremely or rather culpably careless. Possibly my experience may benefit some young sportsmen, so allow me to give that important episode of the "old club's" history. Nine years ago this last fall an enthusiastic friend of mine induced another enthusiast and myself to join him on a deer hunt. Neither of us had ever shot at a deer, but each was anxious to try it. Many were the arrangements we made; every suggestion, whether reasonable or not, was acted upon; libraries were ransacked and all books pertaining to deer hunting devoured with avidity, each of us kept memorandum books in our pockets in order to add to the long list of articles we imagined would be needed, any particular thing we might chance to think of. After due deliberation, we decided to place our reliance upon shotguns rather than rifles, although the latter arms were also to be taken with us. The subject of ammunition was canvassed thoroughly, three-wad cartridges inspired for in those days were ones, but neither were to be obtained, and our disgust was great, as in our innocence we imagined that unless our guns would carry from 150 to 200 yards we could kill no deer. Finally the gun dealer came to our relief, proposing to load our shells with concentrators that he claimed would hold the buck-shot together for a great distance. His plan was to take the regular 10-gauge shell, load it with the powder, then place the buck-shot in a 13-gauge shell, or rather part of one, and slip the section so filled with buck-shot inside the 10-gauge, the idea being to shoot the 12-gauge section bodily out of the gun, expecting it to break or scatter some distance off. This style of loading looked to us correct, so we sent our guns to the store and the shells were loaded to fit them.

When the time at length came for the start the ideal hunter would have laughed long in his silent fashion to see the amount of damage three wad cartridges would inflict had gathered together in ten days' hunt. But how much more amused would he have been when, having secured a guide (he proved to be a nature's nobleman), those three young fellows stepped out of the tavern in a certain Northern Michigan town equipped to go into the woods. Rifles, revolvers, guns, hatchets, knives, were all fully displayed. As one of the spectators afterward told me he "actually tried to find a place on one of us where something like a case could be put, but failed." The other party was very small in stature, and he stepped forth shrouded under an immense sombrero that he had got, no one knows where, with a heavy, large shirt worn outside his pants as a blouse and belted tightly around, large top boots on his slender feet, an immense revolver thrust in his belt, and hatchet and knife hanging from it, carrying his gun over his shoulder, with a small rifle slung across his back, the apparatus of a great gun-slinging lumberjack. The other party was a young fellow, finally turning to the other with the remark as he pointed to our friend, "I say, Hank, what is that? Step on it and see if it's alive."

whereat our friend was indignant. After all, however, every one we met on that trip was very kind, indeed, all interesting themselves to help us in our quest of sport in every way possible.

Our guide and two or three dogs went with him, so the first morning, after reaching camp he led us on rianways with the usual instructions. Within a few moments the bounds gave tongue, and in a few minutes more I heard a crashing and saw a magnificent buck coming my way on the keen jump. I had heard of buck fever, but was not at all excited, so I kept him covered with my gun as he came directly at me, feeling sure that he was mine. When he was twenty yards away I stepped quickly out from behind a tree; he saw me and turned suddenly; as he turned I held for his shoulder and aimed. The loud report of my gun surprised me, but the sound of that deer still running surprised me much more. I stepped aside to get out of a dense cloud of smoke in order to give the swift jumping deer the other barrel, but quickly concluded not to, for a look along the line of my piece showed the right barrel, the one I had shot, to be bursted. For six inches from the muzzle it was torn away from the rim, and was left at nearly a right angle to the other tube.

On the side of the bursted barrel a large iron showed the place where the charge had escaped. No wonder the deer was still running, the shot had passed neatly over my head and into the air. The bullet passed in the direction of the game. I was at first dumfounded, and could not comprehend what caused the disaster. My friends suggested dirt or mud in the muzzle, but I was positive there had been none. Then I examined the shells and cut one open and chambered the 12-gauge filled with shot in the muzzle of the other barrel. I could not drive it through. My gun was choked too much to allow it, and the "mystery" was solved. It was a lesson not to be forgotten. Too much care cannot be used in shooting buckshot on a choked gun.

Now it's time to "turn in" as our nautical brothers say, but I do wish in closing that the "old club" was more symmetrical, then I would keep it. It's my intention one of these days to have a neat cabinet made with glass sides and doors, to place in my library or dining room in which to keep my rifle, shotgun, fishing rods, etc. Such a case could be gotten up of handsome design, and it would with its contents be a unique article of furniture; the contents would be kept in excellent condition, and the top of the case or cabinet would serve as an appropriate place for mounted specimens of game birds or small animals. But how out of place that old gun of mine would seem in such an aristocratic affair! Yes, friend Havens, I guess you can sell me that twelve-gauge hammerless. DELTA.

DETROIT, Dec. 12.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I have owned a good many rifles, but have never been sufficiently charmed with repeaters to invest a dollar in them, I, however, own one repeater given by a friend. This is a Winchester .32, and is a very handsome and well-made little rifle, and the one that I would select if it were a question of squirrels or woodchucks. When it comes to very heavy charges or woodchucks, I must confess to a certain fear of them. In an excellent condition, and the top of the case or cabinet would serve as an appropriate place for mounted specimens of game birds or small animals. But how out of place that old gun of mine would seem in such an aristocratic affair! Yes, friend Havens, I guess you can sell me that twelve-gauge hammerless. DELTA.

"The board decided that the inventor might correct this defect of construction, when the test would be confined." On the second trial: "At the fourteenth shot the gun broke down." A third trial having been granted, the report reads: "It was handled in the safety test by the inventor, in firing which, at the sixth shot, the receiver bursted, breaking the gun in two—the butt falling on the ground, the barrel being retained in the left hand of the operator."

Concerning the other lever gun, the report reads: "On firing the forty-eighth shot, a cartridge exploded in the magazine." This gun was re-entered and at the second trial again came to grief. At the fifty-second shot, "after renewing the cartridges in the magazine, the third cartridge from the chamber exploded in the magazine. Doubtless due to the effects of the recoil on an over-sensitive double." Concerning accidents all occurred when shooting the ordinary service charge, (.45-70-405). It is proper to state that neither of the guns referred to was a Winchester. This company did not enter one of the guns bearing their name, but instead a bolt gun. The bolt guns stood the various tests in a much more satisfactory manner. In almost all of them, however, the cartridges in the magazines showed evidences of the effects of the recoil. When we remember the fact that a shogun the firing of the first barrel often loosens the wad in the second, we must not disregard the effect on the cartridges in the magazine of a repeater, especially when arranged in Indian file, as in the Winchester. If now the recoil is materially increased, as it would be in "D. M. B.'s" 40-90-500, the danger of accident is likewise increased. It would certainly be interesting and instructive to have a "wear and tear" trial between some of the lever repeaters that were not entered in the government trials. Will the Winchester, Kennedy, and Ballard rifles enter? The trials should be confined to the rifles of the largest calibre, and be conducted under the supervision of competent persons, and much in the same manner as the late government trials. Let either of these makers construct also a 40-90-500 repeater, and subject it to a similar trial. If it stands the repeater, we will all of us know more about the matter than any of us know now.

Until such test is made, however, I should certainly prefer the loss of a head of game occasionally, to the chance of loss of my own.

"D. M. B." objects to the recoil of the English express rifle. Ninety grains of powder would be a fair charge for a .40-cal. express, with a bullet weighing about 250 grains. The recoil would be much less than that of "D. M. B.'s" own cartridge, owing to the lighter lead, slower twist, and shallower grooving of the English gun. The reason that so many express rifles are rusting in the corners of Western cabins, is undoubtedly due to the fact that most of the express rifles

brought to this country have been of too large calibre. There are indications of a change in that respect on the other side of the pond, and I am reliably informed that a .32 express is becoming a favorite for English test-stalking. The 16 and 12 bore of a few years ago are being replaced by 40 and .45 cal. express, and the recoil of these weapons is by no means severe, being considerably less than the recoil of the ordinary military rifle. In a single or double rifle the recoil is a secondary matter, as there are a variety of devices for reducing it to a minimum. The purchaser can choose between the expensive Silver or the cheap Holton pad, either of which attached to the rifle will permit heavy charges to be shot without discomfort.

"D. M. B." speaks of an express bullet with a very small hole. If he will send me an express bullet through you, I will take pleasure in forwarding for his inspection a .45-cal. bullet, weighing 245 grains, the hole of which is much smaller than usually seen, and which bullet is one of a lot that has been freely sampled on grizzlies and other large game, by your former correspondent "P." This ball, with a hundred grains of powder behind it, I believe, "P.'s" favorite projectile for such game.

"D. M. B." objects to my giving preference to English express rifles, and thinks that American rifles are just as good, if not a trifle better than the English. Comparing our rifles as a whole with the English, I think the facts warrant the claim that, for short and long range, cleaning between shots, our rifles are greatly superior to the others; that for both short and long range, shooting dirty, there is very little, if any difference; that in military rifles ours are superior. The Springfield (.45-70-405), has less recoil (10 foot-pounds) than the Martini-Henry (45-87-489), the recoil of which is 12.5 foot-pounds. The former is the more accurate, and has the flatter trajectory. In the matter of sporting rifles, however, for short range, it certainly seems to me, that a double-barrel .45-110, with a hollow pointed bullet of medium weight (say 350 grains), would on the whole be more useful than any American single rifle, and probably safer than a repeater of equal power. GREENBORN.

Editor Forest and Stream:

Much is being said just now about "high curves," penetration, proper calibre, etc. In your last issue I notice a call for a 40-90 magazine, and frequently opinions as to the best rifle for large game.

I believe sportsmen are frequently exhorting by the question, "What rifle shall I buy for deer shooting?" I for one have been. After years of experience with the rifle I feel that I can give some suggestions to the Fraternity.

As a general thing, ammunition for our sporting rifles is loaded with too much lead—over-loaded. There should not be a larger ratio than 1 to 3, or 1 to 3 1/2 between powder and lead. Many sportsmen use rifles chambered for the government ammunition, with a powder and lead proportion of about 1 to 6, which, no doubt, is about correct for the purpose intended—a long steady flight and great penetration. For hunting, the trajectory of this ammunition is entirely too high; I believe about 11 in. at 200 yds. High trajectory necessitates frequent adjustment of sights, and frequent change of sights brings very frequent misses.

A ball of 300 grains is heavy enough for deer, black bear, caribou and even elk, and by loading such a ball on 85 to 90 grains of powder, the government shell, the trajectory is reduced at least one-half and the penetration is still sufficient for ordinary game. The recoil will not be as unpleasant as with the government load.

The recoil of a 40-90 rifle with a 380 to 500 grain ball to most men is unpleasant, and in a magazine rifle, where quick shooting in various positions is necessary, would be a serious objection. Better than the government shell is the 45-75 bottled. It has greater capacity and being bottlenecked has another advantage in major ways.

Why do not more of us use rifles giving a bottled shell? I find them just as durable, and giving no more trouble from sticking than with the straight shell. For deer shooting I load these shells through a 24-inch tube with 90 to 95 grains powder and a very hard 300-grain naked ball, and shoot them from the new Whitney Kennedy 45-75 magazine rifle, and get the very flattest trajectory to be obtained from a magazine rifle. Few sportsmen know that the Kennedy is now made in 45-75 and 50-90 calibres, and I am sure they cannot do me wrong in the rifle. For strength, simplicity, accuracy and workmanship they have no superior. B. H. INDI.

GREENBORN.

Editor Forest and Stream:

In your last issue "Greenborn" expresses a fear that the systems now applied to repeating rifles will not admit the use of a 40-90 cartridge. (The 40-90 Sharps and Remington specimens using 370-grain bullet is three and a half inches in length). "Greenborn's" fears are unfounded. I am informed from a reliable source that a repeater of this description will be placed on the market in the course of a month or two. It will not, however, use the regular 40-90 ammunition, but a special cartridge, with a bullet three times the weight of powder. I do not know whether a 370 or 500 grain bullet can be used, but should think it could if loaded into the barrel. But why should a heavier one be used? The curve would be higher and the recoil heavier than with the lighter bullet. The term "express" would hardly apply to a 40-90-500 cartridge. The 500-grain bullet might be best for the grizzly bear (grizzly bear hunters are rather scarce), but I think that 300 grains of lead in the right place is better than 500 grains somewhere else, and it is large enough for any game in the United States. The cartridge in this repeater is backed by a breech action as strong as the Remington. Sportsmen wishing a magazine rifle of this description can soon have their wishes gratified. STRAIGHT SHOOT.

GREENBORN, N. Y.

Editor Forest and Stream:

I am decidedly in favor of the repeater, but the .44-cal. I don't like, and the .44 with 40-grs. powder is not effective enough. I made a suggestion to the Winchester Arms Company, and received the following reply: "Replying to yours, would say that our model '76 gun could be readily adapted to a .44-cal. cartridge, but there would be no cartridge in market adapted to it, and we would have to make a special cartridge, which would be similar to the model of '76, which would be .44-cal. instead of .45." Placing the two .44 and .45-cal. Winchester shells side by side, the .44 will look much smaller. Then make it the same length of the .45, and won't it come nearer the wants of sportsmen than anything we now have? C. H. S.

WASHINGTON.

PHILADELPHIA NOTES.

THE decided change of weather we have had within the past twenty-four hours will have the effect of improving the duck shooting in our river and bay, and will doubtless bring more fowl to the Havre de Grace and Gunpowder grounds if the cold does not beat us to sea, as we are to entirely cease this week of the presence in great numbers of the "white brant" (as the snow geese were called) below Bombay Hook. Can any one give positive information as to where this fowl summers? I have formed an idea that they migrate to the Arctic portion of the Pacific coast, although they are never seen in their flights, at least not as I have read.

Mr. Kridler of our city is having many elegant specimens of birds sent to him weekly for mounting that have flown against the lighthouse at Atlantic City during the night.

The West Jersey Game Society seems to be in more and more trouble. After a series of troublesome meetings the office of secretary, as I wrote you in my last letter, was handed over to Postmaster Barnard of Gloucester, N. J., upon agreeing to file a bond for \$2,000 to insure the safety of the money passing through his hands. Since the secretary has agreed to enter this security, a dispute has arisen between him and Solicitor Joline of the society over the approving the bond. At the last meeting of the society a resolution was passed asking the solicitor to examine the bond and to approve it if found it suitable. The secretary claims that the resolution only requires Mr. Joline to approve the wording of the bond and the board of directors the sureties mentioned in the document.

Mr. Joline has certified to the correctness of the form of the bond, but that is all. Director Keugler of Philadelphia, who was given possession of the books in the early stages of the controversy, refuses to surrender the same to Secretary Barnard until the latter has properly qualified by submitting the names of the bondsmen to be approved by the society. Another meeting of the society has been called for the 20th inst., when it is hoped a satisfactory solution of the difficulty will be arrived at. It is said that it will be impossible to pass the bill spoken of to incorporate the Farmers' and Sportsmen's Game Protective Association of Atlantic county, N. J., as under the new constitution of New Jersey it will be special legislation, and illegal.

Feathered game, owing to the nearness of the close season, is hauzing in our stores and stalls in great profusion. Venison was never more plentiful, and a great part of it comes from our own State. H. HOAR.

ADIRONDACK DEER.

Editor Forest and Stream:

Returning home after a camp-out of three weeks in the Beaver River country, I find three copies of your valuable paper on file for my perusal. Scanning their contents, I note only one article by "Musset" relating to the game of that section. Astonishing as his assertions may appear to the world outside, I venture the opinion that they are not overdrawn. Not only have the hundreds of bounds worked faithfully for the two and a half months allotted to them, but still many parties pretending to go into the woods to still-hunt took their dogs along with them. The northern part of Herkimer county around Crooked Lake and the Mosier Ponds have been so constantly scoured by dogs the past month that a still-hunter stood no show. In fact, scarcely anything could be struck but a fawn or small doe's track to follow. Parties coming out of the woods with loads of from ten to fifteen deer all through the month of November, claiming to be still hunters, with three-fourths of the game showing only a bullet hole in the back of the head, tells its own tale. This constant floating and hounding must and surely is destroying our game beyond redemption.

Parties coming in from Warren and McKean counties, Pa., where but a few years since they found deer in paying quantities to hunt, all tell the same story, that no deer are to be found. Not a track by some one seen, or a single doe or stag. Around my camp in Herkimer county, two years ago, was the home of the deer. So plenty were they that they would come and root over the leaves for snare within fifty yards of camp every night. Upon my arrival there last month, I found instead of deer signs a bark camp near by, with skill and suitable camp equipment stowed away for future use, and well-beaten paths leading to all the lakes and ponds in the vicinity. This I understand is a fair sample of what our affairs are taking all through the whole Adirondack region. CAP LOCK.

FREWSBURG, Dec. 3.

RIPARIAN RIGHTS.

DENVER, COL., Nov. 28, 1889.

Editor Forest and Stream:

In your issue of 22d inst. I find under the caption of "Navigable Waters and Shore Rights" an inquiry and your very comprehensive editorial reply upon the subject indicated by the title above quoted. While you quote laws and decisions of courts touching the point, I think there is one other very important fact to be taken into consideration.

Since the Government of the United States adopted its present system of surveys for the public land it has been the rule to meander and exempt from sale all large or even considerable bodies of water. This includes all navigable streams, whether reached by the water or not, and all lakes or ponds of an area exceeding four acres and 100 acres. That is, forty acres is considered by United States deputy surveyors as the minimum size of any body of water they are in duty bound to meander, and except from the area of public lands they may be required to survey. As the surveyor is paid per lineal measure for the lines he runs he is apt to make all he justly can out of them, yet there may be instances in which this has not been done. These meander lines are supposed to follow the general outline of the water, occasionally cutting its margin, but far more commonly falling several feet away from it upon the land. While the contiguous land is sold by the general Government, or by the State to which it may have been ceded, it is sold to such meander line only. So much of the land as is covered by the body of water and the margin outside of it (if any) to the meander line, remains the property of the United States for the free and impartial use of all the people.

This system of public land survey was adopted and practiced by Ohio and has generated the public land system ever since. I presume it has been applied to the Chair (Michigan) region, whence I understand your inquiry comes, unless that particular locality was covered by some one of the early military grants which ante-dated the plan of surveys above referred to. "Three stars" can easily learn from his county

records how titles originated in his special neighborhood, and the description of meadows and bounds contained in the deeds will tell him just how far estates extend into the water (if at all, and which is not likely) or where the meander boundary lines fall. If unable to determine these facts for himself, his county surveyor, or any other land surveyor can soon make it plain to him.

I apprehend that the court decisions you quote all referred to questions growing out of the early colonies or later military grants. They covered vast areas of irregular form and regardless of navigable streams or other geographical features, save to include as much good land as possible. When the government adopted a plan of surveys for the public domain it early saw the importance of placing it beyond the power of any citizen to fence up, or cut off any navigable body of water, whether inlet, stream, lake or pond.

[The article to which Mr. Byers refers was not intended to treat of any specific case, but to set forth the common law, as we understand it, upon the general subject of shore rights and navigable waters. This common law may be modified or changed by statute or executive interference. As to the mention of the St. Clair shooting grounds, this was merely referred to as an instance in which an attempt had been made by individuals to acquire the right to public water, and was as an example. It should be understood that the broad question—Has the government the right to grant titles to public or navigable waters? To investigate the statutes and usages of the different States of the Union on this question would require a vast amount of labor.]

MINNESOTA.

THE hunting season has been almost a total failure for me this season. On a trip to New England in Sept. 25, and two days later sustained an accident which deprived me of the use of my right hand for several weeks, and by the time that member was ready for duty my eyes were severely injured by a hitherto unheard of occurrence—the exploding of a bottle of crocote. I am now ready for service in the field; but alas! the last flock of ducks have gone South, ruffed grouse are in sadly diminished numbers, bears have sought their winter quarters, and there is no snow on deer trails.

The season, upon the whole, has been a remarkable one. Ruffed grouse have been more numerous than for many years, and the slaughter has been wholesale. One man in town, who neither fears God nor regards man, has been paying twenty cents each for the noble bird, and has secured several hundred. Probably fifty men and boys are scouring the woods to-day for our king of game birds. Talk about game laws! The most effective game law possible for this western country is a special and good round tax on fire-arms of every description. It would kill off the "Zulus" and other abominable weapons, save human life and protect game. But to return to my text.

Some exceptionally heavy bags of ruffed grouse have been made in this immediate locality, twenty-five to a gun in an afternoon being nothing unusual.

The ducking season was short and sweet, the birds come late though in great numbers, and remaining but a short time.

During the summer and fall bears destroyed a large number of sheep, calves and pigs in this and adjoining towns, and several have been captured.

With a couple of good bear dogs rare and exciting sport might be had here every fall. For weeks past the woods have been full of hunters, who, in defiance of law, are slaughtering the deer. It is to be regretted that our game of all kinds is being so rapidly exterminated.

More trapping is being done hereabouts than I have ever known before. Experienced men realizing from \$3 to \$5 per day in trapping mink, rats and coons.

Several otter have been captured in the country. We have had a delightful autumn, and as yet no snow. J. F. LOCKE.

ILLSBURG, Minn., Nov. 20.

THE HIGHGATE MARSHES.

Editor Forest and Stream:

Here in this section of the country woodcock, snipe and duck shooting is virtually over for this season, the cold "snap" that we had from the 18th to the 16th inst., froze up our marshes and drove the birds to seek warmer climes. The past season has been a success, and we are obliged to you for a scarcity of birds but an army of shooters. It is plainly evident that our game birds are rapidly diminishing in numbers, which fact is easily explained. Civilization is encroaching on their breeding grounds, while tens of thousands of new guns are being manufactured yearly that go into fresh hands, and their owners, by glass ball and similar practice become expert shots, and are out on every opportunity to help to exterminate the game; then we old sportsmen not satisfied with our past success, but try to improve them each year by making larger bags of our favorite game. Here is the truth in a nutshell. Even your less birds are bred and more are killed, so unless prompt and energetic legislation interferes and pass stringent laws to protect our game by shortening the length of the open season and restricting to a fixed number the amount of game that each gunner or sportsman may kill during each season, or in a few short years will have no game. It will be among the things that are past and gone.

The Mis-sisquoi Gun Club and the Malden (Mass.) gentlemen, who lease the Mis-tiquet Marshes, have begun legal proceedings against a number of poachers who have infested those grounds during both close and open season. These pot-hunters have openly defied the owners and lessees of those marshes to prevent them from hunting there whenever they choose to do so, and boast that they are backed up by a class of citizens in Suffolk county, Mass., who will back them. It is this should prove true, we trust that you will allow us space for a black-list, and we will exhibit the names of those gentlemen to the public gaze as associates and sympathizers of pot-hunters, who make a business of killing young ducks with dogs during the summer months. The lessees of those marshes have, at considerable expense, tried to improve the shooting there by sowing wild rice back in the sloughs, and by protecting the birds during their breeding season; and that work is now of public benefit, as the best duck shooting is in the public waters outside of the marshes, and permits have readily been granted, when applied for, to the neighboring residents to shoot in the cuto grounds during the open season, providing they would not molest the young ducks in the summer. The members of the club are determined to protect their property at any cost, and as these poachers claim that no local jury would convict them; these suits will

be taken direct to the County Court, and, if necessary, will be carried to the Supreme Court. "The gods sometimes punish slowly, but surely," and those fellows will be a lesson that will be remembered. STANSTEAD.

LIBRATES, VI., Nov. 27.

MY OLD MUZZLE-LOADER.

IN TWO PARTS—PART II.

WHEN I look at Old Bettie I cannot help being reminded of what she once was, and what she now is. Her first great bad luck happened thus. We desired our friend and foreman of Armoey at Marshall to give the gun a thorough overhauling, as our friends Capt. Wally of Shreveport, and Capt. M. A. Pitts of Bonham, were to visit us and have a wildcat hunt. Barney Painter took Miss Bettie and proceeded to execute the order. It was the first time I ever beheld Miss Bettie in all her bloom and beauty.

The barrel of the duck-gun was more troubled than I. The barrels steamed at the waste pipe of an engine, leaving all else on his own desk. Business called him away. He did not return there the whole day until about night. Alas! Shall we tell the direful deed? Neither stock, locks, breech pins or ramrod could be found, and never have we put eyes on them since. Some one of the thousand men we commended took a fancy to them. Barney was more troubled than I. He was directed to make a new out for the barrels, which he soon did. Since then, as I considered her a widow for the time being, I called her ever after "Madam Bettie," until a series of mishaps changed her into Old Bettie.

And that reminds me how one of those sad occurrences took place. I was seated on old gray Tom's back, had been waiting for a half hour or more at a stand, for the deer to come out, and had finally flighted my pipe and crossed my legs, with the stoicism of a martyr, when that of a sudden to our right, without hearing a horn, a gun, or a bound, one of the largest of bucks, in a direction where I did not expect a deer, and never knew one run before, popped over the high ridge. Two or three bounds brought him square before me, not thirty yards off. I had not time to throw away the pipe, nor right my legs. If that deer was shot, it had to be done in the biggest kind of a hurry, for two more hours would not wait a sight. Madam Bettie was thrown to the breast and I cocked one barrel as she came up, and I pulled the trigger. Oh, my! I saw a thousand stars in a twinkling of an eye, and then I saw nothing. When I came to, half of that short pipe-stem was sticking down my throat, way into the flesh, my mustache and eyelashes were burnt off, and when I looked up, old gray Tom was standing with his head over mine, peering with his great big eyes into my face, and I do believe the big teeth were running down them, for he thought I was dead.

When I rose from my unbidden bed of dust and leaves, and took an inventory of damages, I found my neck nearly out of joint, with a sore creak in it that lasted a month or more, the pipe bowl was broken, several burnt holes in my clothing, and shall I write it, my love, my jewel, Madam Bettie, cracked and so broken just back of the locks, that she could not be fired again, until either a new stock was made or bands put around the grip of the old stock. Were there no sugar-coated pills to sweeten the cup of misfortune? Yes, there lay that big buck stone dead. The shot had passed through his heart and then entirely through the body. Madam Bettie made a double shot behind as well as before, for my young friend, Jim Vanderville, had loaded her at my request, and by mistake the charge of powder was the same as for the other barrel. It was the shot that sent her to the Right here I remember a famous shot of Madam Bettie that must not be omitted.

I had moved from the Arkansas River, near Pine Bluffs, and settled in that lovely mountain-perched town of Fayetteville, Washington county, the land of the apples and the fine horses. My wife had been sick, and had a special appetite for a partridge—one of those big, fat ones, that we find nowhere else in the State as good. One day I went to the store in obedience to her request, and as all road husbands ought, I shouldered the gun one Saturday afternoon, whistled up Flora and Carl, my splendid setters, and took a straight line for a small valley near the Ozark Male College. A rougher evening for shooting I had never encountered before. One may speak about a Texas nuther, and I have seen and felt many a one, but this wind that swept down from the summit of the Ozarks, annihilated the chance of all I have ever experienced. It was that I was my cap on tightly and button up my coat, or it would have been torn from my shoulders. The game-bag flopped on my sides worse than a loaded pair of saddle-bags on a hard trotting horse, making a four-minute mile race. The tears froze on my eyelids, so I was more than half blinded and could not see to shoot; my hand was so numbbed I could not grasp tightly the stock nor keep it on a bird, and when I did shoot the birds' wings and the heavy wind carried them faster than the shot. At any rate, I shot many a time at partridge and did not see even a feather ruffled.

Finding the partridges were too quick for me, I turned my attention to the larks, and they were too fast. Not one would light in a tree; it would have been useless, for the wind would have carried them along like a feather. Not a dove could I kill, nor a hare could I find. The dogs had acted splendidly, but I never better succeed. Yet one dog had had been touched, and with a desponding heart I started near about sundown to return home. It was most extraordinary thing for me not to bag every other or third bird in a day's shooting, and here I had shot a wack evening with no feather ruffled, as far as I knew. On coming up the hill into the town, near Mr. McElroy's farm, near where the agricultural college now stands, both Flora and Carl made a great point. One thing was certain, I could not kill on the ground. I tried to get better waders, but I must do the unprofessional thing and shoot them on the ground. Carefully reconnoitering the ground, I discovered, as I thought, one partridge sitting in a cluster of blue grass all alone. I was so cold, and the wind was so fierce, it was with difficulty I could bring Madam Bettie to bear upon that one bird. The shot was made: such fluttering of birds I never saw from one shot at what I took to be one bird. Flora retrieved four, Carl partridges—five or six. I never saw so many.

There was a time once when I would have given worlds for Madam Bettie to have been in my hand. I was on my way to California, had stopped a moment at Humboldt, where several roughs boarded the cars. We had not observed them as they took their seats in positions to command the situation. An apparent greenhorn, their decoy, the most unique specimen of the genus homo that ever came under my observa-

tion, came staggering into the car where I was seated. He did not sit down, but walked back and forth, eyeing the box of \$20 gold pieces, and now and then letting his bag fall and some of the pieces drop on the floor. He said he was all the way from Kaintuck, on his way to Frisco, and could beat any body he ever saw at a certain game. He played the fool to such perfection that several unsophisticated men proposed to bet him at his own game. A very mild, genteel, gentle passenger got up, and remarked that this man was only a decoy duck, some parties aboard, and advised the passengers to have nothing to do with him. In a moment one of this decoy's friends rose just behind the passenger, a quick powerful blow from a giant fist covered with brass rick-knuckles was dealt him from behind; with a heavy thud he fell forward on the seat on which I was sitting, and then by preconcerted signal, revolvers were bearing on us from five commanding points. Not a passenger was armed, the villains had us at their mercy. After finding they could not get a game started in that car, they left for another, in which they were more successful, fleeing a colored man out of all his money in a few minutes. At the next station they disappeared, and we saw no more of them. But did I not wish for Madam Bettie. She was in the smoking car, where I had been shooting at prairie dogs just before we got to Humboldt, and also at sage hens that would barely get out of the way of a locomotive.

Since I have struck on California it will not be amiss to say something about the quail out there. Mr. Van Dyke has most charmingly described them, so it will not interest the readers of the FOREST AND STREAM to go over a twice-told tale. Sufficient to say that in the general make up they closely resemble our partridge, but when habits and color of feathers are considered, there is a very wide difference.

I often think of how the first big covey of near a hundred birds "set away with me" the morning after our arrival at my friend's, Mr. Henderson Holmes, who lived five miles north of the lovely little town of Santa Rosa, in Sonoma county. Mr. Holmes had invited me because I came from his old home, Fayetteville, of Arkansas, to come out to his house and have a big day's shooting at quail. He stated that "he never permitted any one to shoot on his premises, but I was welcome at any time to a day's sport in his farm." That morning I awoke early, and the morning was very fine, and I had ever seen running about at one time. The grounds were full of them, and then such coaching, a noise so unlike that of our Virginia Bob White's.

Dressing as rapidly as possible, I took my gun and the game bag and ran down stairs, opened the yard gate and softly crept along to get as many as possible together. I wanted to kill a common-size covey on the ground with one barrel, and as many more on the wing as they rose. The shots were made, bagging eleven birds all told, and killing more on the wing than on the ground. The birds did not fly more than 300 yards before they came down in some thick grass in the orchard. Madam Bettie was quickly loaded, and I rapidly walked to the place, expediting to find them squatted, as partridges do, not doubting I should get the whole covey by the time it was breakfast. In this I was sadly disappointed, as I had not expected to get more. The shot was wonderfully improved on the quail question. When I found those birds they were running and cooing as if nothing had gone amiss with them. I got two more shots as they rose. Two birds dropped. But the flight of that large covey exceeded anything I had ever dreamed of in the partridge or quail hue. They rose as high as the tops of the lofty live-oak trees, and then, in a bee line as far as I could see, they were coming, landing for the most part. If I had stopped before they got there, just twenty-five miles off, it was more than I ever knew; and as I never saw them again, it is a question of doubt, and admits of considerable discussion, whether they are not still flying.

At breakfast I told my experience to Mr. Holmes. It was of the opinion this large covey were several small ones united, and they were migrating, a thing often occurring in that valley. I had never seen them before, and they were not wild, and not far above the house, that used to feed in his sleep range, and generally flew to his spring branch when flushed. After breakfast he accompanied me, followed by his big Newfoundland. I had been sorely distressed, because I had not brought my favorite, Carl, with me. Before night I would not have given a continental for any setter or pointer that ever lived to hunt for quail in Sonoma Valley. A year's experience then, taught me that all one needed, was a little little black and tan setter and a quail after shooting it. As to a California Sonoma quail standing long enough for a pointer to make a stand, it was just out of the question—unless that pointer stood a bird sitting on a tree. As long as I was there every quail after the first shot flew for a tree and hid itself in some cluster of mistletoe, which grew thickly on nearly every forest tree in that valley. Once in a mistletoe branch, one might just have peered into a well a thousand feet deep, with the hope of seeing a pin in the bottom, as to see a quail sitting and hiding in a big live oak tree.

If trees are not near at hand for them to hide in, they will continue their flight after being shot at and frightened, until one is found, even to three miles off from where flushed. All the quail I saw in California roosted at night in trees, generally flying to the same tree each night. The large proportion I killed were shot flying from trees.

I should like to tell you of the quail brought to Louisiana. With their habits of roosting in trees, I felt satisfied they would increase here very rapidly. The long moss on the trees would serve as a better hiding place for them, and then they would be protected from the depredations of foxes.

But to return to Madam Bettie. The gun received a serious scare from falling out of the wagon when I went to the Big Bend, some fifty miles north of Santa Rosa. The gun carries those scars on its stock to this day.

Many a pleasant evening's sport did I have with my friend, Prof. O. W. Roberts, of the Pacific Methodist College, as he and I took a walk to Uncle Billy Fulkerson's, who gave us free access to his grounds and his vineyard. What a treat that was to pull a five-pound bunch of grapes from a red Tokay vine, sit down under one of his best apple trees or sit on a tree, enjoy the fruit of all varieties, enjoy the mutual cost of the dogmat. Professor's conversation, then all at once try a large covey of quail fleeing on the grapes, jump up, and in a minute the far-killing little gun has brought down a half dozen or more. We return to our fruit; soon a big rabbit comes fleeing down a turnrow, something has started it. Again I take the gun and the jack falls over dead. The Professor measures the ground, it is seventy-five yards. Oh, those were the halcyon days of my life—gone, never more to return, yet memory brings them back, and I

love to dwell upon them, as each scar on the gun arrays every one in its turn, as if it were but yesterday I lived in that most hospitable, most enchanting place I ever saw—Santa Rosa of Sonoma Valley. It is one of the loveliest places on earth. Dear, very dear, are the people I knew when I lived there; ay, the place is the oasis in the dreary desert of my life.

Let me get back to the times when Madam Bettie changed to Old Bettie. Something was wanting to be done to the locks, and I sent my young hopeful from where I was living near Plano, Texas, to take it to Mr. Burton, a most excellent gunsmith in Dallas. It was night before the work was done, a terrific thunderstorm came up before he could get home. The distance he had to ride was sixteen miles. While passing through Mat. Caruth's long lane, that black, sticky, waxy mud a foot or more deep, the rain pouring down, and the hour being 10 o'clock P. M., his pony fell, and great and calamitous was that fall! Rider and horse were both injured, as they fell on the mis-ranched punching across a mud hole. But alas! for the beauty of the gun. Its handsome stock was broken square in two behind the locks at the small part of the pistol grip. The poor half-drowned boy was a long time in finding the pieces, and groped about in fruitless efforts, until a great flash of blinding lightning enabled him to find them. It was 3 o'clock in the morning when he got home, and told his sorrowful tale. His young heart was nearly broken, but I consoled him by telling him accidents would happen, and he could not be blamed. Oh! it went to my heart as I thought over the happy times I and Bettie had enjoyed, and now to think her beauty was spoiled, her strength gone, and to know she would never be the same handy gun that she had been!

I was about to move to Austin to live, and so carried the broken stock to Mr. Peetmestry, one of the best gunsmiths in the State, who banded and repaired the damages as well as possible.

Some fine shooting I had around Austin—one especially that looms up before me very vividly. Near the fair grounds I found a covey of eleven partridges. After the first shot, they flew into a stubble field, adjacent to the Insane Asylum. Old Bettie, true to old associations, had not missed a shot eight had fallen and been put in the game bag, three more had flown up a hedge next to a farm, whose owner did not permit any one to shoot on his premises. Bangs, my setter, came to a dead point, the birds were flushed, two fell to my shot; but one survived, and that one flew into the forbidden field. I watched it and saw it light close to the hedge. The owner had come from his house into the field to watch whether I should invade his grounds, I watched that bird, in fact, I was longing for it; I wanted to tell my brother sportsmen of what success I had; I wanted to boast a little bit to Capt. Billy Pitts and Major Riley, of how I found eleven birds, and killed the entire eleven without missing a shot; good shooting for one with two arms, but capital for one whose left stump was not three inches long. An idea came into my mind to make that owner flush it, and most likely it would fly back into the field from which it flew. I called him to come to the hedge, engaged him in conversation, and gradually got him to keep pace with me until he came near where the bird had pitched down. As I anticipated, he flushed the bird, and crossing over to my side of the hedge, it fell a victim to the pellets. I was satisfied, the bird was bagged, and that evening I had a nice time in recounting the morning's sport to my friends in bragging just a little bit how I had treated the farm.

One more fact of Old Bettie's good shooting qualities and I am done. One morning in November, who should be ushered into my sanctum but Mr. Sampson B. Wright, only son of my friend, W. M. Wright, one of the '49 pioneers of the Golden State. Capt. Billy A. Pitts invited us down to his ranch, some twenty-five miles below Austin, to take a hunt.

Bangs and Old Bettie made my outfit, the other two gentlemen look care of themselves. We arrived at night and had a hunt the next day. Such a glorious hunt it was, too. The best day's shooting ever I did, even in my youth, and with two stout birds, I never beat it. My game bag contained, when I got back, thirty-eight partridges out of forty single shots all told that day. Where is the one-arm man that can beat it? I did not pick chances, but shot at every opportunity. My luck was too good for some mishap not to occur. We started back in the night. A bright moon was shining. While crossing a small creek we discovered a half-dozen more ducks than I could look to be descending across our road. The guns were got ready, but they proved to be wolves, and we did not get a shot. I kept Old Bettie by my side, to be ready to shoot should any game be seen; and alas! I went to nodding. The gun fell out of the back and again had her stock broken. It was patched up by a young Swede, a very fine workman, who did good work but cheated me most awfully. His nickel metal plate that banded the stock and held it tightly together proved to be galvanized brass of most odorous smell.

It is enough. My feelings have been wonderfully wrought upon by relating what I have written. Old Bettie is done for; she has seen her best days; the last are nearing to a close. She has been my companion for many a year. Eight hundred and three deer have fallen victims to her charges, countless birds and squirrels and water fowl, with several bears, and many a wildcat and turkey thrown in for good measure.

GEORGE D. ALEXANDER.

MOBILE, LA.

NOTES FROM THE DEER LODGE VALLEY.—Abconoda, Mont., Dec. 8.—*Editor Forest and Stream:* A few days ago I caught a duck on the ice of Silver Lake, fifteen miles up the cañon above here, and about 8,500 feet above sea level, of the following description: Jet black in color, except white tip on wings, showing only when spread, and small white crescent under each eye; bill and feet red, feet large as a goose, very short bill, and of the most unfamable disposition. It resents any efforts at friendship, and refuses food or eats very little. It is a routine opening at nostrils, through which a pencil might be passed from one side to the other. It is about the weight of a mallard, but shorter and broader. It was unable to fly, but yet appears strong, always ready for a fight. What sort of duck was it? Three large mountain sheep and an elk were brought into this market last week. Black and white tail deer have been very plentiful. There is a species of animal in the high ranges of this vicinity that is quite numerous. It is called a mountain goat by local hunters. Its wool is as white, fine and long as an Angora's, and the animal is of great size and weight. I think its range is small and the animal very rare. It frequently weighs 300 pounds, and I have seen one here in captivity that weighed more. Some call them mountain ibex, which I think is wrong, as they have only small pair

horns like an ordinary goat. English hunters secure them in this vicinity every fall and take home the head and pelts. Of the bighorns and elk they take home the heads and antlers, leaving the meat for the guides.—KRAMO. [We infer from your description that the duck is the common velvet scoter (*Zenaidura macroura*), a species extremely abundant along our Atlantic seaboard, but not common on inland waters. What is commonly called the "white goat" in the northern Rocky Mountains is neither a goat nor an ibex, but an antelope (*Apteloceros columbianus*), although it bears a superficial resemblance to a goat.]

NORTH CAROLINA.—Belvidere, N. C., Dec. 3.—Game in this locality is seemingly quite abundant this season, though my "outings" have thus far been few and far between. Great has been my disappointment in not being able to get off on a deer hunt in the vicinity of Hlickford, Va. A letter from a friend in that locality informs me that the deer, so numerous there early in the season, have almost entirely disappeared—a deadly disease known as "black tongue," having killed nearly all the cattle, as well as deer. However, not to be entirely outdone in the line of hunting, we have put in some days driving the reedy marshes bordering on the great "Dismal Swamp," and some eight or ten fine deer have fallen to our guns. A fine young buck falling to my 28 in. 12-bore Colt gun, a few days since, said gun putting three No. 2 buckshot entirely through the head at thirty-five yards, while running at full speed. (Accident, perhaps! true, nevertheless.) The boys went out again yesterday, and I hear, killed an extra fine buck, very large and fat. Business prevented me from making one of the party, and great was my vexation on learning that they had succeeded in capturing "my buck," as I had chased him nearly a whole day, only a week since, and failing to get a shot had planned another hunt for to-morrow. Haven't tried the quail as yet on a "regular hunt," hope to do so in a few days, they are quite plentiful in some fields.—A. F. R.

SOUTH OYSTER BAY, Long Island, Dec. 7.—Quite a number of sportsmen visit me, and they have, as a general thing, good success. Ducks are plenty in the bay at present, but the weather is too fine for good sport. We want a good south or east wind for good duck shooting. Rabbits are plenty. A party out yesterday killed sixteen rabbits, four gray squirrels and two quail.—GEO. KILLAM.

Sea and River Fishing.

THE KING-HI-O.

MANY of our readers will remember the beautiful specimen of Japanese goldfish, bearing the above name, which was exhibited at the late New York Aquarium. This specimen was imported by a ten dealer of Baltimore, who refused the repeated offers of Mr. Coup for it, until at last it

Professor Baird has expressed an interest in them. We hope that these rare and beautiful fish will not be widely scattered, but that they will be kept half a dozen or more in some place where they may breed, if possible.

TROUTING ON THE BIGOSH.

THE DOCTOR'S FLIES.

"DOCTOR, these 'ere flies of your'n are awful small, but they look neat," said Uncle Ben, picking up two or three which lay on the window sill where we left the Doctor trying them in the last chapter of this tritaceous history. "I suppose the trout will suffer to-day, if they never did before, how's that, Colonel?"

"Perhaps so," replied the old soldier, "but the flies are nothing more nor less than the well-known 'black gut,' and we all have specimens of them in our fly-books. They are good flies sometimes, especially on a bright day when the real insect is on the water, but of no use on a dull day like this. I will use a large bright fly. What do you think?" This latter question to me.

"O, I don't know that I have any opinion worth giving. When the Doctor has given his I will probably split the difference and put on flies of both kinds. Tell us about the new flies, Doctor."

The Doctor, who had been quietly listening, said: "The new flies are not the 'black gut,' which is usually dressed thick and short, with the body made of black ostrich feather and the wings of a light feather and upright. On the contrary, my new flies are made of black wool, and instead of wings are hair-like. I intend that they are new and deserving of a distinctive name, which I intend to give them as soon as I can settle on a proper one for them."

"Why not call them the 'bigosh'?" suggested I.

"All right," said the Doctor, "it's done, although I know that you only suggested it in order to ridicule my pretensions to having invented a new fly. I'll name the new fly the 'bigosh' to spite you, because as you believe in nothing that I am aware of and have no regard for any thing not of to-day, there is no reason to suppose that you believe in my new flies."

"This is hardly fair, Doctor, it is true that I do not worship all the old deities of the past, and you know by this that I particularly refer to your patron saint, Isaac Walton, whose works are only read for the charm of their language and never for instruction in angling, yet there are things to be believed in and to have regard for. I will have respect for the flies which you have tied, and consider to be new to pisciculture, even though I think that an ordinary black gut would do as well. There is no objection to the fly from an artistic point of view, nor is there any from an entomological one. In fact, there is not one fly that is distasteful to my sight, and that is a great long-fibered hackle on a small hook. This is a name script, whose name I do not know, and you are aware that I pride myself on my ignorance of the names of artificial flies, most of which look so

was reported that \$500 was offered and refused, and the fish was loaned to the Aquarium for a time. Its long lac-like tail, which hung so gracefully, was little suited for rapid progression, and it was evident that the fish had been produced by careful selection, and could not take care of itself in a state of nature.

Both the Japanese and Chinese have devoted much attention to the production of fantastic shapes in fishes, as they have in art, and seem to delight more in surprises of this kind than in the way of increasing the food fishes. These king-hi-os have short bodies and large, projecting eyes, and are triple-tailed, making them beautiful object for a parlor tank. No doubt these peculiarities are the result of long and careful selection of parents, as in the case of many of our domestic animals. Our illustration gives a good idea of the fish. The body is a deep, golden red, the tail is filmy, lace-like and semi-transparent, and the dorsal fin is very large.

A few days ago Captain Jones, of the tramp steamship Oxfordshire, from Japan, brought a number of these fish to this country, as well as some of the curious "telescope fish," which have projecting eyes like a pair of opera glasses, and are also varieties of the goldfish, and succeeded in getting over seventy specimens out of two hundred which he started with. The fish are delicate, and special tanks were made and the temperature kept at the proper point. The fish were fed with a bread made of egg and rice, and, considering the rough weather experienced on the voyage, the success in transportation was as great as could be expected.

The fish are now in the care of Mr. E. G. Blackford, Fulton Market, where they are in tanks lit by electric lights, but wild disposition will be made of them is not yet known. Some will probably go to the Smithsonian Institution, as

unlike any thing in nature, that no matter how many fish are taken with them there is a feeling that no self-respecting trout should take a fly so clumsily made."

"Why should a man pride himself on his ignorance of any subject? That's what I'd like to know," answered the Doctor, looking at the Colonel for approval.

Knocking the ashes out of his pipe, the latter answered the look by saying: "The fact is, that Father is an abject worshipper of Deol, Norris. You may think that he has no reverence for anything, but I think that he is plain to me that his old friend is his standard of all that is good in the literature of fishing, and if you will take the trouble to look in Norris's 'American Angler's Book,' I do not doubt you will find all that has been said against your flies has been derived from the chapter on fly-making in Norris. Our mutual friend, M., knows no more of fly-tying than a frog does of the precision of the equinoxes. That he should pride himself on his ignorance is not at all to his discredit, he has enough of it to justify his vanity."

If there is anything that cools a fellow off, it is when he has taken up the quarrel of another, and then the latter "goes back on him," as the phrase goes. The Colonel "sold me short," and the sudden shock which one experiences on being betrayed set the brain machinery at work to devise some plan of squaring the account. The wheels flew rapidly, and amid their hum I could hear the lines of Mizeppa:

"But time at last eets all things even,
And if we do but watch the hour
There never yet was human power
Which could evade, if unforgiven,
The patient's watch and vigil long,
Of him who treasures up a wrong."

The most galling part of the strictures of the Colonel was

The Kennel.

FIXTURES.

BENCH SHOWS.

December 12, 20 and 31. — New Orleans Bench Show. Entries close Dec. 10. Charles Lindbergh, President, New Orleans, La.; John D. H. 4, 1888. — Philadelphia Association Bench Show, Meriden, Conn.; Josiah Stone, Secretary, Meriden, Conn. April 19, 1884. — The Cleveland Bench Show, Cleveland, Ohio. Secretary, Cleveland, Ohio.

THE NATIONAL FIELD TRIALS.

The fifth annual Field Trials of the National American Kennel Club commenced on Monday morning, the 5th inst., at Grand Junction, Tenn. This is one of the best trials the club has ever held. There was a large attendance of members, and the turn out of spectators was good. They followed the running with great zeal, and seemed much interested. The judging has given entire satisfaction. The weather on Monday was fine, and the race for All Stake closed at 8 o'clock with twenty-one entries—nineteen setters and two pointers. The weather on Tuesday was good, but rather warm. At night it rained very hard, and the running was not resumed until 11 o'clock on Wednesday. Thursday was a very windy, bad day for the running. About 3 o'clock it became stormy, and continued so until noon on Friday, when it cleared up and the Derby was finished. There were twenty-one entries in the Derby—eighteen setters and three pointers. The three pointers divided the stake in 100 and the honors. In the Champion Stake there were but two entries—Bryson's Sue and Crawford's Gath. The owners consented to divide the stake, and the trials were concluded by a three hours hunt by the judges over these two celebrities. The judges were: Capt. Henry C. Cliver, Tenn. Dr. Wm. H. Jarvis, Clarendon, N. H., and Capt. W. H. Key, Florence, Ala. The following is the running in the several stakes in the order in which they came:

THE FREE FOR ALL.

Prizes—\$250 to first; \$150 to second and \$100 to the third. GUS BONDHU AND CLIPPER.

were the first brace in the All-Aged Stake. Gus Bondhu was handled by D. C. Saurborn and Clipper by Mahler. They were put down at 11:30 and worked in a large field. Both dogs did nice work, moving off at a good gait. Clipper is a nice little dog and cuts up his ground well. He has never been run before. We worked on down the hill through a cotton field into a large sward of tall grass and sedge where we pointed at a point and a large bevy was flushed. We then swung round on the draw to where birds had been marked down, when Clipper pointed and Gus Bondhu backed. Moving on Gus Bondhu pointed a nice point, backed by Clipper. Saurborn failed to flush the bird and they were ordered on. Gus Bondhu then flushed. Moving on Clipper pointed and was backed by Gus Bondhu. We then moved on when Clipper again pointed, the bird was flushed to order and retrieved by Cliver. Then the dog swung round the hill to a sedge field where Clipper flushed a bevy and dropped to wing. Working up a ravine, both dogs scored a flush. Moving on up the branch, Clipper pointed and was backed by Gus Bondhu, the bird was flushed and killed, and while Clipper was hunting the dead bird, several more were flushed, but the dead bird was not found. They were then ordered up and the heat was awarded to Clipper at 9:50. Down forty-five minutes.

SAN ROY AND GROUSE DALE.

The next brace, San Roy, handled by Saurborn, and Grouse Dale, handled by Talman, were called at 9:25 in a sedge field. Both dogs did well, San Roy having the best of it in speed. Both dogs did nice work, and the heat was a good one. They were worked in across a ditch, where several birds were flushed by the judges and hunted by the spectators. We then swung round the hill to a ditch, and up the ditch in sedge grass, where San Roy was found on a point, but Saurborn failed to put up the bird. It was afterward flushed by the handlers. We then moved on down the ditch, where the birds had been marked down when Grouse Dale pointed, and nicely backed by San Roy, but no bird was found, and Grouse Dale scored a false point. We then worked on down the ravine in tall grass and sedge, where Grouse Dale pointed, nicely backed by San Roy. Talman, on order, the bird was killed two birds, and the heat was awarded by each dog. We then worked on over the hill into a cornfield, where Grouse Dale scored a flush on a single bird. We then worked up a ravine and swung round into a cornfield, where Grouse Dale pointed a large point, backed by San Roy. On up the hill Grouse Dale pointed a bevy, which were flushed by San Roy. We then moved on over the hill, where Grouse Dale scored a false point. Then swinging round to the right into an orchard, Grouse Dale pointed a fine bevy, which flushed as the dog swung round. San Roy followed up the ravine into a thicket of plum bushes. Grouse Dale scored a false point. We then moved on over the hill, where both dogs pointed and birds flushed ahead of them. They were then ordered up and the heat was awarded to San Roy at 11:45. Down one hour and fifty-two minutes.

COLEMAN'S LONDON AND NELLIE B.

The next brace, Coleman's London, handled by Nesbitt, and Nellie B., by Waters, were put down at 11:30 where the last brace was taken up, in a small piece of woods. Nellie moved at a nice even gait. She will undoubtedly make a good one. London was cut out far for her work, which on account of sickness and soon demonstrated that he could not last. The heat was a short one. Soon after being put down Nellie B. drew to a point, and moving on flushed a large bevy. We then moved on across a field of cotton to a large body of woods, where London flushed a single bird. We worked through the woods into a field of cotton and down into a sward, where Nellie B., going very fast down wind, ran into and flushed a bevy, dropping to wing. The birds settled in thick sedge and brins far off into the woods. The dogs were worked. When the dog pointed the bird was flushed, to order, and killed, but was not found. Moving on Nellie B. scored a flush, a little further on she pointed; soon afterward London pointed and the bird was flushed and killed, and retrieved by Cliver. Moving on, where London flushed a single bird, we then worked over the fence into a piece of stubble, where he again flushed. We then swung round into the woods, where Nellie scored a bad flush, out of the woods into a sedge field, London flushing a single bird. They were then ordered up and the heat was awarded to Nellie B. at 12:45. Down one hour and fifty-two minutes.

PINK B. AND MAUD W.

The next brace, Pink B. handled by Short, and Maud W., handled by Tucker, were put down at 12:15. Maud W. is a nice black, white and tan bitch, owned by Dr. Ware. She moves nicely, quartering and ranging, in good style, and evenly matched with Pink B. They were worked on down the ravine and into a cornfield up a hedge row and across the railroad into a large field of sedge, which was drawn blank. We then swung back across the railroad to a ditch, where the dogs were ordered up and the heat was awarded to Pink B. pointed and Maud dropped on a nice back. The bird was

flushed to order and killed, and retrieved by Pink B. Over the ditch Maud scored a false point, backed by Pink B. Then the sedge and bushes, both dogs pointed and rounded on, Maud establishing her point backed by Pink; the bird was flushed to order and killed and retrieved by Maud. We then moved on when Maud pointed a hare, and a few steps further on Pink pointed. The bird was flushed and killed, and retrieved by Maud then scored a point backed by Pink. Working on, Pink pointed and Maud dropped to back nicely. Maud then worked a false point. We then worked up through a cotton field, where Maud flushed badly, and the heat was awarded to Pink at 3:20. Down one hour and three minutes.

GATH AND KINNICKNECK.

The next brace, Gath, handled by Short, and Kinnickneck, a large black, white and tan dog, handled by Nesbitt, were put down at 3:50 in a cornfield. Gath pointed and Kinnickneck, without style or speed; by a piece of good luck he pointed a bevy which Kinnickneck refused to retrieve. We moved on, when Gath scored a nice point, on a single bird, and the heat was awarded to Gath at 5:50. Down thirty minutes.

SUE AND MAJOR CROXTETH.

The next brace, Sue, handled by Short, and Major Croxteth, a liver and white pointer, handled by Stafford, were called at 3:55, and put down in the edge of the woods and cotton field. This was a match for the fast, wide-ranging Sue, who soon left him behind, and after two points and a flush for Sue, and a point for Major Croxteth, they were ordered up and the heat was awarded to Sue at 5:57. Down thirty-two minutes.

DON AND FLOSSY.

The next brace, Don, handled by Vandover, and Flossy, handled by Talman, were called at 3:40 and put down in a field of sedge and stubble. Don was all off, having taken cold, and worked very badly, and the heat was a short and uninteresting one. We worked on when Don, in the edge of some bushes, pointed at a point, backed by Flossy. The bird was flushed by Don, the bird was flushed to order and missed. We then worked on up the draw to the railroad into a cornfield and then swung round a hill down to the railroad again where a bevy flushed by Flossy. The bird was flushed, and the dog swung round to the railroad again where a bevy flushed in succession, he seemed to have lost his nose entirely; we then beat up to a plum thicket, when both dogs pointed at the same time a bird, which was flushed and missed. We then swung across the railroad where Flossy pointed, and Don pointed, and Flossy coming up refused to back but moved on and flushed the bird, which was killed by Vandover and retrieved by Don. Flossy broke shot and lost the heat which was awarded to Don at 4:25. Down forty-five minutes.

VICTOR AND HONEXAM.

The next brace, Victor, handled by Arcant, and Foreman, handled by Talman, were called at 4:31 and put down in a field near the old gin house. They moved off at a fair gait; Foreman having the advantage in speed and style. Working on around the hill, Foreman was seen on a magnificent point up on the side of the hill, where he pointed, and the bird was swung round to the windward of him and backed staunchly. This was a splendid piece of work and very much admired and commended by the spectators. The bird was flushed, and the dog swung round the hill to a plum thicket, where birds had been marked. Victor pointed on the edge of the bushes, and reading in flushed. Swinging round the thicket, Victor again flushed a bevy, backed by Foreman; we then moved on into a cotton field where both dogs came to a stamuel point, but were found to be backing each other. We then worked on through a cornfield into a field of sedge, where Victor pointed, and the dog swung round on over a branch into a thicket, where Foreman roared for some distance, but failed to locate birds. It being dark they were ordered up for the day at 5:40. Arriving at the hotel, upon consultation, the judges awarded the heat to Foreman. Down thirty-eight minutes.

DOG WHIP, RY. AND COUNTESS RAKE.

The next brace, Dog Whip R., handled by Nesbitt, and Countess Rake, handled by Talman, were called at 4:40 on Tuesday morning, and put down in a sedge field, both dogs went off well. Dog Whip R. is a heavy dog; but moved remarkably well. Countess Rake is a grand going bitch and cut up her ground in nice style. They were worked on over the hill into a sward, where Countess pointed a bevy near a cluster of oak trees, and was handsomely backed by Dog Whip. The birds were flushed to order and one killed and retrieved in good style by Countess Rake. We then worked on over the hill, where Dog Whip pointed another point on a large bevy, backed by Dog Whip. We then worked on over the hill to where birds had been marked down. Dog Whip R. pointed a single bird, nicely backed by Countess. This was a fine point, and the bird was flushed to order and retrieved by Countess. We then moved on to a branch in a cornfield where Dog Whip flushed. We then turned up the branch where Countess pointed but rounded on and pointed again. The bird was flushed to order and missed. They were then ordered up and the heat was awarded to Countess at 5:55. Down twenty-six minutes.

HARRISON'S LONDON AND PHYLLIS H.

The next brace, London, handled by Talman, and Phyllis H., handled by Stafford, were called at 9 o'clock, and put down in some corn and sedge where the other brace was taken up. Phyllis H. is a nice little black, white and tan bitch of good speed and style, but not a match for London, who outraces her and was much the most stylish dog. We worked on through the field to a branch where London flushed a single bird. Then in a thicket of scrub oaks Phyllis made a false point, backed by London. We then worked on over the hill where London pointed and Phyllis backed, Talman, on order, flushed the bird and killed it, but it could not be found. A bird got up while London was hunting dead, and Talman killed it and London, on order, flushed a single bird, which was flushed to order and retrieved by London. We then worked on over the hill where London pointed and Phyllis backed, Talman, on order, flushed the bird and killed it, but it could not be found. We then swung round across the hill, when Phyllis pointed backed by London, the birds flushed on the opposite side of a deep ditch in a pocket of sedge between two deep ditches. London pointed and the bird was flushed and killed by Stafford and retrieved by Phyllis. Moving on Phyllis scored a point and London a flush. Phyllis then worked on over the hill where London pointed and the heat was awarded to London at 9:50. Down thirty minutes. This finished the first series, Carrie J. having a bye.

Second Series.

CARRIE J. AND CLIPPER.

were called at 9:55 and put down in a large field and worked down to a piece of stubble, where both dogs did some good work, ranging and quartering their ground well. We then moved across to a piece of plum and sedge, which was drawn blank. Working on to a gully Clipper pointed a hare and was nicely backed by Carrie J. They were worked on over the ground. Working up to the windward of them Clipper flushed, dropping promptly to wing. We then worked on to a gully where they were marked down, where Clipper pointed and the dog swung round again in a large field of sedge, which was drawn blank. We then moved on over a fence into a field

of sedge and scattering bushes where Clipper, going at a fine gait, came to a beautiful point, backed by Carrie J. We then worked over the fence to a ravine where the birds had settled, Carrie securing a nice point, but no bird was found. Moving on, Clipper pointed, then Carrie pointed and was backed by Clipper. The bird was flushed and killed. Clipper, through the thicket, scored a point, backed by Carrie. We then worked the bird, and thus lost the heat. Carrie soon scored another point, and then were ordered up and the heat was awarded to Carrie J. at 10:40. Down one hour and five minutes.

NELLIE B. AND SAN ROY.

were next called at 10:45, and cast off in a cotton field, and worked on down the edge of the woods, when both secured a point; both dogs moved well, San Roy being the fastest ranger but rather headstrong and wild. A good deal of ground was drawn blank, when we came to a ravine of sedge where birds had been marked down, where San Roy pointed and the heat was awarded to San Roy soon after again flushed; they were then ordered up at 11:35, and Nellie B. afterward put down to back, which she did nicely and was awarded the heat. Down fifty-two minutes. As the next three dogs in regular order were all handled by Short, Don was brought up on the list to take the place of Gath.

DON AND PINK B.

were called at 11:40, and cast off in cornfield. Don had recovered from his illness, and letting himself out did some nice work. We moved on into a field of sedge, on the edge of the woods. Don pointed a nice point, backed by Pink B. We then swung round a hill down to a ravine, where a bevy flushed well. Moving on, Don pointed in the edge of a cornfield. Moving on, Pink B. pointed and roared, but failed to locate the birds. We then worked on into a racket, where Don pointed, but failed to locate the birds. Don moved on round a field, where he evidently running birds. Pink B. roared on ahead of Don and located the birds in a cornfield; a fine bevy was flushed. We then worked on into the edge of a cottonfield, where Don pointed, but failed to locate the birds. We then worked on to the branch, where Don flushed. We then swung round into the cornfield, where Pink B. flushed. A great deal of ground was then drawn blank, but we worked on, where Don pointed, and the heat was awarded to Don at 1:22. Don having been rubbed down and given a drink of whisky went off like himself. We worked down the hill, across the railroad into a field of sedge, where Don roared some distance up the hill, and then swung round a hill down to a ravine, where a bevy flushed well. Moving on, Don pointed in the edge of a cornfield. Moving on, Pink B. pointed and roared, but failed to locate the birds. We then worked on into a racket, where Don pointed, but failed to locate the birds. Don moved on round a field, where he evidently running birds. Pink B. roared on ahead of Don and located the birds in a cornfield; a fine bevy was flushed. We then worked on into the edge of a cottonfield, where Don pointed, but failed to locate the birds. We then worked on to the branch, where Don flushed. We then swung round into the cornfield, where Pink B. flushed. A great deal of ground was then drawn blank, but we worked on, where Don pointed, and the heat was awarded to Don at 1:45. Down one hour and thirty-eight minutes.

GATH AND FOREMAN.

were called at 1:48 and cast off where the last brace was taken up; this was a rattling pair of dogs, and the heat was watched with great interest. Both dogs went off finely, and the heat was a good one. Soon after being put down, Gath pointed and was backed by Gath. Moving on down the ravine we swung round up a gully toward the railroad; crossing over, we moved down on the opposite side, where Gath scored a false point. We then worked on over a branch into a patch of sedge and tall grass when Foreman pointed. A large bevy was flushed to order and shot at and missed. Moving on up to the railroad both dogs scored a point. We then worked on, when Gath pointed backed by Foreman. The bird was flushed to order and retrieved by Gath. The heat was awarded to Gath at 4:25. Down two hours and twelve minutes.

SUE AND COUNTESS RAKE.

were called at 4:35 and put down on some scattered birds in thick sedge. Both dogs commenced roaring and pointing, when Sue located the birds and a large bevy was flushed, both dogs steady to wing. Moving on to where the birds had been marked down, Sue pointed and the heat was awarded to Sue at 5:40. Down two hours and twelve minutes.

Third Series.

LONDON AND CARRIE J.

were called at 4:45 and put down in a field of stubble, which was drawn blank. We then worked on up a gully and into some more stubble, where both dogs showed good work in quartering and ranging, London having the best of the heat. When London roared up and found a fine bevy which he pointed staunchly. Carrie J. being brought up, pointed the same bevy, not seeing London. We then worked on down to a ditch, where both dogs pointed and the heat was awarded to London at 11:50. Down one hour and fifteen minutes.

NELLIE B. AND GATH.

were next called at 11:55, and put down in the field where the

last brace were taken up. This was a short heat. Nellie B. ran and quartered her ground well, but was very unsteady in her work and was no antagonist for Gath, who, after scoring two nice points, was awarded the heat at 1:45. Down fifty-five minutes.

SUE AND DON

were next called and put down at 1:30 in a field of stubble and corn. Don, having received the signal, was indispositioned, moved off nicely, and did much better work than in his former heats, but could not hold his own against Sue, who took the lead and kept it to the end of the heat. They worked through the corn into a ravine of briars and sedge, where Don flushed a large bevy, which was marked down over the fence in the woods. Ordered on, Sue pointed and Don backed. Moving on over a ditch, Don pointed, and the bird was flushed and killed, and retrieved by Don, who soon after, near the fence, scored a flush. We then swung round in the thickets, and went on up across the railroad to a large cornfield, which was drawn blank. They were taken up and we moved on some distance to a large field of sedge, where they were put down again and worked through to a small piece of timber, where a bevy of birds was flushed by the judges. Following them up, Sue pointed and soon after, in the thicket, Don pointed. We then went up the road to the edge of thicket, where Don again pointed. The bird flushed and was killed, and after a good deal of unsteady and headstrong work by Don, he was made to find the bird, which he marked badly in the woods. They were then ordered up, and the heat was awarded to Sue at 2:37. Down one hour seven minutes. This closed the third series.

Fourth Series.

GATH AND LONDON

were next called and put down at 2:45 in a cornfield on the edge of the thicket and worked on up a branch when Gath made a bad flush but it was not seen by the judges. We then swung round over the hill, drawing a great extent of ground blank, until we came to a ravine where Gath dropped on a point in a gully and was promptly backed by London, Gath's fault being that he had really made. Moving on Gath pointed a hare, about the same time London, some hundred yards to the left, made a nice point on a large bevy. Moving on down to branch London pointed, and a little on scored a flush. We then swung round over the hill, and thus saw Gath pointed to Gath, when they were ordered up and the heat was awarded to Gath at 3:30. Down forty-five minutes. This ended the fourth series, Sue having a bye.

FIRST PLACE.

GATH AND SUE

were then cast off at 3:35 to decide first money. This was an exciting heat, both dogs doing grand work, but Gath seemed to lose confidence in himself and depended on Sue to find the birds; this, together with the fact that both dogs were handled by the same handler lost him the heat. They were put down in a sedge field where the last brace was taken up. Moving on up the branch Gath scored a false point backed by Sue. We then worked on down the ravine and over a fence into a cornfield, where Sue pointed a hare and London, who was pointed in a thick bunch of bamboo briars and bushes, backed by Gath. The birds were seen running for some distance before the dogs and they were ordered up and one of the judges flushed them and ordered a bird, which was retrieved by Sue. They were then ordered up the hill, where Gath pointed and was nicely backed by Sue. The bird was flushed to order and killed, and retrieved by Gath. We then crossed the fence into some sedge, where Sue flushed. We then swung round through the woods to the edge of some sedge, where the birds had been marked down, but it was drawn blank. We then swung round and worked on through the field, where Gath pointed in the edge of some sedge on a branch. Moving on, Sue flushed. We then worked on into some corn, where Gath pointed in the edge of some sedge by the side of the railroad, but roared on and was found on a point in a thick briar patch, but as he had been ordered up he did not get credit for it. They were then put down across the railroad, and worked up a gully in a thicket of plum bushes, where Sue pointed and the bird was backed by Gath. They were then ordered up for the day at 4:50. They were put down again at 8 on Thursday morning in a field of sedge, where Gath, going at rapid speed, dropped on a beautiful point. Sue, who was asked of him running on the same scent, caught a bit of him and backed handsomely. We then moved on, when Gath scored a flush and soon afterward a false point. Working on, Sue pointed in the edge of some oaks and was backed by Gath; the birds were flushed, and Gath broke back, and dropped on a point in the edge of some sedge by the third nearly. Moving on, Gath pointed; then up the hill both dogs roared for some distance and pointed. We then swung round down the hill where Sue pointed. The bird was flushed to order and killed and retrieved by Sue. They were then ordered up and the heat was awarded to Sue at 3:20, who was declared winner of the first prize. Down in all one hour and thirty-five minutes.

FIRST PLACE.

GATH AND DON

were then called at 8:25, and put down in the sedge field. Don was badly off, and seemed to have no nose. He pattered about and did nothing. After a few minutes' work, two points being scored by Gath, they were ordered up, and the heat and second money was awarded to Gath. Down eight minutes.

FIRST PLACE.

FOREMAN AND DON

were then called, and put down at 8:25, where the last brace had been taken up, to try conclusively for third money. Don being completely used up, was outpaced by Foreman, who secured two beautiful points. Don pattering about with his nose to the ground doing nothing, and passing over birds he should have pointed, they were ordered up, and the heat and second money was awarded to Foreman, who was declared the winner of third prize. Down sixteen minutes.

SUMMARY.

First Series.

- Clipper beat Gus Bondlu.
 - San Roy beat Grouse Dale.
 - Nellie B. beat Coleman's London.
 - Frank B. beat Mann W.
 - Henry beat King's Quixote.
 - Sue beat Major Croxteth.
 - Don beat Plossy.
 - Foreman beat Victor.
 - Henry beat Rake's Dog Whiff, Jr.
 - Harrison's London beat Phyllis II.
 - Carrie J., a bye.
- Second Series.
- Carrie J. beat Clipper.
 - Nellie B. beat San Roy.
 - Don beat Pink B.
 - Gath beat Foreman.
 - Sue beat Countess Rake.
 - Harrison's London, a bye.
- Third Series.
- Harrison's London beat Carrie J.
 - Henry beat Nellie B.
 - Sue beat Don.
- Fourth Series.
- Gath beat London.
 - Sue, a bye.

FINAL TIE FOR FIRST PRIZE.

Sue beat Gath and won first prize.

FINAL TIE FOR SECOND PRIZE.

Gath beat Don and won second prize.

FINAL TIE FOR THIRD PRIZE.

Foreman beat Don and won third prize.

THE DERBY.

SAN ROY AND PAUL GLADSTONE.

The first brace, San Roy (handled by Sanborn and Paul Gladstone) were cast off at 9:05 in a cornfield, and worked on up a branch when San Roy pointed and Paul backed, but he could not keep near the wide ranging and fleet San Roy. Working on across the hill San Roy pointed, Paul coming up directly in front of him backed promptly at sight but no birds were found. Paul also soon scored a false point and was nicely backed by San Roy. We then worked on when Paul pointed and a nice bevy was flushed. Moving on down to a gully San Roy pointed and the bird was flushed and shot at, both dogs steady to shot. They were then ordered up at 9:30 and the heat was awarded to San Roy. Down twenty-five minutes.

NELLIE B. AND KATY D.

The next brace—Nellie B. and Katy D. ran in the free-for-all and beat Coleman's London. They were then turned back by Gath, handled by Waters, and Katy D. owned and handled by Sanborn—were cast off at 9:35 in a sedge field, which was drawn blank. They were then taken up and put down again near a piece of timber, where Nellie B. flushed a bevy. We then swung round over the hill and worked along the fence where the birds were supposed to have gone, where Katy D. scored a flush. We then worked on down to the woods and through them into a large field, which was drawn blank. We then swung round back to the woods, where Nellie flushed a bevy. Moving on, Katy D. dropped on a nice point in the leaves, and the bird was flushed to order and killed. They were then ordered up for Katy D. to be put down to back, which she did nicely and was awarded the heat at 10:35. Down one hour.

SHOT AND FRED. H.

were the next brace. They were put down at 10:40. This was a poor brace. Fred. H. was left by his handler and they were ordered up and Fred. H. withdrew, giving the heat to Shot at 10:47. Down seven minutes.

COUNT LOFTY AND RAINBOW.

The next brace, Count Lofty handled by Nesbit and Rainbow by Waters, were put down at 10:50 in a cornfield. Count Lofty was very fat, and after a small effort broke down, and his handler, who was very much annoyed, and thus saw Count Lofty apparently disgusted and attacked a lot of negroes who were gathering corn. He was called off and without finding birds, the heat was given to Rainbow at 11:12. Down twenty-two minutes.

MAJOR CROXTETH AND GLADSTONE BOY

were the next brace, Maj. Croxteth handled by Stafford, and Gladstone Boy handled by Maj. Merriam, were cast off at 11:20 in a cornfield. The puppy Gladstone Boy moved off very well, though rather awkward. He is eligible to two Derbys, being still the right age for the next Derby, in which he will be entered. He is a dog of much promise, and will make a good one. He has only been handled three weeks. They were worked on through the corn into a piece of sedge and scattering trees, where Major flushed a bevy. Following them into the brush, Gladstone Boy flushed and Gladstone Boy was then ordered up and the heat was awarded to Gladstone Boy, at 11:30. Down fifteen minutes.

GRACE GLADSTONE AND COUNTESS C.

were the next brace, Grace Gladstone, a nice little black and white bitch by Gladstone ex Lavalette, owned and handled by Charles Tucker, and Countess C. owned and handled by H. A. Vent, were cast off at 11:35 in the woods where the last brace was taken up. Both dogs went off well, ranging and quartering their ground nicely and making few mistakes. This was one of the best heats run in the Derby. At first Grace made a little head start, but was promptly backed by Countess C. point ed, backed by Grace. We then turned into some woods where Grace pointed and a few steps further again pointed. Moving on up to the fence Countess C. flushed a bird. We then worked on when Countess C. pointed and was nicely backed by Grace. Moving on the fence into the woods, both dogs showed remarkable speed and style, cutting up the ground nicely, Grace rather the fastest ranger. We worked on through the woods where Countess C. flushed. They were then ordered up and the judges to consult. Ordered again, Countess C. pointed a bevy on the edge of the woods. Grace coming up pointed to the scent of the same bevy not seeing Countess, there being a large log betw- en them; the birds were flushed to order, and both dogs dropped to wing. They were then worked on and Grace scored two beautiful points. They were then ordered up, and Countess C. afterwards put down to back, which she did, and was awarded the heat. Down twenty-five minutes.

PRINCESS TECK AND DON QUIXOTE

were the next brace. Princess Teck handled by Nesbit, and Don Quixote handled by Short, were put down at 12:10 in a cornfield. Princess Teck was very fat, and was backed by J. Teck being too fat to do any work. A large space of ground was drawn blank, the dogs not razing far enough to find birds; when by accident Princess Teck stumbled on a bevy and worked a while on this bevy, and Princess secured three points and was awarded the heat at 12:44. Down thirty-four minutes.

LADY C. AND POARTER

were the next brace. Lady C. handled by her owner, Mr. Stephenson, and Poarter, the winner of second in the Eastern Field Trials Derby, handled by Avent, were put down at 1:20 in the cornfield near the old house. Lady C. is a fast little bitch, and if properly handled will make a good one, but in this heat she showed neither nose nor breaking, and after some nice work by Poarter the heat was awarded to him at 2:20. Down one hour.

RUSH GLADSTONE AND LADY ELINORA

were the next brace. Rush Gladstone handled by Avent, and Lady Elinora handled by Nesbit, were cast off in some woods, when Rush Gladstone, who is a fast and stylish, level-headed dog, pointed. Moving on Lady Elinora, who is a slow-moving pottering dog, scored in rapid succession three flushes. We then swung round over the hill, where Rush pointed and was few steps he dropped on a point. They were then ordered up, and the heat was awarded to Rush Gladstone. Down five minutes.

COUNTESS HOUSE AND COUNTESS GLADSTONE

were the next brace. Countess House handled by Short, and Countess Gladstone, were put down at 2:35, and worked over a large space of ground, neither of them showing much speed or style, and at 3:05 they were ordered up and the decision was reserved. Down thirty minutes. This finished the first series, Bravo having a bye.

Second Series.

SAN ROY AND BRAVO.

The judges concluded upon consultation to throw out the dogs Shot, Rain Bow and Princess Teck, who had won heats in the first series but were not considered as having sufficient merit to win.

The first brace in this series, San Roy and Bravo, who had the bye, handled by Ellison, were cast off at 3:05 in the edge of a thicket. Bravo would not get away from his handler, but looked about as if dazed and not knowing what to do

As soon as Mr. Sanborn could get San Roy in, who had gone off on one of his magnificent bursts of speed, they were ordered up and the heat awarded to San Roy. Down five minutes.

COUNTESS C. AND KATY D.

were then put down, at 3:20, in a ravine and worked up through the sedge, both dogs going at fine speed and in fine style. This was a short hot heat, it being hard to decide which of the two was the best. In some bushes near the edge of a sedge field Countess C. pointed and the bevy was flushed and one killed and retrieved by Countess. Moving on up into the woods both dogs secured a point. We then worked on up the edge of the woods, where both dogs roared nicely a running bevy and Katy D. located them, making a stylish point. Moving on into the woods Countess pointed. We then worked on into the woods, where Katy D., going very rapidly through the woods, dropped on a nice point. They were then ordered up and the heat was awarded to Katy D. at 3:55. Down fifteen minutes.

POARTER AND GLADSTONE'S BOY

were then called at 3:40 and worked on through the woods when Gladstone's Boy flushed and Poarter pointed a single bird. Moving on Poarter flushed. We then worked on when Poarter pointed and the bird was flushed, to order, and killed and retrieved by Poarter. Gladstone's Boy soon after made a bad flush. They were then ordered up and the heat was awarded to Poarter at 3:45. Down five minutes. This ended the second series, Rush Gladstone having a bye.

Third Series.

SAN ROY AND RUSH GLADSTONE

were then put down on the hill in sedge grass and worked on across a cotton field to a ditch, both doing good work, but in ranging, San Roy had the best of it. We moved on up the ditch, when San Roy pointed a hare. We then went on over the hill and a large field was drawn blank. Working on San Roy pointed a hare. We then turned up a swale to the fence at the edge of the woods, where Rush Gladstone scored a flush. They were then taken up for the day. At 1:10 on Friday they were again put down in a large field of sedge and working on through the fence we swung round up a hill, where San Roy was seen on the point a long distance from the judges, but before we got up to him, he moved up, flushed and broke in. Rush, coming up dropped on a point, but moved on. Working on up the ravine, across a sorghum patch, Rush pointed a small bevy, which were flushed to order and one killed and retrieved by Rush. Moving on across the field, San Roy pointed and was nicely backed by Rush. We then worked on when Rush pointed, but discovering his error moved on. At this time San Roy, who had ranged a hare, pointed a hare, which was backed by Rush, but before they could get up, flushed the bird, broke in and chased. They were then ordered up and the heat was awarded to Rush Gladstone at 1:30. Down, in all, thirty minutes.

KATY D. AND POARTER

were cast off at 1:30 on the hill where the last brace had just been taken up. Katy was very much off, and did not hunt as her usual style or speed, and making a great many false points and flushes, Poarter doing much better than he had ever seen his work. We moved down to a ditch, where Katy scored a false point and was very indifferently backed by Poarter. Katy then flushed a bevy. We then worked on when Poarter pointed a false point. Moving on up the ravine and over the hill Katy pointed a hare. We then worked on when Poarter scored a nice point on a bevy in a patch of sumac bushes, and was nicely backed by Katy. We then moved on down the hill to a gully, where Poarter scored a flush and soon after a false point. He then pointed on the side of a gully. Katy soon after scored a bad flush and followed it with a false point. They were ordered up and the heat was awarded to Poarter at 2:17. Down forty-seven minutes.

FINAL TIE FOR FIRST PLACE.

RUSH GLADSTONE AND POARTER

were then called to run for first money. They were cast off at 2:20, and worked through an orchard, into a large body of woods, and into a large field up a hedge row, which was drawn blank. At this time the spectators flushed a bevy, and the dogs were worked down to where they had been seen to settle. When on the side of a branch Poarter flushed a bird. Moving on Rush secured a nice point and Poarter flushed. They were then ordered up and the heat was awarded to Rush Gladstone, who was declared winner of first prize. Down fifty minutes.

FINAL TIE FOR SECOND PLACE.

POARTER AND SAN ROY

were then cast off at 3:25 to decide second money. They worked on over the hill, San Roy pointing at great speed. Poarter scored a false point in the edge of some bushes. Moving on the branch San Roy also scored a false point. Moving on Poarter pointed and was backed by San Roy. We then worked into a thicket, where San Roy was seen to point and the dogs were working down to where they had been seen to settle. When on the side of a branch Poarter flushed a bird. Moving on Rush secured a nice point and Poarter flushed. They were then ordered up and the heat was awarded to San Roy at 3:47, and he was declared the winner of the second prize.

FINAL TIE FOR THIRD PLACE.

POARTER AND PAUL GLADSTONE

were then put down at 3:55 near a thicket, where Poarter scored a point. Moving on up into the cornfield he again pointed and was backed by Paul. We then moved on, when Paul pointed nicely a bevy, which were flushed to order, and one was killed, and retrieved by Poarter. We then swung round the thicket, when Paul roared to a nice point, and soon after Poarter scored a point, but he was lost, and when Countess C. beat Grace Gladstone. Poarter then pointed, and immediately Poarter scored a point, and a little further on both dogs pointed and flushed. Moving on down the fence, Paul flushed and Poarter scored a false point. They were then ordered up and the heat was awarded to Poarter at 4:15. Down twenty minutes. This concluded the Derby, and was one of the best and most hotly contested heats.

THE POINTER PRIZE.

The first brace of pointers, Rain Bow and Major Croxteth, were then put down, and ran till they were tired of showing any good work, and they were taken up and the handlers of three pointers entered in the Derby divided honors and the \$100 pointer prize equally.

Following is a complete

SUMMARY:

First Series.

- San Roy beat Paul Gladstone.
 - Katy D. beat Nellie B.
 - Henry beat King's Quixote.
 - Rain Bow beat Count Lofty.
 - Gladstone's Boy beat Major Croxteth.
 - Countess C. beat Grace Gladstone.
 - Princess Teck beat Don Quixote.
 - Countess House beat Lady C.
 - Rush Gladstone beat Elinora.
 - Countess House and Countess Gladstone (decision reserved), Bravo, a bye.
- Second Series.
- San Roy beat Bravo.
 - Katy D. beat Countess C.

MR. WILLIAM A. BUCKINGHAM'S ORANGE AND WHITE ENGLISH SETTER DOG "GROUSE DALE."

Divided Second and Third with "Don," All-Aged Stake, Eastern Field Trials, 1883. Also divided third with "London" and "Foreman," All-Aged Stake, Southern State Field Trials, 1883.

Porter beat Gladstone's Boy.
Rush Gladstone, a bye.

Third Series.

Rush Gladstone beat Porter, and won first prize.
Porter beat Katy D.

FINAL TIE FOR FIRST PRIZE.

Rush Gladstone beat Porter, and won first prize.
Porter beat Gladstone.

FINAL TIE FOR SECOND PRIZE.

Don Roy beat Porter and won second prize.
Porter beat Gladstone.

FINAL TIE FOR THIRD PRIZE.

Paul Gladstone beat Porter and won third prize.
Porter beat Gladstone.

FOURTH SERIES.

Rain Bow, Major Croxeth and Don Quixote divided equally the pointer prize.

THE CHAMPION STAKE.

The Champion Stake was to have been run off on Saturday, but there being only two entries, Bryson's Stee and Crawford's Gait, the prize and honors were divided between them.

THE PACIFIC COAST FIELD TRIALS.

The first annual trials of the Pacific Coast Field Trials Club were run on Nov. 25, 27 and 28, on grounds selected and preserved by the club on Deer Creek, about ten miles southeast from Folsom, Cal. The place was chosen because the cover is open, making it possible to see each dog at all times, and so make correct judgments, and because quail are fairly plenty. The cover is hardly thick enough to afford first- and second-hand places for the birds. Oak trees scattered about, and here and there little dwarfed white oaks, which are found at intervals in little thickets. Plenty of rocky slopes and points about which there are dead grass and prickly weeds, and now and then a cockle patch in which the birds seem particularly to delight. About one thousand acres are reserved to the use of the club through the kindness of Mr. Woodward, the lessee, who takes great interest in the success of the club, even going so far as to pilot handlers about to know using places, and by his personal presence helping to make the meeting satisfactory. Two trials had already been had in this State, neither of which was what could have been wished. At both trials were very scarce, and such as were found were located in our California clausal, which grows breast high and quite conceals the dogs. Then, too, the walking was so hard, up and down steep high hillsides, as to distress any but those used to hard work.

The last few years have brought to the State a number of well-bred dogs, and many felt that since it seemed impossible to infuse life and a proper sense of responsibility into the club already in existence, it might be worth while to form another which should be representative in its membership and enterprising in its efforts to secure such ground and such conditions as would afford a fair test of the possibility of making a successful trial here.

To this end a number of sportsmen met in Sacramento in last August and organized the Pacific Coast Field Trials Club. It is what its name would indicate. It has no local affiliations which can cramp its movements. It is bound by no ties or obligations to hold its trials in one place rather than another, and it has a widespread membership, means, and a desire to hold the best things possible to enable Californians to claim place on equal footing with those Eastern and English gentlemen whose efforts in behalf of exclusive breeding and handling of setters and pointers have resulted in such a general increase of interest and intelligence among amateurs of field sports. Residents of any portion of the Pacific slope are invited to active membership, and the roll now has upon it the names of gentlemen living in Nevada, Oregon, Washington Territory and California, a good showing for a young club which, until last week, could point to no promises fulfilled, nor any demonstration of its usefulness.

The executive committee for this year arranged a camp on a beautiful spot on the bank of Deer Creek right in the heart of the reserve. The invitation was by all means and bedding provided for all who attended. The club caterer furnished good plain meals on the ground, and at night a huge camp-fire drew to its sides all the weary d sportsmen, who rehearsed the heats of the day with unflagging interest, and ever increasing power of discrimination while puffing at the after-dinner pipe preparatory to rolling up in their blankets and putting away for the night. A pool of clear water just by the camp invited all to plunge in, in the clear frosty mornings, or after the day's pilgrimages. The invitation was not generally accepted. In fact, the bathing was confined to one obese San Francisco member, whose failure in his attempts at Godliness should be condoned because of his distinguished efforts to be clean. On Tuesday evening the club was called to order by President Bassford and the annual meeting held. Some routine

business was done. Mr. J. K. Orr of San Francisco, a member of the club, was tendered a vote of thanks for his offer of a silver cup as a special prize for this year. The executive committee thought best to refuse Mr. Orr's offer, because they had determined to make the first trials of the club dependent on no adventitious aids for interest.

A vote of thanks to Mr. F. W. Dunn, of Battle Mountain, Nev., formerly of Indiana, who judged the trials, was passed. The officers elected for the coming year were: Thomas Bennett, San Francisco, President; I. N. Aldrich, Marysville, Cal., First Vice-President; R. H. Neill, San Francisco, Second Vice-President; N. E. White, Sacramento, Secretary; R. J. Cook, Sacramento, Treasurer. Executive Committee—H. H. Briggs, San Francisco, Chairman; G. W. Bassford, Colusa; J. H. Burnham, Folsom; C. N. Post, Sacramento; ———, to be filled by executive committee.

Selection of place and time of the next trials were delegated to the executive committee. Three judges had signified their willingness to act, but at the eleventh hour there came telegrams from two of them, stating their inability to be present. This seemed a misfortune, but the remaining judge, F. W. Dunn, Esq., of Battle Mountain, Nev., proved his competency to universal satisfaction. His judgments covered the whole work of the dogs, and were delivered with such minute differentiation as to enable all to see their wisdom. The judge had seen some Eastern trial work, and ruled to a high standard, which was just what was needed by California handlers. The latter showed a surprising degree of ignorance and lack of method. With the exception of Mr. Hoff's Dog, not a single broken dog was started by any handler. Most of them were sensible enough to see their weaknesses, and the others will be forced to an acknowledgment by having their dogs continuously beaten hereafter by those who heard and assimilated the suggestions of Judge Dunn. There is some excuse for the lack of knowledge on our part.

Dog handling is a recent thing in the State, and we have been compelled to grope along by the light of books. We have had no man who knew anything about dogs or dog breaking, except from reading. Then, too, we have failed to realize that a dog can be well broken only at large expense in time if broken by owner, or of money if sent East to the nearest breaker. The places were won by setters and pointers generally.

Dorr, the winner of the first in the All-Aged Stake, is an up-standing black and tan setter, with docked tail and short ears. Not a typical Gordon, but a wide ringer and stylish. He won third at Nebraska Trials of 1881. His nose is good, and he quarters well. On point he stands head up and tail a little high; he is steady and staunch.

The winner of second in the same stake was Beautiful Queen, a pointer bitch bred by S. B. Dille. Queen is a little bitch, "tyke" in look, too wide in chest, and with bad head; but she is a stayer, and in competent hands would make a hard one to beat where birds were plenty.

Belle, a red setter bitch, took third in the All-Aged Stake. Belle is a good-looking bitch, has a deep chest, good shoulders, and short couplings, with good feet, but has a markedly laddly flanged, and too fine a coat. The judge remarked that she and Dorr had shown most nose in the trials, but intimated that she was too fat. She won second at last year's trials in this State, scoring 78 to Waddington's Daisy's 80, and with proper breaking is good enough for ordinary company.

In the Puppy Stakes, first was taken by the pointer Butte Bow. Butte is a white, liver ticked dog about fifteen months old. Has deep chest and flat shoulders, with fair feet, a little open. Should be a goer, but has been handled to pointer, and is slow and cautious. His owner shoots in heavy cover, where rabbits are plenty, and has broken the dog accordingly. A good one with breaking.

The red setter bitch Beatrice won second money. She looks like a Chief—Berkely—Duck, except that she has a bad tail, badly carried. She has great staying power and is very fast, but ranges with her head down. She is light red in color, has a good chest and fair feet, and next year, if broken, will be hard to beat.

Gen. Cosby's dog Bow, Jr., a pointer, litter brother to Butte Bow, was the gamest looking dog in either stake. His chest is too wide and shallow for top speed, but his style is elegant when in motion. He is lively, with liver head and blazed face, perfectly unbroken, but has the making of a dog to be proud of.

THE DERBY.

The draw for places in the Derby was made on Monday morning, Nov. 26, and immediately thereafter the party started, the judge on horseback and the others on foot.

BEATRICE AND BOW, JR.

Crossing Deer Creek, opposite the camp, Judge Dunn called up the first entry, Bow, Jr. and Beatrice. Bow, Jr., handled by owner, General Cosby, and Beatrice by Mr. H. C.

Chipman, her owner. At 9:55 the dogs were cast off and ordered to beat up the creek bank, a gentle sloping rise for perhaps half a mile. The puppies ranged at will, covering the proper ground, and pretty much all of that contiguous, without locating birds. Reaching the back bone of the ridge the dogs were sent round to the left through an open thicket of small oaks. Both paced well. Beatrice the faster, but Bow, Jr., in beautiful style. Passing down on the eastern side of the ridge Beatrice ran into a bird which Gen. Cosby dropped at long range beyond a barbed wire fence. Beatrice broke shot and retrieved well. Bow, Jr., attempting to follow the bitch snatched his left hook on one of the barbs and ran lame for a few minutes. Moving on the dogs trailed toward some bushes, and at thirty yards put up a dozen quail. Both broke wing but stood to order. The quail settled on a point some distance ahead, and in moving toward them, Bow, Jr., male game, and was trailing toward a brush pile when Beatrice running by him, pointed for a second, but the quail started. Several birds were flushed by the party here after the dogs had gone on. Coming to the cover taken by the bevy flushed a little before the dogs quartered there it across wind without finding, but after moving on the handlers put up several birds. The dogs were then taken up and the party walked on to Slate Creek, over a divide, where birds were reported to be. While going to Slate Creek a number of gentlemen from the adjacent towns came on to the ground and joined the party. Near the creek the dogs were cast off, and instantly Bow, Jr., flushed a pair of birds from some dead weeds. A little beyond, and after climbing a fence, Beatrice pointed in some prickly weeds, but the quail was flushed by the near approach of the handlers. The bitch stood to wing. Bow, Jr., chased fur, but came in to call. Moving on each dog made two flushes down wind, and were then called in to retrieve hidden birds. Bow, Jr., found dead, but did not retrieve. Beatrice then quailed Chipman's shot. The brace was then put on chain for further trail. Down one hour and fifty-two minutes.

BUTTE BOW AND BEAUTIFUL SNOW.

At 11:50 Beautiful Snow, handled by owner, Mr. George W. Ellery, and Butte Bow by owner, Mr. H. A. Bassford, were ordered down in a dry brush opening, which they drew blank. A little beyond Snow trailed to a weedy place, but flushed the birds wild and broke in, chasing out of sight. Coming back and being sent on by Mr. Ellery, Snow again chased a quail which flew from a tree nearby, and a moment after ran in on a bird which flushed wild. Butte Bow, working close in, seemed to be trailing foot scent, and soon put out a hare, on which he broke, but stopped to order. Twice Butte Bow commenced working body sent, but his handler seemed to fear letting him out, and Beatrice broke and called him out. After moving over a half mile of open ground without finding, the dogs were taken up and the heat given to Butte Bow. Down one hour and six minutes.

At 1:05 Beatrice and Bow, Jr., were again started to complete their first heat. Soon the bitch began feathering toward a weedy knob, but her handler flushed her bird before she could make the point, Beatrice steady to wing. A little to one side Bow, Jr., footing a little gully, drew to point, but the handler, who was working close in, seemed to be trailing foot scent, and soon put out a hare, on which he broke, but stopped to order. A little further on the dogs were put up on a marked bird, but the quail flushed. Bow, Jr., chasing; Beatrice steady. Running together the dogs flushed several birds and without making, Beatrice steady to wing. Down one hour and ten minutes.

This finished the first series. Duke having a bye.

Second Series.

DUKE AND BEATRICE.

At 2:25 P. M. Beatrice, handled by Mr. Chipman, and Duke, owned by C. V. B. Kading, and handled by Mr. W. H. Briggs, were started. They worked out a good deal of cover. Beatrice steadier than early in the day. Duke at good pace, and in excellent style, particularly fine in carriage of stern, and with head well up, but evidently thinking he was out for exercise. Walking over a little knob, a bird flushed from a little oak over Duke's head. He stood to wing. Soon after, starting a hare, Duke chased out of sight, but soon came in. A bird put up by the handlers was shot at by both and missed. Both dogs stood to gun. Duke after twenty minutes, lost in pace, and after heating out several likely spots with but one find, and that by Beatrice, the brace was called up, and Beatrice given the heat. Down thirty-five minutes.

It is but just to say that Duke had never before been out given, and was called simply because his owner desired to fill the field of starters.

BUTTE BOW AND BEATRICE.

At 3:20 this brace was cast off under the same handlers as before to decide as to first place. Both dogs did nice work, covering their ground well, and at killing range. On a hill-top Butte Bow drew to a staunch point on a tomcat, Beatrice refusing to back. Moving on down a slope a bevy was flushed

MR. R. T. VANDEVORT'S LIVER AND WHITE POINTER DOG "DON."
Divided Second and Third with "Grouse Dab," All-Aged Stake, Eastern Field Trials, 1883.

by the spectators and marked on the opposite hillside. Both dogs soon made game on the bevy and roared cautiously, but the birds would not lie. Getting below part of the cover, and ranging back toward her handler, Beatrice drew to an uncertain point at a heavy bunch of brush. A moment after Butte Bow drew on the same birds from the other side of the cover, and when Mr. Chipman kicked out the birds both dogs stood to wing. Passing on, Beatrice pointed down wind, but Butte Bow flushed the bird and Beatrice chased. It began to grow dark and a start was made for the camp, when in a shaded spot Beatrice pointed, and held the point until Mr. Bassford brought Butte Bow up, when the dog drew to back in nice style. Point and back both well held. Mr. Chipman was ordered to flush, but could not put out a bird. The dogs were then taken up and the heat and first money awarded to Butte Bow. Down two hours and thirty-one minutes.

SUMMARY.

PUPPY STAKES.

First trials Pacific Coast Field Trials Club, open to all setters and pointers on the Pacific slope, whelped on or before April 1, 1882, \$25 to first, \$10 to second, \$10 to third. Entrance \$5. Judge, F. W. Dunn, Esq., Battle Mountain, Nevada.

First Series.

H. C. Chipman's red setter bitch Beatrice (Snakee-Nollie) whelped April 5, 1882, beat
G. B. Cosby's liver and white pointer dog Bow, Jr. (Ranger Boy-Josie Bow) whelped Aug. 15, 1882,
Ranger Boy and white ticked pointer dog Butte Bow (Ranger Boy-Josie Bow) whelped Aug. 15, 1882, beat
G. W. Ellery's orange belton setter bitch Beautiful Snow (Dan-Sybil) whelped April 1882,
C. V. B. Kaeling's red setter dog Duke (Colgate's Pat-Howe's Gypsy) whelped July 19, 1882, a bye.

Second Series.

Beatrice beat Duke.
Butte Bow, a bye.
Beautiful Snow and Duke withdrawn.

FINAL TIE FOR FIRST PRIZE.

Butte Bow beat Beatrice and won first prize; Beatrice won second and Bow, Jr. third.

ALL-AGED STAKE.

Monday evening, after a pleasant dinner, was spent about the fire. Many were the tales that were told—most of them highly adorned, many pointed—but the "morks" that they pointed were certainly not inclicated at any very religious shrine. Before retiring the dogs were drawn for places in the All-Aged Stake, and at 9 A. M. on Tuesday, Nov. 27, the first brace was called and the party moved toward the ground selected for the first heat, Judge Dunn having resigned his thoroughbred and taken an old work horse, a very willing, but quite unable, animal, that drew to a point as soon as the Judge mounted. That is, he lunched his backbone to a point upon which the judge sat, while the old thing bucked like a very bronco. The judge was rescued and the horse penalized for not moving on after failing to throw his rider.

SYBIL II. AND BEAUTIFUL QUEEN.

At 9:25, Sybil II., in hands of her owner, Mr. Thos. Bennett, and Beautiful Queen, under care of J. M. Bassford, Jr., owner, were cast off on the creek bank, opposite the camp. Sybil II., just twenty days old for a pup, as a puppy, ranged off at good speed and showed a disposition to quarter. She has, in an aggravated degree, the tail carriage of her sire—a sharp bend to the right and perfect immobility when ranging. She is a sturdy little bitch, as also is her heat opponent, Beautiful Queen. Both bitches were sent. Quartering up the long ascent on which they were started, through good cover, the dogs drew blank, and on reaching the hilltop Sybil II. moved a hare and chased. Working along the ridge Beautiful Queen incessantly ran in from behind Mr. Bassford, thus losing about half her work. Both bitches soon slowed down, and Sybil II. did some very fine work within gunshot all the time. Coming down over a rough point Sybil II. began to draw, but her bird would not lie, and the little bitch broke wing and chased. The brace being sent down to water in the creek, Sybil II., on the water side, pointed in some cockle burrs and was staunchly backed by Beautiful Queen. Sybil II. growing unsteady, both bitches ran in and worked the cockle patch without finding. Judge Dunn then ordered them up and gave Beautiful Queen the heat. Down thirty-five minutes.

DASH AND DIDO.

At 10:10 Mr. J. G. Edwards's Belton II.—Belle dog; Dash handled by Mr. Thomas Bennett, and Mr. C. N. Post's red set-

ter bitch Dido, handled by owner, were sent in on a brushy hill, across wind, Dash working rather slowly but in good form. Dido, apparently oblivious of the fact that her handler was there for the purpose of getting quails, repeatedly covered the same ground, and came in from behind Mr. Post. Both handlers kept talking, hissing and whistling loudly, and very much to the disadvantage of their dogs. After working considerable blank cover, Dash found and pointed in a thicket on a hilltop overlooking the creek, but the bird would not lie long enough to bring Dido up to back. Swinging toward the creek Dido pointed, but instantly moved on, and circling down to the creek found and pointed a bird, which flushed a moment after the bitch steady to wing. At 12:10 the next brace was called for, and decision reserved as to Dash and Dido. Down two hours.

DORR AND BELLE.

Mr. Taft, handling Dor, took the right hand, and Mr. Briggs, handling his Belle, the left. The brace did the first regular quartering of the trials, working out all cover and under good command, Dor in breezy style, Belle more slowly, evidently hindered by her condition. The dogs covered a little slope and in walking after them the spectators flushed, from one side, a bevy of perhaps ten birds. Mr. Briggs shot but missed. Reaching the hill top Dor drew to point but discovering his error went on. Ranging down in a gully Dor chased a hare, giving tongue but instantly returned at command. As he was coming in he commenced to feather toward a densely overgrown gully, but the birds flushed very wild, Dor steady to wing. Belle chased fur, and stopped only after repeated order. On a little rocky point by the water side each dog drew twice but stopped to whistle, and coming in was switched by the water. Dor made birds, and pointed staunchly until the birds flushed. Steady to wing. The dogs were then worked to retrieve concealed birds. Both found readily and retrieved perfectly. Starting on, Belle was sent to a marked bird and pointed staunchly. Dor being sent in, backed in nice style, while old Don, in the rear, happening to see the pointing dogs, drew to back and the three were held for a half minute, when the bird moved and then flushed. Mr. Briggs shot and missed. Dor steady to wing, Belle breaking shot. The dogs were ordered up at 1:35, and Dor given the heat. Down one hour and fifteen minutes.

After the preceding heat the judge directed Messrs. Bennett and Post to hile birds and let Dash and Dido retrieve. Both found dead and brought the birds without mouthing. Under the gun Dash stood, Dido breaking, but stopping to order. They were then sent back and the heat was awarded to Dido. This ended the first series, Don having a bye.

Second Series.

DORR AND DON.

At 2 P. M. Dor and Don were thrown off in the open, Mr. Thos. Bennett shooting for Mr. Taft, and Mr. J. M. Bassford, Jr., handling Don, instantly Dor ran yelping after a rabbit, but stopped to whistle, and coming in was switched by Mr. Taft sharply. Dor worked perfectly after the correction, at great pace, and in good style; head very high, and tail a little too well up. He trailed several recent scents without finding, as also did Don, whose pace was quite equal to Dor's. Dor trailing across wind came to a nice point in a little bush well removed from other cover, Don coming up, stopped an instant, and then coursed away to one side. Mr. Bennett kicked the bird up but did not shoot, Dor steady to wing. Each dog soon after covering a range of two hundred and fifty yards, and out of sight. Both dogs retrieved hidden birds well, and were then called in and the heat awarded to Dor. Down one hour and twenty-five minutes.

BEAUTIFUL QUEEN AND DIDO.

After twenty minutes' rest this brace was put down, each dog handled by owner. Dido did some good quartering up after covering a range of two hundred and fifty yards, and in good style, except that her head was rather low. Several covers were worked out without locating birds, when on a hilltop overlooking camp, Mr. Post following his bitch flushed a quail, shot and missed. Dido steady, Beautiful Queen dropping to gun. Passing on along the ridge toward where quail had been found on the evening before, Dido at speed flushed a bird and was called in and whipped by Mr. Post, which took the wire edge from her and made her more tractable. Ranging together along the ridge, the dogs put up a bird from a rocky patch, which Mr. Post failed to kill. Both dogs breaking shot, but coming in to order. Walking campward down the ridge, both dogs drew on game. Dido in a bunch of little acorns, across wind, and Beautiful Queen up wind toward a similar clump. Mr. Post walked up his point and started a rabbit. Dido steady to fur. Dido was then brought to back Beautiful Queen, but stood, to order only, unsteadily at both ends. A start was again made for camp

and just before crossing the creek Beautiful Queen drew to point on a rabbit, standing, when it was put out by Mr. Bassford. After being down one hour and three minutes, Judge Dunn ordered the dogs on chain for retreat in the morning. The brace was cast off at 1:45 on Wednesday morning to run to a finish. Queen soon pointed, Dido refusing to back. When Mr. Bassford flushed and killed, Beautiful Queen broke shot and retrieved, Dido standing to gun. Soon after, up wind, Dido drew to point, but the bird flushed, the bitch standing to wing. After being down thirty-five minutes they were sent back, and Beautiful Queen given the heat. This ended the second series.

Third Series.

BEAUTIFUL QUEEN AND DORR.

At 8:28 this brace was put down to decide first place. Mr. Thomas Bennett gunning over Dor, whose handler, Mr. Taft, was barely able to follow his dog. Mr. Bassford over Queen. In this heat Dor justified all the praise which FOREST AND STREAM has heretofore given him. He quartered over an extraordinary range in good style and better pace than before, leaving no possible covert undrawn and yet working with game. Dor ran to a hilltop, up wind, and stood body sent near a fence. Beautiful Queen soon discovered him and backed. Mr. Bennett killed the quail, and Dor showed a little unsteady to shot, but retrieved to order well. Crossing the fence Dor chased fur, yelping, but stopped at Mr. Taft's whistle, and on coming in received a dressing down from his handler. Moving on, a rabbit ran from a bunch of weeds, Dor dropping and Beautiful Queen breaking in, for which she was thrashed on her return. A bird being put up by the crowd near Queen the bitch stood to wing and a moment after Dor dropped to wing, after which the heat was declared ended and Dor given first place in the All-Aged Stakes. Down twenty-five minutes.

BEAUTIFUL QUEEN AND BELLE.

Twenty minutes' breathing time was spent, and then Beautiful Queen and Belle were started to decide second prize. Beautiful Queen, under her owner, Mr. J. M. Bassford, and the red bitch under Mr. Briggs. A long ridge was quartered without finding birds, Belle chasing fur twice and not stopping to order. At the upper end of the ridge in briars Belle pointed, Beautiful Queen backing. Belle made out her error and ran on, when Beautiful Queen chased a hare out of sight, returning at will. A great deal of cover was then drawn without success, when Queen, on a warm side hill up wind, drew to point on a bevy. Her handler put the birds up, but did not shoot. Beautiful Queen stands to wing. Turning to the left and following part of the bevy, Beautiful Queen down wind ran into a quail, which Mr. Briggs killed. The brace were sent to retrieve, Queen finding dead and bringing the bird neatly. Moving on down wind, both bitches false pointed, Beautiful Queen soon after pointing fur and chasing the rabbit when sprung. Mr. Bassford, walking too close to his bitch, flushed a bird on which she was drawing, Queen standing to wing. After working on over good ground for a mile or more without meeting birds, the heat was ended, Beautiful Queen being declared winner of the heat and second place in the stake. Down two hours and forty-five minutes.

SYBIL II. AND DIDO.

Judge Dunn preferred that the dogs should work out their own salvation, while their owners feathered and treed. So, rather than designate the dog of this brace which should run off with Belle for third place, he ordered a test heat, and, after a little rest, Mr. Bennett and Mr. Post put down their bitches. Belle, kindly led by Mr. J. B. Martin, false pointed, and the running traces were called to back, but both bitches, when started, Dido ranged to the left and pointed fur, standing when the rabbit was sprung. Being ordered on, Dido began drawing toward an oak tree, and was stiffening on point when the bird flushed wild. Mr. Post missing it, both bitches at once broke sight. Moving on, Mr. Post flushed three birds, shot and missed, Dido standing to gun, Sybil II. to order. Sybil II. then flushed and chased a quail from a weed patch, not returning at command, for which she was well thrashed by Mr. Bennett. Each bitch then worked her own quail in good style, and the heat was declared ended, Dido winning. Down fifty minutes.

BELLE AND DIDO.

At 1:15 these dogs were called for the final heat of the trials and for third place. Mr. Post permitting Dido to run free, while Mr. Briggs kept his Belle quartering immediately before him. Dido showed great gameness, her feet being raw and bleeding, but she ran as well as at first. Soon Belle drew on a bird in some brush, and held it staunchly. Mr. Briggs flushed the bird but did not fire, Belle standing to wing.

Moving on Dido soon drew to a point, but almost immediately detected the mistake and ranged off. Running down wind in the open Belle flushed a brace and stood to wing. Ordered on, Belle soon drew to game, but the quails would not lie, and Mr. Briggs shot one of them. Belle ran in beside her, pointing the same little. Both bitches staunch. The judge called up the brace and awarded the head and third prize to Belle. Down fifty minutes.

SUMMARY.

First Pacific Coast Field Trials Club's Trials; All-Aged Stakes; open to all setters and pointers owned on the Peninsula. First, set; second, Lily, third, set; France 85, closed Nov. 15, 1888, with thirteen entries, seven starters, run at Walltown Timbers, Cal., Nov. 26, 27, 28, 1888. Judge, F. W. Dunn, Esq., Battle Mountain, Nevada.

First Series.

J. M. Bassford, Jr.'s, liver and white pointer bitch Beautiful Queen (champion Ranger) of Chesny's trials; second, set; third, Bennett's black and white setter bitch Sybil II. (Dan—Syrbil). C. N. Post's red and white setter bitch Dido (champion Ben—Jessie), lead; Edward's black, white and tan setter dog Dash (Belton II—Helle). F. A. Taft's black and tan setter dog Dorr (Don—Lady), beat H. H. Briggs's red setter bitch Belle (native Irish red). J. M. Bassford, Jr.'s, black and white setter dog Don (native English), a bye.

Second Series.

Dorr beat Don. Beautiful Queen beat Dido. Final tie for first place. Dorr beat Beautiful Queen and won first prize.

THE FOR SECOND PLACE.

Beautiful Queen beat Belle and won second prize. TIES FOR THIRD PLACE.

Third Series.

Dido beat Sybil II. Final tie for third place. Belle beat Dido and won third prize.

THE SOUTHERN STATES FIELD TRIALS.

THE All-Aged Stake of the Southern States Field Trials was won by Bryce's Setter, and second by Thru. Third was divided between Harrison's London, Grouse Dale and Foreman. The Champion Stake was won by Gath over Sue, the only other entry. The detailed report of the running will be given in our next issue, for to-day, even with the extra pages, our Kennel columns are crowded with news reports.

THE LONELY BENCH SHOW.

[From our special correspondent.]

THE show opened on December 8th morning, Dec. 12, and continued through and Friday, closing at 10 P. M. on the 14th. It was held in connection with the poultry show of the Middlesex Association, and both were under the superintendence of Mr. Chas. A. Andrew, of West Boxford, Mass., whose managing good nature and liberal ideas, and to this cause he has been true, have been of great aid in making the factors in making things pleasant for both exhibitors and visitors. That preliminary preparations were not more energetically pushed, was due more to a lack of experience, than to willingness of spirit or executive ability, and to this cause may be ascribed some of the minor criticisms made, when more than twice that number could readily have been obtained by making the existence of the show known more widely. However, it was plainly manifested, that there is a growing interest in dog shows in this vicinity, and that we are likely to see an annual and successful event, is beyond doubt. The judges selected by the committee were Mr. J. F. Kirk, of Toronto, Can., for sporting dogs and collies, and Dr. George Walton, of Boston, for the remainder of the non-sporting division. The former has always been a popular judge, to which the present occasion was no exception, and Dr. Walton has a wide circle of friends, extending far beyond Boston (which he has made his home since 1849), who have every confidence in his knowledge and experience, and whose attendance was very good, taking all things into consideration, and the judge's decisions gave rise to no growling whatever. The classes best filled were Irish setters, spaniels, and collies, and the quality of the exhibits in these classes, was much above the average. No doubt the influence of Dr. Jarvis's kennel, at Claremont, N. H., has disseminated a widespread taste throughout New England for the handsome and stylish red Irishman, and among the collies, the best of the lot were Irish setters. In these classes, there was not a bad one. The show of spaniels owed much of its attractiveness to the large exhibit made by Messrs. Leavitt and Fellows, of the Hornell Spaniel Club. Twenty-three collies were exhibited and made a very creditable display, the winners being well worthy of their cards.

In English setters Royal Sultan won without much trouble. He was well shown. Dash won in the champion class for Irish setters. He looked excellently well, with lots of hard muscle. The open class for bitches brought half a dozen beauties before the judge, Noreen H. winning her condition, although perhaps five pounds too fat, being so admirable, that she carried off the special prize, a handsome collar, offered by Mr. Kirk, for the best sporting dog shown in the best bench show condition. She is of the highest order of excellence as a typical bitch, and is not too long in the leg, a tendency too common in the breed. This fault should be put to rest, and it is to be hoped that, in the future, it will be a very stylish little bitch. Syren II., vice, is also a good-looker, and Komaine, Flo and Nellie were worthy of their cards.

The puppy class was a good one, and first and second went to two handsome lads, named by Glendora, out of Syren II., the winning bitch being shown in better condition than the dog. Rufus, Spot and Nettie Sandy were quite good. The Gordon's, though few in number, were fair.

Pointers were of a good style, Rita Croxteth (although heavy in weight) Tucker's Drake and Thorn, being especially worthy of notice. The Hornell Club had their usual success in spaniels. Dash, Barones, Bonanza, Dinah, Ruby, and Brunette, all winning first prizes. Dash and Ruby were the best of the lot, but all were brought into the ring in blooming condition. Some spaniels of far more than ordinary merit, made their debut at Lowell. The place of honor unquestionably belongs to Obo II, who, although only 16 months old, has rapidly matured into a very taking cocker. He weighs only 22 lbs., but has abundance of bone, a requisite too often deficient in our cocker spaniels, and first-class coat and feather. He beat Hornell Ruby in the contest for a special prize given for the best cocker, and was also brought to the best of the lot, and merited the award. Blackie III, and Critie also made their first bow to the public, and are likely often to repeat their success. A pair of clumbers owned by Dr. Plunkett, of Lowell, are much better than some that have appeared at our latter shows.

Lane was alone in the champion class for deerhounds. He looked better than at New York and London.

Friday Night and a nameless puppy, were the only greyhounds, both shown by Mr. H. W. Smith, of Worcester, who brought them to the scratch in beautiful condition. The puppy promises to be more than a good one.

Foxhounds were well shown, and B. is promising. Dolly was the best of the beagles shown, the others being rather large, coarse and wide-chested to be quite acceptable, but they were good stauap nevertheless.

Old Brackman's dog, carrying his years bravely, looked every inch a terrier. He wears well. Jeopardy and Bruse are fox-terriers of the correct type.

In mastiffs, Messrs. Shaw & Bates took the honors, with Agrippa and Rena. King is a large dog of good unsentif character, his eyes are closed.

Sau is a Newfoundland of well-bred appearance, but on the small side. Mr. Lindsay brought out Rex in spick-and-span order for the collie championship, and was opposed. He had to play second fiddle with Kitty Mac to Lady Bess for the bitch prize. The latter is a beauty. Floss won in puppies. She is a neat, taking bitch. The second prize winner was very shy, and would not show himself well. In the pairs of collies with age, he will win the higher honors. Mr. Gilbert's collies were not in the best of coat and are rather a heavy-headed sort, too full in the eye. This criticism is especially applicable to Tom. They are all of an attractive color, fawn red. Meg and Ruby, respectively first and second in the class of puppy class, are good looking dogs, but the dog is too high on the leg and heavy in car to promise much for his future success on the bench.

None were shown in champion bulldogs, he having appeared in place of Tippos, entered from the same kennel. Box and Moses were awarded first and second in the open class, the former winning by a good handfull. Sweet Briar is a capital griddle bitch, but looks a little older in the mouth than the record shows.

Sankey is not a bad bull-terrier, but he was quite eclipsed by Grand Duke, a new importation of the Messrs. Livingston, and which will need a good one indeed to beat him. Little Maggie has many quays for a little one, although her tail is a trifle too well clothed.

Among the remaining classes, Pepper, a good Skye, and Sweep, a good poodle, were the only ones showing anything in the way of merit. If we except a small black and tan toy terrier exhibited by Mr. J. A. Nickerson. Following is a list of the winners.

AWARDS.

ENGLISH SETTERS.—Dogs: 1st, Hugh Hill (Royal Sultan); 2d, J. A. Nickerson (General). High com. R. W. Rogers (Danial Webster). Bitches: 1st, George H. Tucker (Rita Croxteth). High com. J. M. Bassford (Dora).

CHAMPION IRISH SETTERS.—Dogs: 1st, Thomas Wilson (Dash).—Open Class.—Dogs: 1st, Brush Hill Kennel (Major). Bitches: 1st, John F. Dwight (Norma); 2d, Jean Grosvenor (Zedda). Very high com. Geo. A. Fletcher (Sandy). High com. John C. Neill (Floss). Ashmore Kennel (Canaan). Com. H. H. Tarr (Nellie). Puppies: 1st, J. C. Jesson (Lulu Lilliput); 2d, A. B. Guild (Dorcas). Very high com. T. F. Richardson (Brace). High com. J. M. Bassford (Sue). J. A. Nickerson (Nette Sandy); Jean Grosvenor (two, unnamed).

GORDON SETTERS.—Dogs. Com. D. A. Goodwin, Jr. (Dan). Bitches: 2d, Ashmore Kennel (Nellie). High com. J. A. Beckford (Bess). Puppies: 1st, Bennett's (Rufus).

CHAMPION POINTERS.—Lover 55 lbs.—Dogs: 1st, Dr. F. C. Plunkett (Snipe). Bitches: 1st, George S. Tucker (Rita Croxteth). Puppies: 1st, George H. Tucker (Rita Croxteth). High com. Dr. J. H. Mayo (Thorn). Very high com. G. W. Leavitt, Jr. (Lady Isabel).

CHAMPION FIELD SPANIELS.—Dogs: 1st, Hornell Kennel Club (Dash). Bitches: Leavitt & Fellows (Barones).

CHAMPION BLACK SPANIELS.—Open 28 lbs.—Dogs: 1st, Leavitt & Fellows (Montezuma). High com. Leavitt & Fellows (Winchester Johnson (Critic)); 2d, George H. Gilbert (Cae of Spades).—Open Class.—Dogs: 1st, Wilcox & Watson (Black Tom). Puppies: 1st, Winchester Johnson (Black Tom); 2d, Leavitt & Fellows (Blue Baboon).

CHAMPION CUCKER SPANIELS.—Other Than Black.—Bitches: 1st, Leavitt & Fellows (Rufus). High com. Leavitt & Fellows (Brunette).

CLUMBER SPANIELS.—Dogs: 2d, Dr. F. C. Plunkett (Romp).—CHAMPION DEERHOUNDS.—Dogs: 1st, John E. Thayer & Bro. (Yellow Rover); 2d, John E. Thayer & Bro. (Duncan).—CHAMPION GREYHOUNDS.—Dogs: 1st, H. W. Smith (Friday Night).—Open Class.—Puppies: 1st, W. Smith (no name).

FOXHOUNDS.—Dogs: 2d, Lewis Bronson (Houpee). Bitches: 2d, Lewis Bronson (Dixie B.). Puppies: 1st, Lewis Bronson (Lena B.).

BEAGLES.—Dogs: Geo. B. Inches (Dell); 3d, H. E. Shaw (Rambler II.). Very high com., H. E. Shaw (Ranger). Puppies: O. W. Rogers (Queenie); 2d, Bennett's (Rufus).

CHAMPION FOX-TERRIERS.—Dogs: 1st, John E. Thayer & Bro. (Brookhurst Joe). Bitches: P. Lawrence (Jeopardy).—Open Class.—Bitches: 1st, P. Lawrence (Bruse); 2d, Louis Coster (Minnie). Puppies: 1st, John E. Thayer & Bro. (Duncan).—CHAMPION NEWFOUNDLANDS.—Dogs: 1st, J. A. Nickerson (Sam).—Open Class.—Dogs: 1st, E. Brocchion (Lion). Puppies: 1st, R. C. Murray (Jumbo); 2d, J. A. Nickerson (Pop).

CHAMPION Poodles.—Dogs: 1st, Geo. A. Fletcher (Sandy). Bitches: 1st, E. B. Nichols (Lulu Bess); 2d, Jas. Lindsay (Kitty Mac). Very high com., Geo. A. Fletcher (Sandy). Puppies: 1st, J. Houghton (Floss); 2d, Very high com. and high com., Geo. A. Fletcher (Rover, Grotter and Soap). High com. and com., J. Houghton (Dolly).

CHAMPION COLLIES.—OTHER THAN BLACK AND TAN.—Dogs: 1st, Geo. H. Gilbert (Agrippa). Bitches: 1st, Geo. H. Gilbert (June).—Open Class.—Dogs: 1st, Geo. H. Gilbert (Box). Bitches: 1st, Geo. H. Gilbert (Queenie); 2d, Geo. H. Gilbert (Niel (del Merelles)).

BULLDOGS.—Dogs: 1st, 2d, R. W. Livingston (Boz and Moses). Bitches: 1st, R. W. Livingston (Sweet Briar); 2d, John E. Thayer (Juno).

CHAMPION BULL-TERRIERS.—OVER 25 lbs.—Bitches: 1st, M. W. Hammond (Sankey).—OPEN CLASS.—1st, R. W. Livingston (Grand Duke). Under 25 lbs.—1st, R. W. Livingston (Little Maggie).—FOODLES.—Bitches: 1st, Lewis Bronson (Floss).

PUGS.—Bitches: 1st, Forest City Kennel (Kath). Puppies: 1st and 2d, Forest City Kennel (Don and Pam). Best Keel: 1st, Forest City Kennel.

BLACK AND TAN TERRIERS.—Bitches: 1st, J. A. Nickerson (Midge).

SPANIELS AT LOUISVILLE.

Editor Forest and Stream: In your report of the Louisville show you speak of Bonanza and Ruby being in bad coat. My dogs are all workers, and after two or three months' work in the bushes and fields of Steuben county after woodcock and grouse, we do not expect a lue coat and feather. We do not claim that Hornell Bonanza is a field spaniel, but that he is a true cocker in all but his weight. He is very good in all respects, but not so good from elbow to ground is not leggy; his eye is good, black, maybe a trifle small, but we do not want a full large eye like a King Charles in a working spaniel.

You also state Ruby is "a beauty." Well, she is the only dog or bitch that ever beat Bonedit. I say that Ruby is a good colorer, but not a golden Sussex. We breed for the market, and no one wants the golden liver; nothing will sell but the darkest liver. Ruby is a good dog, but not a dog for the market, and no one wants the golden liver; nothing will sell but the darkest liver. Ruby is a good dog, but not a dog for the market, and no one wants the golden liver; nothing will sell but the darkest liver. Ruby is a good dog, but not a dog for the market, and no one wants the golden liver; nothing will sell but the darkest liver. Ruby is a good dog, but not a dog for the market, and no one wants the golden liver; nothing will sell but the darkest liver. Ruby is a good dog, but not a dog for the market, and no one wants the golden liver; nothing will sell but the darkest liver.

built cocker in America, but none; a merry, untiring worker; no day or week is too long for her, no mud too deep, no water too cold, no cover too thick, no thorns or briars too sharp for her, and all tasks is to breed plenty more of her type, for she is just what our owners want—a cocker, and a good dog, cannot be a bad color." J. ORTS FELLOWS.
HONNELLVILLE, N. Y., Nov. 25.

THE BEAGLE CLUB.

The following circular has been sent to the members of the American-English Beagle Club:
Decemver, 1887. Dear Sir: With this circular you will find enclosed a list of members of the club. As before stated nominations for officers and executive committee for permanent organization are to be made and acted upon. The officers to be chosen, are president, secretary and treasurer, (the secretary to perform the duties of both) and three members with their officers named will constitute the executive committee. If you wish to place in nomination the names of any members for the several offices, you will please forward to the secretary on blanks furnished any sum at an early date. The check as nominated will be sent you to be voted upon. The FOREST AND STREAM have kindly consented to act as tellers, which is a guarantee the election will be a fair one, and they will endeavor to the best advantage.

The president will then appoint the committee to draft a standard, which will be submitted to the club for their consideration as to adoption. The executive committee will be authorized to draw up a constitution and by-laws for the management of the club, the same to be submitted for their approval for the information of members in regard to the object of organization; is first the adoption of a standard by which all will know what constitutes a beagle, will be a guide to breeders and owners, and the judges at our bench shows; second, to see that proper classes are made for the beagle, and more prizes awarded by our bench show managers, and proper judges selected.

It is desired that all members work in harmony for the success of the club, by placing our favorite breed in its proper place, and not let us be governed by any selfish motives or petty prejudices. The members will be informed from time to time of the business of the club by circulars, as the only means of informing them of the work. Very respectfully yours.

W. H. ASHBURNER, President, pro tem, Philadelphia, Pa.
A. C. KRUEGER, Secretary, pro tem, Wrightsville, Pa.

"AMERICAN KENNEL REGISTER."—Those who intend registering their dogs in the January number of the Register will please send in their entries as early as possible. Quite a number have already been received, but as the rush is generally on the last day of the month it is desirable, in view of the fact that the names of dogs are not put in the Register till now in the hands of the printer, and will be mailed to subscribers in a few days.

NEW ORLEANS DOG SHOW.—Special to Forest and Stream.—New Orleans, La., Oct. 13.—The dog show was opened here this evening, and the sportsman present expressed themselves well pleased with the number and character of the dogs exhibited. Many of the field trial winners are here.

KENNEL NOTES.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Breed.
2. Name and name of owner, buyer or seller.
3. Sex.
4. Owner or breeder.
5. Date of birth, of breeding or B. Dam, with her sire and dam, if of death.
6. Name and address of the person to whom the communication on one side of a paper only, and signed with writer's name.

NAMES CLAIMED.

See instructions at head of this column.
Linnekin.—By Miss (Bertrand) Nichols, Terrytown, N. Y., for red Irish setter dog puppy, name "Linnekin" (The dog show of Vol. I. is now in the hands of the printer, and will be mailed to subscribers in a few days.)

Yolie and Kate.—By Mr. Henry May, Augusta, Ga., for lemon and white English setter bitches, whelped May 28, 1883, by Flinch (Bob) and Miss Sport—BIBB.

Prince Jester, Prince Delaware, Prince Dover, Prince Castle, Good Princess and Princess Omega.—By Mr. E. Jester, St. George's, Isl. set, four blue and white dogs, one white dog, one blue dog, and one lemon bell bitch, whelped Oct. 23, 1883, by Mr. J. H. Woodsell's champion Prince (Fido of the Border—Petrel) out of his Daning Belle (Daning Maud).

Barty.—By Mr. F. W. Wheaton, Wilkesbarre, Pa., for white, fawn and black beagle dog, whelped Oct. 1, 1883, by Restless (Sport—Italy) out of Miss Sport—BIBB.

Theron.—By Mr. Eugene Snyder, Harrisburg, Pa., for lue bell English setter dog, whelped July 25, 1883 (Dashing Monarch—Lisa).

See instructions at head of this column.
Buttons.—Dick, Mr. A. E. Burche's (Washington, D. C.) black and tan toy terrier bitch Buttons (Critic—Melie) to Mr. B. Blue's Dick (Bob—Melie).
Melie.—Dick, Mr. A. E. Burche's (Washington, D. C.) black and tan terrier bitch Melie (Sam—Jet) to Mr. S. Blue's Dick (Bob—Fannie).

Fanny.—Watty, Mr. G. Sanderson's (Moncton, N. B.) imported prick-eared Skye terrier Fanny to his imported Watty, Dec. 6.

WHELFES.

See instructions at head of this column.
Ike. Mr. T. C. Faxon's (Boston, Mass.) sable collie bitch Ike, Dec. 4, eight (five) dogs, by Mr. Thomas H. Terry's Robin Adair (Blue Belle) out of a sable collie bitch (Pa.) imported from England, Blue Belle, Nov. 23, three, by his imported Blue Cap, Lulu P. Mr. J. A. Stoyell's (West Philadelphia, Pa.) imported black and tan toy terrier, Lulu P., Oct. 24, by imported Fannie (Fannie—Grace), Dec. 1, eleven (eight) dogs, by champion Sensation.

See instructions at head of this column.
Watt. Mr. George H. Woodcock's (Woodscock, Oct. 4, dog to Mr. Fred. H. Hoar, Terrytown, N. Y., to Mr. Rowell Skeel, New York.

See instructions at head of this column.
Quadrant. Blue bellton English setter dog, whelped Oct. 25, 1883 (champion Prince—Dashing Belle), by Mr. E. W. Jester, St. George's, Isl., to Mr. A. M. Wright, New York.

Quadrant. White bellton English setter dog, whelped March 9, 1883, by Frank (Frank—Sis II.) out of Victoria (Warwick—Belle), by Mr. A. P. Burcher, Washington, D. C. to Dr. Chas. Nelson, Hgt. Springs.

Red Irish setter bitch, age and pedigree not given, by Mr. A. E. Burche, Washington, D. C. to Mr. H. N. Readford, Fairfield, Ct.

Tippos.—Woodcock Queen whelps. Black cocker spaniels, whelped Aug. 8, 1888, by the Woodland Kennel, Woodstock, Oct. 4, dog to Mr. J. McCullin, Paris, Ind., and a bitch to Mr. Louis Melvold, Battle Creek, Mich.

Tippos.—Woodcock Queen whelps. Liver and tan field spaniel dog, whelped Aug. 28, 1888, by the Woodland Kennel, Woodstock, Oct. 4, dog to Mr. James Jack. Liver field spaniel, age not given (Bob, Jr.—Maud), by the

in the wake of the canoe, fifty yards off. The fishermen at Pennauk Point said they didn't believe that one of these black whales would ever come up under a boat. The canoes were found very comfortable to sleep in. The hours during the cruise were very even, cool, and two blankets and tent were necessary. Mosquitoes were plenty and aggressive at most places. Mosquito-bars kept them off during the night. Very little harm was experienced during the cruise, this was owing largely to the fact that sailing most of the time there was little exertion to produce thirst. A bottle of lime juice taken to make warm water more palatable was not used at all. All the members of the fleet gained in health and spirits, and are enthusiastic over the cruise.

A. S. FINCH (Washington, D. C.),
C. STURGE (Salem, Mass.).

THE CHART LOCKER.

CONNECTICUT RIVER.

W. H. S. desires to know whether the Upper Connecticut can be run as early as May, or whether the logs will interfere, and can a start be made before the winter season.

Thanks are due to W. H. S. for offers of information concerning Merimac, Concord and Sudbury rivers and Massachusetts coast.

TENTS.

THE great question in this department is canoe tent versus shore tent. Like the Indians, canoe members are wishing good luck, "his own opinion still." Canoe tents received a boost from the fine show made at Stony Lake by the Mohicans and others. Certainly shore tents were very good, but the shore tent was experienced during the cruise, this was owing largely to the fact that sailing most of the time there was little exertion to produce thirst. A bottle of lime juice taken to make warm water more palatable was not used at all. All the members of the fleet gained in health and spirits, and are enthusiastic over the cruise.

A. S. FINCH (Washington, D. C.),
C. STURGE (Salem, Mass.).

If a shore tent is desired, I can strongly recommend the pyramid. Only one pole is required, and there are no ropes lying round to trip you at night. My smallest pyramid, made of drill, 2 1/2 square and 2 1/2 high, weighs only 65 pounds. It folds into a small roll, and is easily stored away in the canoe. A set of about 10, made of 1 1/2 inch which paddles, stool bags, etc., can be laid, makes it very snug on a cold night. Two canoes can sleep in such a tent, or on a pinch room can be found for three. The 7-7-7, made of 1 1/2 inch, are very light in proportion to size. My pole for the 7-7-7 is pine, jointed, weighing 1 1/2 pounds. The tent can be put up so as to be available for five minutes. The pyramid is the cheapest tent I know of, and is only costing \$1.

Now, let us hear from other canoeists on this question. BOREAS.

PAPER CANOES.—Editor Forest and Stream: The past summer I have done considerable building and paddling in canvas canoes (shadow model). I became a convert through reading FOREST AND STREAM. I have an idea and hardly know whether it is feasible. My canoe is very heavy, weighs about 45 pounds, made of canvas, and is sailing principally, and I want a light one for paddling and a cruise next year. Now for the idea. Can't I make a paper canoe, using my canvas one as a model, by cutting out the shape of the hull in paper and warm glue, after taking off the shell putting in light timbers. I have never seen this suggested before and do not know if feasible. O. F. H. has suggested a similar idea, but he has not patented and the process is patented. The paper, prepared in lengths for the purpose, is laid over a wooden mold in several thicknesses, secured by a screw in the middle. The glue is laid in varnish or glue. We would advise you to try a wooden boat, directions for building which will be given shortly in our columns.

SPRINGFIELD CANOE CLUB.—This club has built during the past season a boat which is divided into six water-tight compartments, to prevent danger of sinking. The house will hold nine canoes on a side, besides ten in the bow. The club has also built a house for the club, which is also lockers, closets, etc., for the members. The club now numbers nineteen active members and eighteen canoes, besides one spareboat. Several more canoes are being built, and it is planned for next season. On Dec. 10, the members of the Springfield Canoe Club launched their canoes from the club house boat and took a long paddle on the river. The boat for December? The S. C. C. had not gone into winter quarters yet. S.

LAKE GEORGE C. C.—Glens Falls, Dec. 3.—Editor Forest and Stream: The Lake George C. C. was organized in the fall of 1898 and had then a membership of about twenty. At the time of the Association meeting in 1898 the club had on its membership list thirty-eight names. A meeting was held at the Canoe Islands, Aug. 10, and a constitution adopted, and all members who were also members of other clubs were supplied with a copy of the constitution. The constitution in 1898 has undoubtedly led "Camaraad" into the error of dating our organization from that time. Our club has had a representation of from 175 to 200 at the annual meetings of the Association.—J. E. McDONALD, President, L. G. C. C.

DECKS.—The lightest deck you can use is that used on yacht's cabins, covering with canvas in one width and painting with boiled oil, coloring as desired. The deck should be painted with lead paint, should be drawn tight and wetted thoroughly, just before painting. The thickness of deck to be caulked would depend on distance of deck beams apart. The deck should be caulked with cotton. Wetted stuff would probably answer if dry and well seasoned when laid, and the joints painted with thick white lead.

KITCKERBOCKER C. C.—Editor Forest and Stream: Will you kindly correct the following mistakes which occurred in this week's issue of your valuable paper. Our active membership is twenty-eight, not twenty-nine. Address of our secretary is 200 West Third Street, not 435 West Twenty-fifth Street.—E. A. HOFFMAN, JR., Secretary and Treasurer, Kitckerbucker C. C.

PUBLISHER'S DEPARTMENT.

OUR ANNUAL FRIENDS' ENDSORSEMENT.—No well-informed person denies that the most important of the active interest taken by him in the subject, as instructed by the magnificent donation to the Museum of Natural History of New York of the finest collection of specimens of forest trees to be found in the world, is the interest and agency of Prof. Sargent from every State in the Union, at an expense of over \$100,000, has added another obligation to the many due him by getting the Chautauque Park to be made a national park. It is on the subject of preserving the remaining forests in the Adirondack wilderness.—Montreal Gazette.

Yachting.

STOWAGE OF THE NEW SINGLEHANDER.

THE accommodation plan for the yawl whose lines were published in our issue of Dec. 6, will explain themselves so readily that little need be said. The cockpit shelters from the weather and is preferred by many people. For ladies it is certainly a great convenience. The sill to the cockpit is perhaps rather low, but the boat will prove so stiff that it will be all but impossible to sail her cockpit under, and her great buoyancy will insure complete immunity from being run under or "overwhelmed," so that to greater convenience of a low sill may justify its existence in this design. The cabin is as spacious as need be. It is 10 ft. long and 6 1/2 ft. wide across the sofas, with 30 inches floor. Lockers abreast the ladder extend to full height to accommodate clothing and oilskins, while the side-boards and cupboards at the forward end of the sofas afford plenty of room for fishing line, writing materials, books. The forecabin is cut off by a curtain shown in the cross section. On port hand is an ice safe and storeroom, and shelving, racks, etc., and amidships on top of a large locker over the floor the cooking apparatus is located. A double oil stove of the Westlake & Richards pattern is so fitted for the purpose as anything else. The chain leads down through a pipe on deck and is stowed forward of the mast. Shelves in the eyes of the boat are suitable for paints, oils, putty, etc. On starboard side is room for a bunk should a hand be shipped. Seats are stowed in the rowlock and cockpit and boatman's small stoves, boat line, etc., in the side lockers and counter. Water in a tank fitted under saleroom floor. Ample ventilation is provided for by the skylight and doors. The cabin is summerized by a something cooler than those of a light draft boat spread out on the surface and exposing large area to the sun. Access to the space under the sofa is had by openings closed with narrow curtains. For sleeping the width of the sofa is increased by drawing out a slide and doubling up on the cushion used as a back rest during the day. The framing of the boat can be understood from the cross section. The keel is very broad, the heels of the frames stepping into it, bolted and further secured by forged iron floors. The outside ballast is bolted up with a diagonal bolt through keel and counter, iron floor on either side, a half-iron going through floor into keel on the other side. The topsides should be light as to scantling, but well through fastened to produce a tough structure. With a boat of this kind, owner and friend can knob about all season with no fear of any acrobatic feats on the part of the boat, not in the programme, such as befall the heeled crew of the Sopha, Mystery and many others.

LOG OF THE SUESS B.

YOUR readers will, no doubt, be surprised to find that I have abandoned my chronic weakness; that of "A worn out eye and a bowled out back." I have succeeded in getting out of my material and indulged in matters marine. In my day I have done some considerable sailing, in large vessels as well as small boats, but do not thrust myself forward as an expert, or as an authority. I have watched the sharp controversy in your columns and concluded that the public required less "hair splitting" and theory and more facts and actual experience. The only way to arrive at something definite regarding sharpness is to publish results.

A few days since I noticed a trim-looking craft, anchored off the club house, and coasting past. My curiosity being aroused, I found that it was my old acquaintance and coasting captain, M. D. Hendrickson, was owner and in command. I was forced to admire the boat's beautiful lines and admirable rig. On inquiry I found that her name was the Bessie B., that she was built by Mather & Wood, of Port Jefferson, L. I. Length, 38 ft.; over all, beam, 13 ft. 6 in.; tonnage, 14 69-100. Her cargo consisted of 14 tons. She experienced much bad weather during the voyage; proved to be very stiff and an excellent sea boat, slipping nothing but spray. The captain informed me that he sighted a Harnegat Light at night; made twelve sightings of the light; passed him was a steamer. The builders supplied the craft with wire shrouds, which proved too tight, and during the passage those on the starboard side parted.

I requested permis on to copy the log of the Bessie B., which the captain granted, and in order that your readers may form an opinion of the seagoing qualities of this ship, I enclose a copy of the log from New York to Jacksonville, Florida.

Left New York Wednesday Nov. 7, at 4 P. M. wind N.W. made Harnegat Light at night; made twelve sightings of the light; wind S.S.W. light.

Thursday Nov. 8.—Stood on port tack until 2 P. M., went about and sighted land at daylight; north of Harnegat; beat all night in mouth of Delaware Bay, tide against us; lost of the time; entered Delaware Breakwater at daylight.

Friday Nov. 9.—Lay behind breakwater all day, cautionary signal flying.

Saturday—Nov. 10.—Storm signal still flying; 10 A. M. wind hauled

to N. E. light; got under way, and made off Indian River Inlet when wind changed to S. S. W. dead ahead and blowing hard; came "tude to run back to Breakwater and lay there for a fair wind. Got out at night of Cape Henlopen when wind jumped to north; about a tip and ran before it and sighted Hennek Island at 2 A. M., and anchored till daylight.

Sunday Nov. 11.—Got under way at daylight; wind S. E. light; made off Ocean City at 4 P. M.; calm; caught blizzard for dinner; calm until midnight, when wind came out west; made off Chesapeake Inlet by daylight.

Monday, Nov. 12.—Off Chincoteague; wind W. light; course S. S. W. & S. S. W. very wind coming, making sea white with foam; put in double reef in foresail, reefed main and jib, settling main boom on cabin deck; tried to make a lee, but could not, so ran with main a little abaft the beam all day; made Cape Charles Light soon after dark, and made shore at 1 A. M.; made Body Island Light at daylight.

Tuesday, Nov. 13.—Calm all forenoon; wind sprang up very light, but dead ahead; sighted Cape Hatteras at dark; wind, S. W. to W.; made off Hatteras Light at 10 P. M., laying close in to round inside Diamond Shoals; went north of the strong line, and beat about 10 miles N. E. and was further to leeward than when I started; finally stood on port tack, until about eight miles to southward of Light; changed to starboard tack, heading W. by S. 1/2 N.; called mate and turned in; awoke at 8 A. M., expecting to find her inside Hatteras Shoals, but found her S. S. E.; saw two schooners approach the Shoals to go around, and noted that they went the other way from what they wanted to make; they gave up and love-to to leeward of the cape, and we did likewise.

Wednesday, Nov. 14.—Lay to leeward of Hatteras all day; 3 P. M., wind coming out N. W., got under way, and were nearly one hour in rounding Hatteras; wind increased, tending to N., and finally to N. E., blowing a gale; forced main and reefed foresail, and ran under foresail and forestaysl before it; made Cape Lookout at 2 A. M.; crossed shoals, requiring two heads at helm; hailed her on the wind under Cape Lookout; made land about Bearfort Harbor, wind hauled to N., and we concluded not to make a harbor, so settled away foresail, lashed tiller, and went below until daylight.

Thursday, Nov. 15.—Made off Cape Fear Light at 10 P. M., heading for Georgetown; wind N. W., sea kept increasing; midnight parted windward main through setled away main and put in double reef; in about fifteen minutes foreshoals parted. Settled away foresail and fired it; running under reefed main and forestaysl; sighted land at daylight and ran into North Inlet, Georgetown.

Friday, Nov. 16.—On trying to beat through a very narrow creek to Bullers harbor, rigger caught on sandbank, so had to lay over one tide; floated off at 11 A. M., and anchored in midstream, and lay until morning.

Saturday, Nov. 17.—(Got under way and floated through Headwind Reach with the tide; made sail and went into Wingon Bay after much heaving and getting aground.

Sunday, Nov. 18.—Sighted Charleston Lightship at 4 P. M.; wind on quarter; passed Martha's Industry Lightship at 2 A. M.

Monday, Nov. 19.—Foggy; made Fernside Lightship at 4 P. M. At night, wind on quarter; made Fernside Lightship at 2 A. M., and heard whistling buoy; crossed St. John's bar at 10:30 A. M., and reached Jacksonville at 1 P. M.

Above you have the log of the Bessie B., and your readers can arrive at some conclusion regarding the qualities of a sharp. Capt. Hendrickson makes some most interesting trips with his vessel to Jacksonville to Indian River.

AL. FRESCO.

JACKSONVILLE, Fla., Nov. 28, 1898.

SAN FRANCISCO YACHTING.—Yacht building in San Francisco seems to be fairly active. William Stone, the builder of many of the best boats in the San Francisco Bay, has just completed two 30-foot yachts and a yawl. The latter the favorite rig in the rough waters of San Francisco Bay, and is admirably adapted to coast handling in the bay, being by an amateur crew. Stone manages to get in one of the schooners he is building, only 20 ft. over all, he gets a 5 ft. cockpit, 10 ft. John's bar, 2 ft. sisterooms, a kitchen and a 4 ft. deck, all under deck. The main cabin has four berths under the gunwale deck, with transom seats in front 2 ft. wide, thus affording sleeping accommodations for eight persons, besides the two staterooms of 5 ft. x 10 ft. in all. The kitchen of the San Francisco boats are all under deck-house, and the cook can stand squarely up to his work. The boat has 4 ft. beam and 2 ft. depth, centerboard of course, and deck with an 1 1/2 inch, crowned 6 in., gives off, in the clear, making very comfortable cabin. Stone has the reputation of doing very fine work, and is especially skillful in planking. The San Francisco builders have a great advantage over Eastern builders in the way of material. The boat in question has a bent oak frame, rigid, bent, mortised, and bolted in the beam and keel. Every plank, fore and aft, put on running the whole length. No butts; planks 1 3/4 in. thick. She should be a good boat. Stone burns out such a craft complete for about \$3,000; she would cost \$1,500 built here.

GENERAL ACCOMMODATION PLANS OF SINGLEHAND YAWL.

Mr. Whitcher Retires.

THE YEAR.

THE year has been marked by activity in all the departments of out-door life represented by this journal. As we predicted early in the year that it would be, the season of 1883 has proved, in many sections of the country, exceptional for the generous supply of feathered game.

Perhaps the most important event of the year in natural history was the establishment of the American Ornithologists' Union last September. The association includes among its members, active and associate, a very large proportion of the best American workers in this branch of science, and the energy with which its work is being pushed by the Council is an ample guarantee of the good which the Union will do. The Nuttall Ornithological Club has turned over to the new association its *Bulletin*, which will hereafter be the special organ of the Union.

Preparations are now being made to grapple with the problem of bird migration, which has hitherto proved so elusive and so puzzling. The method suggested by Mr. W. W. Cooke, who first put it in practice, and to whom full credit for the suggestion is due, will probably be adopted, and with the result, it is hoped, of adding much to our knowledge of the subject.

It is unnecessary to particularize the various works of more or less scientific importance which have been published during the year. Much good work has been done, and the army of laborers in the field is now larger than ever before.

The interest in angling has increased in most parts of the land. There has been a steady growth of taste for fly-fishing. This is shown in a most practical manner by the sales of fishing tackle to those who fish in fresh water; the dealers say that the sale of fine fly-rods never has been greater than in the past year. In salt-water angling fine rods have been in greater demand also, and the rising generation of anglers have better facilities for learning the art than ever before.

The tournament of the National Rod and Reel Association in October awoke more enthusiasm than any similar one, and afforded a good school for those who wished to study the different methods of casting both fly and bait. One of the most important strides toward uniformity, and con-

sequently perfection, of fishing tackle, during the year, was the adoption of a standard for reel-plates by this Association, which will, no doubt, be adopted by manufacturers in time, and will remove a fruitful cause of annoyance.

In fish-culture there is always progress. Among the many things of note during the year may be mentioned: The International Fisheries Exhibition at London, many accounts of which have appeared in our columns. The extended work of the United States Fish Commission in both scientific and practical work. The building of the improved McDonald fishways at Oswego, N. Y., and Augusta, Ga., and the planning of one for the Great Falls of the Potomac. The increased interest manifested in the science in the different States. The establishment of a free laboratory in Fulton Market by Mr. Blackford, where experiments can be conducted, and where the food and habits are recorded by Prof. Rice. The increased work of the New York Commission, which has built a larger hatchery at Caledonia, and begun work at Cold Spring Harbor, Long Island, where both fresh water and salt water work will be done. The increase of private ponds and hatcheries, notable among which are the stations of the Bisby Club, in the Adirondacks, Herkimer county, N. Y., and that of the Adirondack Club, in Essex county. The States of Michigan, Minnesota and Iowa have extended their labors in fish-culture, and there are evidences of improvement in all parts of the country.

The year 1883 has been marked by the first defeat of an American team on British soil. This was in some measure an unexpected event, but the same can hardly be said of the defeat which took place on American soil during the preceding year. At home there has been in the aggregate an unusual amount of careful, systematic work done with the rifle. The great shooting bodies have been naturally the regular army and the militia forces, and in both of these organizations satisfactory progress has been made. In the regular army something like a real enthusiasm has marked the efforts of the men to place themselves in the picked teams, and the meetings of these chosen squads have been close, sharp contests by men who were experienced in the use of small arms. When it is remembered what the shooting ability of the army was, or rather what it was not, but a few years back, these statements of work done in 1883, gain an additional significance.

Many private clubs and associations of riflemen have found great enjoyment in many contests. Here and there the sport has seemed to languish, but taken the country over there has been plenty of shooting, both at long and short range, and a great deal of keen rivalry enjoyed. In gallery work there is now hardly a city where there is not a coterie of miniature target-makers who, with fine small-calibre rifles, find that careful practice will bring fine targets, and that the best man must win in the long run. Where there are a number of galleries it is comparatively easy to get up a number of small clubs, and then in match shooting an additional zest may be added to the contest. Among the rifle-makers there has been some good work in the direction of improving the present arms, more particularly in the direction of simplicity of action. It is more than likely that the limit of probable accuracy has been reached in the arms now in use, but there is room for satisfactory changes in the way of getting rid of some of the complexity which marks the present arms. Some of the newly introduced pieces have already gained a wide popularity, since they were the invention of men who had already become familiar with the merits and defects of existing models.

In yachting the season has been an eventful one in some important respects. Schooner racing has declined and, instead of occupying public attention to the exclusion of other rigs, the racing has been almost monopolized by sloops and cutters, and by craft of small dimensions. Cruising at home as well as foreign voyages have taken firm hold and given a quiet, but none the less profitable turn to the sport. In racing the feature has been the successful performance of the cutters, as the prizes in more than half of the races they sailed fell to them in competition with the sloops. As all-round yachts they have also grown fast in favor, and it is more than likely that a number of cutters will be added to the fleet in consequence. In general yachtsmen have learned much, acquired more experience and look forward with deeper interest than ever to the first balmy days of spring. Small yachts will be the rule for match sailing as well as cruising in the future, though the expected advent of a challenge from abroad next season, has caused two or three large vessels to be laid down, all of them being of the compromise order, with more depth and displacement than usual, and all are to be rigged as cutters as well, though still

retaining small centerboards and some of the beam of the old-fashioned sloop. Sailing canoes of considerable power and suitable for open-water work are claiming attention in circles where a small and handy boat on a given length is sought, and large and small sharpies have been added in considerable number to the fleet, especially where sporting purposes have been kept in view, and single-hand sailing has been given a great impetus. New measurement rules have been given a trial, without, however, fully settling all differences, and as the racing was not very conclusive, owing to flukes and light winds, another season's trial will be required before flashing interests can be reconciled in a rule which shall be accepted finally by all concerned. Next week we will proceed with our usual summaries for last year, beginning with schooner racing and following it up with a review of the doings of the cutters and sloops.

Besides the American Canoe Association, another organization has been formed in the West—the "Order of Cruising Canoeists"—its main object being the promotion of cruising and the collection of information concerning American watercourses. Two new features have also been introduced into canoeing during this season—local meets between neighboring clubs, in addition to the annual meet, the first of these being held last July by the Springfield and Hartford Canoe Clubs; and the winter camp-fires first suggested by FOREST AND STREAM, and held tri-weekly in New York. The latter meetings are already finding favor among canoeists, and are serving a valuable purpose in uniting them and keeping up their interest throughout the winter season. Besides the A. C. A. meet at the Thousand Islands, a meet will be held early in the season on the Hudson, also one on the Connecticut, and doubtless others in different sections of the country.

ANOTHER WORD IN SEASON.

"SHE'LL ride grandly into port next Monday," said the editor.

"Founder in mid-ocean, more likely," returned the visitor. "At midnight, in the blackness of darkness, no time for a rocket, all on board lost, never heard from again;" and the editor glanced toward the stuffed shark in the glass case. "But it has been smooth sailing so far, and I don't take any stock in your prognostications of woe. Christmas has made you hoarse, but that is no reason for croaking like a raven of disaster."

They were talking about the magnificent craft, full ship-rigged, coming along end on, under full sail, royals, and star-sails aloft and aloft, carrying a bone in her teeth—the Ship of 1883, on the calendar over the editor's desk.

"Time to pull her down, anyway," said the visitor. "The year, in Nessimian phrase, 'must go.' All the railroad men in council could devise no scheme of standard time to save it. Take down the old calendar and hang up the new. Close the Red-Letter Day Book of '83, and open another for '84. My book is unusually full this time. That reminds me, why don't you say something about the Book to the people?"

Is there any one who needs to be told about a Red-Letter Day Book? Here, then, in time for the New Year, is the explanation. A Red-Letter Day Book is a small blank book, in which are set down memoranda of each red-letter day, as it comes in the year. No hunderd diary about it; no printed dates, you write them yourself in red ink; and never a day noted unless so full of pleasure that its recollection will be a joy. "No sane business man," said the visitor, "neglects to record important commercial transactions, and hold that whoever is wise ought to keep a circumstantial account of the good things that fall to his lot, outside of his business rut."

"Yes, the memory of the red-letter dates in my Day Book is worth more to me than my bank account," assented the other.

"I don't doubt it in the least," said the visitor, without a trace of hoarseness, and rising to go; "and I hope you may use a deal of red ink in 1884."

"This, as the editor took it, was the visitor's way of saying 'I wish you a Happy New Year,' which kindly sentiment is here repeated to all who read these lines.

THE "FLICKERINGS" VOTE.—The votes on the "Camp-Fire Flickerings," called for in our last issue, are coming in with every mail. It is hoped that every reader of the paper will accept the invitation to express an opinion upon the merits of the stories. There is no entrance fee. Voters will oblige by putting in their ballots as early as possible.

A BAND OF BEARS.

An old mountaineer will advise you not to fool with a bear. And his advice is worth following. The man who goes into the mountains for the first time is likely to be crazy to kill a bear. After he has gained experience, he is quite willing to let the bears alone, if they will not interfere with him. Of course this advice is intended to apply only to the grizzly bear—the long-clawed species known in the mountains by as many names as he has colors. Cinnamon, range bear, silver pit, gray, black, and yellow bear are some of his names. The true black bear and his brown brothers—usually called pine bears or brown bears—are scarcely ever dangerous. There may be cases where people have been killed by these little fellows, but they are extremely exceptional. Ordinarily you could chase them with a stick, and even if you caught them and gave them a sound drubbing they would at most only give you a scratching in return, which, while it might leave a scar or two, would probably not permanently injure you.

He of the long claws is a very different creature. Usually he is timid and will run from you like a deer, but he is very uncertain of temper, and you can never tell just what he will do. Sometimes when walking through thick hemlock or juniper sprouts, I have suddenly come upon these animals when they were lying down, and have caught a glimpse of them as they plunged into the undergrowth in rapid flight. I have never happened to meet with one that was really cross, but there are dozens of men who have. Old José Telemanche—Mexican Joe as we used to call him—told me many years ago something that occurred within a few yards of where he was sitting. He said: "We was camp on Mill creek coming down through wide valley, me and two Injuns. We make camp 'bout tree o'clock, an' after supper, one Injun, he go into brush, gather plums. Plums very plenty all 'long creek, plum brush 'bout high as man's head. Bear-like plums too, an' he in brush pickin' plums. Injun go 'long pickin' plums, put 'em in flour sack lung 'bout his neck. Bimely Injun come near where bear sittin' quiet, seein' 'what make that cracklin' in brush. Injun come 'long pickin', pickin', and bear just reach out an' hit 'im. I sittin' by fire smokin', hear one yell. Then I jump for gun an' run in brush, in' Injun lyin' there, skull all smash in. Time we take 'im into camp, dead."

Some years ago, while I was in Deer Lodge, a man was desperately hurt under somewhat similar circumstances. He was picking berries, when a bear rose from the brush beside him and struck him. When I left the town he was in the hospital, and was not expected to recover. On the other hand, they are sometimes the veriest cowards under circumstances which would seem to call for bravery. Many years since I was attached to an exploring expedition which was investigating a region about which nothing was then known, but which has since proved one of the richest mining districts of the Rocky Mountains. We had with us some Indian scouts, part of them Arickarees, and part Sioux. One day Cold Hand, an Ogallallah, and a young Ree came upon an old she bear and two well-grown cubs on the open prairie, at some distance from the mountains. The bears ran as soon as they saw the Indians, and the latter pursued them on their ponies. The chase was a long one, but at length they overtook and killed first one of the cubs, and then the other. By this time their horses had given out and could go no further. Cold Hand was a cripple, his leg having been rendered useless by a bullet, and could only walk with a stick, so he remained behind to skin the cubs, and the Ree chased the old bear on foot, until she took refuge in a water hole, where he killed her. Writers are rather given to making the energy with which a she bear will defend her cubs, the superlative of ferocity; but in this case the simile would have failed. I once met a young man who told me that all the stories about the ferocity of the grizzly were untrue, and that they were no more dangerous than were deer. A little questioning revealed the fact that his experience had been confined to two individuals. Both of these were small ones. One he had killed with his six-shooter, and the other he had chased for some distance over the open prairie without being able to come up with it. I have seen other men—old mountaineers, too—who bore on their bodies the marks of deadly conflict with these fierce brutes. One of these was covered with scars from the teeth and claws of the bear, his left hand and arm so crippled as to be of little use to him, and the left leg much shorter than his right, so that he had a very perceptible limp. He wound up the story of his fight by remarking that he wanted "no more bears in his'n."

People who kill bears usually do it for glory. It is true that the skin, when in good order, makes a fine robe, but this is scarcely inducement enough to lead a man to risk his life. The flesh of an adult bear is, to my notion, uneatable; in the sense that badger or coyote is so, though, of course, it all depends on how hungry you are. Young bear meat can be eaten, but is never desirable. When a man takes to hunting bear, therefore, it is usually because he is anxious to be able to tell of his exploits with this dangerous game. And recently a method has been devised by some prudent hunter, who was anxious for fame, but unwilling to run any risks, by which the dangers of this hunting have all been eliminated. Like all good things, this device has the merits of simplicity. The daring hunter starts out with a lot of heavy bear traps, which he sets where the animals are abundant. He makes the round of his traps daily, and when he finds one gone, follows the trail of the clog or grapple until he

comes within sight of the fugitive bear, when he opens fire on and kills him. The clog makes it impossible for the bear to catch the hunter, and he proudly carries home the skin which he has captured in so fair (?) a fight. This method of bear hunting originated, I believe, with an Englishman, but it has since been adopted by many of our own countrymen, who are wise and prudent, and who, while hankering after the glory of killing one, ten or twenty bears, are yet afraid to meet them on their own ground and take their chances in a square, stand-up fight. I do not speak of the method to condemn it. I have no sympathy with the bears. They are vermin, and the sooner they are destroyed the better. But I confess that I have as yet been unable to fathom the motives of the hunters who have in this way added to their tally of big game the name *Ursus horribilis*. Perhaps they are merely butchers, men who would, if it were not for fear of the penitentiary or Justice Lynch's halter, kill the cattle on the range simply for the pleasure of seeing blood flow. What satisfaction can be had in slaying a hampered animal, or skill can be displayed in shooting a bear whose foot is in a hundred-pound trap attached to a ten-foot clog. I am unable to see. Can any one enlighten me?

But all this rambling gossip about bears is wholly foreign to the subject that I intended to write of.

It was in June last year that the Boss saw his band of bears. The men are workers at the ranch, and when any goes hunting from there it is usually because the camp is out of meat. On this day the supply had run low, and so, with John, the Boss left the house in the afternoon and climbed the hills thinking that he would kill an elk. A fat yearling heifer was what he wanted, or, if he could not get that, a young bull would do. For about this time the horns of the males stop growing, and they begin to take on fat, and so are much better eating than the old cows, each of which is suckling a couple of ever hungry calves.

The trail up the mountain is steep, and every now and then they stopped to take a breath. Below them was spread out the broad basin with its little streams and lakes sparkling and flashing in the afternoon sun. Through the clear air could be seen the far off peaks of the Park Creek Range and nearer at hand the lower Freeze Out Hills, and then still nearer the bright green prairie dotted with feeding cattle.

The tableland being reached, they separated, John taking one little park, and the Boss the next one to the south, a timbered ridge running between the two. On reaching a likely looking spot, the Boss dismounted, and tied his horse, intending to walk through the timber, for one can always hunt more satisfactorily on foot than on horseback. He had proceeded perhaps a quarter of a mile through the forest, and was just going down a hill where the trees stood further apart than usual, when he saw through the trees on the other side of a little opening about twenty-five yards distant, a black mass lying on the ground. He could only see it indistinctly, for the trees obstructed his sight and the light was dim, but he concluded that it was a bear, and thought he would kill it. Stepping round a little to get a better view, he found a good opening through the trees, but just as he was about to fire, the mass moved, separated, and resolved itself into five bears.

Without giving the Boss any great amount of time for consideration, the largest of the five gave a loud snarl and rushed to ward him. It was a vicious-looking brute, about the size of a two-year old steer and quite dark in color. His mouth was open, his white teeth gleaming, and the long red tongue swaying as he ran, as if he had traveled far and was hot. Two of the other bears, both large, walked after him as he plunged along, rather as if they were curious to see what was the matter, than from any desire to do harm to any one. The Boss says that he was scared, and, it may well be true, but I venture to say that if any one had seen him standing in front of the mousing monster, that person would not have been able to detect any signs of fear in the erect, alert figure. Once he shouted loudly, hoping that he might thus frighten the bear and check it for a while, but it only responded by another snarl. So he waited, and when the animal was so close to him that it seemed that another spring would bring it within arm's length, the old rifle gave forth its stream of fire and lead, and the owner turned and rushed up the hill as fast as a man would naturally run with a thousand pound grizzly at his heels. There was no sound of the running beast immediately behind him, and when he had thrown another cartridge into his gun he threw a glance backward and saw that he was not pursued. At the top of the hill he paused and looked back. There on the ground where he had stood when he shot he saw the big bear lying on his back, and about him were walking two others, growling and snarling, while from the point where they had all been lying two more were approaching their companions. The Boss was still within easy shooting distance, but he made up his mind that there were too many in the band for him to tackle, so he started off to hunt up reinforcements.

He soon found John, and together they went back to the scene of the encounter. Traveling slowly and cautiously they reached the top of the hill, whence they could look down upon the scene of the shooting. None of the bears were within sight, and on going down the hill they saw that the wounded one had sufficiently recovered to get up and walk away. About the spot where it had fallen it looked as if two or three buckets of blood had been spilt on the ground. The Boss had the curiosity to measure the distance from the spot where the bear had fallen to the prints made by his own

feet, when he shot, and found the distance just ten feet. They then went on to the place where the bear had been lying when first seen. Here at the foot of some large trees they found holes, such as a dog will dig on a warm summer's day, scraped in the dirt and pine needles. And it seemed as if the brutes had been traveling, and on reaching this cool, shady spot, had scraped out beds for themselves and lain down to sleep. On being awakened they were as cross as human beings might be under similar circumstances, and the biggest and most savage of them had let his temper get the better of him, and had made the attack. Returning now to the spot where the bear had fallen they took up its trail. There was no difficulty about following it, for the animal was bleeding freely. For a quarter of a mile they kept on after it, through the timber, and then it passed out into a little park. Here the tracks of the four others were seen, and the five kept on together for some distance. There were still heavy snow-drifts in many of the ravines and low places, and this snow was packed so hard that the feet of the men as they walked over it made no prints upon it. The tracks of the unwounded bears sunk into the snow an inch or two, but the feet of the wounded one made tracks eight inches deep by measurement, thus affording some indication of its size and weight.

The men followed the trail for about a mile and a half, when it entered some low junipers where a man could not see six feet ahead of him. At this point they concluded that they had gone far enough, and very wisely turned about and returned to the ranch.

The Boss told me that he was never so scared in his life as he was when he saw three bears coming toward him, and he confidentially informed me that he didn't believe his face recovered its natural color for three days after the encounter.

Yo.

The Sportsman Tourist.

JOHANNA.

SO many years ago, that now, in looking back, it seems as though it must have been in my early boyhood, a little steamer, trim, taut and tidy, with close-reeded foretopsail settled on the cap, yards secured with well-tautened rolling tackles, lifts and preventer braces; masts by clove-lifted hawsers, the ends well aft; hatches battened down, boats doubly lashed and guns well secured, life lines fore and aft, and a rag of a fore storm staysail, catching first on one tack then on the other, thus checking tendency to yaw; in short, prepared in every way for self-defense, was rushing for dear life down one, then slowly climbing another of the tremendous high and long seas, with which the waters of the Atlantic rush to meet those of the Pacific Ocean when impelled by a howling northwester, off the Cape of Good Hope, in winter.

The waves paced with the little gunboat, and chased and threatened her.

Every pound of steam the boiler could generate, every turn of the screw that could be accomplished was called on to relieve as much as possible the strain which, even with their aid, was dangerous upon the spars, for if in that race for life a rope had parted, spar carried away, or a stoppage through any cause, even for a moment, of the engines had occurred, that little steamer would have been reported "missing."

For if any one of those monstrous foam-capped seas, which towered like great snow-covered blue mountains high above our trail, had come on board, our foundering would have quickly followed. They chased and caught us, but in deference to the low and obsequious bows with which we received them, and perhaps to the gallant efforts the little ship was making to give them a good race, they gently lifted our stern, and passing rapidly under instead of over us, emerged, boiling and fuming, ahead, leaving us behind on their slopes, to which in comparative sizes, we probably appeared as might a cat on a cathedral roof.

It was not thought in my very early boyhood, for I stood on the bridge of that gunboat her captain, and had stood there with but slight intermissions, for five days and nights, enveloped in pea jackets, sou'wester, oilskins and rubber boots, and living on hot coffee by the quart. Upon my pluck and judgment, such as I had, depended the lives of all on board, and our success in the attempt we were making to reach China by "running down the roaring forties."

I had become about convinced that discretion was the better part of valor, and quite willing to merge such of the second named quality as I possessed into the first by an abandonment of my plan at the first opportunity.

We had left Simons' Bay on the 8th of June. We had been detained ten days after we were ready for sea by a succession of southeast gales which kept the table-cloth well spread. On this day a moderate northwest wind tempted us out, but hardly were we well clear of the land when it freshened into a heavy and increasing gale. There was no way of getting back; we must face the music, and the first experiment of a "90-day gunboat" rounding the Cape was to be a thorough test of the ability of these craft to "scud" and "lie to," for we had had a "great deal of weather" on board.

On the 11th the gale, without diminishing, hauled around to southeast; on the 12th from east to northeast "blowing hard in terrific squalls, heavy rain, very cold." On the 13th, a let up for a few hours left us tumbling and rolling, then from the northwest another new one began, which kept things lively for a couple of days longer; then around to southeast again, and with our best efforts with the *Agulhas Current* strong against us, we could make good no better than north on one tack, about west, south-west on the other, and that kind of work would hardly get us over the thousands of miles of easting between us and China; so knowing that this southeaster was but sandwiched in, and would soon give out, I gave up, kept her head on the northerly tack, and to the joy of all hands—full sick of gales—made all possible haste to obtain a lee, which very soon we did, sheltered by the highlands on the southeast side of the Cape, and were soon in smooth water, running for the Mozambique Channel, the strait which separates the two great islands, Africa and Madagascar.

I say islands advisedly, for although at that date the Suez

Canal being as yet undug, Africa was not entirely surrounded by water; it is now, and I, sailing and steaming, have nearly circumnavigated it.

While at the Cape, I had sought counsel as to my route east, for three were open to my choice. The first, usually adopted by steamers, making a direct nearly northeast track to Java Head; as a steamer we might try that. The second, usually adopted by sailing vessels, due east in latitude 40°, sight St. Paul's Island, steer north for Ceylon, thus getting the best of the southeast trades; as a sailing ship we might and did try that one to our heart's content. Both of these were good and well traveled; the third, via the Mozambique to the Line, then due east through the 14° Channel "was dangerous." The Mozambique Channel was but imperfectly charted; unknown rocks and reefs abounded, the currents were very uncertain, and there were whirlpools and squalls of terrific violence to be encountered, and if shipwrecked the native tribes were exceedingly ferocious. If we escaped the dangers of the channel, we had yet a tedious passage along the line, with but one chance of a breeze, and that was the catching a touch of a cyclone from the Arabian Sea or the Bay of Bengal, and we must thread the needle by passing through the narrow 14° Channel, between Atolls of the Andaman group, where, if shipwrecked, the worst fate would befall us, for the natives were tails and cannibals.

These warnings, and tales which I was told of the awful fate which had befallen some who had attempted this route, decided me, and I left the channel out of my plans. But a week of the "forties" changed my mind greatly. Our poor little boat, neither steamer nor sailing vessel, but a hybrid combination of both, like a combination rod, warranted for fly and bait fishing, could do well in neither capacity, and I thought better to fly "the fifts I had, and bear to others of which I knew little," consoled by the axiom:

"Larger ships may venture more,
 Little boats must keep near shore."

The results proved that the choice was a wise one. As we made nothing the winds moderated to a calm, the water became smooth, the weather warm and pleasant, and by contrast, delightful.

Presently we caught the first of the southeast trade, drawing nearly south through the channel; we uncoupled the propeller, hauled fires and slid along nicely with all sail set to a five-knot breeze. Everything in the ship was wet, and everything came on deck for a dry; the lower rigging was decked with damp bedding; the clotheslines stopped full of musty shirts and pea-jackets; cape-gossamers and oil skins covered the booms, and every available sunny spot was covered. No fear of the lucky bag saved even the sacred precincts of the quarter-deck, and the holds gave forth their mustiness. We had the blessed consciousness that once well dried, there would come "stow away for a full due." A sand-covered tarpaulin spread out in the lee gangway, proved a paradise for the poor bedraggled fowls released for a run, and on it they rolled and dusted, and shook themselves off from their feeble legs in attempts to free their salt-encrusted feathers. Dick, the pet batman of the foretopmen, emerged from his retreat under the heel of the bowsprit, where mortified and broken-spirited he had hidden for five days, and made most ludicrously feeble attempts at crowing and love-making. "Dennis, Jr.," the pet pig; "Jake," the monkey; "Nigger," our little black dog; "Shellback," out pet tortoise; the parrots and minot birds, were happy reveling in warmth and sunlight. A few days of this luxurious yachting carried us in safety past Europa Island, the Bassa de Inc a shoals, Juao de Nova reefs, all of which we found to be just where the chart placed them; we encountered no unknown dangers, and such currents as we found were favorable, and thus it happened that early in the morning of July 2 the

grand peak of Mayotta appeared breaking our northern horizon, and as we neared it, that of Johanna came in sight, and soon we were in the midst of the Comoro Islands.

This group, of which the principal islands are Johanna, Mayotta, Cormoro, Mohillo and Glorioso, occupy a good portion of the northern entrance to the Mozambique Channel, in latitudes from 10° to 12° S.

The inhabitants are of Arabian descent, and are thrifty people, cultivating large areas of ground, fishing the adjacent seas, and carrying on commerce between themselves and the Arabian coast, Mauritius and the Seychelle Archipelago. Some of their prahus making even more extended voyages to the Maldives, Laodivres and Jombay.

About 5 P. M. we were off the harbor of Johanna, and the island intercepting the breeze, we coupled the propeller, got up steam and ran in.

As we approached, the scene was enchanting. In "Omoo" and "Typee" Herman Melville has exhausted the resources of descriptive language in depicting the beauties of the isles of the tropics. I could with safety and with truth apply here the most vivid of his descriptions, but, not possessing his talent, I shall content myself with more simple language.

The harbor was bordered by a white sand beach, upon which many prahus, some very large, were hauled up. In the background a chain of moderately high mountains, above which Johanna Peak rose conspicuously. From the beach, and toward the mountains, there radiated a number of low, long hills, their slopes and the valleys between being varied by large cultivated patches and dense growth of palms, coconut and other tropical trees. On a tableland to our left, elevated perhaps a hundred feet from the sea, appeared a city of snow white houses, of quaint and curious structure, surrounded by a snow white wall, some ten feet high, and it in many places where not sheltered by forest, glistening in the sunlight. Many boats, prahus, feluccas and canoes were moving about the harbor, and builders were at work on unfinished vessels on the beach.

Three hours before the sun went down, we anchored; and then began for me an experience, both novel and pleasant. Never before had it been (nor has it since) my fortune to associate on most intimate footing with royalty, to exchange friendly notes and visits with a Sultan, to be accompanied on my strolls by a Prince, to be taught words in foreign tongue by a Princess, to hobnob, smoke and drink *en suite* with a Duke, to dine *en famille*, and exchange souvenirs and autographs with Kings, Princes, Dukes and Kadis, to review a regiment and attend a ball fight given in my honor. Such was my experience in Johanna, and all concentrated in a little over two days.

Soon after we had anchored, the quartermaster reported to the officer of the deck: "There is a prow coming along-side, sir, and I guess the King of them islanders is in her."

The prahu was a very large one, flying an Arabian flag, and rowed by twenty men, whose white turbans contrasted strongly with their naked glistening brown backs. The boatswain's mate (we did not rate a boatswain) hurried up the side boys, and "piped over the side" a most distinguished and dignified old gentleman of about sixty years, who, with several low salamis introduced himself to me, the First Luff, and officer of the deck, as the Duke Omash, and handed to me a paper on which was written his title in full, viz.: "Dragoman Omash, eben (son of) Sultan Ali, eben Sultan Hassan, and uncle to Sultan Abdallah," (the reigning monarch).

Omash was tall for an Arab, of light bronze complexion, bright black eyes, regular features, and a patriarchal snow white beard, descending nearly to his girdle. He was richly attired in silk robes and turban, embroidered sandals, and around his waist a very valuable cashmere scarf,

supported a yataghan, which, until later I saw others, I thought unequalled in beauty, the blade being of fine Damascus, and the sheath and hilt mounted with gold, richly set with jewels. Altogether he was a most slightly man; the *best ensemble* was, however, somewhat marred by two little blood red streaks reaching from each corner of his mouth; these and the hideous red cavity, fringed by jet black teeth, which he displayed during our interview, as from time to time a genial smile of the grubstake produced uncomfortable sensations, which he sought to relieve by a yawn, proclaimed him a devotee to the use of the betel nut, scrapings of which, mingled with a little lime, and rolled up in a leaf—I believe of the Areca palm—are used by most of the Malayan, Hindoo and other Indian people, as our people use tobacco.

Omash spoke English very fluently, also read and wrote it, in fact, was the most learned scholar in the kingdom, and his official position was Minister of Foreign Affairs; in this capacity he visited us. With many extravagant and complimentary Oriental expressions, he informed me that "he came to bid me welcome in the name of the Sultan Abdallah, whom may Almighty God soon restore to health, that he may return from the place he is now honoring with his presence, and where he is resting from the cares of State, and enjoying the breeze, from the sea." The place was a sugar plantation on the south side of the island, owned and managed by His Majesty, who is a most thrifty monarch, and derives much revenue from the sales of sugar, of which he exports annually to Mauritius from 600 to 800 tons.

Omash thanked Allah and the Prophets, devoutly in our behalf, for our safe voyage, and intimated that "your (my) excellency would earn the blessings of the Almighty by going around to the plantation, and bringing His Majesty home in your noble ship."

A rapid mental calculation convinced me, that such a voyage would draw too heavily upon our stock of coal, already below safe limits for the long journey ahead of us. So after learning that the usual conveyance for His Majesty was the back of an ass, I concluded that he had best to again utilize that safer, though but blessed, mode of transport. I, however, based my declining on more diplomatic grounds, and explained that the motion of the little steamer, and the odors from the engine room (we were hauling and wetting down fires) would be greatly increased, were we out at sea, and that I was sincerely apprehensive of the deleterious effect they might have on the Sultan's health, "whom God preserve and defend," and thus I got out of it, and the ass fulfilled his functions without complaint.

The Duke then informed me, that very soon His August Highness, Prince Syd Alle, brother of the Sultan, Prime Minister and Acting King, would pay me a visit. He then took his leave, carrying to the Prince my assurance, in the most oriental style I could command, of the felicity I should experience from such visit.

At the appointed time, the State prahu, this time with an additional flag forward, came alongside, and with all of the officers and crew in uniform, four side boys, and three rolls of a drum, Prince Syd Alle was received with due honors. Omash accompanied him, to act as staff and interpreter, and some handsome young fellows, whom I learned were Prince Mahommed, a still younger brother of the Sultan.

Syd Alle was a very handsome young man, of about thirty; bright, piercing, black eyes, aquiline nose, good mouth and chin, of medium size but straight and wiry looking. His dress was of the same general style as that of Duke Omash, but of richer material, his yataghan much more valuable, and on his ring finger he wore a large cut jewel signet. He spoke some English, but left most of the conversation to Omash, through whom I answered questions Syd Alle had asked.

They sat with me half an hour, and gave me considerable information about the islands and their resources. Excepting occasional visits from American whalers, which drop in for fresh provisions and water, very few foreign ships had ever visited them, and it had been many years since a vessel of war had anchored in the harbor. The last steamer of war was the Confederate privateer Alabama, which paid them frequent visits, and earned the hearty ill-will of the inhabitants, partially by exercising a monopoly of the salt, and partly by the fact that through her presence American whale ships were deterred from their usual visits, and from these they had derived considerable revenue.

The island is very fertile, and much of it under cultivation, the principal exports being arrowroot and sugar. Of the latter large quantities are sent yearly to Mauritius, the Sultan being the principal producer and exporter.

The full title of the Sultan is Abdallah, eben (son of) Sultan, etc., etc., through a long line of Sultan forefathers, terminating, or rather beginning, with Mahommed the Prophet, from whom it is claimed Abdallah is a lineal descendant. He is Sultan of the entire group, and in addition King of Johanna, each of the other islands having also a king.

Our interview was pleasant, and after inviting me to dine with him on the morrow, Syd Ali bade me good-bye, and salaamed himself over the side. Not so the Duke, who returned from the gangway and revealed a new phase in his character and accomplishments, in which he proved himself a most useful Duke. He informed me that if we were in need of supplies of any kind he would furnish them promptly, and at low prices; also that if we would entrust to his care our soiled linen it should be promptly returned, well washed, ironed and mended.

At first I was somewhat embarrassed at calling upon so high an official for such petty services, but when I saw him the next morning in the bum-botoh alongside, divested of his robes of office, and with a short, sharp coconut-cypher, substituted for the yataghan, driving sharp bargains with the sailors, with whom he seemed on most familiar terms, calling them "Jack" indiscriminately, and they him by the name "Oh, My," which they had given him, my scruples vanished, and from that time the Duke Omash fulfilled most successfully his functions as Minister of Foreign and Domestic Affairs.

Sharp as he was at a bargain, we could not complain of the prices. My market book shows me that in the way of sea stores my steward laid in 2 kids, 1 dozen ducks, 3 dozen fowls, 10 dozen eggs, 6 large bunches of bananas, 50 green coconuts, and 2 bushels each of oranges, limes, sweet potatoes and yams, all for the sum of \$14. The steward told me afterward that he tried to procure a couple of pigs, but failed badly. The demand was too much. It was necessary, as a Mahomedan nobleman, that Omash should draw the line somewhere, and he drew it at pork; and expressed himself as wounded in feelings that he could be thought capable of pandering to such unclean tastes. With this exception, as both Duke and purveyor, Omash was a success,

but I cannot conscientiously endorse him in his capacity of laundryman; buttonless shirts, ragged wristbands, and plentiful sprinkling of stain from betel-nut juice, forbid it.

On the next day I had the honor of dining with the royal family, namely, Prince Syd Alle, Prince Mohammed, Duke Omash and Kadi Mohammed Hoffman, father-in-law of Syd Alle.

As my boat neared the landing I observed unusual commotion ashore. It was a little ahead of the appointed time, intending to stroll a bit before dinner, and in no way connected my movements with the "comings" on the beach. Crowds of people were assembling, and among them a number in semi-military uniform, some with guns; while Omash came hurrying ahead to the landing, and begged that I would "forgive the never-to-be-pardoned blunder, through which all was not as yet in readiness to do honor to my Excellency." I waited.

As the soldiers arrived they fell in in double file, half (there were about a hundred) on each side of a narrow lane, and when all were pushed and shoved and shaken into position, I was invited to land, which I did, under escort of the Duke, and was received by Prince Mohammed, the General in command, a succession of blasts of trumpets and present arms of the troops; and then my august suitor having been sought and obtained, a drill in the manual of arms took place. The whole affair was very ludicrous. Simon Suggs's Company, composed of a number of a third of the soldiers had muskets; such as did compose, as far as they would go, the front ranks. The arms were old-fashioned flintlocks; nearly all had cross belts; some had cartridge boxes; many had uniform caps, none had shoes nor trousers; they got along after a fashion, but the present arms was the funniest, for in addition to the usual manoeuvre, every man took off his cap and saluted, holding his gun at some curious angle with one hand.

Presently the two double files coalesced in some way indescribable (not however, until we had marched through between them) and fell in, in our rear; then with fearful band play, trumpets braying and drums beating, the procession started: first, Prince Syd Alle, holding a sun umbrella over me, next, Omash and Mohammed, next, several other officials, then the troops, then every male human being in Johanna.

Reaching the walls, we entered through an arched gate, so narrow that two abreast could do so. The wall was fully ten feet thick and very high, the streets were little over a yard wide, and running in one direction not over a hundred yards, when bringing up against the wall of a house, they turned sharp to right or left and skirted it, coming back to the original direction, somewhat beyond, or short of the continuation of the first part, in about this style: East 100 yards, south 100 yards, east 100 yards, north 100 yards, east 100 yards, south breaking joints, so to speak. They were paved with small cobble stones; all ascents and descents were provided with concrete steps.

The houses are generally square, of one story, and that a high one. They are built of concrete, and like the walls of the city, are brilliantly whitewashed. Not a window relieves the monotony of their dead surface, nor an aperture excepting the narrow door, and a few loop-holes for musketry; the walls are about eighteen inches thick, and the doors doubled. The roofs are nearly flat, covered with white mud, and projected as overhangs, about eighteen inches beyond the upright walls, from which they are separated by an open space, about two feet deep, in which at intervals there are supports to the roof. This open space furnishes ventilation and some light. One reason for this peculiar style of architecture and engineering I could very well appreciate that hot July day. The narrow streets were completely shaded by the overhangs, and such little air as was stirring seemed to be concentrated into a breeze.

I could not understand the reason for the abrupt changes in direction, but at dinner the whole mystery was explained. In olden times the Mozambique Channel and the adjacent seas were infested by pirates, who, landing, would be able from the adjacent hills to command the city with musketry and guns, and to demand tribute from the inhabitants. The thick walls, narrow and crooked streets, and windowless houses were evidently projected as a means of defence, and a successful assaulting party would meet with a very serious repulsion, split up as it would necessarily be into skirmishers. But the islanders are not warlike, and shut up thus in their almost impervious retreat they were very safe. It is probable that among these pirates Captain Kidd, "as he sailed," was prominent. In his naval history Cooper says: "Kidd ravaged the east coast of Africa and made Johanna a resort." No one, however, seemed to remember him or his name, except, perhaps, the Sultan, who, when I asked him, could tell me nothing about Kidd, replied, "Can your Excellency doubt it? I have fine ones, and very cheap."

Except that the Sultan's palace was larger, it differed but little from the other houses. The reception and dining-room were in one, an oblong apartment about thirty by twenty feet in dimensions; it was dimly lighted by the ventilating space and by oil lamps. There were no evidences of wealth or luxury, the furniture being of the plainest and of various patterns, evidently purchased, as were most of the ornaments, from whale ships. The two long walls were bare wood and bare of ornament; at the lower end of the room the wall was faced with shelves and pigeon holes, on and in which were placed as ornaments, many articles, which to the Arabs may have been so considered, "but which undoubtedly had formed part of some whaler's outfit; such as bowls, cups, pitchers, etc., of common but highly colored glass. The dining table, once doing duty as a whaler's cabin, was of walnut, uncarved, and large enough to seat comfortably our party, which consisted of Prince Syd Alle, myself on his right, Prince Mohammed, Duke Omash and Kadi Mohammed, the Sultan not having been able to return, his health, he wrote (but I rather fancied chagrin at my having declined to come for him), preventing.

The dinner was good, but an odd jumble of native and foreign dishes, learned evidently from American whaler's wives. Served in courses, it consisted of soup, for one letter, with sundry messes of kid and turtle flesh, and for dessert waffles and pancakes, with fruit of several varieties. Each of us was attended by a boy, who fanned us constantly. Dinner finished, there ensued a very animated discussion in Arabic between Syd Alle and the others, which terminated, all rose, saluted me, and except Omash and Syd, left the room.

The former then informed me that the Prince wished to pay me a great compliment. The Princess, his wife had expressed a strong desire that "her eyes might be gladdened" by seeing my excellency, and although the Mohammedan religion forbade the gazing upon the uncovered female face, yet I do not believe that of that religion, it had been decided

that no sin would be committed in permitting the young lady to have her own way, the husband in doubt, duly instructed and persuaded) having been a strong advocate in her favor. I was informed that with the exception of the husband and her father, Kadi Mohammed Hoffman, no living man had, since her earliest infancy, been favored with a sight of her countenance; would I "condescend to make her a sharer in the happiness which my visit had given to them all?" I was, I confess, rather astonished, but faced the music, and consented to do what I could to "gladden her eyes."

Then Omash withdrew, and the Prince, parting a red curtain which separated the dining from another room, invited me to enter. As I started I heard a rush, and "caught through the half open portals glowing," a glimpse of a female figure vanishing through another door. This interrupted the proceedings, the curtain was dropped, and I judiciously halting, overheard quite a dispute between Syd Alle and the half of the women. This little matrimonial breeze ended, the curtains parted, and I was ushered into the chamber of the Princess, a much smaller room, but much more richly decorated, although very much in the same style as the dining-room.

On the wall fronting our entrance were a number of works of art, evidently once adorning some whaler's cabin, consisting of highly colored lithographs, one I remember well, a parting scene between the weedy Susan, in red, white apron, and curls, and sweet William, attired in best Sunday suit; another was a scene of whaling life, "Cutting in." Two of the walls were, as in the dining-room, fitted with shelves and pigeon holes, whose contents, however, were much more valuable, consisting of porcelain vases, carved sandal-wood boxes, inlaid cabinets, and a hoquet of shells.

These things though I noticed later, for naturally my eyes first sought the Princess herself, who sat, her feet tucked under her, on a sofa to the left, attended by a woman; the room was dimly lighted, and she studiously kept her face turned from me. All I could make out was a little plump woman, enveloped in robes and shawls of rich cashmere, on her head a long white veil, which, however, did not cover her face.

The sofa was placed near a matting-covered platform, raised about two feet from the floor, on which there was a low bedstead, supporting upon a brass frame a mosquito netting. The bed, probably the only one, was covered with an embroidered silk spread, and both bedstead and platform were bordered with scarlet curtains. A little stand, on which were articles of toilette apparatus and a small mirror, stood near the bed.

Syd introduced me, and as I was not fully up in Arabic ceremonies, I fell back on American, and extended my hand to her; this upon instruction she took, and I had the honor of teaching her to shake, after which I seated myself by her side and began to get acquainted. Our conversation was rather limited, but as it went on, she from time to time stole sidelong glances at me, blushing and bridling like a young country maiden. Once I caught her eye fairly and quick as a flash the veil hid her face, and it was only after urgent remonstrance that she permitted Syd to again withdraw it.

After an interesting question, and at last would look at me, and on making a question of which, one started, she pronounced many. Nearly all of her inquiries were in regard to American ladies and their customs. She had seen several of them, and liked them very much. Was I married? And when I answered yes, I must teach her my wife's name, and she taught me her's, Briana Rukea Hoffman; and would I carry to my wife a present from her? and a little slave girl was summoned, who, kneeling before me, presented a salver on which, covered by a soft napkin, sat the present.

The girl lifted the napkin, and the Princess took from the salver a necklace of rare and curious workmanship. At first I thought it composed of strings of apple seeds, with occasional lumps of shoemaker's wax. It was not a thing of beauty, although I afterward learned of some value, in this respect: the seeds, which had a peculiar and agreeable aromatic odor, are used only by royalty, and the wax-like lumps were ambergris. This treasure, my wife failed to appreciate, and it now comes among the "curiosities" in the museum of the Naval Lyceum, at the Boston Navy Yard. In return I presented her with a pair of quite pretty steel engravings and an ostrich shell-basket of everlasting flowers, which I had picked up at the Cape.

In one important point I fail in this attempt at description. I can't remember just how she looked, and my note book says only this: "Princess short, rather stout, and not particularly good-looking, nose rather broad, and of the most complicated octoron. Altogether rather of the Dudu style."

After I had taught her to say "Good-bye," the visit terminated.

The next day was the 4th of July, and we did our best to make it one to be remembered in Johanna. A rainbow dressing of flags arched from our jobboom to spauker boom ends, on each yard arm a streamer, and from each mast-head a national flag. At one the Stars and Stripes, at the other the Arabian crescent. About 11 A. M. the entire royal party came on board to luncheon. "All hands to muster," was followed by a drill in infantry broadsword, fire quarters, and at noon, we having bet to quarters, a twenty-one gun salute was fired in honor of the day, the party and the flag. This salute was a little irregular in more than one way; first, as not carrying sufficient number of guns, the broadsword was not authorized to salute; and secondly as the guns were carefully muffled before firing, the intervals were irregular; but our guests were not critics, and watched with eagerness, tempered by considerable fear, the flight of the sixty-pound shells, and howitzer projectiles, with which we completed our target practice for the quarter, and demolished a target.

All these things interested them, but I believe that the greatest interest was excited by the sight of Dennis, my six foot six cossack, and his trained pig, Denis, Jr., a little red and white fellow, from the Cape, who would at command leap bars, through paper-covered hoops, act as horse for the monkey to ride, and squealingly submit to the administration of "a dozen with the cat," the dozen, however, being reduced to four, which was as far as Dennis, Jr., could count. When ordered to prepare he would set up an outcry, but reluctantly place his fore feet against a half-burnt plank and take it, squealing lustily throughout, and never backing, but endeavoring to come up to the mark, and never trying to get away till the fourth blow was given. Any sort of a pig was to them unclean, physically and spiritually, but a pig which would do these things, they felt sure had yet in him a devil, and some of them prayed aloud to Allah.

My luncheon was not an expensive one, they ate nothing but fruit and drank *arc-carcere*. After luncheon I succeeded in getting my cigars rolled, but they were soon given up for their own pipes and Turkish tobacco. We exchanged souvenirs and autographs, and with this letter, I loan you the card on which are the originals of their, viz.: "The Sultan Abdallah, Princes Mohammed and Syd Alle, Duke Omash, Kadi Mohammed, and the Princess Briana Rukea, all but the first and last, written by their owners, these two by Syd Alle, but I think to reproduce them will go beyond your resources."

In the afternoon a "bull fight" was gotten up in our honor, and quite a number of us including Captain Macy of the whale ship Lancer, who had put in for fresh provisions, attended.

I had witnessed bull-fights in Spain and in Manila, the former were bloody, disgusting butcheries of horses and bulls, the second more travesties where none but the bull suffered, and he only from torture; and I had resolved never again to witness one, but here I could not refuse; and prepared to be again sickened, I went. My apprehensions were groundless. This is what I saw:

About a mile from the town, on a plain, a concrete wall about eight feet high, inclosed a parallelogram of about sixty by forty feet. The wall was covered by the natives in holiday attire. At one end a series of raised seats were provided for the ladies of the party, and the center of which was the royal box, where the guests were seated in safety, and such comfort as a combination of hard board and a thin mat could give.

In the middle of the square was a strong post, and to this was attached one end of a long rope, the other being around the neck of a small, hump-backed animal, that stood tranquilly enjoying his cud until the sport began.

It was of the species of wild sacred in India, and is seen in America only in incursions and incursions. I remember that Dan Rice had one which he advertised cost \$5,000; they are cheaper in Johanna. One that was bought for the crew cost three cents a pound, live weight, and one was given me by the Sultan.

As soon as we were seated the music—and such music—struck up. I verily believe that it was depended on as one resource toward making the bull crazy. To lessen the chances of an accident, the horns of the bull had been shortened and tipped with balls.

A fighter advanced, saluting profoundly to our party, shook a red cloth in the bull's face; the bull didn't like it; shook his head and retreated as far as the rope would let him; being followed up, he finally got angry and made a charge at the cloth, captured, hooked and shook it, the man getting nimbly out of his reach. This was repeated time after time until the poor beast, who got very wild and plunged around the length of his rope, which occasionally threw him. This was the climax, and the shouts of the assembled crowd were prodigious. The rest of the fight was but a repetition of that described.

That evening we wound up our exchange of courtesies, by a little concert given by our sailors, which being conducted on the "nigger minstrel" system, was received with great enthusiasm, and when we had our guests good-bye, I seemed like parting from old friends instead of the acquaintances of but three days.

The next morning our anchor rose with the sun, and we were soon steaming toward the equator, our decks covered with piles of cordwood, tanks full of fresh water, cups with bowls and ducks, goats and kids bleating in all directions, tortoisés crawling about, boat davit spans overlaid with bananias, and lockers full of all sorts of provisions. The next morning the long boat rode out to sight forerider of this Arcadia, the singular town in whose limits there were no dogs, no pigs, no horses, no windows, no chimneys, no wine nor spirits and, except those of the troops, no weapons. Three weeks later, after a pleasant run through the Channel, we were anchored in Point de Galle, Ceylon.

PERCO.

DOWN THE YUKON ON A RAFT.

BY LIEUT. FRED'K SCHWATKA, U. S. ARMY.

Part I.—Introductory (Concluded).

OF course there was the usual confusion and delay in getting away on the 7th with such a large party; but at nearly 10 o'clock the little steam launch Louise, of the Trading Company, with my effects on its deck and one large dog and nine or ten canoees in tow, steamed away from the bank down the Chilkoot Inlet, then turned northward up the Chilkoot again until the Mission was reached, which, in a straight line, is only three miles from the cannery. Across this narrow peninsula a party of us walked to meet the launch at Chilkoot. Everywhere the flowers were in bloom. Dandelions as big as a large aster, cowslips twice the usual size, grass with stalks five feet long, and many other things in proportion, made it hard to believe that we were in the United States' Arctic colony. The dense swarms of mosquitoes added to the impression that we were in the tropics, until a glance at the mountain tops revealed glaciers and snowbanks enough to satisfy any Arctic explorer. At Chilkoot four or five canoees were added to our already long string, and we continued up the inlet.

The route which I had picked out is known as the Chilkoot trail, and is one of three or four passes leading from the inland passes of the Yukon to the country to the various sources of the Yukon; another trail close by being by the Chilkait, but requiring ten or fifteen days' portage instead of three to five, as would the Chilkoot. The Chilkait trail is now nearly abandoned, but formerly was much used, the Chilkait being the larger band of the two and the Chilkoots, then prohibiting all Indians but their own tribe from using their route. This piece of selfishness has now been given up. The inducements for using these trails was the large trade with the interior. Kati-Keshi or "Stick" Indians, who were prevented by both tribes from coming to the coast to trade, but even this blockade is now raised. Arriving at Chilkait I found, as I had expected from previous reports, that the irresponsible American mining pioneer, driven from the densely populated districts of Washington Territory and British Columbia by a family to every square foot of ground, had found his way into these parts, and that the Chilkait was any the wiser for their excursions as far as the "day of the country" was concerned. They had as the Indians had before them, reported the country and its mountain ranges and streams as hard to traverse, and supplied with a very scanty population of dejected Indians to help one through. When it became known among the various people, white and native, that I intended to build a raft and try my chances on

it down the great river to where canoes or boats could be found to transport my whole party. I was looked on as a cross between an idiot and a lunatic, and when I added insult to injury by hoping to do it that summer, there was no mistaking the looks that I was considered a fitler subject for a commission of lunacy than I was for a commission in the army.

One of the arguments they used did little appalling to a person who had never ridden a dozen yards on one of these primitive craft, and I acknowledge that I felt a little dubious myself as to the complete success of my plan. It was represented in glowing language that there was no end to the lakes that I had to cross, one of which was said to be over a hundred miles long. The prospect for paddling across these did not look inviting. The method by which I did finally overcome them, that is, by sailing, occurred entirely on my opponents. There were also many miles of boiling rapids that I would have to shoot with my raft, and it would require a corps of coroners to collect my party after each if I wanted an inquest. Unless I built a new raft after each of these obstructions it seemed hard to comprehend how I would get along, and this would necessitate more work than stopping a week or two to build boats from whip-sawed lumber, a species of labor for which I was not prepared in any way.

Indian opinion strengthened that of the whites, so that I was left completely alone to fight my battles. They regarded my canoeing as a long and a very slow and good way, regarding the right inherent in savage labor of discharging themselves whenever they felt like it. These Indians of all others carry the principle about as far as any I have ever known. At any time that it suits their feelings they will declare a contract off, and even after a bargain is consummated they think they have a perfect right to revoke it by bringing back the article or articles obtained and receiving those they gave. Years will not obliterate this right of revocation, and negotiations as unamiable as were in the year in question, unless the article, or articles, were obtained, or in some way able to be gotten rid of. The cost incurred in these revocations may be charged up to the opposite side.

An army officer in Alaska gave an amusing incident where a Sitkan Indian had wasted several charges of powder and shot trying to bag a band of decoy ducks, and when his mistake was discovered, with an assurance that would have commanded enough salary as lightning-rod agent to buy a powder mill and shot tower, coolly demanded damages from the owner of the decoy, sufficient to reimburse his wastage. While we have had the least of this chattering about other matters, the little steam launch with its long string of canoees tied one behind the other has been pulling northward up the Chilkoot Inlet. Of course the connecting ropes near the little launch had fearful strains on them, and several breakings took place which seemed to be a real amusement to the Indians, until the master of the launch commenced running on a half mile mile or so before he would wait for them, and the labor necessary to paddle up alongside soon ceased to be unamusing.

In fact some four or five of the more sportive canoees were left to paddle and sail up the inlet to the point of disembarking. Leaving the Chilkoot we entered the Dayak Inlet, still steaming square to the north. This inlet is of the same general character as the inland passages in this part of Alaska, a river-like passage in between high hills covered with pine and spruce to the top, capped with bare granite mountains covered in gulches with snow and glaciers which furnish water for innumerable waterfalls and mountain streams. Sixteen miles from the Chilkoot Mission we came to the head of the Dayak Inlet, a narrow part of the Dayak River, where our effects were hurriedly thrown into the canoes and lightered ashore, and the steam launch puffed away out of sight and our explorations were commenced.

We "tracked" the canoes about a mile above the swampy mud flats at the mouth of the river before we went into camp, and spent the rest of the evening assorting the packs into one hundred-pound bundles, to be assigned the different packers, or in less weights for the few boys who had eagerly solicited a load, some twenty in number. Here we also found a camp of Talk-heest or "Stick" Indians, who were over here hunting bear, the black variety of which they say are very numerous along this river, an assertion that the number of tracks constantly met with made good. One or two big brawny fellows were secured as packers at the eleventh hour, and another with a summer cut on his hair was hired at reduced wages to simply go along and to make himself useful if any one of the large party should be taken sick. He amassed a large Indian fortune from private sources, and formed the intention of returning to his village at the numerous places it had to be crossed in its winding from bluff to bluff. It had been a splendid day, with light southern wind, and as the evening shades fell from a dozen quarters on the hillsides, amid the fir and spruce could be heard the hooting of the blue grouse, a familiar sound to those who have hunted the woods of Oregon or Washington. Through the day a solitary cock could be heard now and then, but in the quiet evenings one would think that he had run across an assemblage of fowls.

On the 8th we started up the Dayak, by far the greater majority of our effects being placed in canoes and these were "tracked" along Indian fashion, pulling with thongs and pushing with stiff poles, and crossing backward and forward according to which bank was the best for the purpose. All of the stores could have gone into the canoes as well as not, but those provided with these crafts strenuously objected to the loads of those who had none; and the latter were forced to carry their burdens on their shoulders the whole ten miles to the head of some navigation—a ten miles, that were nearly doubled for them by their being forced from one mountain side to another in following the meanderings of the streams, unless they plunged boldly in up to their very middle and forded them at the imminent peril of their lives and more valuable loads—for their comrades even refused them the little favor of ferriage. When I saw this ungenerous conduct of the Chilkats toward each other, I was not at all sorry that I had brought along some extra help; for I found them as slow in assistance to a sick companion as to any other, unless they received a Shovel's share of the compensation. Despite all this inherent meanness in their character, they have the incongruous trait of a keen sense of the ridiculous, and will not be a merry-hearted, laughing race of people. Any ludicrous mishap that occurs to a companion, if he makes a noticeably poor shot, slips up in the water, tumbles off a log, and so on, is at once greeted with a prolonged shout so suddenly sent up that it is hard to distinguish the originator, although only one or two may have seen the mishap, and the noise of the laughing and voices combined to make the noise. It stops as suddenly, and one is forced to think that it must have required a great deal of exercise to acquire such perfection. One who has ever heard the midnight serenade of a lot of Indian dogs on clear, cool

moonlight nights, or the howlings of a cordon of contralto coyotes, he will see much resemblance in this Chilkat cry, and may think it is borrowed from one of the other.

The Dayak is a very rapid stream, from thirty to seventy-five yards in width, and often contains several beds within the limits all of it by the steep mountain banks that determine its valley, which is from three-fourths of a mile to a mile wide, containing great bars, and banks of boulders, sand and coarse gravel, with here and there groves of poplars forty to fifty feet high, hedged in by small birch and willow. There are very few places where it can be forded, owing to its swiftness and slippery rock bottoms, while its waters are icy cold fresh from the glaciers on the mountain tops. These became more marked as we ascended the inlet and river, and one on the western side ascended through the for that it was deepened on its side to last from about a mile to the mouth of the Dayak (if not before), clear past the point where we left the river, twelve or fifteen miles further on, and then branched off up a western tributary of the Dayak until it was lost in the clouds that its cold sides kept wrapped round them. I named it after Prof. Baird, of Washington, a name familiar to the readers of FOREST AND STREAM. Like all streams fed by glaciers, especially if they cut through calcareous rock, the waters of the Dayak and its covering tributaries were noticeably white and chalky. Dr. Wilson and Mr. Homan, of the party, fished a long distance up and down the river, but could not get a "rise" or a "bite" to either fly or bait, although the Indians catch trout in their peculiarly constructed fish weirs. At least some were offered us for sale, which they said had been caught in this way. Their non-biting proclivities may be due to the glacier water, or the fact that at this season of the year salmon roe is their principal food, and they find it in abundance when these fish commence running. The first day's march up the river brought us to within half a mile or so of the head of canoe navigation, a point we avoided as being destitute of wood for camping purposes, so our Indians informed us.

That evening our perfumed allies amused themselves with a social gambling game, not inappropriately called *la-hell*, although the philological deduction may be incorrect. Any number of these boreal brokers range themselves in a line, sitting or kneeling down, with an equal amount of material for missionary work directly opposite them, separated by a narrow Wall street three or four feet wide. Each one gambles for as much property, gain or loss, as concerned directly with his *zi-er-er*, although the particular loss or gain is regulated by the rules of the game played by the party as a whole. That is, each row is pitted against the other, and when the game is decided one whole row loses and the other gains, but gains only that put up by his opposite fellow. The "lay-out" in this game consists of the bed of sand or soft earth on which they sit *à la Turc*. There are two small cylinders of polished bone, about the size of small pen knives, and ten or a dozen sticks five or six inches long cut from some neighboring willow brush. One of the ivory cylinders has a black ring or two cut around it and the other is plain. The point of the game is to guess which is the white one, called "the king," after one of the men in a row has changed it backward and forward in his hands under an apron or at his back or in any hidden way. During all this tergiversation, so deep and incomprehensible as to almost rank it with that brain-bursting game of *baro*, which requires such intricate formulas to play it properly, the savages on both sides are singing a low not unmusical

"Oh! Oh! Oh!
Oh! Kersion, ker-shoon."

Until one of the opposite side, inspired by some revelation, (thinks he has detected the whereabouts of the "king," and makes a sudden guess which, if successful, counts his side one of the tally sticks of willow. This is kept up until one side gets all the willow, when the other side loses. These games were often kept up until way past midnight, several dens running at a time, while the amount of property, present and prospective, that changed hands, would be immense. The opposite party would often dictate what the other should pledge; if he desired live stock, his cap was requested; if real estate, even the shirt on his back was demanded; if movable property, one of the worm-eaten salmon he brought along for food was staked, and so on through the list. To cap the climax, they constructed caps of birch bark, on which were rudely engraved the names of such character, that they would have to be sent by express.

On the 9th we made an amazingly short journey of three or four miles, all of the Indians now packing like mules; and anticipating that this was a sample of all the packing days across the portage, I felt that "dangers disappear as you approach them," and also that I was being cheated out of a day or two in time, if not in money. I had to change my mind, however, before I was fairly on the head of the Yukon. Trout were seen at our new camp on the Dayak, but could not be caught. In the dense fir forests some of the Indians spent a great deal of their time (and this probably accounted for the short march of the day) in cutting long-life fir poles which they cached away, intending to obtain, as they returned, and use as the handles for salmon spears.

The next day, the 10th, our real genuine labor commenced, the trail leading us up the Dayak Valley to its very head until the mountain pass of the coast range loomed up directly ahead of us over four thousand feet above the sea level. The day's travel was not much more than a mile, as the narrow mountain valley, with its steep and most formidable ridges, for walking, I think it was more than equal to treble the amount on an ordinary road. We consumed the time from 7:30 in the morning till 7 in the afternoon, half of the time being spent in resting from the labors of the other half. I noticed that an Indian in getting over a log on his trail never stepped upon it, but always over it, and in crossing a log over a stream pointed the toes of both feet in the same direction—to the right—although otherwise walking naturally in crossing it. (Grouse will do the same with their feet in the woods through the warm pleasant day, and we wished many a time that we had some of the polar theorists of Alaska's climate with us to give them a chance to change their minds. Nearing camp, however, we passed over three or four hundred yards of snow, and except looking back along the densely wooded valley the scene was somewhat of an Arctic character. We got into camp about "as tired as tired could be," as the children would say, and I was thinking how much more exhausted the Indians must be after carrying a hundred pounds each, and the fellow carried a hundred and twenty-seven; and a boy not over twelve or thirteen carried sixty-five). Just then it was reported to us that a large mountain goat could be seen near the edge of a glacier on the western mountain side, some 2,500 to 3,000

See Mr. Schultz's description of gambling among the Blackfeet Indians, page 362 of this volume.

feet above us. If that goat had been on the top of Mount St. Elias, I imagined he need not feel safer if our allies felt any way near as completely fagged out as we did, but such was not the case. The identity of the goat had been classed as certain more than fifty minutes before one of the "Stick" Indians that had carried about a hundred and fifteen pounds over the trail, and the only one having his gun with him a flint-lock, smooth-bore Hudson Bay musket, started in pursuit and soon was seen across the valley, making his way up the steep snowbanks until he looked like an ant crawling over a white wall. The goat in the meantime, having walked around once or twice to show that he really was a goat, remained as immovable as if he had been pinned there solely for statutory purposes. The "stick" and his maneuver had gotten tired for our hundred feet above the goat, and I believe would have bagged him, if it had not been for a little black mongrel cur that had followed him up and evidently frightened the game, which came trotting down the mountain flank. The Indian followed him like a chamois, stopping only when the goat would stop. The animal, after running on a level for some time, changed his course and came bolting straight for camp, within ten or five hundred yards of which he ran, getting every one excited, and then, knowing the doctor's ordering, he started grabbing up by Winchester, another with a Springfield rifle and a box of revolver cartridges, put out after him, but none of them ahead of the indefatigable "Stick" (except the goat). Two or three wild shots from camp and the game started up the eastern mountain side, as if he wanted promotion, the "Stick" sticking to him about three hundred yards behind, like a hero. On they went, until the goat was fully as high as he had been on the opposite side, when the "Stick" and the other Indians gave up the chase. A big Chilkoot brought back my rifle with the wrong cartridges jammed into the feed magazine, chamber and muzzle, if I had been starving I do not believe I would have wanted that chase for all the goat meat in Brooklyn.

Early on the morning of the 11th my packers commenced striding out to ascend the snowy pass that frowned down on us at an angle of not less than sixty degrees. How these small Indians, not averaging over 140 pounds, could carry 100 pounds up such a precipitous mountain side was marvellous beyond measure. In many places the ascent seemed almost perpendicular, the packers clinging on to the rocks and knobs and using the stunted spruce and juniper roots to assist them along. In other places along the snow banks probably covering glacial ice, the unloaded packers had to go forward and prepare the trail so that footholds could be had in places where a misstep would have sent them many hundred feet down, and where those packers having boxes often scraped them on the ice, so steep was the incline. One or two hundred feet was climbed at a time, and then a rest for a few moments alternated until by 10 o'clock we stood in the little rally of snow that the Indians said was the top, for by this time we were in a dense fog which drifted along and hid everything from view, although it had been as clear as crystal when we started. From the summit we descended quite rapidly for a few hundred yards, which brought us on a small lake two or three hundred yards across, with not only ice upon it but the ice deeply covered with snow. This little lake was discharging its waters to the northward and was therefore one of the sources of the Yukon. From here the walk was still on the snow for four or five miles and some of the packers put on their snowshoes to keep from sinking in the softer places. Where the basin contracted to a narrow gorge we could hear the water under us as we traveled on the snow, and a little further on these snow-bridges had caved in, showing their abutments to be twenty-five and thirty feet thick.

At about five in the afternoon we caught a glimpse of the lake at the Yukon's head, where the Indians, acting as packers, would deposit our effects and return, and at seven we landed on weary selves on our picturesque banks, thankful that the worst was over. What was my surprise when the packers came straggling in to have them sling their packs before me to show that all was right, demand their money, coolly remarking that they would return that night, some of them even to the head of canoe navigation on the Dayak. I was glad enough to get rid of them and to be left alone with my own party and the Indians that were to go through with me, so that we could construct our raft and commence that journey which is more in keeping with my title than this hasty preamble has been.

[TO BE CONTINUED.]

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

FIFTH PAPER.

"THE method of Mythologic Philosophy," says that eminent theologian, Major J. W. Powell, "is this: All the phenomena of the outer objective world are interpreted by comparison with those of the inner subjective world. Whatever happens, some one does it; that some one has a will and works as he wills. The basis of the philosophy is personality. The persons who do the things which we observe in the phenomena of the universe are the gods of mythology—the *cosmos* is a *pantheon*. Under this system, whatever may be the phenomena observed, the philosopher asks 'Who does it?' and 'Why?' and the answer comes 'A god with his design.' The actors in mythologic philosophy are gods." Thus in the mythologic philosophy of the Blackfeet. In the beginning was a great womb in which everything was conceived, animals, trees, man, everything was in this womb and they fought continually to see who should be born first. Once, when they fought furiously, they burst the womb, and a man jumped out first. So all the animals and everything called him Old Man, and he named them my Young Brothers. The Old Man made the people, but instead of putting hands on them, he put on claws like the bears, and they dug roots and berries for food. In those days the people were not like the people into ps-kans, and then kill and eat them. One day the Old Man came along when the buffalo were feasting on them, and when he saw what they were doing, he sat down and cried and tore his hair. And he said: "I have badly made the people, they cannot defend themselves." And he went to where were yet a few people, and with his stone knife slit their paws, making fingers thereon. And he taught them to make bows and arrows, and knives. And he made their right arms and their hands to hold the bow and the arrow with great force. He talked to the people, saying: "When the buffalo again come to drive you into the ps-kan, go quietly and hide your weapons under your robes. When you have come into the ps-kan, then draw your bows and shoot rapidly." And the people did as they had been

told. The first arrow that was shot struck a buffalo in the side, and he cried out "Oh! my brothers, a great fly bites me. I die!" and he fell to the ground and died. And the people shot many more buffaloes, and they cried out "Great flies bite through us," and they fell and died.

The buffalo yet alive found that the people were shooting them, and they said: "You people! you people! do not kill us; we will never eat any more of you." Then the Old Man, who was sitting on a rock looking on, said to them: "Hold on, hold on; we will gamble to see which shall be eaten." So he cried out to all the animals to come and help the people gamble against the buffalo, and they all came. All the birds and animals came. First, the elk gambled with the buffalo and lost, and the different animals in turn gambled against the buffalo and each one lost. Now on the third day all the animals had lost except one which had not yet gambled. The little mouse's turn was now come, and when he took the bones in his little paws (the game was "fill the bones") all the animals and the people shouted, "Take courage! little mouse, take courage! little mouse." Then the little mouse took courage and made his little paws go so fast that the buffalo knew not which one of them held the bone, and they guessed the wrong one, whereupon the people shouted loudly and, quickly stringing their bows, they shot a number of fat cows and gave a feast to all the animals, and the Old Man gave the mice the buffalo heads to live in. To this day they make their homes in them: so are they rewarded for saving the people.

The Old Man, the sun, the sun hole, is a god; but he is not the chief god; the sun hole is that position. Perhaps the best way to give the Blackfoot idea of the sun will be to translate the legend of the origin of the O-k'an, or what is known among the frontiersmen as the "medicine lodge." It is as follows:

Now, in those days a man fell sick; for a long time he lay in his bed because of his sickness, and his wives and relatives said, "His sickness is of the evil spirit kind; he will surely die," and they cried unceasingly. In the night a spirit came to the sick man, when he slept, and it said to him, "Come, let us go to the Sun and ask him to pity you, and you may recover." So the soul of the sick man went with the spirit to the Sun. And when they came to the Sun's lodge they dare not enter, but sat down by the doorway on the ground, and covered their heads with their robes. At night when the Sun returned home he saw the spirit and the sick man sitting by the doorway of his lodge, and he said to them, "Rise and enter, for the night is cold;" and when they were come in he said, "Why have you come?" and the spirit said to him, "Oh, Sun, pity him! pity him! his body is sick; make him well." And the Sun for a long time did not speak. Then he said, "Go back and make a lodge like mine. Have your head wife make the lodge, and all the people shall help you. You shall call it O-k'an (his sleep), and he told the soul of the sick man every thing to do, and the soul went back to its body.

In the morning the sick man arose and ate, and his relations were very glad to see him well again, and they told him "your recovery is very strange." "True, true," he said, and he told them about his going to the Sun, and they began to make a lodge as the Sun had directed them. The man who had been sick and his head wife went up on a hill and smoked and prayed to the Sun, and the young men, thirty of his tribe, came and brought the tobacco to the lodge. And all the women of the camp who had not committed adultery came and helped to cut and dry the tongues, and if any woman helped who had committed adultery, and any man knew it, he cried out quickly, and they immediately killed her, for so the Sun had said. No woman who had committed adultery was allowed to help make the O-k'an. Now when many hundred tongues had been dried and the berries gathered, the women began to build the lodge. First they built a high circular wall of upright poles and then made a peaked roof of smaller sticks and covered it with brush. When the lodge was built and much firewood had been gathered, the sick man who recovered and his wives brought all the dried tongues and berries, and much other food into it, and they slept there that night.

The morning was the first day of the week. All the men wore their war shirts and war head-dresses, and brought with them their weapons, their bows and arrows, spears, knives, shields, and their trophies of war; all their brave deeds they brought with them. First entered the lodge the head chief, and after him came the "medicine men," the under chiefs and warriors, according to their rank. Now, when all were come into the lodge who could be seated, the "medicine men" took choice portions of the tongues and other food which had been gathered, and put it all in a hole in the ground for the Sun, and they sang the "medicine song," for so had the Sun said to do.

There was a "medicine" pipe filled and held aloft to the Sun, and a medicine man prayed, saying "O Sun, take pity O Old Man! take pity, let us survive, let us survive. Let our lives (be) full; let us survive, let us (be) old. Old men, young men, women and little children, pity them; let their lives (be) full. Give us our eating, let us not starve. We have built you a lodge, and you a big lodge; let us survive. Keep the ghosts away; keep our enemies from coming upon us; let us see them far off. Give us good hearts; give us good lives, all you Above-People. O Sun, we have built a lodge for you and we give you (to) eat. Look at us, pity us; pity us." (All the people) "Ah-h-h-h-h! pity take, pity take."

Every one who came to the O-k'an brought presents and hung them all round the lodge. Each person gave the little children, gave (to) the Sun. Quivers of bows and arrows were given, shields, war head-dresses, war shirts, spears, scalps, bags of colored earth, fine furs, eagle feathers, everything was given. If any one had killed a white buffalo, he brought the robe and gave it (to) the Sun, saying: "Here is your very own; I ate not the meat, not even the tongue." I gave you the meat long ago, there now is the robe, take it and pity me, give me full life, let me (be) old.

Now, when the presents had been given to the Sun, each warrior in turn counted his "coups"—that is, his successes in war. For instance, one would say: "The sweet grass hills, that place we fought the Crees. I killed three; two bows I took. My friends there, Bear's Paw and Heavy-Runner, saw me. I took the scalps." Singularly enough, the taking of a scalp does not count a "coup," neither does the killing of an enemy. To count a "coup" the person must take a bow or weapon, or the horse of an enemy, and must witness present to prove it. He must also bring with him the arms by which he counts his "coups." Every time a "coup" is counted the musicians—the drummers—beat their drums, and all the people loudly shout the name of the one who counts it. The number of "coups" a person counts are

accurately counted and remembered. The head chief of the tribe is the one who has counted the most "coups." Whenever he dies, or when he becomes too old to go to war, the one who has counted the most "coups" must hit him across the head chief. The chief of a gens is the warrior who, of all others belonging to the gens, has counted the most "coups."

Now, when all the "coups" had been counted, all the young men who had been in battle for the first time were made warriors. Blits were cut in their backs, and cords passed through them, to which were attached buffalo heads, and the young men ran a long way, dragging the heads by the blits in their backs, and if any one cried out or could not run, he could not be a warrior. Women, too, came into the lodge, and they wore clothes like the one of whom they would speak. Their hair was dressed the same and they were painted like him, and they touched the Sun's things and told what brave deed the one of whom they spoke must do that they might always love and honor him.

Now, when all these ceremonies had been done, generally at the close of the third day, the people returned to their lodges and the medicine men only remained behind, to whom came the sick that they might survive. The medicine men cured them. After that the O-k'an was left and no one could come near it, or take away the presents which hung in it, for everything belonged to the Sun. And after this, when a man was very sick, and even the "medicine men" were not sure they could save him, then would the head wife of the sick man put on a garment of ewskin only, and barefooted, she would walk all about among the lodges saying loudly: "Take pity Sun! very sick lies my husband. You have seen my ways; you know that I am not guilty of any sin. Pity take and make my husband well; I will build you a lodge; I will make the O-k'an. We all will build the O-k'an and make you presents. Hear me, hear me, and give us full lives." So it happens that every summer when the berries are ripe that a lodge is built for the Sun. Sometimes only one woman promises to build it, and again, many women make the promise.

The building of the O-k'an and the attending ceremonies is designed for three purposes: first, any woman who has been unfaithful to her husband is then pretty sure to be exposed and killed, and in this way adultery is suppressed to a great extent; second, the lodge is built for the Sun, the wonderful Above-People, and the Old Man—it is an offering to the gods; third, the public counting of the "coups" is designed to give to the Sun, and to his wife, the number of the exploits and the plaudits of the people. A chieftainship is an enviable position among the Blackfeet, and can only be obtained by most indomitable courage in war.

EGERIA PARK.

THIRD PAPER.

SIX o'clock next morning found us "in the saddle" and on the road, for we wanted to make the lowlands by early camping time and try our luck on the antelope, of the numbers and tameness of which John had given us wonderful accounts. He said he had often seen five hundred in a band in the park, and that in a single hour he and some thirty of his tribe had killed and brought in a hundred. I never tired ("Injun is very much like white man," in this respect) of telling me what a mighty hunter he was, and as we jogged along, there was scarcely a turn in the road, or a prominent landmark in sight, that was not the scene or the monument of one of his former deeds of daring and slaughter. Of course I could not allow a Ute to "crow" over me, so I completely and exultingly silenced him by relating a few of my own exploits, and naming the animals and the gazelles of South Africa—making myself the hero. He remembered when I told him Cumming's story about killing five lions in one night, and said that was "heap too much lion" for him. I have often thought he meant another kind of lynx, although he manifested no more intention of punning, by his demeanor, than one of the rocks by the roadside.

The first five miles of our way west from the Blacktail is over the Gore's gulches, and across the nameless little brook, up and down hill, and across a dozen nameless little brook, in every one of which our horses stopped and took a sip, as though they could not get enough, and each of which seemed to me more sparkling, clear and more beautiful than the last. They are all full of trout, during the summer season, and I know of no place where a fisherman may enjoy himself better, if he will be satisfied with fish that will average seven or eight ounces. With such, a sixteen-pound basket may be filled within an hour.

Just after crossing the third of these creeks, and as we started up the wooded slope on the other side, there came from the thicket on the right, and apparently not a hundred yards away, the wailing, cat-like cry of some wild animal. I thought at once of the mountain lion, whose exaggerated caterwaul I had often heard described but had never listened to. John, who was riding beside me, simply said, "Link!" beckoning me to follow. Creeping cautiously for some forty yards, and gliding from the incessant "meow-yeow," snarl and "spit" of the brute. I finally caught sight of him walking back and forth on a log; stopping now and then he would erect his "back hair," spring a couple of feet into the air, and, on alighting, would make the bark fly in all directions, then, with a "yow!" equal to that of twenty domestic ton cats, he would strike a sort of "bad-man-from-the-plains" attitude and, with his mouth hanging to come and be devoured. It was while he was thus unwardly admiring himself that I took a look at him over my gun barrel and put a .44-bullet through his heart. John had his hide off in about two minutes, remarking that he was a "bad cat; kill heap little bukskiu" (little deer or fawns). They are very destructive of small game, particularly the "snow-shoe" rabbits, which abound in these mountains. I have found five of these wild cats here in three days, and within a mile of a trap, twenty-three deer, one bull elk and a small brown, or cinnamon, bear—my partner killing seven deer in one morning. The next creek—two miles—is "Rock," a splendid stream, carrying as much water as all the brooks we have crossed, and containing plenty of big fish. We cross it just where it comes out of the hills, and for three miles it flows through a

comparatively open country, making a delightful piece of fishing ground, and a joy forever to one who is fond of the beautiful in nature. Among the hills about its source the woods are alive with deer, and there are some famous old bears on its headwaters. In the tracks of one there, three years ago, that was so very large and so unmistakably "fresh," that I made my tracks point the other way. Barney Day (who was assassinated at Grand Lake a few months ago) killed three "grizzlies" (so called) here one day in September, 1881. I saw the hides "pegged out" in front of his tent, and he said he had seen two others the same day, but that he had not kept, as he thought, and meat enough of that sort. Poor Barney! He was a kind and a good citizen, a rattling sportsman and a capital shot, and although ambushed and taken unawares by his cowardly assailants, he killed one and fatally wounded another before he fell. My reader will pardon this digression when I tell him that I had hunted, trapped and camped with the old man, and had a thorough admiration, not only for his skill, but also for his kindness of heart and his manly ways. Peace to his ashes! and wear, unutterable wool to those who so basely murdered him!

About three miles down the creek from where our trail crosses it there is a magnificent mineral spring, a spot where a "lazy" hunter, who don't care to climb the hills and thread the thickets, can sit down in the shadow of a great rock at sunset and take his pick of the numerous deer that come to drink about the spring and along the little rivulet that runs for fifty yards to join the routing creek. We did not go on our way to visit it on this trip, but pushed on to Fish Creek, some five miles further, where we stopped and "unsaddled" to let the horses graze for an hour or two, and to eat a bite of lunch and smoke a pipe ourselves. After going through this very comforting ceremony I put half a dozen cartridges in my pocket and concluded to take a stroll up the stream. This is a tiny creek, that reminds me of many of the little streams in the hills. I have fished among the trout farms of Connecticut, when I used to think I was having famous sport if I got seven or eight four-ounce trout in an afternoon. It is only about seven miles from source to mouth, through a country varied by grassy meadows, low ridges, finely timbered with spruce and silver fir, and now and then a rocky knoll adorned with scattered pines. Along the banks, and for only a few yards on each side, grows a heavy carpet of ruffed grouse, fully as finely flavored and equally as difficult to kill in flight. They are very abundant among these foothills, where they get rolling fat on grasshoppers and berries, but with the first heavy snow they "pack" and go down to the piñon groves and wild-rose thickets along the Grand and White rivers. I tried to head one of them as he sat cackling on a dead limb, but as he kept his head bobbing back and forth, like a mad muskrat, I missed him, and clean and clear I saw him slip and get killed when he was in a tramping of hoofs, telling me that I had started a herd of some sort of wild cat, and running around a point of timber where I could see straight up the creek for a quarter of a mile, I caught sight of the rumps and tails of five bison just disappearing over the "divide." There must have been more in the herd than those I saw, for they made a tremendous tramping. I concluded not to follow them, but to go back to our camping place, where I suggested to the boys to wait for me that night, and take their trail next morning. "Pi-sh!" listened to my scheme very patiently, and then remarked that the bison would very likely not stop till they got about timber-line, where they could overlook the whole country. He said it was "no burns" (no good) to follow them in the mountains when they once got sight or scent of a human being. I learned from him that this was the number of a band of about a hundred, driven in here by the Northern Arapahoes several years before, out of which "bunch" the Utes had killed some each year, until they were less than a hundred left. Two years after the time at which I saw these, "Antelope's" band of White River Utes "corraled" the herd in a deep snow on the head of Muddy Creek, and killed fifty-six out of sixty-seven. I presume they are all gone now, as I have heard of one or two being brought in by the hunters each since, now-crowded heads 3,000 feet above their mighty pedestal. In the foreground, like a sentinel at the entrance to the Park, stands the Sphinx Rock (so called), though I think the Indian name for more euphonious and appropriate. They call it "Tun-bee-wa-aa-ra," the "Sleeping Lion," and indeed from where you first see it there is a striking resemblance to the lion couchant, as we so often see him pictured. The trail passes close by this queer mountain, and as we near it we see that it is a huge high column of basalt rock, 450 feet high, and about 300 feet broad at the base, that forms the face of one of the "spurs" that run down from the mountain into the Park. The Utes say it is really a fierce beast in a dormant state, placed there to guard the sepulchre of the great and wise Chief Ne-na-va, who was the first ruler of the seven once mighty tribes—the Tabagwaches, Weeminches, Meeches, Capotes, Uintas, Yanpahas and Grand Rivers.

These Indians carefully hide the graves of their dead, and the places of sepulture of their departed chieftains are as perfectly secreted as was the tomb of Alaric, when, at his dying command, his sorrowing followers,

"The mountain stream did turn,
And lay its rocky channel bare;
And hollowed for their sovereign's urn.

A better place for ever theirs.

I have been in the Ute camps a dozen times when one of

their number has died, but if it were to save my life I could not, to-day, tell the burial spot of one of them, nor do I suppose that I could find it in a month's search.

Our ponies have been picking their way down the stony trail for a mile, and here we are on the banks of "Teponis" Creek, almost at the foot of the great rock, where, without a dissenting voice, we agree to stop, and find out before we do what the neighboring woods and adjacent valleys contained. It is quite curious that where Brush Creek falls into "Teponis." If any of your readers, who have heretofore been satisfied with fighting black flies and mosquitoes, and vainly looking for "big bucks" in the Adirondacks, want to "enjoy a new sensation," as the gentleman said at the dinner party when the servant spilled a hot cup of coffee down the back of his neck, let them come here in September and set their tents anywhere in sight of "Tim-be-wa-na-ra." Here are no insect pests at this time of the year. The days are bright and clear, and just comfortably warm; the nights cool enough for a couple of pairs of blankets over you. The green hills are spotted red and yellow, where the frost has touched the thickets of aspen, oak, mountain ash and choke-cherry, and on their slopes and in the gulches the hunter who can endure rough, hard climbing will find bear, elk and deer; plenty of mountain sheep if he goes above timber line, while in the level park he can pass an afternoon stalking a herd of antelope, or bending the bushes along the creek for sharp-tailed grouse, and after the labors of the day rest himself by taking a few dozen trout out of one of the beautiful ponds along the creek. For the more agreeable talk to our Pike county companion, Jeff, as usual, who said "he'd rather stay right in camp 'n' look out for the 'stock' 'n' git supper fur ye in case ye git belated," and dividing our forces, we struck out for the timber, John and I down stream this time, as Curtis and Peah thought we "had the bulge on them" at the last camp, in having the best ground to hunt. John winked and said to me, aside, "Never mind, me tell you sumting," and, as we started off, he pointed to the low hills that rise from the creek, less than a mile below our camp, saying with a "crack" "Two or three little water (little lakes) o'er dah. Heap big buckskin stay dah."

We climbed the backbone of one of the knolls and on coming to the summit found the entire hill for a mile and a half was a "land-slide" or "slip," forming a regular bench on which was a scattered growth of pine and aspen, with here and there a thicket of scrub-oak, and about a quarter of a mile apart, as John had said, were three little lakes with bright reflections on the surface, and only a few small, mossy, rocky islets. We passed the first one and "took post," as the soldiers say, on a flat rock and behind a clump of oak brush, over the tops of which we could see the little lake, or pond, for it was not over a hundred feet across. The sun was scarcely half an hour high by this time, and we knew the deer would be stirring soon.

I had watched the brush patches till my eyes ached, and was relieving them by looking at the glorious effects of the sunset on the crags and glaciers of the Dome Peak, when John laid his hand on my arm and whispered "ponce lea!" He pointed to the opposite side of the pond stood one of the biggest buckskin I ever saw. He was staring at us "with all his eyes," and his mule-like ears were pointed forward to catch the least sound or slightest murmur might make. I knew that a deer would often stand and gaze for minutes thus at a motionless hunter, but that a turn of the head would startle it like a clap of thunder. Realizing that it would not do to deliberate, I threw my rifle up with a jerk, and fortunately caught the sight of his head through the brush. But the deer was as quick as I, and he pulled the trigger he whirled about like a flash—too late! poor brute; the bullet caught him behind the left shoulder and smashed the right to smithereens. Two or three despairing bounds, a side-long plunge, and the noble animal by dead. At the crack of my rifle out from the brush bounding us, and the water's edge, jumped another buck, bounding high, and in such a zig-zag fashion that my shot missed, but caused him to turn up the hill. As soon as he showed above the "brush," my right commenced pumping lead, and I acted spectators. The first shot broke a hind leg and halted him a few seconds only, the second went over and the third fell short. By this time the deer was within fifty yards of timber. I was raising my gun to try my luck, when "crack!" went the Ute's Winchester, and almost simultaneously I heard the bullet "sput" as though it had struck a stone wall; the deer going down as if hit by a bolt of lightning, and no wonder, for this last shot went in at the back of his ear and out above the opposite eye, and caused him to fall with a gasp, and with a faint "spit" he was dead, so we took his liver and some choice cuts, and left the other for the proprietor of a den we found in the rocks near by, whom we knew, by the tracks about his front door, to be a very large timber wolf.

On our way back to camp we saw five more deer in a bunch within easy range, but we did not fire at them, and they, in turn, stood watching us as long as we were in sight. As we descended the hill a flock of thirty or more sharp-tailed grouse rose singly, two three at a time, and sailed away to the lowlands, where they dropped their legs at the edge of the willows on the creek, and no doubt were asleep long before we were. We were ahead of our companions in reaching camp, and too hungry to wait for them, when we caught the incense of Jeff's fragrant coffee and "briled" venison. After supper a pipe and a walk to see that the horses were all right consumed half an hour, and still the loiterers came not. Tying up the dog and leaving coffee-pot and frying-pan by the fire we turned in to sleep the sweet sleep of the tired and successful hunter. Daylight came all too early, and with the first glimmer I was up and at the tent door. The camp-fire was dead, the cooking utensils undisturbed, and I had got the sleep out of my eyes sufficiently to realize that our companions had laid out. In my next I will tell you what befell them and how they took a lesson in herding mountain sheep. YUMPAH.

DEVER, Col., Dec. 15, 1883.

The "Ritchevings" notes should be mailed as early as practicable. See page 428.

ADIRONDACK FOOTHILLS.—Comstock's, N.Y., Dec. 17.—Comstock's, being situated upon the foothills of the Adirondacks, is never without plenty of game, but this year there is more than ever. A bear has killed several sheep quite near the village, and has been seen by several persons. A lynx also has been seen several times upon the mountains. A country fox has been distributed all night. We report seeing deer while at work, a quite quite unusual. Partridges and woodcock are very plenty, but "grey's" are very scarce.—G. C. B.

Natural History.

THE PURPLE FINCH AND HIS COUSINS.

By Dr. ELLIOTT COUSINS.
2.—*Cherpodanus cassinii*.

IN 1854, at the time when Cassin's purple finch was first made known to science by Prof. Baird, who described the species from specimens procured in the Colorado Valley by Dr. Kennerly, the richness of the avifauna of that region was only beginning to appear. That wonderful Basin has since continued to yield a rich harvest to the explorer and enterprising naturalists who have undertaken its exploration. Novelties have continually been brought to light, and the ventures of men like Henshaw and Bendire, who have faced toil, privation and danger in their enthusiasm, have fortunately shown us how rich a field had before lain fallow. If we except, perhaps, the valley of the lower Rio Grande, whose varied treasures have been laid out for feet by Sennet and Merrill, no other region in the United States has been more fruitful of discoveries in ornithology of equal interest. The proportion of rare, interesting and still imperfectly known species is, in the Colorado Valley, exceptionally high. This is due in part to the peculiar physical features of the region, and the climatological influences there operative in producing those modifications of bird-life which we call "species;" in part to the geographical position of the great Basin, which causes it to be tenanted by many kinds of birds from the neighboring parts of Mexico. When collections began to come in, before 1858, and were submitted to Baird's examination, that naturalist's critical faculty and insight into many species which have ever since held their own; but some of the more conservative of our ornithologists were inclined to marvel or doubt, as the case might be, that so many novelties remained to be characterized. What would such say now, after scarcely more than twenty years, at the extent of the Colorado bird-list; at the proportion of what were then unknown birds it contains; at the familiarity we have acquired with many a bird long known to us only by name? But science progresses; and we have found that Wilson and Bendire, and others, had not characterized neither birds in New England and the Middle States, nor birds in the West. It is not surprising that the herdfolks of our country, such as the valleys of the Rio Grande and of the Colorado, and of the Columbia and of the Yukon, are but gradually drained of their resources.

Strolling one morning in early April along the little stream that flows past Fort Whipple, I noticed a flock of birds in a tall cottonwood, which stood where one of the many side ravines made down from the hills. I noticed with my eye that they were purple finches, but supposed them to be the year round, and of whom I almost secured good store. But my attention was drawn to their song, as one after another was induced to join in a chorus, following the lead of the most ambitious member of the flock, who had sounded the key-note first. Drawing nearer, I soon perceived how much larger they were than bunions, and was satisfied that a different species of *Cherpodanus* was before me. Instinctively marking the brightest colored bird of the group, I drew off flew the female size, and the next moment I was admiring the size and beauty of the specimen I had secured. "Cassin's, and no mistake!" I said aloud; and having made sure of this, I went with the collector's ardor fully aroused, in quest of more. The flock had not flown far, some were singing again as merrily as if nothing had happened, while others had resumed their operations upon the bials of the tree in their new feeding ground. Needless of approach as they were, I could watch them at my leisurely and noticed that nearly all the company were in plain brown attire, though some of these were singing with the rest; and in this respect, as well as in their whole bearing, mode of feeding and behavior toward each other, they might have been the familiar objects of my boyhood's home in the East, instead of the ornithological prizes that they were. Observing all these points to my satisfaction, and feeling no little elation on the discovery of a bird new to me, I secured several specimens before the flock dispersed in face of my persistent pursuits. I had satisfied myself later in the course of such pursuits I had satisfied myself that Cassin's purple finches were common birds in the portion of Arizona where I then resided. This was entirely within their breeding range; and, although I never took a nest, there could be no doubt of their nesting about Fort Whipple. Comparing my own observations with those of others, it seems that the bird is neither abundant nor universally distributed in that Territory, where the lower arid portions afford no congenial home, but that it may be looked for with certainty within the mountain ranges, at moderate elevations. It seems to prefer the coniferous tracts at most times of the year, but may be found on the hillsides amid scrub oak, red cedar and piñon, as well as along the ravines where the *Salix* and *Populus* give sign of living water. Dr. Cooper does not appear to have found it at Fort Mojave, nor do I remember to have seen any during my delightful boat voyage down the Colorado and up again, between the point just named and Fort Yuma, at the mouth of the Gila. It is not noted among the results of Mr. Tushnet's collecting in Arizona, though he has observed it in numbers about the Pueblo of Zuni, in New Mexico, as well as in Southern Colorado.

The general distribution of Cassin's purple finch has been determined with some precision, though doubtless some details remain for future observers to fill in. Southward the bird has been traced along the tablelands of Mexico as far as Orizaba, where, on the mountain of the same name, Mr. Francis E. Sumichrast is reported to have secured it. In the opposite direction it is accredited to British Columbia by Mr. John Keast Lord. On various high elevations, Dr. F. Y. Hayden has noted its presence in different portions of the Rocky Mountains, giving us the most northeasterly advances we have thus far received. Westward the bird certainly goes to the Cascade Range, and the eastern slope of the Sierras Nevadas, but whether or not it actually reaches the Pacific coast remains to be determined. In the region thus bounded, Cassin's finch is migratory to a certain extent, but liable to be found at any season of the year in suitable situations; its breeding range, and the extent of its winter range, are so largely overlapping. On the surface of the physical characters is so varied in elevation and in other physical characters, that a remove of a few miles may become, in some cases, equivalent to the whole of the migration which some individuals of its Eastern cousin perform. The wooded parts of Utah and Nevada, of Eastern Califor-

nia and Northern New Mexico, and Arizona, appear to represent the area of its principal dispersion.

Two eggs of Cassin's purple finch, now in the National Museum, were taken June 28, 1869, in Parley's Park, Utah, by Mr. Ridgway, while attached to the Survey of the Fortieth Parallel. They are indistinguishable from those of the Eastern purple finch; in fact, they might have come out of the same nest with some of those of *C. purpureus* I have described, for any difference that I can perceive. They may however, be found to average a trifle larger, when sufficient numbers are compared. Some very pale sets occur, as in the case of *C. purpureus*, and immature specimens may be expected to turn up. The eggs of this species, as supposed by Dr. Brewer, and described by him as such in the Boston Society's proceedings (xvi, 1873, 109), were wrongly identified, being from Capt. Bendire's collections, and belonging to *C. frontalis*. According to Mr. T. M. Trippé, Cassin's finch is abundant in portions of Colorado, where it breeds, and where a few pass the winter in sheltered places among the mountains, though the greater number pass southward. He found them in early spring haunting the willow brush that fringes most of the mountain streams; afterward, in pine woods, where they nest, sometimes at an elevation of 9,000 feet.

Our best advices respecting the nidification are from Mr. Ridgway, who had abundant opportunities of studying the bird during the breeding season in the Walsatch and East mountains, and other places in Utah and Nevada. This gentleman gives us memoranda of a number of nests which he found—one in a box-elder bush, at an altitude of 7,000 feet; another in the top of a cottonwood; and several in aspens along the streams. The eggs in these cases being two to five in number, though oftenest three to four. "In certain localities on the eastern slope of the Ruby Mountains they (the birds) were quite abundant on several occasions, the flocks consisting chiefly of young of the year, which, with their parents, had apparently come from the higher coniferous woods near the summit of the range, since no nests were found among the cedar and piñon groves of the lower slopes. In the pine belt of the Walsatch and Uintah mountains they were abundant from May to August, during the whole of which time they were nesting. Many of the nests found were among the aspens and narrow-leaved cotton woods (*Populus tremuloides* and *P. angustifolia*) of the higher portions of the ravines, where these trees replaced the conifers." One of the nests secured by Mr. Ridgway from the top of a cottonwood forty feet high is described by Dr. Brewer as a soft homogeneous structure, flattened and with but slight cavity, four and a half inches across by two deep, composed chiefly of roots and twigs, lined with similar materials, interspersed with moss and other soft substances.

INTERESTING PETS.

POSSIBLY a brief sketch of my two pets might be of interest to some of your readers who are fond of natural history.

Dear old Solomon Blink was a great brown and white horned owl of whom I was the fortunate (or perhaps unfortunate) possessor during the past summer. He came into my hands in this wise. His fondness for young chickens led him into a neighbor's back yard one night, and, amidst the family laughter on a corner, he came out and found him engaged in a struggle with the mother hen who was trying bravely to defend her brood. His feet were entangled in a string by which the hen was fastened, and he was thus easily secured. Thinking to keep him a few days to please the children, they fastened a stout fishing line to his leg and tied him where he could perch in a tree. This did very well for a day or two, when he managed to bite or break it off, and was making his escape. One of the boys discovered him, and shot at him. The shot brought him down, though not at the end of a tree. After this he was kept confined in a large box, until, for a small consideration, he was transferred to me. I thinking to keep him if he would live or mount him if he died.

It was a rather difficult proceeding to remove him from the box and fasten him out with a dog chain, and could only be accomplished when we had thrown a thick cloth over him; even then he inflicted some pretty severe scratches with his sharp talons.

We were careful about approaching him for a few days, but he soon ceased to offer any remonstrances, and would even allow us to stroke his head, and seem to enjoy it, though if his back were touched he would immediately snap at one.

Through the day he would sit on his perch, apparently asleep, but on close observation it would be found that he almost always kept the right eye open, just enough to peep. I never saw him so sound asleep that he shut both eyes, and when those magnificent golden orbs, flut out his feathers until he looked as large as the head of a barrel, elevate his horns, hiss and snap his beak with a noise like bone castanets, while the poor dog would drop his tail and leave for parts unknown, when Mr. Blink would calmly resume his dozing.

When wet he was a dreadful looking creature. He seemed about all eyes and beak and claws, with scarcely any body. He would eat anything in the way of food, such as meal, mice, nuts, chickens, ducks, snakes, fish and beef. I preferred to swallow everything whole if possible, and always crushed the head first. One day a dead duck, almost as large as a gosling, was given him. He tried for almost half an hour to swallow it whole, throwing his head back and making frantic efforts to do so, but did not succeed. He then took it in his talons and tore it in pieces. When given a rat he always tore its head off before proceeding to eat it. He was always on the lookout for birds, and when one came near he would regard it with great interest. Twice he caught a full grown chicken that had ventured too close, and he would in no wise loosen his hold at our approach; clubs, sticks, and even cold water dashed in his face were alike unavailing, and we were obliged to tear the poor fowl from his cruel talons by main force.

Stepping out one morning, I came upon the remains of a chicken, and wondering what had been making a raid in the poultry yard, I passed on to an open space where some of the young birds were still left. There I beheld a spectacle indeed. There, proud monarch of all he surveyed, stood Mr. Blink, while around him by a half dozen more chickens that he had slain, seemingly from the mere love of killing, as he was not eating, and of course could not possibly have eaten half the number he had killed. Some of them he had neatly decapitated, and others he had killed by a single thrust of his hooked bill in the back of the head. Of the

Game Bag and Gun.

OPEN SEASONS.

The digest of open seasons, printed in our issue of Aug. 10, has been published in convenient pamphlet form, and will be sent to any address, postpaid, on receipt of 10 cents.

KENTUCKY QUAIL SHOOTING.

A POSTAL from my old neighbor and friend Major S. A. of Lincoln county, informing me that, *Deo volente*, and weather favoring, he would expect a horse—and grain bag for shells, "and so forth"—at depot, afternoon of 2d inst., incited an sacrificial "rumbling up" chores which provoked many a significant snarl from the Madam—so unbecomingly wouted the boy-like eagerness of fifteen years ago. It being two miles across the mountain to the nearest quail fields, and the inconvenience of getting over without walking, uncertainty of a marker and game carrier without previous arrangement, together with an unaccountable disinclination to get ready and go, had rendered persuasion to sell my old breech-loader at a profit rather easier than I would have been possible six or seven years earlier, and I had to fall back on my old 13-gauge muzzler-loader for the hunt. Scoured and oiled, a 12-gauge, thick eard board was slipped down either barrel as smoothly as when she came from the workman's bench with insides as smooth as planished glass, and the familiar click of never-failing lock when capping the nipples suggested the reflection after all "Is there such great superiority of the breech-loader over our old reliables?" "Of course there is," the inevitable confession. Still the old muzzle-loader is good enough—indeed, can't do better—since a dozen plump birds at from twelve to even twenty-four shots inspire as great contentment, as did two score when a bigger bag than Dick's or Hig's was my aspiration.

Estimating the train an hour late, the ten miles from the depot to my house should have been traveled by 8 or 8:30 P. M., and the supper hour had been deferred for the occasion. The uproar of a pack of mongrels half a mile away on the mountain side, and the fact that they were coming, and lighting a lantern I sallied out to return that night, that supper might as well be spread within the next fifty minutes. With assurance that supper would be properly attended to, I proceeded to the stables and, after waiting long enough for the Major and escort to have ridden a mile, I despondingly returned to the sitting room to find the children tucked away for the night, the Madam reading the latest magazine, and no supper in sight. An hour later I suggested the Major to either delay supper, or to return that I had instructed the messenger not to return that night if the train was more than an hour late, or if the Major didn't come, and as the limit had been passed I argued that it would not be inhospitable to serve the Major something which had been kept warm. During that endeavor to convert the mistress to my way of thinking, the dogs renewed their concert, and on the second time emerging with lighted lantern was greeted with "All right" from the stable, and they were here.

We adjourned to the supper room. Broiled squirrels and celery were not slighted. Surfeited, cigars were laid on a mantel and pipes preferred; the speakearsip briefly adverted to, a few reminiscences of the first five years after the war, prospects of the morrow, and to bed at 23 o'clock standard time.

On leaving my guest for the night after seeing that he was comfortably tucked in, he observed, "Now, Tom, I think 9 o'clock will be soon enough to enter the stables, and let's not derange domestic customs by urging a daylight breakfast. Remember that we are going for sport and not for "a bag." We anticipated the hour but a few minutes, and when the old pointer was permitted to "lie away" in first stubble, he "spun away" at such a headlong gait that within a hundred paces he pulled up almost in the midst of a bevy, which failed to lie. The Major got off one barrel at quite low range, but could not enter the stubble, and thus brought to bay. The entire bevy pitched into fine cover on a woodland hillside, but got up in twos and threes without considerably awaiting the reloading of even a breech-loader, and we got but two each after first rise. As they flew into the woods where we expected to drive more, it was voted better to hunt a fresh bevy, and we returned to the fields. Soon a flock was flushed out of range which pitched into the brush, snags, weeds along a ditch, and they got up in bunches, flying in opposite directions. But two were bagged when it was determined to follow the larger bunch, which pitched out of sight over an elevation in the field. We failed to find, but unexpectedly put up the third bevy into which we had walked, and in the flurry and turning to get in second barrel to best advantage, failed to retrieve our first birds in the thick sedge, standing and abominable "rumbling" cries. Marking down the greater portion along a neighboring ditch we followed in expectation of a sure thing, but found the tangle so great that the birds began running before the dogs, and we drew off to hunt another bevy—having bagged an average of, but three to a bevy. The old dog staved out directly we entered a field; and two birds got up, which swelled our bag to thirteen, when 'twas resolved to shoot no more till we had tried a neighboring slough for mallards. Ordering the dogs to lie, we crept into the range, and on rising but a single duck arose, which tumbled to the Major's charge of No. 8 chilled, at fully fifty yards.

After a refreshing draught from an old gourd which hung at the spring, and, concealing our game in the long grass, we proceeded in quest of quails. Three more bevs were put up, and on swinging back to the spring seventeen more were added to the pile, and we partook of lunch. A smoke, a snooze of an hour, and we were ready for the afternoon sport. Scolding the madam, with instruction to the Madam to expect us after dark, we tramped around till sunset, adding twenty-three more to our bag, having lost six, and put in the day without a split. I fired at one bird late in the afternoon, which I discovered that the Major from behind had seen, but too late to reserve my charge.

Tuesday morning we prepared for new grounds, and on reaching the scene of the first day's sport the Major insisted that we could not begin until we were under protest I submitted. While I stabled the horses he visited the slough, and after waiting both cartridges on a brace of drakes, which rose about fifty yards off, had the mortification of seeing a flock of twenty get up almost under his feet and soar away. But very few quail were found, and only nine and one mallard bagged. Wednesday morning we got in both barrels on the mallards, but each scored a miss with first and got a duck at long range with second. Too eager on the rise. We took leisurely Wednesday, often sat and smoked,

napped two hours after lunch, and returned before sunset with but thirteen quail and two ducks.

Thursday morning we resolved to devote the day to the mallards. None on the slough, so we took opposite sides of a small stream and followed its banks till nearly exhausted. Flushed but three, bagging one. Their flutter on rising gave me an "ager" which discouraged my fire at random on bringing up the gun, and I got only a few feathers with second. Walking into a couple of bevs we bagged fourteen of them, and started home shortly after noon. Over the grounds where we bagged fifty-three on Monday we didn't get half a dozen the next two days. Didn't put up a bevy. My friend left me Friday with a handsome string of game, promising to come again soon.

I had planned to take my first to grounds over which I have been invited to shoot, and felt confident of easily making a bag of fifty each day, but comfort is not an inconceivably ingreible thing with some of us who are not especially eager to expose the sprinkle of grey hairs, though not too proud to confess an occasional rheumatic twinge, and I was happy to discover a sincere desire to confine our tramps to a unit which admits of convenient return home at night. A day's shooting was foregone because a morning glance at the mountain tops less inviting than recollections of the bevs and ducks of the day before. Quail are plentiful, and farmers are becoming more prone to order off trespassers, though many are indebted to sportsmen for the additional dish of quail they enjoy. A bunch of six deer was reported to me last week, and I am now expecting "Uncle Joe's" advice as to when we will go for them. KENTUCKIAN.

SOUTHERN KENTUCKY, December, 1888.

DEER IN MICHIGAN.

LIVING on the line of the main railroad to Northern Michigan, over which quite one-half of the game shot in the North is shipped, it will not be a difficult task to give some idea of the myriads of deer carcasses that are transferred each season. Having kept a fair estimate during the past three years, the present season's supply can be easily compared with the others.

It has been a good season and thousands of deer have been shipped over this one road, the G. R. & L. R. R., during the past ten weeks. An occasional carcass is expressed down now, the officers of the road satisfying themselves that no wrong is done, from the assurances of hunters that such deer were shot before the extra-limited date, Dec. 1, but I leave the readers to judge whether a hunter would keep a good-sized deer quite two weeks before transporting it. I have counted over one hundred carcasses taken in the North and shipped off on a branch road connecting with the main line at this place, and feel safe in saying that at least ten deer pass down in the flesh to one that goes in the hide. Large bucks are always sold intact, and only when hunters are making a regular camp for the sake of money do they skin the deer.

The notion, generally prevalent, that there are more hunters in the woods of Northern Michigan than there are deer, is undoubtedly correct. In fact, the woods along the country road is filled with hunters, and frequently in the height of the season fifty hunters may be counted on a train. All classes of men are to be met with in hunting camps in Michigan from nearly all States east of the Mississippi River. Thousands annually hunt in our State whose homes are in Ohio, Indiana, Illinois and Kentucky, besides the hordes of sportsmen inhabiting the Peninsula State, as well as the usual allowance of pot-hunters from the adjoining States.

Yes, there were more deer shot this season than ever before in this State, and though many more hunters returned to their homes without the usual trophies such results came about from the fact that with so many hunters all could not be supplied even by the fertile resources of our pine forests. Now that the road extends clear to the apex of the Lower Peninsula, and communication is established with the upper part of the State, more hunters are invading the territory untroubled by our few remaining moose and elk. But of these monarchs pass through inland, most of them being shipped to Chicago, Detroit or more remote points by steamer.

Caribou, elk, moose and the common deer are found in the Upper Peninsula, while but few if any elk are found now in the Lower Peninsula and no moose nor caribou.

It proved by the editor's will, sometime in the future, develop a portion of the valuable space in the FOREST AND STREAM to a partial history of the game mammals of Michigan in which I will show the original territory occupied by the various members of the family Cervidae.

The laws relative to deer protection in Michigan have, until within the last few years, been a dead letter, and had the farce been continued much longer the hunting in the State would have ended up this, but still we are in great danger and such protection as is guaranteed to the moose of Maine should also be extended to all our game, both feathered and hoofed.

The law is only stringent in relation to transportation of game after date, and in this respect is often violated, and as regards the privilege of settlers to kill game the leniency shown them is simply abominable and makes them entirely lawless.

A story goes the rounds that a man was disgraced by a judge after pleading guilty to the charge of shooting a deer in August, on the plea that he had no meat in his family. "Go," said the judge, "and when you get out of meat again, kill another deer." Let us hope that it was not a judge, but an ignorant justice of the peace, one of that class infest our country towns.

Let me give one instance of the lawless manner in which the seasons are disregarded: I was riding leisurely one July day, and planned to travel in my horse after quite a trip, and while waiting a brace of woodcock flying over a mill pond in a clearing, I was suddenly made aware of a man's presence by the crack of a rifle quite near. Soon the wretch made his appearance, in one hand his rifle and over his shoulder a beautiful spotted fawn about four or five months old I should judge. He desired me to call on his wife as she was quite ill, and as the shanty was near I hitched my horse and drove to the house, about as soon as I had engaged the only of the mansion in conversation, and before I had learned her symptoms the backwoodsman blurted out, "Dock, I ought go no money to pay with, or if you want any of this blating venison just say so." It is needless to say that a doctor is not surprised in this land of pine and sand to hear that no money is in the investment, but when it comes to eating wretch (then stolen meat it makes a conscientious man guess. But I will tell you (and please don't criminate me for the truth,) when I left the shanty a hind quarter of blating

brass and impudence in those great yellow eyes, as if I turned them upon me, and challenged me to touch him if I dared.

However, I dared. I loosened his chains, which had become entangled round a stick, or he might possibly have made his escape (though I'm not at all certain he would have done so), and dragged him in no gentle manner to his box, and shut him in, he all the time making all the resistance possible, clinching his nails in the ground, etc. I kept him a close prisoner for several days as a punishment.

Some fine specimens to this I had observed that he was infested with mites, there were myriads of them. If I stroked his head (which I soon ceased doing) or touched his perch or box, my hand would be instantly covered with them. They were extremely small, scarcely larger than the point of a pin, and brown in color. I blew insect powder from a bellows box among his feathers and on his perches, and I also placed burning sulphur in his box, covering it closely to suffocate them, but all to no purpose. There was hardly any perceptible diminution of their numbers. I was dreadfully afraid of their being communicated to my canary birds.

Poor Blink! I was not greatly surprised on returning from a drive one day to find him dead. Dear old Blink! brave Blink! We buried him in the garden, as, of course, he was utterly unfit for mounting, on account of the mites, and beside, I do not think I should have felt like mounting Blink.

My other pet is simply a plain striped gopher (*S. tridecemlineatus*)—"ground squirrels" the boys call them—but some boys drowned out of its hole and brought alive to me, or the owl. I could not for a moment think of sacrificing the pretty, bright-eyed creature; so I placed it in a box, prepared for its reception, with some shavings for perches and a front of screen wire, and there it is at present, cosily installed in a warm corner of the kitchen. We feed it grain, corn, nuts, etc. It sits up and eats like the squirrels, holding the food between its feet. It is not very tame, however; when disturbed it utters a sharp, ringing, rolling sort of cry, resembling the call of a canary bird when separated from its mate. Indeed, my birds reply to it whenever they hear it.

Toward the latter part of August it became very fat, and so clumsy it could hardly crawl up on its perch. I gave it some grasses, corn silks, etc., and it formed itself the cunningest little round nest, and there it stays the most of the time. On the 5th of September it became torpid, and was confined so nearly entirely a shanty, waking up at irregular intervals it partakes of a hearty meal, then goes back to bed, covers itself entirely over, curls round into a little ball, and goes to sleep again. Once it slept for three weeks or more. Thinking it perhaps dead, I took it out. It was quite cold to the touch, its eyes were closed, and I could not discover the least signs of respiration. I took it to the fire, and after warming and rubbing it I laid it down, thinking it probably dead; but in about half an hour it began to show some signs of returning animation, and presently woke up. Yesterday it waked after a nap of a week's duration. Altogether, Little Fawn, as we call it, for its prettily spotted sides, is quite an interesting creature, and much less trouble to keep than the owl. VIOLET S. WILLIAMS.

CORALVILLE, Ia., Dec. 18, 1883.

OTTAWA FIELD NATURALISTS' CLUB.—We print below the programme of the winter's work of this flourishing society:—1883. Dec. 20.—Notes on the *Flora americana*, with special reference to the introduced plants, by J. Fletcher; report of the Ornithological Section, 1884. Jan. 17.—The sand plants and changes of water level of the Upper Ottawa, by E. Odium, M. A.; report of the Geological Section; notes on and a list of the Cambro-Silurian Fossils of the vicinity of Ottawa, by H. M. Ann. Jan. 31.—Edible and Poisonous Fungi, by J. Macoun, M. A.; L. S. F. R. S. C.; report of the Botanical Section, Feb. 14.—Ottawa *Coleoptera*, with notes on New Species, and on those beetles not previously recorded from Canada, by W. H. Harrington; revision of the *Silicaria*, by J. B. Tyrrell, B. A., F. G. S.; report of the Geological Section, Feb. 28.—The occurrence of Phosphate Deposits, by G. M. Dawson, D. S., Assoc. R. S. M., F. G. S., F. R. S. C.; note on a new species of *Leptaena*, by W. R. Billings; report of the Entomological Section, March 13.—The Deer of the Ottawa Valley, by W. P. Lett; report of the General Zoology Section. The soires will be held in the Museum of the Ottawa Literary and Scientific Society, No. 25 Sparks street (opposite the Russell House), and the chair will be taken at 8 o'clock P. M. The annual meeting will be held on Tuesday, March 18, 1884 (in the same room), at 4 P. M.

NESTING OF THE HOODED Merganser.—Last summer, while in the Adirondacks with Mr. Calvin's survey, I was going down one of the Eagle chain of lakes in a boat with the guide "Jack" Sheppard, when he called attention to a dead tree on the south shore, and said that a pair of sheldrakes nested in it every year. We rowed in close, and while looking at the hole, which was about fifteen feet from the ground, the male bird came out, and was easily recognized as the hooded merganser, called there sheldrake, and in Western New York saw-bill. The hole was similar to that used by wood-ducks.—FRED MATHER.

Have you read? See page 438.

LONG MEADOW GUN CLUB.—Minneapolis, Minn., Dec. 19.—The club was organized under the State laws in October last, and has now a membership of thirty-three out of a total membership of fifty as authorized by our articles of incorporation. We control about 2,500 acres of bottom lands located on the Minnesota River, within fifteen miles of this city, and having several of the best duck passes on the river. At the last meeting of the club plans for a club house were selected, and the building committee were authorized to let the contract for the same, the building to be ready for occupancy by March 1, 1884. The plans adopted provide for a complete house for the purpose, containing parlor, dining room, kitchen and pantries, a large gun-room, hall and the male sleeping room, and it was easily raised on the grounds this fall, some good bags being made.

MALONE, Franklin Co., N. Y., Dec. 14.—FOAMS are plenty; can be started within half a mile of the post-office. Not been many killed yet, as we have not had much snow. Partridges are scarce, but there are plenty. Partridges are killing large numbers still-hunting.—FOX.

venison (as the man called the fawn) was dangling from the pommel of my saddle.

I reasoned like this: "I took a dog one day on account, an old gun and a live 'coon on another, and why should I not have the meat? Anything in account is better than nothing, and so it came about that at dinner we had "antelope" on the table.

The deer are shot indiscriminately in all wild portions of Michigan, and the large majority of settlers shoot them whenever opportunity offers. Few settlers would steal cattle from one another, but the laws for protection of game are entirely ignored by nearly all.

I have repeatedly found nests of the ruffed grouse and thus learned of their being robbed by farmers who took the eggs to eat. Such acts are despicable, but as the laws are never enforced they are to be expected.

HOWARD CITY, Dec. 18, 1893.

QUANTUM SUFFICIENT.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

One word more and I have finished. Several friends have called my attention to the fact that in my previous correspondence I have omitted to say anything concerning the probable weight of the proposed 40-90 repeater, and the number of cartridges it will carry.

Do not consider that the weight would be more than eleven pounds at the most, even supposing that it be necessary to have stronger and heavier breechwork.

Such a rifle with a thirty-two inch barrel ought to carry at least seven cartridges in the magazine, which is a sufficient number for ordinary hunting purposes.

In expressing the hope that I have not occupied too much of your valuable space in this discussion, allow me to express the further hope that the claims I have advanced in behalf of this rifle will meet the favorable recognition of some manufacturing and sporting arms, and, as a result, that shortly those who are of the same opinion as myself upon this subject, will be made happy by the possession of a repeating rifle which will effectually do the work intrusted to it.

PHILADELPHIA.

D. M. B.

Editor Forest and Stream:

Probably no one man ever spent more time in private experimentation with rifles than Gen. James, of the honorable Enfield Company's service. His later evolution in 1856 was a muzzle-loading 32-gauge, 24-inch double barrel, four-grooved rifle, with deep grooves and bands of equal width, and one-half twist in length of barrel. The projectile was three diameters long, with two bands to take the rifling and the forepart cast of zinc, the better to enable it to retain its shape under pressure of the great charge used. The charge was from 2 1/2 to 3 1/4 drams. Great range and accuracy were obtained with this weapon, and the penetration of the balls at 2,000 yards was four inches into very hard birch.

Light bullets and light charges cannot be expected to attain such results, and the movement in favor of a 40-90 repeater is certainly to be commended. Double barrels and single breech-loaders are behind the age for war or sport; but there is room for improvement in the repeating apparatus. A friend of mine tells me that, when traveling in a disturbed part of Mexico, he was dismayed to find, after a hard day's ride, that his Winchester would not work, the cartridges and spring having been jammed by the jolting, a violent hunting or fighting, a man wants a weapon he can implicitly rely on at a pinch, and if the present repeating apparatus cannot insure this, attention might again be turned to revolving rifles. These again have a disadvantage that seems impossible to remedy. They cannot be used as single breech-loaders, reserving the magazine, and the cylinders must be exhausted just when most needed.

Possibly when we get a perfect rifle was will have ceased and game disappear before the all-slaughtering hog and the poor hunter.

NEW YORK, Dec. 20, 1893.

W. L. D.

VENISON IN THE LUMBER CAMPS.

AS is generally known, the deer sections of Michigan are dotted with lumber camps at this season of the year. Connected with nearly every camp will be found one or more professional hunters under contract to supply the voracious lumbermen with fresh meat—in other words, venison. Some of these hunters are paid by the season or by the month, others are paid about \$1.50 per carcass for all the deer they kill. Although what is ironically known as the "open season" on deer ended Dec. 1, it is safe to assert that nine out of ten of the lumber camp hunters are killing and getting their pay right along for all the venison they can bring in. Some of these hunters score from one hundred to one hundred and fifty deer killed during the fall and winter, and no one knows how many more during the rest of the year. Why, I have it on good authority that one, Potter, who hunts in the vicinity of Alpena, killed over one hundred deer in the red coat last summer. This Potter, by the way, always hunted on the Ausable River until last season, when, finding deer were becoming scarce in that section he emigrated to Alpena, and if he keeps on as he has begun, he is certainly in a fair way for emigrating again.

While, of course, many thousands of deer are slain by parties who hunt more for pleasure than for profit, the total is insignificant compared with the number taken into camp by the regular hunters on killing the red coat by such fellows as the man Potter. Only one who has traveled through the lumbering regions of our State, stopping here and there at the larger camps, can appreciate the amount of venison devoured daily. Imagine a camp consisting of say 100 men eating it three times every day, or nearly every day, for months in succession! And there are hundreds of such camps!

Now, the owners of these lumbering establishments are, as a rule, wealthy men and law-abiding citizens; and if at the coming meeting of the Michigan Sportsmen's Association means were devised to induce these owners of camps to refuse pay to hunters who killed or brought in deer out of season, many thousands of the devoted animals would be preserved during the next two months. The right influence, if brought to bear upon our lumbermen, would surely effect great results in the line of game preservation.

Another matter I also hope will meet with the attention it deserves at the hands of our State Association, it is the growing and reprehensible practice of "shooting" deer. From all accounts it would seem that many hundreds of beautiful birds have been used this season, especially by market hunters,

and with startling consequences. I have heard of one party of three market hunters who confined their efforts to this black work, killing sometimes as high as ten deer in one night.

Quail shooting in the vicinity of Detroit has been only "so-so" for a week or two. There are birds, but they are hard to find. One day I will perhaps flush a leucy in the open; the next day they will be in the woods. As good a bag as I have heard of lately was made by Mr. George Avery and Mr. Slocum, the latter of the Star Island hotel, at Port Lampton, Ontario—75 quail, 5 ruffed grouse, 2 black squirrels. They were gone two days.

Grand ruffed grouse shooting is reported in Lapeer county, near Deckerville. There have been over thirty wild turkeys shot in the Grosse Pointe woods within ten miles of this city during the present season. One gentleman, who has been after them several times, counted thirty-seven in one flock he put up. He also said that foxes were very numerous; in fact, they spoiled the turkey shooting, for no sooner would a turkey light on the ground than a fox would be after him. I saw "Cherry Brandy" to-night. He told me he was bound for Toronto on a flying trip. Said he: "There's a pigeon shoot there to-morrow; several hundred dollars in prizes; head, and I'll have a shyt at that thing." DELTA.

DETRIT, MICH., Dec. 21.

GRIZZLY BEARS AND LARGE RIFLES.

IN the choice of a hunting rifle the width of the caliber should be governed by the kind of game one expects to kill with it. For small animals, such as foxes or turkeys, the light caliber of .32 will more than suffice. If the hunter desires nothing larger than deer or elk, a .40 or .45 will answer, although I prefer a larger caliber. But in hunting dangerous game like our grizzly a much heavier caliber is needed. It is not safe to come to an absolute conclusion as to the power of a rifle, from witnessing its effects in only one or two instances of large animals, owing to their vitality, and while one bull elk will go down from one or two well placed shots, another will carry off half a dozen. Again, an antelope, as is well known, will often stand more lead than an elk, and go off when apparently riddled. With such game the object is to so disable them that they cannot go very far from where first shot, for if only wounded there is no danger in tracking them up.

With grizzly, however, the hunter can take no chances. When he approaches his formidable game in the gloom of heavy timber, he must be armed with a weapon of power sufficient, if necessary, to stop the bear in his charge, or he may never hunt grizzly but that once. Imagine him facing the monster as it peers out at him from among the young pines some thirty yards away, swaying from side to side with that uneasy motion the bear hunter so well knows. All around is deathly silence. He raises his rifle and looks along the sights, trying to pick out a fatal spot in which to place a ball. Now is the time in which he needs a gun that will crash straight along the line of aim through hide and flesh, bone and sinew, on animals very tough in their vitality, and while at which it may strike a bone and notwithstanding enough to strike its way through any such obstacle. His very life may depend upon the nature of the wound given to the bear. No express rifle will answer now, with its hollow ball flying in splinters on the first massive bone encountered. No .40-90 will do with its elongated pointed bullet striking a bone, glancing and flying off at a very different angle from that intended, or if it does hold its course, giving a wound of small size with little resultant shock. The number of resident hunters, users of Sharps, .40s, or Winchester .45s, who are annually killed by grizzly, answers this point. For such fortunately game no gun can well be called too heavy, if within the hunter's power to handle it.

For this work I prefer a double-barrel, breech-loading rifle, No. 12 bore, of nine and a half pounds weight, using the old-fashioned round ball, slightly hardened, and 120 grains of F. G. The heavy round ball possesses excellent smashing powers, and by most authorities on large game hunting is considered as vastly more killing on the animal skinned than the same weight of lead in an elongated bullet of necessarily smaller caliber. With the conical, elongated projectile the flesh is not so much cut out as it is displaced; the wound has a tendency to close and does not bleed so freely as from the larger ball. Caliber 12 is about equal to .75, and as the areas of circles are to each other as the square of their diameters, the size of a wound inflicted by a 12-bore is three and a half times as large as that made by a .40 caliber, and the damage caused by it is proportionately greater. The recoil of a properly fitted 12-bore with a hardened bullet is greater than that of the 12-bore; but notwithstanding sufficient to go clean through and through a bear is all that is required, and this is easily obtained with the 12-bore. With 120 grains of powder I have frequently smashed through both shoulders, the ball lodging under the skin opposite and occasionally going clean through. Again I have driven a ball lengthways through the grizzly, entering in at the left rump and lodging under the skin of the chin. This is penetration enough.

I have used 153 grains of F. G. in my 12-bore, but there is some recoil from this large charge, and I found that 130 grains did the work well enough and was not at all unpleasant to shoot. From constant practice a man can stand up under very heavy charges of powder without discomfort; besides, in the excitement of firing at game, the recoil is not noticed as much as in firing at a target. Furthermore, in these large calibers, with a light polygroove rifling, a moderate twist and a properly fitted round ball, hardened about one-twentieth, the recoil need not be heavy. English express rifles frequently are in this respect, having heavy, deep rifling and a severe twist, and their owners invariably informed me that they kicked tremendously. A very rapid twist in such rifles is a great mistake and causes heavy friction, loss of power, and unnecessary recoil. The bullets also are often badly fitted, being too large and insufficiently hardened, and upset too much in going through the barrel, thereby impairing the accuracy and materially adding to the kick, of which their shooters complain. Sometimes these defects can be easily remedied. The trajectory of the 12-bore is very that up to one hundred yards. If the express is used with a solid bullet instead of a hollow one, then the charge of powder must be reduced, and the gun is an express no longer, and its performance must be compared with that of any rifle of the same caliber.

The English express is almost always incorrectly sighted, the tendency being to give an apparent long point blank by raised breech sights, and many a man throws his express away in disgust finding that it shoots over at one hundred yards, and not coming up to remedy the difficulty.

The express is no more suited for dangerous game than the

.40-90, although from different reasons. The hollow bullet flies to pieces on striking a bone, without smashing it. This I have seen on mountain sheep, elk and grizzly. The hollow ball will do this on grizzly even when fired through the stomach, and will arrive on the other side vastly diminished in size, and small particles of lead will be found at quite a distance from the wound lodged in the fatty tissues.

Theoretically, a wound from a Winchester express, .50-95 ought to shock a grizzly tremendously; practically, he does not seem to mind it much at first, only roaring the louder and getting very much excited. I have known a grizzly to run 200 yards and live five minutes with three such express bullets lodged in his forequarters, before and behind the shoulders, one actually passing through his heart, and a fourth lodged in his stomach. The heavy round ball of the 12-bore, if placed in the shoulders, generally knocks him down and apparently stuns him for an instant, in a second he is up again, but that one second gives time to reload the empty barrel and the dose can be repeated until he goes down and stays down.

I do not mean to assert that grizzly cannot be killed by a .40-90, .45-75 or .50-95 express, for that would be incorrect; but that if a man wishes to make a success of hunting them, he should use the wide-bored rifles in preference.

No animal on this continent can compare with the grizzly in extraordinary vitality, and I have witnessed exhibitions of this tenacious quality under circumstances that seem absolutely incredible. Hunting him is the most intense exciting of all wild sports. What hunter who has heard the tremendous roar of a charging grizzly as he comes crashing at him through the "popples" will ever forget it? And he who hunts grizzly often and successfully will gaze with more respect upon the dead body of his last bear than he did upon his first. *Ursus horribilis*—"the horrible bear"—well is he named, and bravely has he earned his title through blood-curdling exhibitions of tremendous strength, enduring grit and terrific ferocity.

EDWARD H. LITCHFIELD.

BROOKLYN, Dec. 18, 1893.

THE ATTRACTIONS OF BEAUFORT.

SETTING sail from New Haven Harbor in the good ship Miriam, of two tons burthen, twenty-five feet length and ten feet breadth of beam, for a cruise on the Atlantic coast through the Sound, our crew consisting of a skillful sea captain, Capt. George W. Ward, an old salt and a fearless and intrepid navigator. In fact, the latter had already been upon the briny deep in all sorts of weather, fair and foul, and finally put into this famous harbor for rest and recreation. Really, nature seems to have lavished all her charms upon this delightful spot. For the first time since we started for our destination, which was to have been St. Augustine and Indian River, his our party felt like tarrying and making Beaufort instead our head quarters. The climate here is delicious, and the old town of Beaufort, which is beautifully situated, has afforded our whole crew much rest and pleasure. We are assured that the climate is better known and more extensively advertised, many of the northern tourists who now seek Florida would come and spend their time here. The scenery is more attractive, the inducements and advantages are far superior, both for the invalid in quest of an equable and balmy temperature, and the sportsman seeking sport and diversion with gun and rod.

We stopped in on our route along the Santee further north of us in this State and had some good gunning, but the birds are more abundant here, and the river and bay in front of the town all full of fish. The bay is fine for yachting sports, and the bold entrance to Port Royal through its mountains, a noble harbor is one of the finest sheets of land locked waters we have ever seen. The depth of water on these bars is such that vessels drawing twenty-one to twenty-three feet may enter at any time of tide. We have not been impressed either with the appearance or the promises, present or prospective, of the far-famed, or rather much talked of, town of Port Royal, which it seems to us, is a city of the dead rather than of the living. In fact, for purposes of the commerce of this section, Beaufort is doubtless a much better accommodation for many years, and perhaps, centuries to come.

Beaufort is a sweet, cosy little place. Five hotels and most excellent private boarding-houses invite the guest who may desire the choice of either. The Sea Island Hotel is well managed by the proprietor, John Clancy, Esq. Boats, yachts and facilities for enjoying aquatic sports are at the very doors of the hotel, and guides for hunting and sailing are numerous, probably the best in the section. A large, colored people who are in the majority in this section, but whose conduct and behavior toward all classes is unexceptionable so far as our observation goes, and so far as we are informed by persons resident as well as transient here.

In former years, when Beaufort was only a Southern planter's retreat, this old town was a sleepy, drowsy town of but a few hundred inhabitants, who spent their summers here, coming from their plantations, to which they repaired in winter. Now it is a thrifty commercial place. It was the center of the Sea Island or long staple cotton culture of this part of the State, and much wealth was aggregated here in lands and slaves. The war came and wiped out all the possessions in lands as well as slaves of the former inhabitants, who were bereft of their plantation property under the operation of the United States district tax sales, and many of the elegant old homesteads passed into other and strange hands for a mere song, being bought by Northern purchasers and speculators. At present those properties are held by those purchasers under those titles, which are pronounced good by the Supreme Court. In our opinion this is a place where capital could find profitable investment at present prices, for the natural advantages of the section—its rich, fine lands—must command higher prices as times improve and as the section is redeveloped. The great phosphate interests of the State are just commencing to be asserted here, and already have some stupendous mills been erected and outlays of foreign and Northern capital has been expended for the development of the great fertilizers that have Beaufort River rock for their basis.

The coast is fringed with a congeries of what are called the Hunting Islands, which are mere sheets of barren sand islands covered with palmetto and other trees, and which were owned and used in former years as hunting grounds for the wealthy planters, whose plantations were adjacent on St. Helena and adjoining islands. The islands then were stocked and abounded with deer, and there are still numbers of deer and wild turkey and game remaining upon them. Quail hunting is fine in this vicinity, and guides may be hired for \$1 a day to give a sportsman all the shooting that may be desired. The rates of board at the hotel, which is delight-

fully situated and well kept, are \$2 per day for transient boarders, and \$4 and \$12 per week for permanent. The boarding-houses also offer comfortable and pleasant quarters for more retired tastes at from \$4 to \$5 per week.

BEAUFORT, South Carolina, Nov. 29

RANGER.

NOTES ON GAME BIRDS.

WINTER has fairly set in now, and in some places our farmers are already feeding the quail. Not a great many are left to feed, however, and if it were not for the foresight of some of our more successful shooters, few would remain on the necks of land which used to be the best shooting ground in this town. Some of these men post their land and stock the premises with birds; others warn off any person whom they find with dog and gun. One man who follows the birds without any let up from the first day in the open season till it no longer pays to shoot, told me he had killed one hundred and fifty partridges (ruffed grouse). He shoots for the market only, and the farmers, neighbors and sportsmen generally look on him with some concern as a man likely to make the shooting very poor in another year. He says that in September he can find a covey of partridges which, when his dog points and he puts them up, do not fly far, keep together, and he can get every one. There is no help for this, but to begin on time and each man get his share. The writer can remember when there were not two pairs of pointing dogs nor arch-leading gun in town. Now, on the fifteenth day of October, twenty men and dogs come in on the morning train, and there are perhaps twenty coveys of quail within two hours' walk of the station. It requires but a moments thought, and one may well predict where they will be in a week.

We knew where there were three coveys within ten minutes' walk from the house. There were about fifty birds all told; personally we got thirteen of them. To-day one covey has been used up, and the writer started five out of another, and he has not seen nor heard of the third for several weeks. The last one we shot lies on the fire-frame before us, a female; we skinned and stuffed it as well as our skill admits, and it serves as a model for a picture of dead game. A snipe, killed on the marsh in front of our house, and a pair of quail, occupy the canvas, which is nearly finished. The skin of a ruffed grouse lies beside the quail. We got this just before a snow. The ruffed grouse, with young oaks and pines. We quickly came to hand, and then on went the dog, now pointing and then moving on. It said there were no birds, but I knew better, and said it was a partridge and that it was running. We kept going round and round among the bushes, and I told H. to look for the bird on the ground. Finally I saw something on a stump, and it was that partridge. I waited just long enough to catch sight, and pulled on him. Ought to let him fly, had I? Couldn't have seen him a yard in that cover. Old Roy is a most careful dog on grouse, and will hardly ever flush unless the birds are so wild that they rise out of shot.

There is much in "Nessmuk's" theory that is true. The hunting is the sport. Who is there but enjoys the tramp through the woods and pastures? Who would care to shoot if there was no hunt to it? Who goes fishing in canoe, or sailing craft, and pulled on him. Ought to let him fly, had I? Couldn't have seen him a yard in that cover. Old Roy is a most careful dog on grouse, and will hardly ever flush unless the birds are so wild that they rise out of shot.

There is much in "Nessmuk's" theory that is true. The hunting is the sport. Who is there but enjoys the tramp through the woods and pastures? Who would care to shoot if there was no hunt to it? Who goes fishing in canoe, or sailing craft, and pulled on him. Ought to let him fly, had I? Couldn't have seen him a yard in that cover. Old Roy is a most careful dog on grouse, and will hardly ever flush unless the birds are so wild that they rise out of shot.

Among our birds the ruffed grouse takes the lead and the Bob White follows. The grouse are found all over the Cape from to Provincetown, and they were once killed out in that place there would be no grouse unless they were brought; as none would ever cross East Harbor beach, nor come around by the hills from Green Head in Truro. I do not know that any are found in Nantucket or at Martha's Vineyard, though a very few pinnated grouse are found in the latter, some mention of which has been made in the columns of FOREST AND STREAM. One pinnated grouse was shot by Mr. T. A. Church, in Wareham, some years ago, and at best a grouse that was out of our regular variety. The partridge will long continue to be one of our commonest game birds, because in our town many swamps are so thick, and in Middleboro most of the woods that one cannot get in and shoot at the birds his dog points. Little Bob White is fast learning that the woods are his only salvation. He is now quite a woods bird. I have found him several miles from any cleared land and why not? He is a native, and when our fathers came he was here to whistle a welcome to them, and when were the fields then? I wonder if the Indians ever killed the little fellow; I guess they trapped him as some persons do at this day.

Our little bird likes to feed in the top of fallen locusts; these trees bear a little pod with a few hard fat beans in it, and Bob will open these and eat the seeds. I have watched them hours at a time. Often have I seen one jump up and catch on to a pod with his bill, and hang on till he jerked the pod down. There is as much sport in watching a flock as in bringing them to bag, that is to the hunter; make an exception in favor of the gunner—he goes shooting, a hunter may not have a gun with him.

The voice of a quail is one of the sweetest and most melodious of all our birds; not the clear "ab-Bob-White" of spring, or the simpler "Bob White" and "quite-e-quitte-e" of summer and fall, but the many variations of their every day talk and gossip, perhaps, when feeding. I did wish I could understand what they were saying when they were so content twenty in a locust top at one time, they said, "Clear-ki, ah-cho-kie, ih-cho-okie, click-ee, click-ee," and many other words too fine and sweet for phonetic spelling. I have heard

a male crow in spring; he sat on the top rail of a fence, and croaked his neck, and made a peculiar sound—imitatable. Whether they have gular sacs like a pinnated grouse, I am not certain, but I never found any or heard of them.

I have seen a quail run up a tree trunk that was inclined at an angle of sixty degrees. The sunny ends of a stone wall is a favorite place with them in the winter. Fallen timber, old brush heaps and thick, tall grass are eagerly sought by them for shelter when feeding, and whoever tries feeding them will do well to have some such cover near by, so they can retire quickly at any approach of danger. They have so many enemies that one cannot do much for them except to supply cover and shoot all the stray cats, animals, skuunks, weasels and foxes that come in range. Hawks probably get some, and I never let a hawk get away if I can help it. Their nests are not so easy to find as one might suppose, and they lay a good many eggs, all of which seem to be fertile, as I never saw a rotten one or one that did not hatch. Two litters or hatchings are the rule with us; this I know from seeing a mixed flock of two sizes with only one pair of adult birds.

Quail will sometimes lie so close as to puzzle the shooter. I got one this summer into a bush, but with old limbs and leaves at the foot of a tree. The dog pointed and I looked through sticks, and at last kicked the quail, and still he did not fly. I thought he was a dead or crippled bird, and reached down and pulled over the sticks and up he got, and off he went before I could catch a sight at him.

Once, after a light snow, my brother and I tracked three into a heap of brush that could all be got into a bushel basket. We knew they were under it, and we looked all over it in vain, then stood on it and stamped, none got up. "Dead," says Phil. I began to dig after them, but they were not dead, and two didn't die that day.

I once picked up a quail that Roy pointed. Sometimes they learn wisdom very soon after being shot at. I know one covey that will rise out of gunshot and fly clear over a wide piece of woods, and get out into the field on the other side before one can hunt through to them.

I never got a "shot" and a "seven" in a man, as I ever knew any one to kill at one shot; that was in Maryland, the shooter was a farmer who was out after rabbits, he tracked the quail in the snow, and came up with them in a path through a field; they hid under a little pine bush, and two got away with broken wings, for he could not find them in the briars. Seventeen he took home, "And there was a right smart of feathers then," he said. He never hunted again and would not shoot at less than six or seven. We knew they were under it, and we looked all over it in vain, then stood on it and stamped, none got up. "Dead," says Phil. I began to dig after them, but they were not dead, and two didn't die that day.

ON THE VIRGINIA BROADWATER.

I HAVE just returned from a two weeks' shooting on the Broadwater, by which term I mean that section of sea meadows near the foot of a headland on the Chesapeake Bay. Time was in the memory of a man, when these islands, mud flats, and sandbank over which the ocean broke in high tide, was the finest sporting ground on the American continent. I have heard old sportsmen tell of the quantity of wildfowl that wintered here, so vast in quantity as almost to stagger belief. Among the many varieties were the two gamest birds that fly, the brant and black duck. This Broadwater was the stopping place of the duck, waiting wildfowl, and estuaries of the Chesapeake Bay were alive with them, and royal sport could be had. I have often heard old man Cobb speak of the huge flocks of brant that wintered around his island, and Nathan, his son, who was the sportsman of the family, made some heavy bags, as high as one hundred and eighty brant in one day's gunning over the decoys.

Just after the war the duck shooting was fine, but it has steadily declined ever since. I have spent several weeks in every winter since '86 on the Broadwater, and I ought to know something about ducks by this time, and what I learned was beat in my head and impressed on my mind by the hardest kind of experience; I have risked my life over and over again in the stormiest weather, have been capsized twice, cast away on a barren sandbank, losing my decoys; have undergone enough hardships in fighting the storm, and been in the blinds in such weather that nothing but a sea gull and any business that was in it, so I write this not to boast, but simply to show that I know what I am writing about. And now I want to give a solemn warning to my brother sportsmen, and some advice ancient duck shooting, which will be of great value to any misguided man who contemplates coming this way with a gun on his shoulder.

It is this: Don't come down to the Virginia Broadwater duck hunting. Don't go to Cobb's Island, Cape Charles, Scotland's or the Capes with the expectation of having any brant or wild geese shooting; if you do, you will go back home a wiser and a madder man.

Brant shooting is the most fascinating sport I ever experienced; their size, their rapid flight, the beautiful way they approach the decoys, all combined thrill the sportsman with a keen delight, and make him sit for hours in a blind with the numbing northwest wind blowing a gale, and chilling him to the marrow of his bone, content indeed if he can catch every now and then one of these black-headed, white-breasted brant in its careering flight, and see the heavy body strike the water with such force as to send the spray high in the air. It requires much infinite patience, and a capacity to wait equal to that of a Pawnee Indian; there are not, on an average, more than two days out of the week when you can shoot brant—three requisites are absolutely indispensable, a high wind, a flood tide, and a bright sun—if unless all three perfectly conjoin it is no use to set your decoys. It is weary waiting for the birds to drop the weary length out, especially if you are in the confined hold of a vessel, or some island hut.

For the last two years there has been absolutely no brant shooting. There are plenty of birds, but they are as wise as serpents, and have obtained a degree of sagacity that that bird of the devil—the crow—would be proud to possess. The brant keep together in one large flock, and neither tempest nor gale could divide them; they avoid a blind, with all without decoys, as a jail bird does, and they are so smart, it is simply impossible to stool them. Captain George Hitchings of the

Coast Guard of Division No. 5 told me yesterday that though that king of gunners, Nathan Cobb, with all of his thirty years' experience, and with the aids of perfect decoys, only killed eight brant last winter, Tom Spady, of Cobb's Island, an ardent and enthusiastic sportsman, has given up the sport in disgust.

Two weeks I have tried the most famous blinds in the broadwater, and have not had a single shot at the brant that would not come within a half mile of the blind. I am done; never again in my life will I try brant hunting in this region; it is, to use a slang expression—simply "played out." The black ducks are very scarce, but to any one with more ammunition than he knows what to do with, and who is fond of popping at feathered things, there are hundreds and thousands of coots, loons, dappers, water witches, bull-heads, etc., that he can fill his bag—but hardly his stomach with.

The Hygeia Hotel is thronged with sportsmen on their way to Florida and the South. This seems to be the favorite stopping place of the fraternity, and to see some of the outfit that some of them carry, one would think they were on a trip with Stanley in the heart of Africa instead of simply going to see a couple of months in the land of flowers.

OLD POINT COMFORT, VA., Dec. 30. CHASSETER.

THE QUAIL FOR STATES ISLAND.—Mr. G. Walter, chairman of the game law committee of the Brooklyn Gun Club, having consulted Mr. Francis Endicott in reference to a published report that 600 quail were to be taken from Long Island to stock Staten Island, Mr. Endicott has written the following letter which explains itself: Editor Forest and Stream: A statement has been published in some of the New York papers that the Richmond County Game and Fish Protective Association were about to procure live quail from Long Island for the purpose of stocking Staten Island. Will you permit me to say that there is no truth in this story. We have turned out over 600 quail on Staten Island in the last three years, the progeny of which are living to-day, but the birds we have obtained are from States where they are so plentiful that the few taken would be but as a drop in the bucket. We have never thought of obtaining them from any of the counties of New York, deciding that it would be simply robbing Peter to pay Paul.—FRANCIS ENDICOTT (President Richmond County Game and Fish Protective Association).

Camp Fire Flickerings.

"That reminds me."

WHICH ARE THE BEST?

OUR last issue contained, in a special supplement, the entire series of Camp-Fire Flickerings from the beginning of the column in July, 1882. The ninety-six stories were given in the order in which they were printed, and each one is numbered. Of these ninety-six stories every reader is asked to select the ten which he thinks the best; to write down the numbers of these ten, one below the other, in their order of merit, putting the best first, the next best second, etc., and then to send the list to the FOREST AND STREAM. Each list should be signed with the name and post-office address of the voter. It is requested that the lists be sent on postal cards; if in envelopes they should be written on slips of paper the size of a postal card.

To send in this list of ten stories is all that the reader is asked to do.

There is no entrance fee. All who wish to do so are cordially invited to put in a vote. The balloting is not limited to subscribers, nor to those who buy the paper—the privilege is extended to the neighbors who borrow; the friend to whom it is sent after the subscriber has read it; yes, even to the postmasters who keeps it over Sunday and puts it into the subscriber's box Monday morning (and who is hereby warned to desist from this trick, for we have his name, and by and by the time will be ripe for civil service reform in that village); in short, this is an opportunity for those to vote who never voted before, and may never have a chance to vote again; without regard to age, sex or previous condition of non-sportsmanship.

Two sets of seven prizes each will be awarded, one to the writers of the winning stories, the other to the voters who send in the best lists. The method of determining the winners in each class was explained in our last issue.

The prizes for the writers and the prizes for the voters will be the same. They will be for each class as follows:

- FIRST PRIZE. A copy of the book "Sport with Gun and Rod," in enhanced leather binding, or any other book or books of same value (\$15), at option of winners.
SECOND PRIZE. "Sport with Gun and Rod," cloth binding, or any other book of same value (\$10), at option of winners.
THIRD PRIZE. Norton's "American Angler's Book" (price \$5.50), or Stonehenge's "Dog of the British Islands" (\$5.50), or Coues's "Key to North American Birds" (\$5), or any other book or books of same value, at option of winners.
FOURTH PRIZE. The FOREST AND STREAM FOR ONE YEAR.
FIFTH PRIZE. The FOREST AND STREAM FOR SIX MONTHS.
SIXTH PRIZE. "Training vs. Breaking," by S. T. Hamilton (which, by the way, contains some capital stories).
SEVENTH PRIZE. "Angling Talks," by Geo. Davis.
In case of a tie the prize will be divided. No person will be awarded more than one prize. If two prizes are voted to the same individual he will be given the highest of them, and the other will pass to the next man on the list.

Ballots should be sent in as soon as is practicable. To give distant readers an opportunity to vote, lists will be received up to February 2, and as the editor of the American Kennel Register so often says, "none can be received later."

The polls are open

Sea and River Fishing.

FLORIDA FISHING.

ON several occasions I have referred to the fishing on the lower St. John's River, near Mayport, and as evidence that I did not exaggerate I will favor your readers with a few recent scores at this point. Last week, James Arno, a professional fisherman, with an ordinary Japan cane pole and line, caught on one day 100 strings of channel bass and sea fish, and the next day 109 strings. This market consists of one or two more fish weighing about five pounds.

I noticed in this morning's paper that my friend, Col. Hart, had made a successful catch with an eight-ounce split bamboo trout rod. To insure the correctness of the statement, I sent him a note and received the following reply: "Dear Doctor: On Monday last, the 10th inst., near the mouth of the St. John's River, I took, with an eight-ounce split bamboo trout rod and Kentucky reel, 321 trout and were from 4 to 9 pounds. I had 44 bass—10 the latter channel bass—there were 377 trout and 24 bass—10 the latter channel bass—1 of 9 pounds, 2 of 7 pounds, 2 of 5 1/2 pounds, and the balance averaged 2 1/2 pounds. The trout were exceptionally fine; the two largest weighing 34 pounds each. Sea trout fishing in the lower St. John's cannot be equalled in the world. If the above score can be beaten anywhere north of Florida I should like to see it. Yours, fraternally, J. E. Hart."

The sea trout of the lower St. John's are closely allied to the weakfish of the North, and weigh from one to four pounds. The Colonel made his catch with shrimp. These fish will take minnow, and my impression is that they will furnish a fine field for the fly-fisherman. At Freeport, Jacksonville, Fla., Dec. 15, 1888.

TROUTING IN NEW BRUNSWICK.

IT was the good fortune of the writer to spend the summer of '88 at Oak Point, situated on that most picturesque of New Brunswick rivers, the Passaic. The fishing was excellent. Fine sport I had with my rod among the many beautiful trout lakes and brooks of that vicinity. I make no pretense of being a scientific angler, in any sense of the word. When the fly did not take, I do not scorn to use a lively hopper. If the trout were told, I believe that a good many men, that I have met on my fishing trips, with all their talk of blue and red and red and white worms after all. If not, why was it that sunbry urchins dug worms so assiduously for something or somebody, and always a day or two before these men went fishing?

Back from Oak Point, some four miles by road, and through the woods two good miles more, situated on the summit of a lofty hill, lies Fish Lake, one of the most beautiful trout ponds I have ever seen. This pond, covering some thirty acres, is so thoroughly concealed by a thick forest growth, that one is not aware of its locality until he is within a few feet of its shore. Neither inlet nor outlet is perceptible, and how the trout got there was a mystery to me. The water is very deep, cool and clear, and far down beneath its surface one sees on the bottom giant blackheads, that some rude September blast has swept into the lake to water-soak and sink. The first time I visited this pond the water seemed at every cast to boil with fish, and using three flies, I often landed as many fish. The kind of fly seemed to make no difference, for I tried several changes with similar success.

The trout are not large for lake fish; but run from 4 to 14 pounds, and are remarkably gamy and of fine flavor.

One trip to this favorite spot I shall never forget. With a farmer's son as companion, I started early one morning for a good day's sport. Arrived at the lake we embarked on our raft (none of the lakes about Oak Point have boats on them). On the tramp through the woods he had provided himself with a stout birch pole, to this he tied a stout cord, and to the cord two large hooks and a three-ounce sinker, worms was his bait. By this time horror had seized me. "See me yank them out," said he; but I didn't see them. Hop would go the pole, splinter, and I would go to the water. My explanation had served to nerve his arm to more energetic thrashing of the brook. At noon, I having caught two small trout and my companion none, we made our way out to the road, where my friend left me to return to his haying. His "folks" had done me many kind offices, or I am afraid he would have come out of those woods alive. Though tired and still more disgusted, I made up my mind to fish a stream called Flagler's Brook, that runs close to the road at this point, and empties the waters of Long Lake into the Passaic a short distance below Oak Point. I had fished over the same ground with a fair amount of success two weeks before; but the club, those vexations that try the angler's soul, were so abundant that I made up my mind not to do so again. How many resolutions of this kind do anglers make and break? I soon had my rod in trim, and plunged into the brook waist deep to have the agony of the cold water over as quickly as possible.

Fifty yards or more down stream, where the alder bushes afforded good concealment, and where a gentle riddle glided into smooth water beyond, I saw a large trout jump.

How carefully I waded the space between me and my prize! How glad I was when the spot I had hastily selected as my stand for casting was reached! My flies scarcely touched the water, when, presto! two beauties are securely hooked. Up stream and down they go, but it is no use, and they are soon flopping in my creel. So I keep on in the same spot for an hour and a quarter, at the expiration of which time 38 trout have fallen prey to my skill, or my luck, or whatever you may call it. Two days later I turn up at daybreak to the same place, and before noon return well laden with forty-two more.

All these fish weighed from half to three-quarters of a pound, and three of them lacked but half an ounce of weighing a full pound, and were remarkably fat and clean flavored. I thought then and still think that it was a school making its way to the lake that I fell in with.

Morgan Lake, Deer Lake, Island Lake and many others quite near to the Point, afford good sport. Most of Lakes and brooks are situated from two to five miles in length and two or three hundred yards in width, is alive with small trout that the old settlers in that region say never grow any larger. Whether this is true or not I cannot say, but this I know, that among the fourteen dozen my cousin and I caught in one day's fishing, there was scarcely the variation of an ounce. These trout are very red of belly and fin, and will average four to the pound. I might mention some other lakes and brooks, tell of the beauty of the woods and hills, and of the hospitality of the inhabitants of this delightful region, but space forbids.

It is a source of wonder to me, however, that more Ameri-

cans do not prefer New Brunswick or Nova Scotia to the Adirondacks, since the cost of living is much less and the fishing as a rule much better.

The expense, too, of the pleasant trip up the Maine coast, is not greater than that of the trip to the Adirondacks. At any rate (D. V.) I mean to try it again next summer. P. B. V.

THE ENGLISH AND AMERICAN TROUT.

I SUPPOSE, from seeing the article under the heading of "English and American Trout," in FOREST AND STREAM issue of Dec. 6 last, that we are at the eve of a somewhat hotly contested warfare upon the relative merits of the trout in England and America. I think that the opinions of those who have not had ample opportunity for comparison, would show but little in favor of either cause, and therefore we need the experience of those who have killed and eaten both kinds. I may here mention, as a matter of course, writing myself, that after a residence of three years in the midst of Scottish lochs and English streams, I have spent three successive years at the Rangeley Lakes, fishing in the Rangeley, the Kennebecago and the Seven Ponds lakes, and think I have some excuse for intruding my opinion upon your readers.

Well, what is my opinion? you will ask. Perhaps my answer may be disappointing to many, who expect a decision against one or the other fish, but I must truly say, that I think each country can boast of a trout no way inferior to that of the other. I have found the English trout a king among the game fish, a splendid fighter, a wily foe, requiring a master hand to throw the fly, and a master hand to bring him to land when once hooked, and if you had told me, when I was whipping English streams, that there existed in American waters a fish in any way superior, I would not have contradicted you, as I had then killed no American trout, but I would have taken the liberty of inwardly doubting your statement. On the other hand, no one could have made me believe, when I was casting the red fish, the brown huckle, the Montreal or so many other inhabitants of my fly-book upon the rippling surface of one of the Seven Ponds, paddled about by a splendid sample of those champion swimmers, a Maine guide, that I ever had killed gamier, stronger, more voracious or better tasting fish in the waters of old England. Now, there are differences arising from the peculiarities and idiosyncrasies of both countries.

English trout as a rule are pretty scarce even in the best streams, when compared with the basket of a dozen good-sized trout anywhere in Scotland and England is a very fair one; the fish are constantly, during the open season, fished for; they are very easily frightened; they often think about it several times before taking the alluring fly, or the tempting worm, and make the most strenuous efforts to escape when once hooked. Therefore, if the average British sportsman was to come to some such waters as those of our Maine and New Hampshire, and even Massachusetts streams, crowded with the spotted tigers, and such as I have often seen at half a dozen fish leaping at the same fly; if this sportsman found that he could fill his basket in less than half the time here that he took to do the same abroad, he might think our fish was more stupid a great deal, easier to hook and kill, and decidedly a less worthy match for his skill than the English trout. In the same way one of our "bug-chuckers" might go abroad, and after exercising his skill all day, if he landed a dozen small trout, and was complimented by his friends there upon his success, he might think that English trout fishing frequently must be a great deal of hard work, and if such work has been successful, a result of a few small fish, fine fighters for their size, but of much too small a stature to fight well. There are of course many exceptions to all this, many poor baskets made in America, many a glorious haul in old England.

As to the taste of English and American trout, I think they are equally perfect. I think that our trout are a little richer in taste, but not quite so finely flavored as the English. I must say that I have enjoyed American trout better than that of any other country, but for a good reason, they have always been associated in this country with the glowing camp-fire, the bed of fir boughs, the many tales narrated at night, the magnificent scenery, and the wilderness of our Northern lakes and streams.

In conclusion, I would say, let us, by rigid adherence to our fish laws, protect our American trout. They cannot be improved in our waters. Let us frown upon those who send in their reports of hundreds of fish killed in a day for count, and let the excellent trout of our American fisheries go on aided by the good will of every one of our trout fishermen.

On the other hand, the English ought to pay more attention to fishculture, forbid the killing of small-sized fish, make the season shorter, and on their side they would have no need of importing other breeds, but would soon have a fair supply of fish without superiors, but with fish equals here in America. G. V. S. New York.

Send in your vote on the "Flickerings." See page 438.

Fishculture.

MR. WHITCHER RETIRES.—Mr. W. F. Whitcher, Commissioner of Fisheries of Canada, has been obliged by ill-health, to retire from office, and the onerous duties which will cause him to seek a milder climate than Canada this winter, where he can still follow these sports with rod and gun which he is devoted to, and in pursuit of which he contracted his malady by his exertions to those things which seem trifling at the time, but are laid up in the system to worry humanity in after years, such as exposure to wet and sleeping on damp ground. We regret the retirement of Mr. Whitcher at this time, for he was valiantly fighting abuses in his department, and had his pen might to the very utter, the encouragement of fishculture; his pen has often enlightened our pages, and in his winter sojournings we hope to hear from him again.

SCOTCH FISHERIES.—The objects of the Scotch Fisheries Improvement are: 1. Amendment of the laws relating to salmon, trout, etc., in the fresh waters; 2. promoting the formation of distinct basins in the fishing districts where they do not already exist; 3. the extension of the functions of the Scotch salmon Commissioners; 4. the encouragement of fishculture; 5. prevention or curing of pollutions of rivers, streams and lakes. The reports of Mr. Young, commissioner of fisheries for England and Wales, are quoted from the *Survey* and *Review* in the action. The salmon disease still attracts great attention. A marine station for biological research has been established at Edinburgh, a gentleman having offered £1,000 for founding it and government assistance is expected.

Of the 98 "Flickerings" which 10 are best? See page 433.

The Kennel.

FIXTURES.

BENCH SHOWS.

Jan. 2, 3, 4, 1889.—Meriden Poultry Association Bench Show, Meriden, Conn. Secretary, S. J. W. Smith, Secretary, S. J. W. Smith, Jan. 16, 17, 18 and 19.—St. John, New Brunswick. H. W. Wilson, Secretary, St. John, N. B. April, 1889.—The Cleveland Bench Show Association's Second Bench Show, Charles Lincoln, Superintendent. C. M. Munhall, Secretary, Cleveland, Ohio.

THE BEAGLE CLUB.

I READ with pleasure the communication of Mr. Ashby, in FOREST AND STREAM of Dec. 13, and very heartily endorse his views on the formation of a beagle club, and the creation of a standard for the too long neglected little hound. My own communication, in the same issue, seems to be at one with his. But I do not like the name "American-English Beagle Club," and hope that it may be changed, as FOREST AND STREAM suggests, to the simpler and more euphonious one, "The Beagle Club." This is comprehensive enough and will look far better on our banner than the one already used. We wish to start fair in every respect and a good name is an admirable acquisition and, in the club's case, may be "better than great riches." At the late bench show, in Lowell, there were some fine dogs of all classes exhibited, and the judges evidently did their duty by all in a straightforward and unbiased manner, and the same may be said of the superintendent. Bench shows, however, held in conjunction with poultry shows, are far from satisfactory in many respects, though in provincial towns the combination must perforce be suffered a little longer.

Herewith I send a partial list of first and second prizes awarded, and includes most of the sporting dogs. Is the Massachusetts Kennel Club to have a bench show in Boston next spring? It is to be hoped so, and that it may be the best one ever gathered in the State. The interest in thoroughbred dogs is increasing, and the bench shows, if conducted by the manner of educating the masses to a better understanding and appreciation of the noblest of all animals and the best friend of man—the dog.

By all means let us have "blue blood" and a true standard in all classes, and let the "ours" be the standard for the bipedal species who take an interest in our dear, faithful friends. O. W. R.

SALE OF FOX-TERRIERS.

MESSEHS. L. & W. Rutherford's second annual sale of fox-terriers took place at the American Horse Exchange, Broadway and Fifth street, on the afternoon of Dec. 30. Twenty-three dogs were catalogued, and the dog, at a reserve of \$100, was not sold, and one of the young puppies having died the number sold was reduced to twenty-one, and for these a grand total of \$850 was obtained. Warren Wakefield went much above her value at \$125, and as did Warren Bessie, both being legs and light of bone. The cheapest dog sold, considering quality, was the Nailer—Diana puppy, who has an excellent head and grand legs and feet; the same buyer also secured Jaunty, the best of the bitches. The Brockhurst Jack puppy, at \$150, was also sold, as expected to be, being very heavy in muzzle and rather cloddy. The young puppies sold very well, the average for the ten being \$15.40, three of them bringing \$22, \$25 and \$31 each; on the other hand two went for \$5 and \$5 each. There is evidently a market for well-bred dogs at auction, as the bidding throughout, when once started, was brisk, and business was meant by those present. Mr. Wm. Easton, manager of the exchange, officiated as auctioneer.

Table listing dog sales with names, breeds, and prices. Includes entries like Warren Jack, Nailer-Freifel, whelped Sept. 1887, \$25.00; Jack Nailer-Viola, whelped May, 1887, \$30.00; Dog by Nailer-Diana, whelped May, 1887, \$25.00; Dog by Brockhurst-Jack, whelped July, 1888, \$10.00; Brother to the foregoing, Wm. Weiling, whelped Sept. 1887, \$30.00; Brother to the foregoing, Mr. Penlow, whelped Sept. 1887, \$18.00; Warren Wakefield, by Brockhurst-Jack, whelped Sept. 1887, \$102.50; Jaunty, by Jaker-Tornell, whelped Sept. 1887, \$70.00; Warren Blossom, by Royal-Fidelity, whelped Aug. 1887, \$24.00; Belmont, whelped Aug. 1887, \$30.00; Warren Bessie, by Bowstring-Viola, whelped Sept. 1887, \$30.00; Wm. Weiling, by Jaker-Tornell, whelped March, 1887, \$15.00; Ten Puppies, all by Jaker and out of Wakefield, Blossom, Bessie and Tornell, whelped Sept. 1887, Mr. Leonard \$10.00; Mr. Hunt \$10 and \$16, Mr. Miller \$14, Mr. Kelly \$16 and \$22, Mr. Cikes \$26, Mr. Courtright \$6, Mr. Grand \$5; Bunning \$31. Total \$850.00.

SPANIELS AT LOUISVILLE.

Editor Forest and Stream: Mr. J. O'H. allows that exception in your last issue to my criticism of the two spaniels, Bonanza and Ruby, exhibited by him at the Louisville show. My remarks about the dogs in question were as follows: "Hornell Bonanza is faulty in head, eye and coat, and is none too straight in the legs, and is much too long. Hornell Ruby was in the cocker class, Faults—Plain face, bad ears, light in bone, and of poor color." Mr. Fellows first complains that I represented his "dogs" as being in bad coat. Such is not the case; but I could not consistently overlook the retriever coat of Bonanza. Mr. Fellows is in error in supposing that field work made Bonanza's coat faulty, for two or three months' work in the bushes and briars of Steuben county after woodcock and grouse" would have a strong tendency to pull some of the curls out of his coat, and to be told that because a dog is "very rough and shaggy" does not claim that Bonanza is a field spaniel, but a true cocker. In that case Mr. Fellows was not justified in receiving the second prize at Louisville in a class for field spaniels, and he should forfeit the prize money. It is something new to me to be told that because a dog is "very rough and shaggy" he is a field spaniel. Many massifs, fox-terriers, etc., have a very rough appearance and yet are perfectly straight on their legs. I can assure Mr. Fellows also that a dog seven and a half inches from the ground can be leggy and faulty in its. All depends on what the legs have to support. If Mr. F. will give himself the trouble to look into Bonanza's face he will find that the dog's eyes are faulty, which does not necessarily mean that the eyes of a working spaniel should resemble those of the King Charles.

It does not prove that because "we bred for the market" that Ruby's color is not bad, neither is there any reason why the public should be misled because the "market" does not know what a typical spaniel ought to be. True it is that Ruby was purchased by Benedict (she never beat him) on a certain occasion, but Mr. F. forgets that the gentleman who arrived at that decision has refused henceforth and forever to judge spaniels. Mr. F. seems equally blind to the fact that he himself told me in New York that the decision was made on the ground that when he says that breeding for bone is all rot and nonsense. A sporting dog must have good legs and feet, without which he is "useless." Prizes have for years been awarded to the blind, the lame and the halt, and the bandy-legged cripple with his splint has been allowed to compete successfully with the sporting dog proper. We are now on the road to improvement; let us not turn back! The im-

MR. H. H. MATTOCK'S LEMON BELTON ENGLISH SETTER DOG "SAN ROY."
Winner of the Eastern Field Trials Derby, 1893.

flushed to order. Moving on Pink flushed, and about the same time London also flushed. Both were going down wind. Moving on, London flushed and dropped to wing, and Pink scored a false point. A bevy was then flushed by the spectators and marked down, and the dogs worked toward them, and Pink pointed. The bird was flushed to order and shot at and missed, both dogs steady to shot. After a great deal of roading, false pointing and flushing by both dogs, they were taken up and the heat was awarded to Pink B. Down three hours and fifteen minutes.

This finished the second series, Mingo having a bye. Following is the summary:

Second Series.

Sue beat Harrison's London.
Foreman beat Countess C.
Gath beat Rush Gladstone.
Pink B. beat Coleman's Loundon.
Mingo a bye.

Third Series.

MINGO AND SUE

were the next brace. They were put down at 4:15. Mingo, owned by Mr. W. H. Wells, is a black and white English setter dog (Druid-Star) and was handled by Will Davidson. He is a very handsome dog and a good mover though rather heavy, but is no match for Sue, who soon beat him. Working over the hill Sue flushed a bird and dropped to wing, Mingo coming up flushed the rest of the bevy. Moving on to the edge of the cotton Sue pointed and Mingo backed indifferently. The bird was flushed and shot at and Mingo broke shot. Moving on Sue flushed a single bird. Mingo then in rapid succession flushed three times and Sue secured two points, over the list of which a bird was killed and she retrieved it; they were then taken up and Sue awarded the heat. Down fifteen minutes.

FOREMAN AND GATH

were put down at 4:35, and worked over the hill in the sedge, when Gath pointed and broke in to wing. Moving on, he again pointed, backed by Foreman. Gath, after a nice piece of work roading his birds for some distance, pointed in the edge of a ditch, backed by Foreman. Working on down the ditch, Foreman scored a false point. They were then taken up, and the heat was awarded to Gath. Down, 25 minutes. This finished the third series, with the following result:

Third Series.

Sue beat Mingo.
Gath beat Foreman.
Pink B., a bye.

Fourth Series.

SUE AND PINK B.

were cast off at 9 on Wednesday morning in a sedge field. Pink soon pointed, and was backed by Sue. Moving on, Pink flushed. Sue then pointed to order, the birds were flushed and one killed and retrieved by Pink. Working on, Sue pointed, moved up and the birds flushed wild. We then worked on, when both dogs roaded to a point, and a bird was killed and retrieved by Sue, who soon pointed again, and was backed by Pink. Then near a fence, Sue scored a false point. We then worked on over the hill, when both pointed a large bevy. Moving on down to the branch, Pink pointed and Sue flushed a single bird, and soon after she pointed. Working on up the hill, Pink pointed. Sue then drew to a point, but moved on up the hill, and again pointed. They were then taken up, and the birds were flushed to order, and two birds killed, and one was retrieved by each dog. We then worked over the hill, when Sue pointed a large bevy, and soon afterward roaded for some distance and pointed. They were then taken up, and Sue awarded the heat at 9:30. Down fifty minutes. This ended the fourth series, Gath having a bye. Following is the summary:

Fourth Series.

Sue beat Pink B.
Gath, a bye.

FINAL TIE.

SUE AND GATH

were cast off at 9:55 in a field of sedge to decide first place. Working on to branch Gath flushed, and a little further on he pointed near the branch, but soon moved on. Sue worked on through a cotton field to some sedge and pointed. Working on over the hill Gath flushed, and a few minutes after he pointed where a bird had been eaten by a fox. We then went over the fence to where the birds had been marked down, and Sue awarded the heat to back. Moving on Gath pointed, but moved on, when Sue flushed and Gath soon followed. Sue then pointed nicely, and was backed by Gath. The birds were flushed to order and one killed, which was retrieved by Sue. They were then taken up, and the heat was awarded to Sue. They were declared the winner of the first prize. Down one hour.

TENS FOR SECOND PLACE.

First Series.

LONDON AND PINK B.

were put down at 11:05 in some woods, where London pointed

in beautiful style on the side of a hill. Pink flushed a bevy behind him, which caused the birds pointed by London to rise. He was perfectly staunch to wing. Moving on into the swamp Pink pointed a hare; London then pointed. Moving on Pink pointed a hare; London then pointed. Moving on the swale Gath pointed staunchly. Short claimed it to be a mouse, but after a good deal of searching he unearthed a land terrapin. Then across the ditch, London pointed in nice style a bevy, and was backed by Gath. Moving on Gath pointed and roaded on, and the bird was flushed by handler. They were then taken up for lunch at 12:30, and put down again at 1:30 in a cotton field and worked down into a swale, where London pointed and was backed by Gath. Moving on, Gath pointed in a deep gully. We then crossed to another gully and crossed to a cornfield, which was drawn blank. We then swung round, and London pointed. Then up the hill Gath pointed a single bird which was flushed and killed to order, and retrieved by Gath. Moving on London flushed, and a little further on Gath scored two points and London one. They were then taken up and Gath was awarded the heat and declared the winner of second money.

FINAL TIE FOR SECOND PLACE.

LONDON AND GATH

were put down at 12 in a field at the head of a gully and worked on down to a swamp, where some birds flushed by the spectators had been marked down. London flushed a single bird and soon after both dogs scored a point. Then up the swale Gath pointed staunchly. Short claimed it to be a mouse, but after a good deal of searching he unearthed a land terrapin. Then across the ditch, London pointed in nice style a bevy, and was backed by Gath. Moving on Gath pointed and roaded on, and the bird was flushed by handler. They were then taken up for lunch at 12:30, and put down again at 1:30 in a cotton field and worked down into a swale, where London pointed and was backed by Gath. Moving on, Gath pointed in a deep gully. We then crossed to another gully and crossed to a cornfield, which was drawn blank. We then swung round, and London pointed. Then up the hill Gath pointed a single bird which was flushed and killed to order, and retrieved by Gath. Moving on London flushed, and a little further on Gath scored two points and London one. They were then taken up and Gath was awarded the heat and declared the winner of second money.

TIE FOR THIRD PLACE.

When called, Foreman, Grouse Dale and London divided third money; one-half to London, one-fourth each to Foreman and Grouse Dale.

THE SPECIAL POINTER PRIZE.

The special prize offered by Dr. N. Rowe, a silver collar to the best pointer in the All-Aged Stake, was contested for by:

TYLER AND PRIDE.

They were cast off at 2:30, and worked over the hill, where Tyler pointed. Moving on, Pride pointed, and Tallman shot and killed a bird, which was retrieved by Pride. Moving on Pride scored a point, and soon after Tyler scored two points, and working a few steps further he again pointed. The bird was flushed to order and killed. Tyler broke shot, and retrieved it. Working on, both dogs roaded, and both scored a flush. Ordered on Tyler made a nice point; the bird was flushed to order and shot, and he retrieved it nicely; they were then ordered up and the heat was awarded to Tyler, who was declared the winner of the pointer prize. Down thirty minutes.

SUMMARY:

First Series.

Harrison's London beat Carrie J.
Sue beat Tyler.
Foreman beat Flossy.
Countess C. beat Dick Counton.
Gath beat Grouse Dale.
Pink B. beat Eric.
Rush Gladstone beat Count Rapier.
Coleman's London beat Dover.
Mingo beat Sue (absent).
Jack, a bye (withdrawn).

Second Series.

Sue beat Harrison's London.
Foreman beat Countess C.
Gath beat Rush Gladstone.
Pink B. beat Coleman's Loundon.
Mingo, a bye.

Third Series.

Sue beat Mingo.
Gath beat Foreman.
Pink B., a bye.

Fourth Series.

Sue beat Pink B.
Gath, a bye.

FINAL TIE FOR FIRST PLACE.

Sue beat Gath, and won first prize.

TIES FOR SECOND PLACE.

London beat Pink B.

FINAL TIE FOR SECOND PLACE.

Gath beat London, and won second prize.

TIES FOR THIRD PLACE.

Third prize was divided. Harrison's London receiving one-half and Foreman and Grouse Dale one-fourth each.

THE CHAMPION STAKE.

Purse \$250 and a silver cup, value \$100.

GATH AND SUE

were the only entries in this stake. Both were handled by Mr. H. M. Short, and in justice to him we will say that although the dogs belonged to different men, and his interest in the winnings of each dog was different, we have never seen two dogs handled in a more impartial manner. Gath who has never heretofore let himself out in his contests with Sue, seemed in this race to throw off his allegiance to the old dog, and began from the first to cut out his work for himself, which he did in fine style, while Sue did not do so well as we have seen her do heretofore. They were run two hours to test their merits to the fullest extent, Gath coming out comparatively an easy winner. They were put down in a field near the cotton gin and worked up wind. Several birds were flushed by the spectators, but were not followed. Both dogs moved off at great speed and ranged very wide, making it almost impossible to keep them both in sight at the same time. After going some distance a bevy was seen to rise out of the sedge, and Sue was found pointing them down wind, but was neither scored a point or flush. We then moved on to where the birds were marked down in some tall grass on the side of a ditch and both dogs going in flushed several birds. Then out into the open Gath pointed at the edge of some sedge, and at the same time Sue scored two flushes in the ditch. We then worked on up the hill where Sue pointed and was neatly backed by Gath. Working on down into a swamp, Gath pointed. Several birds were put up and it being a bad place to work the dogs they were ordered out on the hill where Sue pointed and a fine bevy was flushed and at the same time a small bevy rose wild. Gath, who had been lost, after a good deal of searching was found on a point in the tall weeds, where the last birds rose. Working up a draw leading to a piece of woods, when both dogs roaded for some distance but failed to locate the birds. We then worked up into the woods where Gath pointed a nice bevy. One was killed by Short and retrieved by Gath. Ordered on over the hill Gath roaded for some distance but the birds flushed ahead of him. Moving on Sue flushed. We then beat down into the hollow where Gath pointed a large bevy. One was killed by Short but he failed to find it. Moving on to where the birds were marked down, Sue flushed and Gath secured two points. It then commenced to rain and the two hours agreed upon by the judges having expired, they were ordered up and Gath declared the winner of the stake. Down two hours.

THE PUPPY SWEEPSTAKE.

On Monday, while the Members' Stake was running, there was a sweepstake for puppies arranged and run with Messrs. Trezevant and Tallman as judges; entrance, \$10, divided into three prizes; Mr. J. M. Aven's donated a puppy to go to the winner. There were eight entries, which were drawn to run as follows:

J. M. Aven's Pointer against Dr. R. Kemp's Jack, Will Davidson's Dover against J. M. Aven's Rush Gladstone, C. L. Wallin's Pride Dixie against Will Davidson's Irish Don, H. M. Short's Shot against J. M. Aven's Countess C.

POARTER AND JACK

were cast off at 9:55 in a sedge field. In speed and style they were about equal. Poarter soon got lost in some high grass, and when called flushed a bird. Then in a cornfield Jack roaded to a flush, and a little further on Poarter flushed a bevy. A little further on Jack pointed. The bird was flushed and when Jack broke shot and chased. Poarter then pointed. Jack refused to back and flushed the bird. They were then ordered up, and the heat was awarded to Poarter. Down forty-three minutes.

RUSH GLADSTONE AND DOVER

were cast off at 10:40 in a field of sedge. In style and speed, Rush had the advantage. Rush in a few minutes scored two flushes, and after some work in the sedge, he flushed a bevy, which were marked down in a thicket, where Rush again flushed and Dover scored a very unsteady point. Moving out into the open, Dover pointed and was very indifferently backed by Rush. They were then taken up for a while and put down again, when Rush pointed in a thicket. Moving on he flushed, and a little further on he scored a false point. He then got a nice point, and they were then ordered up and the heat was awarded to Rush Gladstone. Down one hour and forty minutes.

PRIDE OF DIXIE AND IRISH DON

were put down at 12:15 in a sedge field. Pride soon pointed, but he points so indifferently that it is hard to tell when he has a bird. Moving on Don flushed a bird, and shortly after Pride pointed. Moving on both dogs pointed together side by side a single bird; a little further on Pride flushed. They were then taken up for lunch at 1:10 and put down again at 2:30, when Pride pointed a single bird in the woods, and soon after

12ft. long, but 10 or even 9ft. will do for a small dingy. Clear white pine or cedar will work the easiest and make the lightest job. Depth say 15 to 18in., with some flare to the side, sheer to suit fancy, and 24 to 3ft. in width. Board can be had properly dressed from the nearest mill, and the whole thing ripped out, nailed up and varnished in three hours. After another hour of contemplation the varnish will be dry, and you can go ahead for a trial. An eight-foot double paddle or simply a single blade whittled out of pine or spruce and set in a slot in the end of a stout round stick will be sufficient. There will be no nickel plate to the affair, nor hideous lacustras decorations, but with clear stain and a little "varnish" the boat will make a neat and serviceable one to a small yacht, and can be stowed in a space 3x3x3 or less by slipping one section into the other, unscrewing the nuts on the ends and pulling out. For sportsmen's use she can be carried across country or taken aboard a wagon or buggy with less trouble than a hand valise. Total cost of boat anywhere from \$8 to \$4.

NO NONSENSE WANTED.—When a person writes that "I then started on a trip north and was obliged to put back," that person reports known to falsehood. That such a condition should arise under the lash and white about "temperate advocates" after being convicted in these columns of slanderous fabrication, is not to be wondered at. For the sake of truth it is imperative that dishonesty on the part of a reporter should be brought up with a round turn and in plain English. That duty, disagreeable as it may be, we do not intend to shirk, and the sooner those persons who resort to vulgar falsehood understand that they will permit no nonsense of that kind to go unrebuked, the better for them. The statement made in a turf journal last week that I was "obliged" to put back, was obliged to put back, is a common lie. That is the most "temperate" language the utterance of a falsehood deserves.

THE LIBERIS.—One newspaper libber delivers himself of the same opinion that I have left under "trial and forestall" and the skipper who would get a cutter under way under such sail would be languid ashore in short order. Mainmast and forestaysail may be the custom with fresh and green talent at the wheel of a sloop, but libberly tactics of that kind find no place aboard a smart vessel. Captain Penny knows a thing or two more about getting a yacht under way. But we certain newspaper reporters make such a ridiculous show of their ignorance in drawing upon their imagination and printing blunders which stamp them as falsifiers on the spot.

PERSONAL.—Commodore Mot of the Cricket cutter, Oswego, Y. C., and Mr. J. B. McMurrich have been in the city. The Commodore speaks well of his cutter, thinks her just the boat for lake use, and her draft does not bother him in the least.

VERY NATURAL.—According to the *Herald*, Skipper Willis, of the Dauntless, is pleased to consider her a fine sea boat, and announces himself a sort of reformed British sinner, who has seen the error of his ways. Of course, a "soft berth" and big pay under the American flag has nothing to do with this sort of laffy, always supposing Skipper Willis really did express himself as stated in the *Herald*. Considering the numerous denials of the so-called news in that paper which continually reach us, we would like more reliable authority than a bare statement in the *Herald*. Likewise does the excellent Willis go into transport over the beauties of the Sound, and he is reported as saying that he cannot understand why any one wants to hammer of shore. If Skipper Willis was really guilty of such a confession, he has evidently mistaken his profession, and ought to settle on a farm with a duck pond attached. We scarcely think an English skipper would give himself away in that fashion, unless there was some object in view. No doubt Skipper Willis would much prefer seeing the Dauntless well settled in the mud of some Sound port for some six months to come, but the owner evidently has a higher ambition. As for the sailing of Dauntless, she was rounded off by British yachts in the New International last year, and the verdict of the critics present was that Dauntless is of no account to windward. This is well enough known even here in America. Her reputation for handiness and close-hauledness in Solent waters is none too good, as we learn from dispersed sources. No one has ever questioned the "fair to midling" seagoing qualities of the vessel, with dead rise enough to make her approach the modern British yachts in performance at sea more nearly than the typical flat bottom of American devices. The big rig of the Dauntless helps to make her easy. Should it ever be cut down the difference would at once be noted in quicker and harder behavior at sea. The Dauntless left this port Dec. 10 bound for the Mediterranean in spite of the superb attractions of half a day's sail from one end of the Sound to the other.

STILL ANOTHER.—Cutter building is becoming brisk. Driscoll, of Greenpoint, will stretch the keel of a fine little vessel for New Haven owners, from designs by A. Cary Smith. Over all 40ft. 8in.; waterline, 32ft.; beam, 8 1/2 ft.; draft, 9ft. 5in.; lead on keel 7 1/2 tons; inside half a ton for trimming. Lead is 2ft. wide across top, and 1 1/2 in. across bottom. Mast, 31ft. 9in., deck to cap; topmast, 23 1/2 ft.; boom, 31ft. 9in.; gaff 22ft. 3in.; bowsprit, 31 1/2 ft. over all.

TRUE BLUE.—A gentleman ordered a single-hand yacht, 12ft. long, from a builder, and wrote: "Deck her all over and give me a cabin. But, said the builder, it will be very small. Well, wrote the prospective owner, I can sleep in it, cook in it, smoke in it, read and write in it "and what more can a man ask for?"

MAVIS.—This noble little cutter has been sold to Mr. Thomas E. Frazier of Boston.

BUY YOUR BALLAST NOW.—Lead is very low at present, and the price still tending downward. Pig in England has been sold to \$55 per long ton or 240lbs., but in America, thanks to a protective tariff, the yachtman has to pay 3 1/2 cents per pound or \$74 per short ton. The market is not likely to go lower, and those who buy during dull times this winter will probably get the metal for \$80 or less. Scrap lead can be bought for 2 cents.

RIGHT MOVE.—The fleet of cabin yachts in the Knickerbocker Y. C. will receive fresh accessions this winter. Mr. Mathews, of the open boat *Wesley Fish*, is putting up a little cabin sloop thirty feet long, and Mr. Christie, of the cartoon, *Contant*, is likewise following the bent of the day and building a cabin sloop. Neither is likely to repent the change from a shifter to a regular yacht.

GIYANA.—This schooner arrived at Bermuda, Dec. 12, bound for European waters. Steamer *Sinclair*, Sir Theo. Brassey, left the same port Dec. 10, bound for Portsmouth, England. Steamer yacht, *Mormail* reached Jacksonville, Fla., Dec. 20 in safety.

CUTTERS.—Mr. Beavor Webb, designer of *Freda*, *Tara*, *White Wing*, *Medusa*, and other successful boats, announces his address in our advertising column.

NEW CUTTER.—Dr. Whitney, of Boston, is to have a thoroughcut cutter 30ft. long, to be built from designs by Burgess Bros., of Boston.

Every year of this journal (it is expected) will "have a say" about the "flickerings."

ANSWERS TO CORRESPONDENTS.

SPANIEL, New York.—Since you are still the owner of the bitch, you are the breeder, according to the rules of the club.

FATHERSINER, New Hampshire.—Please send your post-office address to this office. We wish to write you relative to your communication recently sent us, which bore no date nor town.

H. B.—The following times were made at Lake George in 1882, under paddle: Class 3, distance 1 mile, A. E. Highway, 10 min. 55 sec., canoe life, 3 1/2 min. Class 2, 1 1/2 miles, 16 min. 6 sec., C. B. Yaux, canoe life, 3 26 in.

The longest river in the world is the Mississippi, reckoning from the source of the Missouri, being 4,300 miles, or equal to the combined length of about three thousand miles of *Esterbrook's* sunbath falcon pens and pen-holders.—*Ad.*

SECTION BAMBOO RODS.

Having been the pioneers in the manufacture and introduction of Section Bamboo Rods, we have always taken great pride in securing and perfecting every improvement in order to maintain our position as the makers of the very best rods. Knowing not only theoretically, but also by long experience, that a properly made round rod is the only absolutely perfect rod, we have invariably refused, and still do refuse, to put our name on any but our "Best" round section rods. Our prices for these round rods average only about 40 per cent. more than the prices asked by any other makers, while the rods are widely known to be incomparably superior. While no hexagonal or any angular rod can be perfect, we long believed that with proper workmanship and material a really good angular rod could be made. Being much easier and cheaper to make than round rods, we hoped to be able to offer to those anglers who can not afford to pay the price of our "Best" round rods, a hexagonal rod that would be good and serviceable at a moderate price. We are more than satisfied with the success which has attended our efforts, for we are now able to furnish a hexagonal rod that is really worth having, and at a price which is only a trifle in advance of that asked by other makers.

Orders received from persons residing in cities in which the dealers keep a full line of our goods will not be filled at any price.

ABBEE & IMBRIE,

Manufacturers of every description of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, NEW YORK.

LUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS & POULTRY. For Twenty Years Lumphrey's Veterinary Specifics have been used by Farmers, Stock Breeders, Horse R. R., Traveling Hippodromes, Menageries and others with perfect success.

LIST OF SPECIFICS.

- A. A. Cures Fevers and Inflammation, Milk Fever, Spinal Stiffness, &c. 75c.

Trout and Black Bass Fly Rods, 10ft. long, \$1.50 to \$10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and do not admit of a heavier charge, as owing to the thin metal, inside of meter is nearly two gauges larger. Load same as any brass shells, using wads any two sizes larger than gauge of shells. Or can be effectively crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

ANSWERS TO CORRESPONDENTS.

so well begun may be carried on with better facilities, more adequate means, and still more gratifying results in the future.

THE ADIRONDACK FORESTS.

IT is reported that the Senate Committee, which was appointed at the last session of the New York Legislature to investigate the forest lands of the Adirondacks, will report adversely to the purchase of the Adirondack territory by the State. The reasons given are: First, that the timber now remaining is not worth cutting, and, therefore, there will be no further decrease of forest land by the work of the lumbermen; second, that the State is rapidly acquiring possession of the land by the reversion of property on which the taxes are not paid; and third, that if the State attempts to buy up the land, present owners will demand an outrageous price, and the result will be a "job" of the worst possible character.

To criticize this report of the Senate Committee before it is presented in detail would doubtless be premature, but if the committee is correctly reported as putting forward the reasons just quoted, its adverse recommendation will not appear very strongly to those persons who are familiar with the actual condition of things in the Adirondack Wilderness.

In the first place, it is not true that all the marketable timber has been cut; on the contrary, it is the present activity and the prospective wholesale lumbering operations that have specially drawn public attention to the topic at this time. The second reason given by the committee loses all force when we reflect that the land thrown back upon the State for non-payment of taxes, does not become public property until the trees have all been cut off from it, and it is reduced to a barren waste instead of a wood.

Nor is there much substance in the third point made, namely that the purchase will be a "job." The State has the power and the right to assume possession of this domain without paying for any part of it an exorbitant price to satisfy speculators and leeches.

The situation is grave; the necessity of adequate, prompt and wise action imperative. The Adirondacks should be saved, even at great cost. The State has a perfect right, for the undoubted good of the people at large, to purchase the North Woods at a price determined upon as reasonable by a commission of competent judges; the State can take the land and pay this price; and the would-be speculators may substitute their chagrin for their prospective spoil.

WINTER CARE OF TACKLE.

IT will repay the angler to take good care of his tackle during the off-season. Yet few take such care of it at the close of one season as to have it in readiness for duty at the opening of the next one. There are those who give their tackle a thorough inspection once or twice during the winter, and to them it is a labor of love, bringing up many a memory of past pleasure. Here is the little fly that captured the big trout last June; it is in good order still, but the gut is a trifle frayed and needs attention. Lay it aside to be sent to the makers for repair, unless you do this yourself. Here a leader that has a kink in it, which has partly broken it; cut it in two and soak the ends and re-tie them. This is not only useful, but congenial work, and brings the reward in more ways than one.

When rods are to be laid by for the season, they should be carefully looked over for faults, guide-rings inspected, and the fittings of the ferules seen to. When the rods are placed in the cases, take care that the strings are not tight or the rods may warp. Straighten all the joints before casing, and lay the rods on a shelf, never on hooks nor brackets, and never leave them standing against a wall or other objects for fear of their warping.

Reels should be cleaned and put in order, if necessary, and lines should be looked over for chafes or other injuries; creels should always be cleaned after every trip, but before the reels and lines are packed away in them, they should be again inspected. We have found fruit jars the best protection against moths, and dice properly put away in them are sure to be in good order when wanted.

These hints, if followed, will save both worry and expense, and the angler will take more pleasure in the knowledge that his tackle is in order, than can be computed in money.

TURK SNOW.—With the first of the month game bird shooting was brought to a close in most of the States; and none too early, for the recent very heavy snow fall has made sad havoc with the game.

NEW RIFLE MANAGERS.

THE annual meeting of the National Rifle Association, which comes off in a few days, should be the occasion of a general shaking up of the dry bones at the head of the Association. If the life members fail to make an earnest protest against the growing do-nothing policy of those in control of the affairs of the Association, then it is useless to look for any very excellent results from the practice of 1884. The dry rot is striking very deep into the affairs of the Association, and but a few years more of such control as we have recently been treated to in this central Association will see its demise. There is need of a policy which shall command the enthusiastic support of the actual shooting men. There has been too wide a gulf between the managers and the workers in the Association in the past, and the actual needs of those who use the ranges have been disregarded by the titled individuals who lend their names to grace the official list of the Association.

One trouble in the line of making a change has been that a large proportion of the life members are not active shooters. They either belong to the ranks of the "have beens," or they are so bound up in official relations to those now in control that they fear a free expression of their opinions. A system of rotation would be a godsend to the Association, but with the chance for notoriety which the reception of the British team in 1884 will give, it will be a hard task to induce any of the present inner circle to forego the temptation of re-electing themselves.

If an earnest effort is made prior to the date of the meeting, there should be no difficulty in making up a list for balloting which should be in every way satisfactory. The old members cannot object to the new blood sought to be introduced. It surely cannot be urged that it is wise to let well enough alone for the affairs are now in such a dead-alive condition that the change must be for the better, and it cannot come too soon.

THE CAMP-FIRE VOTING.

BALLOTS are coming in with every mail at a rate very gratifying. The interest shown in the voting is much greater than we had anticipated. We repeat on another page the directions already given and the declaration that the privilege of voting is extended to all who read the paper.

MICHIGAN.—The Michigan Sportsmen's Association will meet at Jackson next Tuesday, Jan. 8. This society is just now called upon to maintain its interest and strength, for never before has there been more urgent need of "backbone" in the cause of Michigan game protection. We hope that the sportsmen of the State will respond promptly, heartily and substantially to the call of the Secretary published in another column. The success of the Maine system should encourage the Michigan Association to persevere in the effort to secure a State game warden.

THERE IS A DEAL of cant about the "pot-hunter" and the "true sportsman." Each term has been iterated and reiterated in season and out of season by honest men and hypocrites. Neither expression has been so hackneyed as to have lost its significance. The Maine game report contains a suggestive passage descriptive of the kind of beings who are pot-hunters in that State. Read the paragraph and test the faithfulness of the picture by applying it to some of the pot-hunters you know yourself.

"DOWN THE YUKON."—The continuation of Lieut. Schwatka's account of the Alaska expedition was received too late for insertion in this issue. It will be given next week.

A NEW LEAF.—Among all the other good resolutions for the year, suppose you adopt one something like this: To talk game protection less and protect game more.

AMATEUR PHOTOGRAPHS.

WE have received a number of photographs in exchange for the two views taken from our office windows, and find them very charming and suggestive pictures of camp life and pleasure travel. We repeat that we have taken, with amateur outfit, two views from the windows of the FOREST AND STREAM office, and shall be glad to exchange one or both of them for amateurs' photographs of camp scenes and other pictures made by the sportsman tourist. The views are 5x8 in. No. 1 is an instantaneous picture. It shows the north side of the Post Office, Mail street, a strip of the City Hall Park, and a varnish sign over on Broadway. There is also a pie wagon delivering pies to the stand on the Post Office corner, with a fat pedestrian in close proximity. No. 2 shows the front of the old City Hall, with the roof of the new County Court House, other public buildings, the top of Stewart's old wholesale store, and a slice of the American News Co.'s building in Chambers street.

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

SIXTH PAPER.

THE religion of the Blackfeet is a strange mixture of three stages of mythologic philosophy. It consists of remnants of *Heavenism*, a complete *Zoötheism*, and, to a certain extent, *Physiötheism*.

So far as the writer knows, only three inanimate things are worshipped now by the Blackfeet, but there is conclusive evidence that their religion was once prominently hecatheistic, that is, that they worshipped trees, rivers, mountains, rocks, in fact, all inanimate things. There is a certain fossil found in the bluffs along the rivers which is much the shape of the buffalo. It is called *o-nis-kim*, buffalo rock, and is worshipped by all. It is sometimes hung on the necks of little children as a necklace, but is more frequently deposited in the "medicine" racks of the "medicine men."

The legend of it is as follows:—
Long ago in the winter time, the people were starving, for no buffalo could be found. The young men went out to hunt every day, but not even a poor old bull could they find. They waited and waited for the buffalo to come, saying: "Surely they will be here to-morrow," but they did not come; and at last the people were so hungry and weak that they could not move the camp. Now, one day a young married man killed a jack rabbit, and he hustened home and said to one of his wives: "Go quickly now and get some water; you will cook this rabbit and eat it." When the young woman was going down the path to the river she heard something singing, and she looked about to see what it was. There, jammed into a crevice of the bark on a cotton-wood tree, was a stone (the *o-nis-kim*), and with it a few buffalo hairs, for there had a buffalo rubbed himself. And the woman was afraid and dared not go past the tree. And the *o-nis-kim* sang a beautiful song, and the woman stood and listened. And when it had finished, it said: "Take me to your lodge, and when it is dark call all the people and teach them to sing my song. Pray, too, that you may not starve; that the buffalo may come, and when it is once more day your hearts will be glad." So the woman took the *o-nis-kim* home and gave it to her husband, telling him all that had occurred. In the evening all the people came and learned the song, and prayed, and when it was yet dark they heard the buffalo coming. Many came, and the sound of their running was like thunder, and as soon as it was daylight the hunters went out and killed many fat cows, and the peoples' hearts were glad.

Another object of hecatheistic worship is a large red and white colored rock lying on the side of a hill some five miles above Fort Conrad on the Marias River. It was once on the very top of the hill, but successive rainings seasons have gradually washed the loose soil from under it, so that each year it moves down a few feet. The Blackfeet regard this as a supernatural power and consequently worship it. Seldom does one pass by it without making it a present of a bracelet, or string of beads, or something of more or less value.

The middle butte of the Sweet Grass hills is also worshipped. The worship, however, partakes more of fear than veneration. It is said that if any one happens to see it, that it will appear to him in his dreams and ask him for a woman, promising in payment some of the game which is so plentiful on its slopes. Camps are never pitched at its base, and any one hunting about it must make it a present.

It is not unlikely that there are more objects of Blackfeet hecatheistic worship than the ones given above, but as yet the writer is unacquainted with them.

Zoötheism forms an important part of the Blackfeet religion. Still, the animal gods hold but a secondary place among the wonderful beings, the rulers of the universe. Each Indian has his own secret god, either an animal or a star, or constellation of stars. Having arrived at the age when he may go on the warpath, each young man goes out on the prairie or to some lonely spot by himself, and then fasts for four days and four nights. Whatever he dreams of, as he lies in a half insensible state, he takes for his god, for his secret helper. But the Blackfeet pray to him directly to this secret helper. The wonderful animal which he takes for his own god is not directly asked to fulfill his wishes. Animals are supposed to be much nearer the supreme gods (the Sun, Moon, Old Man, and the Stars) than mortal man, and the secret helper is implored to ask the supreme gods to grant whatever the Indian may pray for.

Of the physiötheistic gods, the Sun stands at the head; next to him in power is his wife, the Moon, and after them the Morning Star, their son, called *kwá-táck*; after death it takes the form of the skeleton and is then named *sít-át*. Although the Sand Hills are the homes of the many dead, the *sít-át*, or, as we may translate it, the ghosts, do not always live there. They have the power to come and go unseen, and often visit the spots which were dear to them, and it is thought that they are always present at a death to lead the new ghost to his future home. A ghost also is capable of avenging any wrong which may have been done to him by bad death. Sometimes he will come and whistle over the lodge of any one he hates; sometimes he shoots invisible arrows, which quickly kill any one whom they may hit. Enemies, who have been killed and scalped, are thought to be specially invested with this power of shooting invisible arrows. Not long ago the Cree Indians made a raid on the horses belonging to this place, and in the fight which ensued two of them were killed and scalped by the Blackfeet. A few days since, a little chief belonging to the Blackfeet who were in the fight—was taken suddenly sick and

died in a few hours. The reason assigned for his death was that the ghost of one of the fallen Crees had shot it.

Every person, after death, is supposed to go to the Sand Hills. The good and the bad are both certain to go. The "happy hunting grounds" of another world are unknown to the Blackfeet. Their idea of a future life is a dreary, everlasting make-believe existence, a pantomime of the life in this world.

Disease is supposed to be caused by the many evil ghosts which are constantly hovering about, seeking an opportunity to take life. These ghosts have many ways of causing death. Sometimes they shoot their invisible arrows; sometimes they cause small, unseen animals to enter persons and eat their vital parts; again, they kill by degrees, causing one to suffer and linger for a long time in great agony; and sometimes they congregate at the feet and kill one slowly, every day killing up toward the body a little further until death at last ensues.

When a person dreams, the Blackfeet believe that his shadow has in reality been away from his body and actually participated in the acts of which he has dreamed. The dream is thought to be a special gift from the gods, thus enabling man to look forward to a future and woe-free life. One day that a young man was dreaming, he dreamed that he had seen a person long since dead, he immediately on waking makes a present to the gods, entreating them to drive the death ghosts away. If he dreams of anything good, he also makes a present to the gods, to pay them for the good fortune which they may give him. Thus, no matter of what one dreams about, it is sure to be interpreted either for good or bad.

[TO BE CONTINUED.]

SHOOTING IN SWEDEN—III.

THE coachman whipped up the horses. The ladies waved us adieu from the hospitable porch. We rattled over the stone bridge by the old stone mill and stretched away across country for six miles over a good macadamized road. Stone walls flanked the road on either side, and cliffs of cold grey granite rose abruptly everywhere from the level fields green with winter rye. Then we turned squarely to the left, and over a by-road drove out on a peninsula that juts into the stormy Cattegat, and pulled up in the square court-yard of an old Swedish farmer's residence.

The old farmer was blessed with eight stalwart sons, all men grown, all over six feet tall, all with blue eyes and flaxen hair, and all living at home with him.

Two of these young men went with us to the rocky shore. The wind was blowing half a gale. The waves beat spitefully against the strand. All over the sea the white caps came toppling toward us, and long streaks of foam stretched away to windward. No, the boat would not live in that sea with six of us on board; they would go up into the cove and row out the "Prm."

And soon, far up the shallow cove, we saw the young vikings splashing along in the knee-deep water, towing and showing a great blue-green lighter. Big canoes were to cross the Atlantic, so we defied the waves of the Cattegat, and after a hard pull with the clumsy oars the vikings rowed us over to the island of Balgó.

This island is about 400 acres in extent, it lies a mile off the southwest coast of Sweden near the town of Warberg, and is the property of Alfrid Bexell, Esq., whose guest I was, and who accompanied me to the island. With us came his son, Alfrid Bexell, Jr., and his daughter, Miss Bexell, his daughter Ebba, a blue-eyed girl of twelve, who scampered away over the fields in front of us, her flaxen hair streaming in the wind, as lithe and graceful as a young gazelle.

We soon reached the farmhouse, and I had occasion to admire the two substantial barns of heavy stone, which Mr. Bexell, who never does anything by halves, has just erected to accommodate the increasing harvests that his superior methods of cultivation are producing on the island. Mr. Bexell, Mr. Bexell, Jr., the vikings, and several of the farm hands, with tin pans and sticks in their hands, started west across the island, while Mr. Bexell and I followed a field down to a cove on the north.

Some seven or eight years ago, Mr. Bexell had put some hares upon Balgó. They had multiplied very rapidly, and occasionally the proprietor gave his friends a rare hare hunt. Such an one was to come off to-morrow, but my host said, "You are a stranger, you do not understand this hare shooting, you must go over to Balgó with me to-day, and we will have a little hunt all to ourselves, just to get your hand in."

So here we were. A stone wall ran across the foot of the field, about forty yards from the head of the cove. Behind an angle in this wall I stationed myself, laid my cartridges in a row on a smooth stone before me, and took a careful view of the situation. The water in the cove was within forty yards, the hares must pass by my gunshot, that was certain. A dirt road was running parallel with the water and the course the hares must come, was a dilapidated stone wall built of large boulders. From me to the old stone wall was a green sward, that would be easy shooting; but beyond I must catch them at snap shots between the boulders. Luckily a large gap in the old wall was nearly opposite me, where a brook from the field rippled down to the sea. So I crouched behind the angle of the wall and waited. A little while off my host started, and I saw, and smoked his cigar as coolly as Gen. Grant on the eve of battle. He had no gun; he never shoots, but a great lover of shooting is he all the same.

Now a hare appears on the crest of the upland pasture to the west, cocks himself up on a knoll, raises himself bolt upright, like a kangaroo, cocks his ears, bends them forward, wheels and gallops back again out of sight like a flash, evidently not pleased with his reconnaissance. Three more hares go through this season's evolution. The wind was blowing steadily from me to them. Did they smell me?

But now from afar we hear the distant beating of the tin pans, and the shouts of the drivers. Down the hillside leaps a hare and with ears flattened back on his neck gallops across the green sward and by me like the wind. I give him an allowance of nearly his own length and pull trigger. He turns a somersault and lies flat up stone dead.

Now another scuttles by beyond the old wall, a snap shot tumbles him into the brook. At the report five hares leaping down the hillside, turned and scampered back in very truth, "for dear life." But "clatter, clatter," "hullo! hullo!" ever nearer come the drivers, with little Ebba's clear child's voice sounding high above the din.

And now scamper, scamper the hares shoot by like woolly shuttles darting through the warp of rocks. Bang! bang! load and fire, it was hot work. Fast as I could cram in the cartridges, the hares came faster. In shooting one, there would come a hare, I laid them out on the green sward, beyond the wall in the brook, put on the brook, up

around, everywhere I piled them up for two burning minutes, and then the drivers were up with us and the shoot was over. Mr. Bexell continued to smoke his cigar sitting on the stone wall. Hastening to him and dashing my hat on the ground, I grasped his hand and heartily thanked him for the best shot he had ever enjoyed. "We never had a hare who could load and fire as fast as you," said the drivers. Picking up the hares they laid them in a row on the grass; fifteen there were, a pretty sight. Young Alfrid picked up my empty shells. There were twenty, three had required the second barrel. I had missed but two clean.

But as my host and I stood talking a hare came bounding along from the east, and looking up I saw Mr. Bexell had prepared a surprise for me, and that the men were driving the eastern pasture. Running under cover of the stone wall I pulled myself again into shooting trim, and bowled over nine more brown beauties as they came leaping by. The men beat their hands full. Twenty-four hares they carried across the field to the house. Time of shooting, three-quarters of an hour. It was concentrated sport.

Several of the hares weighed 9 pounds, one weighed 10, and one noble fellow brought down the scales to 11½ pounds. Another was the little hunt all by ourselves just to get my hand in.

On the morning, October 17, 1883, the grand hunt came off. Eight guns were in line, the whole island was driven twice by about thirty drivers, and we shot sixty-six hares. But the sport lacked the romance, the beauty and the freshness of the day before, when my host sat and smoked on the wall, the flaxen hair of his fair daughter blew out among the drivers on the hill, and the hares scattered like mad over the narrow pass between the stone wall and the sea.

That evening there was a grand dinner party at Göingegården, the hospitable country seat of the Bexells. The priest and all the magnates of Warberg were there, and a jolly night we had of it. America and Sweden were toasted in honorable terms, and with three rousing cheers, and "Vart Land" and the "Star Spangled Banner" were sung in full chorus.

Next morning I bade *Farewell* to my kind friends and drove to the railway station. As we rattled through the portal, the American flag which had been flying during my visit in honor of my country, was lowered from its staff in the center of the pretty garden, and my shooting for 1883 was over.

Mr. Alfrid Bexell owns not only the estate of Göingegården, but 700 acres, but also some ten miles away the estate of Thorstorp, covering 2,500 acres in extent. He was born in Sweden, but he is an American for all that, for the true American spirit of manly independence, and the will and work that conquers every obstacle is within him. He is the architect of his own fortunes, and has risen to be one of the leading agriculturists of the kingdom.

He was one of the first to discover and make use of marl in the agriculture of Sweden. A large area of the country lies a desolate moor, covered with heather, producing nothing. Mr. Bexell found out that marl, while a fertilizer to useful crops, was the destroyer of heather. He at once and at large expense built fine macadamized roads from his marl pits to his most distant heather hills. Over these roads he hauls many thousand loads of marl every year, and is bringing hundreds of acres of waste land into crop.

Where the heather land is too stony for any possible grain or grass, there he has prepared, and in a few years Mr. Bexell will turn a vast area of heathery moor into crop or forest.

If he be "a benefactor to the human race who causes two blades of grass to grow where but one grew before," surely Alfrid Bexell, Esq. of Göingegården and Thorstorp is a true philanthropist.

And now when the snow is deep outside my windows in this cold city of the Northland, he pleases it is to look back upon the scenes and friends of brown October—upon the days of Thorstorp, where young Alfrid and I kept harelords' hall, and went afield together, not forgetting one bright moonlit evening when Miss Bexell, a tall, graceful maid of seventeen summers, galloped ten miles over the hills on her favorite steed to bring us our mail. And then the days at Göingegården, where Mrs. Bexell presided with such a motherly, St. England grace over the household, and my host conspired to make the American feel that he was no longer a stranger in a strange land. And even now I see the hares, with ears pressed back, galloping wildly past me at Balgó, and turning a leaping somersault at every shot. Rest quietly in your case, good old gun of mine; the good days of brown October will come again, and may I again meet my generous friends of Göingegården. MANSFRAUD.

SAVE THE ADIRONDACKS.

Editor Forest and Stream:

I vote with great pleasure the importance your paper is placing upon the crying necessity of legislative action to preserve from further destruction the grand forests of the Adirondack region. I do not write this to suggest means, or to argue the constitutionality of the means suggested by notable political journals of the State—for example, the *State Herald*—or for the accomplishment of this purpose; but, so far as my opinion may go, to urge that the Forest and Stream keep this matter before the great army of its readers, a large number of whom reside in the Empire State, until they shall realize more keenly than now that something must be done, and so bring their influence to bear upon the Legislature this winter at Albany, which shall accomplish this result. I know what is the commercial value of the woods in lumber, and as a reservoir of supply for the Erie Canal, the Hudson River, and all those streams, great and small, which source is to this region. Still, speaking from the standpoint of one who would like to see the Adirondacks left as they are; for a place where a camp-fire can be built out of hearing of any *siez* whistle; where the secker after rest and grand scenery may catch his own trout and bag his own venison for many years to come. I am not a sportsman, but I enjoy sport with rod and rifle, and each summer finds me somewhere in the forest gaining what experience and sublime instruction in the difference to the conventionalities of life; counting it grand luck if trout and deer keep out of camp that (to me) ambulation—salt pork—and this within forty miles of where I am writing. There is less of the wilderness each year. Let the cutting of timber go on, and the granting of lands, and building of roads and railroads continue ten years longer and the Adirondacks will be a barren waste, stripped of timber and void of game—a tract of valueless country.

The commercial value of the woods, as a reservoir of water, is vastly more than that of the timber every year being cut enough for a hoop pole out away. It is to be hoped that our

legislators will see the importance of immediate action and act. A word in regard to the deer in this State, and our game laws. The deer on this side the woods have been quite plentiful this fall, and still-hunters and hunters with dogs have made good records. The law is particularly good but not half so well as it might be. If a law could be passed to prevent shipping deer to market from the Adirondacks at any time of year, it would please the sportsmen of this portion of the State wonderfully. Forbid, under a heavy penalty, the marketing of deer and thus destroy the "market hunters" trade and the deer, I believe, would increase. Thirty-eight deer were shipped from this place one day in November—as many as would be killed by a dozen parties of sportsmen or tourists. No one would be wronged by such a law and the poor deer now slaughtered in the lumber camps for fuel for fire-works, for many years to come. This is my maiden letter to FOREST AND STREAM, excuse its length. Mr. Editor, and give it space in your valuable paper, should you think it worthy, and perhaps when the open season again comes round, I may tell you of the effect of my 40-60-200 Marlin upon the deer among the fountain waters of the Oswegatchie.

S. R. M.

GROVERSVILLE, NEW YORK.

Natural History.

THE PURPLE FINCH AND HIS COUSINS.

BY DR. ELLIOTT COOPER.

3.—*Carolinus frontalis*.

FROM the Rio Grande to the Pacific have I traced the charming bird which I beg now to commend to my readers' very distinguished consideration, as one whose elegance of attire, agreeable address and musical proficiency cannot fail to please. During the vicissitudes of long years passed in the study of natural history amid the semi-savage peoples of our frontier, I have been thrown with many companions less congenial, less intelligent and decidedly less agreeable than the birds whose biographer I aspire to become; and the contemplation of objects so animated, so interesting has not seldom restored a peace of mind disturbed by rude human contact. The "burion" of Mexican thieves and prostitutes, the "adobe finch" of the Gringos and Jews who live among them, the "California linnnet" of the Pacific coast population, and the "house-finch" of the books—be the latter *frontalis* or *rhodopis*—are one and the same bird, which abounds in the region in question, and there plays a part not unlike the agreeable rôle which the bluebird performs in the East. Familiar to a degree that neither the bluebird, the barn swallow nor the house wren surpasses, of higher feather than any one of these, vivacious, melodious and ubiquitous, the crimson-fronted finch becomes an object to which no common interest attaches.

On reaching Santa Fé, as I did in the spring of 1864, and making known the object of the extended tour I was making through the Southwest, I was politely ushered into the courtyard of my host's dwelling house, to beshow the burions, in whose presence my friend seemed to take no less pride than pleasure. It was bright, balmy morning, and at an hour earlier than I often turn nowadays to the contemplation of nature—*heu fugaces!* The sun was just touching the roof of the adobe building, on the corners of which several male burions were singing in concert with hearty emulation; while here and there, in recesses of the sun-dried walls, I saw the situations of the nests which were pointed out to me. Everything Mexican was new and strange to me then, and the chords that bound my heart to distant scenes had been stretched flat in many a pang would come unbidden, but the scene was so cheerful, so restful, so homelike—that I felt reassured, and turned with zest to the breakfast of *hucos, colobito, tortillas, frijoles* and *chile Colorado*, which awaited my leisure.

During the next few days I traveled by stage coach along the Rio Grande to Albuquerque, fluding the same bird an agreeable feature of the villages passed en route; and it was no less numerous at the town of Los Pinos, where the party to which I was attached delayed several days in final preparation for crossing the great river at this point, to take up a long march westward into the very heart of the then almost trackless wilds of Arizona. Every available nook and cranny about the old quadrangular house with its verandas inside, its court-yard, and queer little loopholes for windows, was occupied by the nests of burions and barn swallows. Two more vivacious, voluble and pertuacious birds it would be hard to put together; incessant were the disputes they had in settling their respective rights, interminable the argument with which these cheery suits were conducted. Though the swallows were active and plucky birds, their more amiable natures generally induced them to yield in the end; even when it came, as I am sorry to say it did not seldom, to actual dispossession of their chosen nesting places by their determined competitors. Such a din of mornings! Such twitter and flutter and fuss! Such earnest protest from *Hirundo* when *Carolinus* grew intrusive! Such cheery congratulations when the coast seemed clear, and such triumphant bursts of song from the house-top when victory pointed on the banner of the lion!

There was a tree in the court-yard, where several "adobes" had their nests, no swallow, of course, and very few finches saw fit to nestle there; and from these, as well as from other similar receptacles, I extracted as many eggs as I desired—not, however, without protest. The birds reconstituted, of course, and had a perfect right to do so; but I also came under the ban of several of the noble autochthons of the establishment—those "forked radishes" which flourish on the soil of Mexico, grow to a height of five or six feet, acquire the dignity of a cucumber and scrape, and become distinguished for their dexterity in rolling cigarettes when propped up against the sunny side of a mud-house, and for the quantity of villainous tobacco they consume while waiting for the chances of a dog fight in the street, or missing on the luck they had the night past at three-card monte. "No enchido, Señor." Well, some people never do. Take, for instance, the following animated dialogue, addressed by a breathless naturalist to one of these "blanketed thieves," as I might call them:

"¡H! bamba! Hay rista vista a caballo yamosing along the camino with a couso so flame on his cahzan?"

"No entado, Señor."

"Confound a fellow who doesn't understand his own language!"

selves with apartments in the walls of the adobe buildings. Other pairs of the birds betook themselves to the trees along the acequias that led into the streets, and the surrounding thickets gave rise to the occupied cavities in the tall umbragous cottonwoods, which formed the bosque along the river itself. Thus, these touches of bright warm color gave life to the listless scene, and their endless snatches of song seemed like the effort of nature to bring discordant elements into harmony.

The burions were not conspicuous features of the scenes we next passed through in the toilsome journey to Fort Whipple. At this place, however, I was gratified to find myself again in company with birds very common there, and especially abundant during the vernal and autumnal shifting of the seasons, though resident the year around. But I missed the familiar demeanor they had acquired in the New Mexican towns; they seldom came about the fort, and were as decidedly *from nature* as the jays, woodpeckers, or other exclusive denizens of the forest. For Fort Whipple was something that only took a "local habitation and a name" in earnest when we built it, having previously consisted of few tents. The neighboring village of Prescott, capital of the Apache country, which had but a little while before been named Arizona, was but a mining settlement of a dozen cabins or so, and the "house" finches of the vicinity had not yet learned to adapt themselves to their changeful "conditions of environment." I found them anywhere and everywhere, sometimes in the heavy pine timber, but oftener on the scant-wooded hillsides, in the gulches half choked with shrubbery and seedy herbaceous plants, or among the aspens, willows and poplars that infallibly fall in each others' arms over the streams whose course they mark, in whose waters they rejoice. I here had ample opportunity to study *frontalis* in his pristine simplicity, before he had caught from contact with Mexican hoodlums the habit of bullying and teasing swallows; and I saw enough of him, in all his changes of plumage, from his leafy cradle in the trees to his grave in my collecting chest, to make me doubt that *rhodopis* is not my friend under a forced alias. It has certainly a coat of many colors, which it not seldom suits his whim to change.

More than year passed over my head at Fort Whipple; pleasantly in some respects, less so others; and the autumn of 1865 found me fretting with impatience at the delay of a coveted permit from Washington to pass on to other scenes. For that mysterious impulse which makes so many men vagabonds was still strong with me, and the spirit of unrest had not yet been curbed by experiences that have since taught me the sufficiency of "forty days in the wilderness." I longed for fresh fields, and turned my eyes with yearning toward the setting sun, which I wished once to see dip beneath a wavy horizon. With November came the year that was gratified. I had crossed the dreary alkaline desert that separates Apache-land from the fertile slopes and valleys of Southern California, and come down to the "Stilly Sea." At my back, snow-capped peaks aspired to the azure; at my feet, the broad bosom of the Pacific rose and fell in endless rhythm; I was in a garden that seemed like that of Eden in comparison with the scorching, biting sands of the desert so lately traversed. The air was soft and balmy as a May morning at home; vines and fig trees labored with their luscious loads, and the flow of the limnet's song, that music that melted with the current of my joyous mood. The place was beautiful indeed, but there in the offing floated lazily the steamer that was to bear me to San Francisco, whence my homeward voyage by way of Panama was to begin.

A few days were passed very pleasantly with my excellent friend, Dr. J. G. Cooper, whose name so often appears upon my page as that of a diligent and successful vohary in the cause we share. I saw many a bird to which I had hitherto been a stranger, and prepared the best specimens that my two years' wandering across a continent was to yield. Burions no longer, but "California linnets" then, were abundant in this region, and no less confident of man's good will than the adobe finches had become along the Rio Grande. They came about dwellings with all the heedless temerity of house wrens; they fluttered along the hedgerows that divided contiguous gardens and never hesitated to take their title of the fruits that hung so temptingly in sight. Much as I admired and enjoyed the birds, however, I could not but complain that the garden-hill region I was to leave, even to the extent of abusing the whole tribe and destroying not a few of them.

The variety of taste shown by the linnets in choosing their nesting places is remarkable. Dr. Cooper, whose opportunities of knowing have been ample, mentions so many of their vagaries in this respect as would puzzle the most ingenious wren to exceed. Speaking of the nests, he says: "I have found them in trees, on logs and rocks, the top rail of a picket fence, inside a window shutter, in the holes of walls, under the eaves or at the roofs, in haystacks and barns, in the interstices between the sticks of a hawk's nest, and in an old nest of the oriole. About houses they always seek the protection of man, as if quite unconscious of having made him their enemy. Heermann mentions also, as locations of nests, the thorny cactus and deserted woodpeckers' holes. The materials are usually coarse grass and weeds, with a lining of hair or fine roots. According to this same writer these linnets are easily kept in confinement, and frequently to be seen caged; and which, under the care of the bird-keeper, gradually fade. He tells us that they sing all the year round, and certainly those to which I listened in November were as cheery and voluble as ever they could have been in the hey-day of their tuneful lives.

Both Mr. Ridgway and Mr. Henshaw have given good accounts of their experiences with these birds; and both have likened its familiar ways to those of the European house sparrow. The former writer has been at the pains to note the varied situations in which he found nests in Utah and Nevada; and I have further to add, that this subject with one more extract: "Few birds," says this accomplished ornithologist, "are more variable as to the choice of a location for their nests than the present species, since it adapts itself readily to any sort of a place where safety is assured. At Sacramento they usually built among the small oak trees, generally near the extremity of a horizontal branch, but one nest was placed inside the pedunculous, basket-like structure of a "banging-bird" (*Icterus bullocki*); in the narrow gorge of the Truckee River, and in the mountainous regions of the Virginia Mountains, one was found inside the abandoned nest of a cliff swallow; along the eastern shore of Pyramid Lake numerous nests were found among the rocks, placed on shelves in the interior of caves, along with those of the barn swallow and Say's pewee, or in the crevices on the outside of the tufa-domes, while in the neighboring valley of the

Truckee, where there was an abundance of cottonwood timber, their nests were nearly all built in the low grass-wood bushes. On Antelope Island, in the Great Salt Lake, they preferred the sage bush, like the black-throated and Brewer's sparrows; in City Creek Cañon, near Salt Lake City, one was found in a mountain-mahogany tree, while in Parley's Park another was in a cottonwood tree along a stream. At all the towns or larger settlements, however, a large proportion of the individuals of this species have abandoned such nesting places as they were accustomed to resort to in the buildings, where 'odd nooks and crannies' afforded superior attractions."

Numerous sets of burions' eggs which I have examined at my leisure in Washington are easily distinguished from those of the Eastern purple finch by their smaller size and paler color, which seems even more fugitive, in specimens emptied of their contents. The average burion egg is near the minimum size of a purple finch's; though the respective measurements of the two kinds overlap. They are also more globular, as a rule, the difference in this regard remaining the distinction in the shape of the parents' bills. A fair specimen measures 0.78x0.59; a narrow one, 0.75x0.54; a small globular one 0.68x0.60. The ground color is decidedly paler than that of a purple finch's egg is usually found to be, and rather of a dull bluish cast than of the quite greenish tint of the latter. In the collection are several specimens which have faded so far as to be nearly colorless, but others, comparatively fresh, and at any rate as recent as some of the examples of *C. purpurus*, placed side by side, still show the distinction here maintained. While the character of the marking is the same in both species, the spotting of the eggs of *C. frontalis* is sparser, and immaculate eggs, or those nearly white-colored, are of more frequent occurrence. The full clutch appears to be five, but many sets of three or four are taken.

It only remains to consider the geographical distribution of the interesting bird before us, and that will depend a good deal upon how we take the species.

The typical *frontalis* of Say, as recently restricted by Mr. Ridgway's discriminations, is the bird which inhabits the United States, from the eastern foothills of the Rocky Mountains to the interior ranges in California and Oregon, but not to the Pacific slope itself. Both its northern and its southern limits of extension remain to be ascertained with precision. It is somewhat southerly; I doubt very much that it reaches our northern border in latitude 49°, and I have no adjectives of its presence in the interior north of the Territories represented by Colorado, Utah and Nevada. It touches our southern border; but where it ends in that direction I do not know. The bird may be found in different breeding or wintering in most, if not the whole, of the range here indicated.

The alleged variety *rhodopis* is stated to be confined to the Pacific coast region of California, and thence southward to Colima. Quotations of *frontalis* from this region are probably referable to this form.

Carolinus honorarius, which seems to be more decidedly different, is a purely Mexican form, which has never been found over our border, so far as I am aware. It appears to be identical with, and not the same as the *frontalis*, which Audubon figures for Say's birds, he having drawn an individual received from Mr. Gould, of London, and "reported to be from California." The *frontalis* of Swainson, and of some of Bonaparte's writings, cited as from Mexico, is also this form; though Bonaparte had the right bird before him when he originally described Say's *frontalis* in his "American Ornithology."

PINNATED GROUSE IN DAKOTA.

THIS letter dates from beyond the range of the pinnated grouse, the prairie chicken, or prairie hen so widely known and industriously pursued throughout many Western States.

These birds are gradually approaching us in our sportsman's paradise, away up in this "ultimate realm of the North," but there are none here as yet. We have, however, heard of them following the wheat fields to within fifty miles of us.

In two or three years our sportsmen will welcome them with well-trained dogs to hospitable points, "weshin birds and slaughterin' guns."

As you tell your readers, if you have any like the writer, ignorant concerning the matter, how long it is since the pinnated grouse disappeared from the great tract of half barren lands that formerly spread over the interior of Long Island. In my boyhood, say forty years ago, I snared and shot ruffed grouse in Massachusetts, Connecticut and Ohio. I never saw the pinnated grouse until I became acquainted with them in Michigan a few years later. They were not numerous there as compared with Illinois and States further West.

The occasion of writing to you for this instruction, results from a letter now before me, dated New York, Sept. 19, 1810, signed Samuel L. Mitchell, and addressed to Alexander Wilson, the well-known American ornithologist. The latter speaks of Dr. Mitchell as a well-known naturalist and scientific man of that day, to whom he had applied for information relating to the pinnated grouse. Wilson inserts in his beautiful volume, with Dr. Mitchell's letter, a handsome colored drawing of the pinnated grouse, and takes care not to have it confounded with the ruffed grouse, of which he also furnishes a life-like picture. The edition of Wilson I have to refer to was printed in 1832.

Dr. Mitchell says: "The birds are known here emphatically as grouse. They inhabit chiefly the forest range. This district of the island may be estimated as between forty and fifty miles in length, extending from Bethpage in Queens county, to the neighborhood of the court house in Suffolk. Its breadth is not more than six or seven miles."

The Doctor says further, that on each side of this range of the "prairie hen" was "the Long Island," that is toward the ocean and toward the Sound, "the subject with a margin of several miles in the actual possession of human beings."

Also concerning the grouse: "The region in which these birds reside lies mostly within the towns of Oyster Bay, Huntington, Islip, Southtown and Brookhaven. * * * Their territory has been defined by some sportsmen as situated between Hempstead plain on the west and Shinnecock plain on the east."

He goes on to say the "popular name of these birds is 'heathen' and 'heathen' is an amusing anecdote of a bill introduced into the New York Legislature in 1791 (for the preservation of heath-hen and other game." The speaker or chairman of the Assembly, when he read the title to the bill, read it "heathen and other game," and mistook it for a friendly measure relating to the Indians.

The law was made to protect the heath-hen from April 1

to October 5 of each year, and any persons having the birds in possession were liable to the penalty.

Dr. Mitchell proceeds: "The country selected by these exquisite birds requires a more particular description," he gives it as of mainly a sandy waste, with more or less dwarfish timber, and a soil more especially useful for making glass; but nevertheless, "within the towns frequented by these birds there are numerous habitations, and among them some of our most wealthy farmers."

In this region of sands, stunted trees, and "brusby plains." Dr. Mitchell was impressed with the idea, in 1810, that New York would find fuel for its fires and game for its tables, with recreation for its sportsmen for ages. I must beg room for his next paragraph.

"But within these same limits there are also tracts of great extent, where men have no settlements, and others where the population is bare and scanty. These are, however, by no means naked deserts; they are, on the contrary, covered with trees, shrubs, and smaller plants. The trees are mostly pitch pines of inferior size, and white oaks of small growth. They are of a quality very fit for burning." * The city of New York will probably for ages derive fuel from the grouse grounds. * Experience has proved that in the term of forty or fifty years the new growth of timber will be fit for the axe, hence it may be perceived that the reproduction of trees and the protection they afford to heath-hen would be perpetual, or, in other words, not circumscribed by any calculable time, it refers the persecutors of the latter would be quiet."

The poet Pollok preferred the amount of limited information in his day, who thought

"The visual line that get him 'round the world's extreme."

Your correspondent writes from the borders of this magnificent lake in Dakota, with its three hundred miles of shore line, teeming with water fowl, and in the midst of vast prairies abounding in game, more than two thousand miles from the court house that bounded one end of those "tracts of great extent" on Long Island—prairies so apparently boundless, that one can not go out of sight of his home to shoot without a compass, any more safely than one can without a compass go out of sight of his home to go to fish. He finds it difficult to realize that so late as 1810 New York, which then scarcely extended uptown so far as its post-office now is, was expecting, in the estimation of one of its scientific men, to rely on the interior of Long Island, "where men have no settlements," for pinnated grouse and the wood through "incalculable time."

While here in the far Northwest, we have neither the pinnated nor the ruffed grouse, and in considerable numbers the sharp-tailed grouse, a bird very closely resembling the pinnated, though not quite so heavy, a little lighter color in plumage also, and a little lighter color in flesh; the latter almost as white as that of the ruffed grouse, and of a deliciously gray flavor.

The sharp-tailed grouse is entirely without the neck feathers, that give names respectively to the two other varieties; the males and females looking much alike.

The bird lies very low, and when it rises goes off in a straight line like a shot out of a gun. It inhabits the driest plains, as well as the vicinity of lakes and ponds, and depends on the dew for drink. The sportsman who pursues it has to carry water for his dogs, and one or more flasks for himself.

The sharp-tailed grouse inhabits high northern latitudes as far up as Hudson's Bay at least, and west from Minnesota to the Rocky Mountains. It was little if at all known to our people until the first of Lewis and Clark's expeditions, and Wilson found the only stuffed specimen of it known to exist in any museum in Philadelphia. That was a female, and the same Dr. Mitchell, whom we have before quoted, mistook an imperfect drawing of it for a female ruffed grouse, and declared it to be an inhabitant of Virginia.

The sharp-tailed grouse is very highly prized by sportsmen here, but we are apprehensive of its gradual disappearance before the pinnated grouse, whose arrival in great numbers will soon follow the farmer with his broad stables of wheat and other grains.

This letter is longer than I intended. The writer is getting to be an old sportsman, and in deference to his old gun his signature is

PIN-FIRE.

CREEL CITY, DEVIL'S LAKE, DAKOTA, DECEMBER, 1883.

[We have known of a pinnated grouse being killed within twenty years near Isip, where the South Side Club has its house; but it was not certain whether this bird was indigenous or from an imported stock.]

ANOPLOPOMA FIMBRIA—(Pallas) Gill.

BESHOVE, COAL-FISH, HOUSE MACKEREL, CANDLE-FISH, BLACK COD.

THIS fish was first described as a species of cod (*Gadus fimbria*) by Pallas in "Zoographia Rosso-Asiatica," 1811, pages 200-201. It was referred, however, by Girard in 1838, and Günther in 1862 with some doubt to the genus *Merluccius*. In 1859 Ayres re-described the fish under the specific name *merluccius*, placing it in his new genus *Anoplopoma*, which he supposed to be nearly related to *Hottelina*. In 1879 Dr. William Peters again re-described the fish as a subgenus new genus and species to which he gave the name *Scophorobolus salmouiscus*, and indicated a relationship to both the mackerels and the trout. In 1863 Gill adopted the genus *Anoplopoma* of Ayres for the *Gadus fimbria* of Pallas, and, ten years later, he pointed out Peters's mistake and stated that the affinities of the species in question are with the *Clupeidae*, and more especially the *Clupeidae*.

The beshowe is related to the other well-known members of the *Clupeidae*, i. e., the species of *Merluccius*, food fishes variously styled sea trout, rock trout, starling, green fish, etc., etc.; 2d, the atka fish or atka mackerel (*Pleurogrammus monopterygius*); 3d, the cutlus cod (*Ophiodon elongatus*); 4th, several other less known genera, the species of which are not used for food.

The beshowe is found on our western coast, from Monterey northward to the Aleutian Islands. It is sufficiently common and little esteemed in the markets of San Francisco. In deep water, from Puget Sound northward, the species grows to a larger average size, frequently exceeding three feet in length, and fifteen pounds in weight, and it is considered an excellent food fish. We are indebted chiefly to Judge James G. Swan, of Port Townsend, Washington Territory, for our recent knowledge of the edible qualities of the fish. He states that it is highly prized by the Makah Indians, who have given it the name "beshowe," which is the most appropriate of the common names so far applied to the species.

The beshowe, when of about the same size as a common

mackerel, resembles the latter in shape and general appearance, but lacks the oblique dark bands. Its color is usually slaty gray, somewhat mottled with white, and the lower parts are pale. The fins are dusky, the caudal is edged with whitish. Large individuals, particularly such as Judge Swan has recently forwarded, from the deep water of Vancouver's Island, are very dark brown, sometimes nearly black.

The peritoneum is dark, but the flesh is white. When salted like cod it is said to be excellent. In this condition Judge Swan has recently sent specimens to the National Museum for trial.

According to Jordan and Gilbert the beshowe feeds on crustaceans and small fish. The same authors state that it is caught in rather deep water at Monterey with set lines and about San Francisco in winter with sweep nets, while at Seattle in Puget Sound it is taken from the wharves.

WHAT DOES IT MEAN?—Editor *Forest and Stream*: For the last ten years or more it has been my good luck to have the time each fall to indulge in my hunt of all hums—a one to four weeks' stay in the country of southeastern Ohio. Among almost every bunch of squirrels that we brought in we would find one to three females pregnant. I commenced to shoot Aug. 28 and stopped Oct. 26. It was the exception not to find a pregnant female in the bunch on dressing them, and the number of young was either three or four, always one of the two numbers. In my ten years and over of squirrel shooting I never found but one female who was likely to have a care of a family at the time of year mentioned until this fall. Does this mean an open, mild winter? So far the signs have been very favorable for an easy winter.—Geo. K. JENNEY (Marietta, Ohio, Dec. 11).

Game Bag and Gun.

AN OCTOBER SAIL FOR DUCKS.

A TRIP to the Berkshire Hills, taken for health, was certainly a pleasure; but with all its charm there came the haunting idea that the season for boating was rapidly flitting away, and if the state of the temperature in the attractive hill towns was any criterion to judge by, freezing as it did some two or three nights in succession, there must be a lot of innocent ducks far away on salt water just aching to be shot. So the little plan was made that an early return to the shores of Narragansett Bay would put in reach a pleasant sailing trip, with ducking as a motive, and a smiling moon to beam upon our efforts after "Old Sol" had turned in at the early hour he affects at this season. While our preparations were in progress the weather put on its most enticing ways. Summer seemed to have returned to stay, and the thermometer took a look even at 80. All nature seemed to say, "We are only waiting for you, this is the best part of the season for boating; come upon the gentle sea; be wafted by the soft airs; no equinoctial now, oh, no."

So everything being finally got on board our small craft at noon, we started. We being F. and myself, two condoling creatures armed for slaughter, with visions of more black ducks than we could possibly shoot, or perhaps give away. Our boat was a comfortable ketch, with cabin room enough for two; I ought to say three, perhaps, as a capital spud was one of the party, and without not to be overlooked. Slowly drifting out of the harbor with the gentlest of sou'wester, we turned before ten and were fairly on the road to our destination, some ten miles north, the last words of a friend on shore were, "Look out for bad weather. The barometer is falling, and this kind of thing is a weather breeder." That's what they always say when they have fine weather, I think to myself, can't let anybody enjoy it, try to scare them from taking comfort in the present. But it was hot; July this year could not equal it; no coat could be endured, even shoes were intolerable, and had to be discarded temporarily, the sun burned so hotly on our deck.

But night comes early; and long before dark we are at our anchorage in the lee of a long island, and there we have seen ducks before. F. determines to take in the bay of the land before dark, and goes ashore to interview one of the inhabitants, who is visible in the distance nowing. He soon returns and tells me that his interview with the afore-said brings to light that no ducks have been seen there for a year; but as his informant has lived on the island for eleven years without visiting a town but a mile away, I feel that a man of so little ambition to a poor degree of anything, perhaps he could not know a duck from a jawtie. His observation is strengthened, however, by a smart young fellow, who pulls alongside in a sloop; and so we decide to make sail again for another and better spot at once, instead of next day as was our plan.

We have enough daylight and reach our anchorage, where there is good shelter from all winds; and glad enough we did so, as the sky begins to look ominous. That falling barometer meant business. It is only for a few hours, however, we are to have a good breeze and decays; it looks for a desirable pond where our prey is pretty sure to seek shelter at night. Away we start, feeling fresh and full of enthusiasm. The decays are heavy, but what of that? We will soon have them where they will do the most good. But—where has that pond gone to? I thought I could find it in the dark. Down drop the decays, that pond must be caught before dark; and a rush up a hill, to where an extensive view can be got, hardly coming to rest, but a narrow track at the other shows itself half a mile further than I remembered it; and we grab the basket of decays and make a dash for it. It proves to be the pond hidden by a hill, and just as we set our decays the first "blackie" appears right over our heads. F. is at the decays, up goes my small bore loaded with, as I suppose, No. 6 chilled shot. Spang, I look for results. No results. What is the matter? I ought to have had him, he got nearly combed out, but a narrow track at the other shows itself half a mile further than I remembered it, and we grab the basket of decays and make a dash for it. It proves to be the pond hidden by a hill, and just as we set our decays the first "blackie" appears right over our heads. going to have another chance at those ducks, it will never do to go home without something to show. So here goes," and for he did, taking that a good breakfast for two is what that for me, though, but a good breakfast for two is what is most needed, and if this weather keeps on our provisions, water and even kerosene will run short. Both the latter are low. This would be weather bound with a vengeance. The sky, however, looks a little better. The sound of P.'s No. 10 bore gives promise of something, and I hustle about in preparation for a dead beat to windward, getting in my cables and putting in a reef. By the time it is about ready, P. appears loaded with decoys and a few ducks. I knock P. over at the last minute, as one might say. Up goes the sail, and the boat follows, and we are off homeward bound. A brisk sail of a few hours brings us back safe and sound to anxious ones, whose fears the heavy gale had roused, to be allayed by our appearance with substantial evidences of success. Thus safely and comfortably ends an October sail.

P. W. L.

THE WORK IN MAINE—1883.

FROM the "Report of the Commissioners of Fisheries and Game of the State of Maine for the year 1883" we extract the following paragraphs, which exhibit fairly well the work accomplished. The Commissioners are Messrs. E. M. Silwell, and Henry O. Stanley:

"We have this year been called upon to enforce a number of new and stringent laws, that may almost be termed measures, to the enactment of which the State was impelled to save the remnant of the game of the Commonwealth, both fish, fur and feather, from utter annihilation by poachers and market hunters, from home and abroad. The destruction of moose has been very great by Indians from the Province, crust hunting in spring, for hides. One party of Indians, in presence of a reliable witness, counted out forty skins; other parties were equally successful. These all went over the border to the Dominion of Canada. We have been credibly informed of three moose wantonly shot down in hot August weather by a party of whites (we will not class them), where even the trophies could not be pleaded as a temptation, as but one bore horns. Of other as flagrant cases, committed in the same region, we are in possession. This condition of this valuable game is greater by residents of other States than by our own, while arrests and convictions are mostly of our own citizens. The cause is obvious without explanation. Money, bribery, concealment of the trophies, to be brought out only in open time, by the suborned guides.

"The Commissioners have the will to enforce our laws to the bitter end, upon all offenders, but have not the power, both from restricted means and from other causes, of which we propose to speak further on. All new laws, like those given us at the last session of our Legislature, should be accompanied by a special appropriation for their enforcement. We should have been enabled to station a competent warden and assistants at certain portions of our State, to make prompt arrests and seizures of persons, weapons and outfits. To a limited extent we have done this, but were only enabled so to do by withdrawing funds, and expending money that should have been devoted to other branches of our service. The year's experience has presented to us some cases of poaching and violation of our game laws where the meanness and infamy of the acts seem to have been in almost direct ratio to social position, education and profession.

"The ability to bribe, to demoralize, has been freely used; in one instance offering \$500 to a hesitating guide who feared the State penalty of \$100. We would ask of our Legislature to add imprisonment to the penalty of infraction of our laws where bribery is proven.

"The laws of close time for our State are only such as a judicious farmer acts upon, and the most profitable management of his breeding stock, and are absolutely essential to their preservation. FOREST AND STREAM has well observed: 'Beast, bird and fish have seasons which nature has set apart for their vacation; men theirs, which are not fixed by any unalterable law. Which should be most respected?' The efficacy of all laws in correcting the habits of a people is dependent upon the facilities of enforcement afforded by speedy and prompt justice. Laws can be perfected only by the demonstration before the public of their faithfulness to their duty. We want no officer to judge of the popularity of a law to influence his fidelity to his oath in enforcing it. If a law is unjust, oppressive, let it be rigidly enforced, and give the public an opportunity to know it by actual demonstration and experience. Laws then if wrong, would be as promptly amended or repealed as enacted. Better laws would be the result in place of the present school for perjury. People would then amend their laws in place of persecuting faithful officers for refusing to prove to them their faults. By statute, our wardens are to look for their pay for service as State officers, chiefly to one-half of the penalty against convicted persons. At present through the means afforded us from the country trial justices to the bench, the enforcement of the law and the punishment of crime is as uncertain and precarious as a venture by lottery. The jurisdiction of a trial justice is limited to \$20. The penalty for killing a moose illegally is \$100, a caribou or a deer \$40. All these cases must go to a higher court, and we are therefore, by a grand jury, not being unsympathetic through ignorance. Our county attorneys are elected by the votes of the people; their salaries, as a rule, are entirely inadequate to the severe and important duties required of them.

"Final jurisdiction should be conferred upon police courts and trial justices for all violations of our game laws, regardless of the amount of the penalty. We could then obtain speedy trial and justice, while the parties would be protected against the gross expenses of the ordinary courts, which are equal to the penalty, even when the defendant is successful. For two years past moose have been largely killed in our State by aliens. Citizens of our State are obliged, of course, when in the Provinces to obey their game laws, which impose a license fee of \$20 or \$30 for the right to hunt or shoot. Much of our game is yearly slaughtered, much trapped for furs, etc., by our alien neighbors. Will not our Executive now exercise his influence to obtain such a law through Congress as will forbid the killing of our game by aliens throughout our domain, without a license obtained by the payment of a specified sum, say \$50? Our game law is now required on our Western plains, and would be applicable to the protection of every State and Territory in the Union. Maine has now the influence to obtain the passage of such a law by Congress, if it be exerted. The stock of moose within our State is still good, sufficient under proper protection to give an abundant supply of this most valuable meat-pro-

ducing animal. There are thousands of acres of land in the State of Maine that are forever unfitted to produce any other crop; if not venison, then nothing.

"The deer this year have not been as numerous as last. Had not the new law been put in force, they would have been all destroyed. Entire possession of the game of the State had been taken by a worthless class of men incited to its destruction by middle men, who reaped the larger share of profit. The honest, faithful guide will now be better employed than ever. The future will be brighter to him and to the true sportsman.

"The partridge or ruffed grouse is plenty in some sections this year, and very scarce in others. This is the history of the bird every year, from some cause independent of an unusual wet season, or severe crust following a heavy fall of snow, in which the birds will plunge for rest and security from the cold and thus sometimes get frozen in and perish; apart from this, unusual abundance in any one locality seems to attract the presence of a species of winter hawk, or else to perhaps some enemy of the quadruped family, that will fairly clear them out from that section, thus changing their abundance from place to place.

"Marketing game, of course, incites many to shoot who would otherwise follow some other calling. This is especially true of the grouse, and their exportation from the State should never in the future be permitted, as it inevitably would lead to their utter extinction. Many a worthless bar-room lounge, or petty saloon keeper, will readily buy his boys with a few dollars' worth of ammunition, that will be paid for in birds at ten cents apiece. There has been less exportation of our grouse this year than for a very long period. Although our market has been limited by the State law to only three deer, etc., yet that has exceeded in most instances their previous local sales to our citizens. Hitherto they exported and found it more profitable than to cut a saddle for their customers. As more venison has been offered within our State to house-keepers, the first impression has been that the number killed has been larger. This many have exceeded the prescribed number of three deer, we have no doubt; we entertain as little doubt that all these violators of the law will be picked up and punished by our faithful wardens sooner or later. The exportation of our partridge has been confined most largely to Portland, whose dealers have advertised largely in the back towns and solicited for consignments to be sent to and forwarded by them."

"Dr. S. B. Hunter, of Machias, reports that in Washington county several poachers have been brought to justice. The following cases were secured: Boah, Gillette, killing deer of crust, \$40 and costs; M. W. Flye, possession of game, \$100 and costs; Daniel Dunbar, killing deer with dog, \$40 and costs; Virgil Richards, killing deer with dog, \$40 and costs; and Dunbar and Richards were fined \$10 each and costs for killing woodcock on Sunday. He adds:

"Warden L. O. Hill has shown great interest in his work and has the confidence of our best citizens. He certainly has done good work, and I hope we may see him in the future as an active game police, for which service he is well fitted."

"The year of 1882 was the most destructive of game of any for years. Market hunters swarmed into our woods from all parts of the State and Massachusetts, broke over all restraint of law and decency, used dogs, crust hunted, and even shot the does upon the barrens in April. The frequent light snows of November and December gave the pot-hunters immense advantage. At the close of the open season of 1882 the prospects were dark for the future, for his work of 1882 was nearly destroyed in a single season. The great success of these poachers promised to add ten times their number for this season. I was discouraged, knowing from a long experience in this region the basis for game in Maine, that market hunting and game protection were largely incompatible, and that it must be checked or our large game would be exterminated.

"Our Commissioners proposed that sportsmen meet in August. A few of us responded, but our city friends did not. I do not as yet feel inclined to believe them selfish and not in sympathy with us, thinking perhaps they would like to hunt the game, and we, country chaps, do the work of protecting. We did the best we could to make the Legislature understand what we needed, and the result was our present laws, not perfect, but effective. Let us find no fault, but use the tools we have until the time comes for change, then let all interested meet at Augusta, as proposed by Commissioners, and improve them if we can. Our new law is a success, it has stopped the market hunting, and is gaining in favor daily. It has proved more of a success than his friend is dared to expect.

"However inconvenient the law may be to sportsmen not living in the vicinity of game regions, it must be remembered that this crowd of poachers require severe measures, and that we must consult the interests of all. We can watch and see what changes can be made at the proper time. One thing is sure, the law must be enforced or be such that it can be. The sportsman living on the border of the game districts is the man who is expected to watch and work and he must have an effective law, for these fellows do not yield to straws but require stones. Our market hunters are a peculiar class of hoodlums, made up in great part of men without an occupation, and among them we find the skeddaddler, snagger, thief, frog, and lazy squatter who lives from what lumber he can steal, berries he can pick, fires he can fight after setting them, or anything else save honest labor. The middleman is the prototype of the city pawnbroker and junk dealer. He buys at any time what he can sell at a profit without regard to the law or to decency, and nothing but the most extreme measures will restrain him. These men are wonderful expounders of the law, and are ever sure to find them unconstituted when they in the least interfere with their pockets. Market hunting is a nuisance; it destroys by a few what belongs to all. It encourages idleness, lawlessness and is a school for vice. It is not, nor can it be, a respectable business. There is not a market hunter, or middleman, in the State who is at heart a protectionist. They all hunt for pay at any and all seasons, and they are the parties that give so much trouble with their dogs, net snarls, torches, etc."

"Our fish and game are a great attraction for the majority of our State as well as all New England, and if properly protected, will prove a source of revenue, both directly and indirectly, and an unlimited source of health and pleasure to all. To suffer it to be destroyed by the merciless pot-hunter would be the mistake of the age."

Mr. H. R. Taylor of Machias, writes of the present law:

"It is steadily doing a good work. It is awakening our people to a better knowledge of the wealth and the privileges contained in our streams and forests. It leads to a better

appreciation of those bounties and blessings, the best interests of the State, its just pride and heritage. More than this we are enabled with free yet prudent hand to share all these with our friends and fellow sportsmen. A square, restrictive law commands respect. Too broad license will always be denied and violated. Among us, those who last year secured the law cherries through the winter and spring months, were with some few exceptions men who had derived the full privileges of the open season. They had enjoyed the greatest latitude, they rebelled against the first check. Having killed their dozens or scores of deer each, they were unwilling to be restrained when the close time arrived. They personate lawlessness in everything. They are ready to shoot the mother duck or partridge from her callow brood, cut the throat of a gravid doe in March, steal knees and sled-crocks from other men's timber, set fire to pine lands and rob lumbermen's camps, drinking and boasting "that law cannot reach them in the woods."

"If our sportsmen in this or our sister States think our law too exclusive, let them consider the class with which we have to deal and against whom we have to legislate. We have found no barrier against game destruction so effective as the transportation amendment. That and the general acquiescence on the part of carriers to sustain the interpretation, has almost completely stayed the shipment, and as a sequence the killing of deer and grouse. It is easy to observe the difference.

"This year 'Obello's occupation's gone.' The shiftless cabin dweller, the lazy loafer and the school-despising hoodlum, has had, this autumn, no fifteen cent premium to encourage his expenditure of time, of bodily effort and ammunition toward securing a luckless grouse, which he never wanted for himself or family, but, by its sale for shipment, did partly keep him in tobacco under the old dispensation.

"I believe, too, that the present warden is the right man, and while some and I fear that the game law could not with its present features be enforced by an officer, let our court records testify (with others in the State) that it is enforced and that evil doers are weakening every day."

"Detective C. M. Wormell gives a list of parties with whom he has had to do in 1883, and the offenses for which they were indicted. There were twenty-one separate cases, and indictments were found against thirty-eight individuals, as follows:

- William Perkins and A. Davonport, of Gardiner, Me., for killing two moose at King and Bartlett lakes.
- Robert E. Frank, A. French and Robert E. Metcalf, all of Boston, for killing one moose in Franklin county near the town of Eastville.
- Clifton L. Wing, Daniel Hunt, both of Boston, for killing one moose on the coast.
- John Phillips, of Eastis, for killing one moose on Spencer Stream.
- Dr. C. B. Porter, Albert E. Porter, both of Boston, and Joseph St. John, of Eastis, county of Franklin, for killing one caribou on Baker Pond.
- Frank Smith and John Smith, of Worcester, for killing deer near Eastis.
- David Bagshaw and William Edmonds, for killing one moose on Rugegeus Stream and one caribou killed on Soaper Brook.
- Joseph St. John, of Eastis, for killing one caribou in Franklin county.
- George Polke, of Great Woods, for killing two moose on Ragged Stream.
- John Nicholas, Thomas Nicholas, Andrew Nicholas and Joseph Nicholas, of Greenville, for killing moose in Somerset county.
- Paul Peters, of Oldtown, for killing caribou on Chesunook Lake.
- Thomas Gray and Suple Jack, for killing one moose and two caribou on Pine Stream, near Chesunook Lake.
- Michael Burni, of Kineo, for killing one moose near Chesunook Lake.
- Samuel Hilton, of Chesunook Lake, for killing two caribou on Chesunook Lake.
- C. C. Westcott, of Worcester, Mass., for killing one deer on the Megalloway River.
- Charles Bancroft and Edward Bancroft, of Philadelphia, for killing one deer on the coast.
- Henry Hartwell, of Lewiston, for killing deer in Oxford county.
- George Atwood, for killing four moose in Piscataquis county.
- Leander Samuel, of Eastville, for killing one moose and one caribou on Mount Chase, for killing three moose in Piscataquis county.
- Samuel Emms and George Emery, of Norway, for killing three deer in Norway.
- Lucrezio Linnett, of Macleavel, for killing deer in Oxford county.

A FLYING TRIP TO VIRGINIA.

AT Thanksgiving time Mr. J. J. P. and myself and son, that three years old, took a flying trip to Virginia, the original object of which on my part was to "teach the young idea how to shoot." My friend P. had a newly broken pointer of fine breed which he was anxious to try. We left Jersey City on the 9 P. M. train Wednesday, and got to Petersburg at 1 P. M. next day (Thanksgiving), after a very pleasant trip. Travel has been very much improved over this route since my last visit eight years ago. The Coast Line, as it is called, runs a buffet car through to Savannah, new and clean and well appointed, with a polite porter over board, and every one will admit that a polite, sleeping car porter is a *novus ordo* anywhere. So we were in a measure independent of the wayside hash mills when fifteen minutes for refreshments was called.

At Petersburg we were met by my friend Mr. C. (a true Southern gentleman with all the proverbial kindness, who had made all arrangements in advance, and we were soon on the road, with two teams carrying all our traps, and three fine setters belonging to our Petersburg friends. After driving a few miles to the east, and past the old lines of Federal and Confederate earth work, still plainly showing in all directions, we came to quail country, and made three stops where there were coveys, finding not less than one at each halt. This was the result of having a good sportsman to guide us, or as he aptly expressed it in a letter to me beforehand, that in case he could not go with us, he could easily send a man to show us the country, but that was a different thing from showing us the birds. I do not propose to tell you how many birds we shot at and how many we missed, for it is not a record to be proud of, but I will say that we could have gotten, if we had been good shots, from one hundred to one hundred and twenty-five birds during our stay, while we got a little less than half simply from poor shooting.

At night we reached Prince George Court House, where we were to put up till Sunday at the hospitable home of mine host Temple, the county sheriff; and were soon made comfortable, and our dogs locked up in the county jail over night, lest they might be among the "lost, strayed or stolen" in the morning. The jail was a curiosity to us, being a wooden building, but made of heavy twelve-inch timbers laid close together, and being made stronger than it seemed. One old darkey imprisoned there, who was crazy on religion, waked us up in the morning, singing at the top of his voice. Sheriff Temple has a very interesting family of children, the oldest daughter Mary, only eleven years old, being a model little house wife and deserves kind mention.

After a good night's rest, we were off in the morning as soon as the frost began to disappear, and with the two

teams drove a few miles toward the river before beginning to hunt. This seems to me *par excellence* the way to hunt quail when the birds are in different localities, as we were able to hunt over twenty-five to thirty miles of country in a day, driving from place to place with the dogs in the wagon to rest them, and getting out wherever birds were known to be; we certainly found plenty of them, and good big fat fellows they were, and strong enough to fly fast, as we sometimes found out. The most of the shooting is done in the covers are generally in some open place near a bramble thicket, or old deer run, and when flushed they plunge into it at once, where they lie close, and it requires good dogs and thick clothes and gloves on one's self to get them, and quick aim when you find them. Good dogs we certainly had. For Carlo and Don, belonging to Mr. C. and his brother, and Scout, loaned by a friend, were marvels of training and keenness of scent. Some beautiful work was done by them, one particular sight I remember, when they all stood on a covey in the open, each on a different side. (Thus we passed our two days, and had we been as good behind the gun as we claim to be on a boat, we should have had a goodly bag; as it was we ate a good many at our meals, and our quantity to bring home (about two dozen) was so small, that we have had to stand some chaff.)

Near the river the country about here is very pretty, and to my eyes the wheat and peanut fields were an interesting sight. The weather about the shooting is not very bright, and clear but hazy days, and I think in such weather the climate of Eastern Virginia is unsurpassed. The numberless varieties of all ages and description were very amusing, especially when driving the popular rig, a "steer kyart" (steer cart). One old grizzly-headed "mammy," smoking a pipe, who came out of her cabin to try and call her dog in, amused us very much crying out, "Hyere, you, sah! don't I done telt you come hyere?"

Saturday night our shooting ended, and on Sunday morning we drove comfortably back to town, and after dinner had a look around at the objects of historic interest, among others the celebrated "Craze," which was a Confederate fort mined by the Federals and blown up, and where Mahone made his reputation by coming out from Petersburg with reinforcements and driving back Grant's men, killing so many of the colored troops. We left Petersburg at 5 P. M., getting back to York in time for breakfast on Monday.

One thing more of interest I might tell you is, that rail shooting in September on the marshes lining the James River near here is very good, and a good shot can kill from twelve to eighteen dozen of them at a tide. I propose to try this next fall and see if I can practice enough to get my hand in. E. A. W.

THE NEW YORK GAME MARKET.

(Reported for the Forest and Stream, Dec. 29.)

THE first of January and the end of the open game season in the New York market finds the stalls heaped high with all sorts of land and water fowl, while of venison there are hundreds of hunches which will disappear as if by magic from the public view, but which may be had by the trusted caterers only under another name. The dealers in this city have become, it would seem, as shy as their own stock in trade, and a visitor who asks questions is not given any warm welcome at the stands of the game dealers. Recently there has been a great deal of talk about the markets since the falls of snow have permitted their ready tracking, and the supply of game of every sort has grown for the last few days to meet the holiday demand for toothsome table delicacies.

"We have had," said Mr. Hart, of the firm of Robbins & Co., "a very good game season as to quantity, but the prices have ruled higher than usual, owing to the warm weather which we had during the earlier part of the season. At that time enormous quantities of game reached us in spoiled condition, and we were compelled to throw it away as unmerchantable. This stock came from Indiana and Illinois and that section. Lately we have had no trouble from this source, and the game is coming in very nicely indeed. The demand has been good for really good birds. In fact, it always is in New York, and so with the diminished supply we have found it easy to get good prices. There have been no special features of other produce, thousands of rabbits, a great falling away of old sorts of game, nor the coming in of new stock, unless we so call antelope which we are now getting, and of which we had the first lot last year.

"It is a pity to see the law step in against venison just now, when we have two good venison months before us. January and February are really the right months to market venison, as it comes then in good shape and can get to table in the very best condition. Still, the law is there, and we can only obey it, not letting any of the deer meet in our possession after the 1st of January.

"No, I don't look for any legislation at Albany this winter; that is, I don't know of any schemes on foot; but it is very hard to say, indeed, what new notions somebody may have to carry out. It is bad now and might be made worse. It is almost hoping too much to expect any improvement. The spies will be round, I suppose, looking for game which would come under the law, but they must be sharper than they usually are, and not take any longer for fools, as they did with us last year, and be able to distinguish between mountain grouse and partridge, which they were not able to do last year. What we want is a sensible law, where the interest of all will be protected. The game supply is a big interest and involves the use of a large capital, and we game dealers do not care to be looked upon as law breakers and regarded with suspicion as always trying to do what is prohibited by the statute.

"The holiday demand has been a very large one, and we have been kept very busy. We have good ice houses for keeping our stock in, and so are able to have a sufficiency to meet the rush at this time. After we once get the game here in good condition, there is no trouble about keeping it in good shape, but the heaviest losses come in birds spoiled on the railroads."

In dozens of small commission houses about Washington Market or in houses where game only comes as an accompaniment for shipments of other produce, thousands of rabbits and hares and feathered game may be seen, while the buyers for the larger hotels and restaurants, or uptown private markets, look about and pick up lots at very moderate rates.

Knapp & Van Nostrand are regarded as the heaviest game dealers in or about Washington Market. They receive the special attention as a representative house of the agents of the game protection societies. Information was very generously given and the disposition seemed to be to refer any inquiry into the manner of conducting business. It was stated, however, that the season had been a good one, looked at from the dealer's standpoint. Game had come in from

all quarters in the most abundant quantities and generally in very good shape. A sharp eye was cast at the questioner when snared birds were mentioned, and a general denial of any such game being in possession was made. It is a conceded fact, however, that purchasers who complain of the mutilation of the birds by shot can easily find dealers who will produce another lot where the shot have in some mysterious way, best known to the handlers of game, been snared and freed from the dead line. Yet a questioner who inquired of the illegal snare-net is pool-poked at once and it is always the fellow over the way who has this description of bird in his possession.

FORTY-FIVE WASTED SHELLS.

WE are camped on a stream which rises in the Gore Mountains, and runs to the Blue, the whole distance being about six or seven miles. It is made up by two small branches, which join about three miles from the mouth, and between the two branches is quite a basin of small forks and small patches of aspens, which look like bare poles, the leaves having fallen. Ed. and I went hunting about a week ago, and took the morning of the month of December. Following a trail, and while whistling which way to strike, we saw six or eight deer come out of the pines, and go to feed in the aspen. We slipped back until out of sight of the deer, and stole up a slight gulch until we reached a bunch of pines, when we took up our trail, Ed. to the right and I to the left about six feet apart. We did not see the bunch of deer, as they had fed about two hundred yards further on, and we could not see them owing to a rise in the ground. When we were just stepping in the open, a fine doe got up and stood looking at us about sixty yards, when Ed. scored a clean miss. The doe took the trail of the bunch, and Ed. ran on the deer trail to get a shot running, while I ran to the left expecting to catch them as they ran up the hill for the pine timber. Ed. first saw them while in a little hollow, and scored a miss and yet another. They ran past me, and I scored a beautiful shot.

After that we struck for the north branch, hoping to see some antelope. We ran across a very fresh track of a bull elk, but we did not want him, too poor after running. The antelope were where we expected to find them, but had taken the trail when we commenced firing, and had left only very fresh tracks and sign. One of our party having been promised a jack rabbit, we decided to get him one, and to that end started down the left side of the north branch of the stream. We had gone about twenty yards when we jumped a jack, and after a few feet got up when Ed. missed him by shooting too low. As he was going away I shot and took off an ear, and for a couple of miles we saw jacks in plenty and in easy distance, Ed. shooting too low and I too high, though we had the best of rifles, and had previously done good work with them. Just before crossing the stream to cross to the south branch, we saw a jack in the trail about a foot or about thirty feet, Ed. says, "I will close and shoot," but shot and never touched a hair. I told him to see me do it, when I stepped a few feet (the rabbit sitting up all the time), and wasted lead, for I never touched it. We stepped across the stream, and had not gone over thirty yards, when we jumped two deer out of a very small bunch of sarvis berry bush. Ed. thought he could see an opening on one, while I should take the other in the open. Ed. fired and missed, though only twenty steps off, and they both ran and kept the brush between us and them, so we did not get in any more. We went to the south fork and followed it up to camp, and got in after dark. Forty-five shells emptied, and not a bullet found fair.

The above is just as it occurred, and when we got in camp the boys could not be made to believe we had such luck. A little snow on the ground, cloudy over head, and no too cold, just such a day as when a man should be best. We had a great many antelope, and the rabbits up to forty, but above I will send an account of one of our successful hunts.

RROX.

IN CAMP, MOUTH OF THE BLUE, Colorado, Dec. 6, 1883.

GAME IN NEW HAMPSHIRE.

NOTWITHSTANDING the unfavorable weather for sporting this fall, more interest than ever has manifested in the use of the gun. There are about twenty-five fine breech loading guns (not to count the many muzzle-loaders still in use), and many valuable dogs owned in this vicinity; and every day parties are scouring the country over in all over the foxes and partridges. It is the same here as it is all over the country; sometimes good boys are more than their own luck, and on account of the game changing from one piece of woods to another. If we are lucky enough to strike the piece of woods that the game happens to be in for that day, then is the time that the good bags are made. But, as a general thing, the empty pocket rules. We think that if the sportsmen would study the habits of the game and learn by their own observation the different kinds of food which is most sought after at the season changes, then they could themselves posted on the places where such food can be found, they would find that better bags will be the result. But still every one likes to make his story good on his return from a hunting trip. He wishes to make people believe that he has done something, when in reality he may have done nothing. It is often amusing to hear the ingenious stories told by the disappointed ones. But when good luck goes with them and they come in with a good load of game, the road is none too wide for them.

Some two weeks ago two brothers killed two large foxes, one partridge and one white rabbit. They were out about one-half day. Yesterday two other fellows went out foxing; were not out over two hours, and returned with two beauties. These are the best records in foxing for the season. Squirrel shooting has been a failure this year; we have never known them to be so scarce as they have been this season, although a few have been killed. Partridge shooting is unusually good, and considerable numbers have come to my gun. This is my favorite sport, "combined with squirrel hunting," but owing to a press of business I have been able to go out but a very few times this season; but did not come in every time with an empty pocket.

During the shooting months we have many visitors from Boston who come out with their fine guns and trained dogs, but with all their pretensions they are not satisfied with a man who had been out with some of them (who, by the way, is a good shot himself) that they did not average more than one bird in ten shots.

The weather is coming cold now, and not much more shooting will be done until the snow comes, which is

anxiously looked for by the fox and rabbit hunters. We hope to be able to send you a favorable report of their doings when the time comes.

We should be pleased to find an account of a good squirrel hunt in FOREST AND STREAM, and hope that some one of your many contributors will favor not only us, but many others who favor sport it is.

NEWARKET, N. H., Dec. 3.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

"Greenhorn's" views and mine are not so widely divergent as I had first supposed. But I am afraid they are irreconcilable upon one or two points, chief among which is the utility of repeating rifles for hunting purposes. Upon this they are diametrically opposed. While I admit that for heavy game repeating rifles fail to carry the necessary amount of powder and lead, yet insufficient as they may be, I respect their possible advantages in the rapidity of loading and extracting of shells which makes them preferable to those which carry only a single cartridge.

I fully appreciate the force of "Greenhorn's" objection to the proposed repeater of 40-90 pattern, but I cannot at present concede it to be valid. All that I desire is that a rifle of this description be subjected to a thorough test. If it fails to stand the racket that I will be disappointed, that is, unless the primary consideration is of course, that it be safe, for that is the *sin qua non* of a sporting rifle.

I am thoroughly in accord with your correspondent when he says that he prefers an occasional loss of a head of game to "the chance of loss of his own." This is beyond question sound, and I have always had a dread regard to some such sentiment in my selection and use of rifles.

As to the danger involved in the use of repeating rifles by the bursting of shells, weakness of the breechwork, etc., let me give my personal experience. I have owned four repeaters of lever action. It is only due to them to state that they were all of Winchester manufacture. I have certainly at the lowest estimate fired out of them several thousand shots. Rarely, however, have I shot with the slide closed. This is a caution which I think should be heeded. I have never had a shell to burst in them, nor have I noticed any bursting of shells, or evidence of weakness in the machinery of these guns in consequence. All were of 1876 model; two 45-75 and two 45-60.

I have known the bottle-necked shell of the 45-75 to burst upon several occasions in rifles similar to those owned by me. This was due in one case to a defect in the chamber, and in other cases it happened only when the shell had been reloaded a number of times and had been worn thin in consequence.

The shells always burst at the bulge or shoulder, leaving the smaller part in the chamber; beyond the trouble of getting this out, there was no inconvenience caused or injury to the gun in consequence. For this and for other reasons, such as its greater liability to stick in the chamber, unless kept very clean and bright, the greater recoil occasioned by its use, and the effect which it seems to have of throwing the gun up and off the game (especially objectionable in a repeater), I have ceased to use the bottle-necked ammunition and prefer the straight shell at the loss of 15 grains of powder.

I must confess that I think there is something in the theory that the former by reason of the confinement or retardation of the force due to its shape, shoots harder, sends a ball quicker, and therefore gives a flatter trajectory than the same charge out of a straight shell. Still, I consider these advantages outweighed by the disadvantages referred to in a repeater. I have owned a 45-75, I purchased a 45-80. The stock of this having proved to be rather too long for me, I got the same rifle, 32-inch bore, with stock stock. This rifle I now have.

With neither of these guns have I ever had the slightest difficulty. I have subjected them to very hard and rough usage, extending over a period of several years, and find that they work to-day as satisfactorily as when I first got them. The machinery of a rifle of 45-75, I purchased a 45-80. The stock of this having proved to be rather too long for me, I got the same rifle, 32-inch bore, with stock stock. This rifle I now have.

With neither of these guns have I ever had the slightest difficulty. I have subjected them to very hard and rough usage, extending over a period of several years, and find that they work to-day as satisfactorily as when I first got them. The machinery of a rifle of 45-75, I purchased a 45-80. The stock of this having proved to be rather too long for me, I got the same rifle, 32-inch bore, with stock stock. This rifle I now have.

As far as they go they are perfect, and extremely satisfactory, the proportion of powder and lead (160 grains and 300 grains) is just about right to give good penetration. I have shot grizzlies, moose, and many other very considerable animals, and I have shot deer and the like with them. I find that in running shots I have been much more successful than with the 45-75, since in rapid firing I can hold this gun nearly on the game, which I could not do with the other, because of the recoil and upward tendency given to the rifle by the use of the bottle neck shell (I can think of no other reason). But while I like my "Kitty" (45-60) and rifles of her pattern exceedingly, as long as they go, yet they do not go far enough.

While according to my present knowledge and belief there is no more satisfactory rifle for deer, sheep and even elk within 200 or 300 yards (ordinarily outside game distance, not only because of the difficulty in hitting at all, but also because of the fact that one ought to be able to get within that distance unobserved), and no rifle which is open to less objection except on the score of rather high recoil, or consequent annoyance and liability to miss by reason of frequent adjustment of sights. I regard them as much too light for heavy game such as buffalo and the elk.

If the charge was increased to 80 or 90 grains of powder, the results I think would be more satisfactory. But then, having been entirely cured of my penchant for big bores, I have a sneaking fondness for the small 40-caliber. For a single shot, no rifle which I have ever tried performed its work as satisfactorily as a 40-90 Sharps, using 40 grains of powder and 60 grains of lead.

Now what I want is a 40-90 repeater, and I have already at some length endeavored to set forth the merits of such a rifle.

To repeat my position is briefly this: Given a repeating rifle, safe and easy of manipulation, such shot out of which is as effective as a shot out of a 40-90 Improved Sharps, and we will have the very best rifle for hunting purposes.

Why, it may be said are you not satisfied with your 60-grain Winchester? If you were going to shoot only deer and like small animals I would be perfectly satisfied with it, but for the heavy game of the West I want more powder and more lead. I have killed with these 60-grain Winchesters a large amount of game, and have never had an accident of any kind. I have killed with them such game as heavy buffalo bulls, several grizzlies (more properly silver tips) and a considerable number of elk. But notwithstanding, I

would have been more successful had I been using heavier charges. Of course such game can be, and is killed with these and much lighter guns.

Many thousands of buffalo have gone down before the '73 model Winchester, and even the old "muzzle stuffers" of early days. The largest Sierra Nevada *bona fide* trophy I have seen is a single shot from a '73 model Winchester. The bullet struck him in the breast (he was sitting on his haunches) and going through, broke his back. But still, in tackling these or any Rocky Mountain bear other than the black and the brown (for with these exceptions they are all apt to prove ugly customers, and I am willing to confess to at least a very wholesome respect for them), I want every possible advantage, and therefore the best and most effective rifle made. Even then I am not particularly fond of shooting at them, unless the position be favorable and my hand steady.

As can be readily understood, a good serviceable repeater for a bear fight is of great assistance and vastly preferable—especially if it has to be conducted at uncomfortably close quarters—to a rifle, no matter how good, which carries only a single cartridge. If the first shot miss, the second is ready in an instant of time. They have saved more than one life which would have been lost with a single breech-loader. But it is not only for bear shooting but for all larger game that I would have the proposed 40-90 repeater. Every one who has done any large game shooting has probably seen the remarkable instances of the difference of vitality in animals of the same or of different species. Some will fall dead from a shot which another would carry for hours. I have seen aldehyde exhibit more vitality than some bear, some bear more than others, and so on. Notably is it the case with buffalo. Some will stand an almost incredible amount of shooting. I know of a bull that was shot through nine ribs with a heavy Sharp's before he came down; most of them were behind the shoulder at that. He received the last five or six with stoical indifference, having braced himself as he received them; finally he rolled over, dead. I knew by another to go for a mile or two shot with the same rifle clean through both lungs.

I have always thought that the mental condition in which the animal was at the time he receives the shot, has much to do with its effect. I have frequently proven this to my satisfaction. If the animal is very much agitated, or in some cases very much scared, certainly in the former, he will take more shooting than if surprised by the lead while in an tranquil and quiet state of mind. But I digress. I simply refer to this because we wish to get hold of a convenient gun that will kill them in whatever frame of mind they may be. If there be anything in this theory. You might as well all shoot at an old bull buffalo going dead away from you with a pop-gun, as with a 60-grain or 75-grain Winchester. In such a case it is not very probable that you will get your buffalo, unless he changes his position, but it is more than probable that you will with a 40-90 or 45-125 Sharps. Now let it be tested and determined whether or not can be made a repeater of exact manipulation, and as safe as the 60-grain Winchester, and as effective as the 40-90 Sharps. I am only voicing the opinion of some of the most experienced hunters I know, in saying that this would, in all probability, be the rifle most adapted to hunting purposes. As to weight, even supposing that it be necessary to have the breech work made stronger and heavier, I do not think that this would exceed at the outside 14 or 12 pounds. My 60-grain rifle, with full magazine, weighs 11½ pounds. With a 32-inch barrel ought to carry at least seven cartridges in the magazine, which makes it quite sufficient for ordinary hunting purposes.

If it be found that the repeater cannot be made which will stand this heavy charge, well, there's an end on it. Certainly, however, a repeater can be made of the 40-70 pattern. This compromise would be far in advance of any repeater now in the market.

The best and most successful skin hunter I have known and most skillful stalker, used a 40-70 Sharps, and would use nothing else. He has killed with it twenty-six elk in one day, twenty-eight in another. When he was out alone and alone, he states it was foolish not to profit by his profound knowledge of everything which pertains to the art of shooting large game. I personally have learned from him many "points" which have been invaluable to me in my pursuit of game.

I take this opportunity to express to "Greenhorn" my appreciation of his kind offer to send me a .45-cal. express bullet, and to thank him for the same. I have forwarded to him through you my address. It is rather strange about this, for it was of these very same rifles and lot of bullets that I buy.

A friend of "P." who has hunted with him and who regards him as next every one who has known or heard of him) as one of the most thorough sportsmen in the West and certainly the most successful bear hunter, is my informant. He stated to me that "P." had used the .40 or .45-cal. hollow pointed bullet upon bear with excellent results. As I understood it was with these that he made the truly remarkable score of seventeen bears in seventeen shots. This is a kind of argument which cannot be disregarded and will sometimes convince a man against his will. I try to do my best estimate, but it will take a good deal to convince me that a single or double express is better for game shooting than an effective repeater.

In repeating rifles the express principle, so far as I have seen it tried, is a failure.

A Winchester .50-caliber express using the hollow-pointed bullet was most unsatisfactory upon game; with a solid ball the practical results were much more satisfactory, but still the caliber is too large to my mind.

I really have written very much more than I had at first intended and am afraid I have let my pen run away with me. I plead in extenuation my great interest in all that pertains to legitimate sport, and a desire to make myself clearly understood, since I have gone this far and have the blame resting upon me of having raised this discussion.

One word about sights. These are quite as important as a good rifle. With regard to these nearly every one has an idea of his own, because I suppose of the very great difference in eyesight. My advice is to have your rifle sighted for 125 yards—with any good sight—to practice entirely with this, and under no circumstances use any other, no matter how good a sight it may be. I try to experiment with this. The result will be that in the end you will be able to do good and entirely satisfactory shooting with these sights, no matter whether others can or not, and certain it is that you will be able to do much better shooting than if you had been in the meanwhile experimenting with a dozen new styles of sights. Cooper's sights (Bozeman, M. T.) are very good, and Freund's patent sights (Cheyenne, Wyo. Ter.) are excellent. I have seen, however, a great deal of most excel-

lent shooting done in the field with a plain, old-fashioned bead and V-shaped notch.

While presuming to give advice at all, let me add that which I have been taught to consider (unfortunately not to observe) a cardinal rule in shooting at all game with a rifle, which is indubitably sound, is: "Reserve your excitement until you have finished shooting. Take plenty of time (you generally can have all you want), and never shoot quickly unless you must."

With due appreciation of what I have just written, I somewhat diffidently submit the following diagrams, which will briefly explain a combination of sights of my own and which I have used with great satisfaction, and with which I have been especially lucky upon running game.

Front sight, bead shape; blued; pin of platinum driven in bead; (a) front view; (b) side view; 7/32 in. in height.

Rear sight on barrel; blued; showing platinum line in center; with notch; (a) front view; (b) side view; extreme height, 9/32 in.; extreme breadth, 9/32 in. The object of this sight is to enable one to more readily find the center of the globe.

Rear globe sight on small of stock, Lyman's patent with rim slightly enlarged, and large aperture slightly decreased in size.

Appearance of three in conjunction, and as used. The head is supposed to be the exact center of the globe and on a level with ears of No. 2 and the slant of No. 1, to find a continuation in platinum line of No. 2. It amounts to the same thing almost as having cross hairs.

The combination is not nearly so complicated as would appear; in point of fact it is extremely simple. It has a great advantage—in that it can be caught the instant the gun is thrown to the shoulder. Through it the whole body of the game can be seen, yet a spot only as large as half a dollar aimed at by placing the bead upon it.

If it be necessary to fire at long range, this can be done by elevating the globe (No. 3) and using a smaller aperture, with which it is provided; and the bead, disregarding altogether No. 2.

Having thus delivered myself, I will do what probably I should have done some time ago, i. e., abruptly close.

By the by, I hope I have said nothing from which it can be inferred that I have not scored my fair proportion of misses. If I have produced this impression in the minds of any one, right specially do I wish to disabuse them of it, and assure them that there has been in my experience a very large number of inexcusable misses which could not be charged to any effect in rifle or in sights, but which were due wholly, entirely and altogether to the fault of D. M. B.

PHILADELPHIA.
P.S.—Much that I have written will apply to the communication by "Big Injun." I doubt not that he gets very good results from his mode of loading. I had not before believed a 45-75 shell capable of taking such a heavy charge of powder.

I hope that we may all be apprised through your columns when the repeater referred to by "Straight Stock" is put upon the market. I for one would much like to see it.
D. M. B.

Editor Forest and Stream:

In your issue of November 29 I note a plea for a 40-90-500 repeater by your correspondent, "D. M. B.," and the confident assertion that such a rifle would become a prime favorite with sportsmen. He claims to have had some practical experience with such a cartridge, and to have got the opinion of those "who do not advance a theory with regard to the effect of ribs, bullets, etc., etc., till they have stripped it of all probability or surmise, and reduced it to a fact by testing the same upon game." This would lead one to suppose that such a cartridge had been thoroughly tested in a single breech-loader, and it only remained to adapt the mechanism of the magazine gun to this cartridge to make it "such an improvement as would be welcomed by all true lovers of the sporting rifle who wish to kill cleanly, etc., etc." Having spent considerable time and money in getting a single shot rifle to shoot a 40-90-500 cartridge, intended for long range target practice, which proved a complete failure, I should like very much to know where the 40-90-500 rifles were made from which "D. M. B." and his "non-theoretic game shots" got their experience?

Perhaps it may be interesting to your readers to know something of my experience with this 40-90-500 cartridge. I found the bullets struck sideways (key-holed) at 50 yards. Another barrel was then fitted, having a twist of 13½ inches. This kept the bullets point on, but they did not spin quite true, most of the holes made, even at 100 yards, showing some elongation. At 100 yards rest, I fired fifteen consecutive shots into an 18-inch ring, but at distances beyond 200 yards it was inferior to the ordinary R. rifle. At 1,000 yards it would be off the target on an average of one fifth of the shots. The trajectory was higher than the average .44 or .45 L. R. rifle, and it was inferior in every shooting essential,

though made with the greatest care by a celebrated rifle manufacturing company.

There were but two of these rifles made at that time, and I have never seen or heard of any other that had such a twist to give a 500-grain, 40-cal. bullet point on. My experience with this cartridge leads me to very confidently predict that a 40-90-500 repeater, with tubular magazine, cannot be made to work at all satisfactory. That if it could be made, it would not be what sportsmen would prefer to those already in the market, and that the concern turning out such a rifle would harvest a lot of money—out of pocket.

In my judgment riflemen have nothing to complain of now in regard to rifles suitable for large game. The Winchester 50-05 or 45-75, or any of the other repeaters using these cartridges are pretty effective weapons at game-shooting distances. Perhaps the 50-05 Winchester shell could be choked down to take a .40 bullet, and used in their present mechanism to advantage, but a .30 bullet would be amply heavy. In my judgment a bullet of 2½ to 3½ diameters its length is as long—no matter what the bore—as can be used to advantage in a sporting arm. It has sufficient staying qualities with a proper powder charge, and a greater length can only be used at a too serious loss of velocity.

Some years ago I was one of a party who spent some time in Dakota and Montana shooting large game and small. After much cogitation and experiment I chose for my weapon a Peabody-Martini Military (Turkish model), 45-caliber, with stock and sights altered to suit. This arm weighed 8½ pounds. I loaded shell with 110 grains powder and the Winchester 350-grain bullet. At 200 yards without cleaning I could shoot continuously into an 8-inch bulls-eye. At 250 yards I killed two antelope—a buck and doe—at one shot, the bullet striking the buck just back of the fore shoulder, cutting off two ribs, passing into the doe at about the same place but coming out at her breast. The bullet was badly smashed on the ribs of the first animal, and made a large hole where it came out, and passed through the second, but I believe it still had force to have killed a third had there been another in line. This cartridge was but a little longer than the Winchester 45-75, but was quite bottled in shape. Could such results be got out of a repeater, I can imagine nothing more to be desired in a weapon for large game.

If I was to enter a plea for a new rifle it would be for a .35-bore, weighing about a 30-75 cartridge, suitable for ducks, quail and other small game. Our .32 cartridges are all too large and too slow; except the Winchester .32 cartridges there is not a decent small-bore cartridge in the market. All those cartridges the bullets of which are reduced at the butt to fit shell of same outside diameter as bullet, are an abomination—relics of the early days of breech-loaders, and ought to have been discarded long ago. Not one of all the various sizes of this style of cartridge will shoot decently accurately when a proper powder charge is used. Some of them with a proportion of 7 to 10 in. length to 1 of powder will do fair target work when there is no wind, but for game shooting they are altogether too slow, causing many misses by a misjudgment of distance by a few yards.

The larger cartridges of this style, the extra large .38, extra long .325 and .32s are all notoriously inaccurate, because of the nicking down of the butt of bullet, the gas getting by this nick deflecting the bullet as it leaves the muzzle of rifle. Of course, the greater the muzzle pressure the greater will be this deflection.

Another reason for a smaller bore than .32 is that bullets when driven at a high velocity have a splashing effect on thin-skinned creatures like birds, and for this reason should have as small diameter as will give sufficiently accurate range, say 200 yards.

I am happy to state that there is some prospect of such a rifle—single-loader—being placed on the market by one of our reliable rifle manufacturers before many months, and I think it will be appreciated by those who prefer the scientific spiral bore with its tiny projectile to the heaving scatter gun with its handful of powder and lead.

PEABODY-MARTINI.

Editor Forest and Stream:

I quite agree with "D. M. B." in what he says in your issue of the 29th of November, in favor of the 40-90 repeater. I am getting a 40-60 repeater to take out to India for long range shooting, but would have preferred the 40-90 if it had been in existence; but the 40-60 is the most powerful, considering its caliber, that I know of. The English 40-cal. expresses take 85 and 110 grains powder and 180 and 22½ grains bullet. The penetration of express rifle bullets can be increased, if required, by casting them with a smaller hole, or solid, and some makers fit their express molds with plungers, by which the size of the hole can be regulated.

LOXON, England, Dec. 11, 1880.

BENGAL SERVOY.

ORANGE MOUNTAIN GROUSE.

The "heathen" must go, for the true inwardness of the vain tricks has been discovered hidden beneath the feathers of an educated Orange Mountain partridge.

These birds have been reared under the sound of church bells, factory whistles, and the unceasing screeching of locomotives, and it behooved the mother bird to early teach them the doctrine of "self preservation," and to instill into their infantile brains the necessity of watchfulness and "git up-and-git-downs." They graduated early in life, and as dutiful children endowed with natural opportunities, they have become greatly refined and quickened by long experience with the yellow dog and the U. S. A. musk-rat, etc., they have become a wonder, and fool for reflection only. As the art of shooting, and the legitimate taking of game should be classed among the higher sciences, here then is a grand field for the velvet-curtain-hammerless student, to study nature in a bunch of feathers, and return to his city home at night empty—not accepting his intense eagerness to solve the why and wherefore of the "pure cussedness" of this, the king of game birds.

But occasionally a man, who has never yet willingly submitted to any created thing, whose power of endurance surpasses any animal of his inches, whose insatiable appetite leads him to persevere, endure, do and dare, whose will is to will and nothing less; man, with the aid of his old companion, the two working together, succeeds after a two hours' chase in cornering one of these winged wonders, and then with an arm of steel, and eye, brain, nerve, muscle, and every fibre of his body keeled up to the mark, he strikes the word "Hi" on which, as we are told, cracks the bottled lightning, and within the thirty-second part of a second a scene is enacted which beggars description. Grand old fellow. We almost sigh as we lift his inanimate

body from the soft bed of leaves, still we wanted him, and as we could not take him alive, we were justified in practicing any and every method known to "autology" in reducing him to ownership.

All this for one and a half pounds of flesh? No sir.—You couldn't hire, coax, buy or drive us to undergo the laceration and fatigue for any such thing. Then why all this? I'll never tell. Perhaps in after ages, as each succeeding age grows wiser, the yet unborn may, with a gifted tongue and use of language then understood, be able to portray in some feeble manner the consuming nature of the thing, which for the want of a better name we term sport.

The earning and securing of a grouse in this manner is more valuable than a dozen shot down in some unfrequented spot where they know no better than to lie until flushed under your feet, and afford an easy shot to the sportsman. Grouse shooting is a question of location and surroundings, and the following, sometimes by sight and sometimes by sound only, of one of these educated birds through its many flights, and locating its probable hiding place from a thorough knowledge of its habits, and the final strategic movement to outgeneral and capture the fleetest of all birds, is an episode—an oasis in the desert life of the sportsman. The event will show many failures, and the balance sheet will need propping up on account of its lopsidedness, but the heart swells to its full proportions when the hand grasps firmly the brown form, and the mute ecstasies of your dog are mingled therewith. REEBECK.

NEWARK, N. J., November, 1883.

WILDFOWL IN CALIFORNIA.

WE have plenty of ducks, geese, rabbits, quail, deer, etc., in this vicinity. The geese are here by the thousands. I was going to say by the million, but will be positive and say by the thousand. In places where they are the thickest, six or eight miles from here, they are pulling up a law prohibiting the killing of ducks, and geese in certain seasons of the year was revoked, and they can now be killed at all times. We have fair duck shooting at the mouth of the Ventura River, just at the edge of the city.

We have a Rod and Gun Club of forty or fifty working members. Our club is not a dead letter, but enforces the game laws. This county is one of the best, if not the best, in the State for wildfowl. Deer are within three or four miles of town. Quails are very plentiful. TPVO.

SAN BERNARDINO CO., CAL., Dec., 1883.

MICHIGAN SPORTSMEN'S ASSOCIATION.

THE ninth annual meeting of the Michigan Sportsmen's Association will be held in Jackson, Tuesday, January 8, 1884, commencing at 7.30 P. M. The meeting will convene in the Council Chamber, and I am informed that the Huron House will be the headquarters.

The M.C.R.R. and branches will carry delegates for one and one-third the regular fare, and other roads will probably do the same. Parties intending to attend should notify their railroad agent, so that the proper tickets can be procured. Each club, a member of the Association, is entitled to send five delegates, and it is earnestly requested that there be a good attendance.

Sportsmen, not members of the Association, are invited to be present, and the meeting will be made more interesting if sportsmen and game protectionists will come prepared with papers on any subject of interest to the fraternity.

Our Association has done a great deal of good in the past, and its usefulness will continue to increase if sportsmen will only put their shoulders to the wheel, and one of the best ways to get at the wheel is to attend the meeting. Try and bring along your member of the Legislature, and let him hear what is being said, not far from the "Game Warden Bill." W. B. MERRISON, Secretary.

EAST SAUSAN, MICH., Dec. 15, 1883.

PHILADELPHIA NOTES.

THERE are some fears entertained that the late snows will damage the quail and grouse of our State and the neighboring ones. The crust which formed on the surface was softened to be sure by the rainy weather of the past two days, but the fall of snow has been a heavy one and the ground still remains deeply covered, and the sudden dropping of the thermometer in the last twenty-four hours has again frozen everything tight. We may surely expect hard times for both grouse and quail if other snows come upon us before the present covering entirely disappears. We have yet to have two long months of winter.

One week ago a woodcock was shot by a Gloucester, N. J., sportsman near Springport, not far from that place. The bird was strong on the wing and in excellent order. This is very late for even a stray woodcock to stay with us, but the weather up to that time had been quite open. Several years ago your correspondent shot a woodcock on the 24th of December while rabbit hunting, when the snow covered the ground to the depth of several inches, not far from Heighstown, N. J. The bird was put up near the border of a spring in a partly cleared wood, and, like the one mentioned above, was in fine order and flew so vigorously that it was missed with the first barrel. This is the latest date on which I have ever heard of a woodcock in this latitude to have been shot.

The new party of the West Jersey Game Protective Society gained a complete victory at their meeting in Camden on the evening of the 20th of this month, and elected their entire ticket of officers. Now that peace is pronounced we have no doubt some good work will be done. Not that the past labors of this association have not been commendable; indeed, they have been, but we fancy the want of harmony between its members of late has necessarily drawn attention from important questions in relation to the game of South New Jersey, which otherwise would have been acted upon. As an illustration of what the protection of deer for three years in the southern portion of the State has done, witness the great increase in the number killed during the past season ending Dec. 1—the first open one that followed the close years. Every alternate season should be one of protection for the deer in New Jersey, and if this be

found not enough extend it to two or three. I doubt not but that the sportsmen of Atlantic, Cape May, Ocean and Burlington counties will agree with me in this.

The ice in our lower river is aiding ducks to paddle upon wildfowl in open water. This kind of sport, if it can be called sport, is not so much indulged in during the winter months here as it is in the spring, when there is a break-up of the ice and the different varieties of marsh ducks have returned from the South. A large flock of snow geese is still below Bombay Hook and remain unmolested, in fact they are said to be in the best of times. Sportsmen who have returned from Florida speak of game being unusually plentiful there this season. One gentleman who owns a large orange grove not far from Teocot, on the St. Johns River, who has been absent superintending the packing and shipping of his oranges, informed me that his men have shot a large number of wild turkeys around him, and that the cove of the river near his place is alive with wildfowl of all kinds. Travel to Florida thus far has been light, but now the holidays are about over it will be greater.

Friends of Dr. Beckley will be glad to learn that he has been moved from Port Penn (where he was domiciled since his painful accident) to Philadelphia, and is steadily gaining health and strength. HOMO.

SNARED BIRDS.—Editor Forest and Stream: What have we a game protector for in New York county? Is it to watch the shooters? Is it to watch the trappers? No; there is no game to shoot, there are no live birds. What is he for then? It is to watch the markets to see that there is no game sold out of season; it is to see that no snared or trapped birds are sold in or out of season. Watch that game peddler coming down the street, loaded with quail and partridge. Beckon to him, and ask him the price of his birds. The first question he will put to you will be: "Do you want good birds or common ones?" His "good birds" are the snared birds, the "common ones" are the shot ones. Comments of course are unnecessary. If, however, Mr. Editor, you want proofs, please to take a walk to any of our public markets, or stop the first game peddler you will meet, and if every word I have written or said is not true, my name is not—WALTER.

ROCHESTER NOTES.—I am told that certain gunners living in a village of this county were guilty of the very unsportsmanlike act of shooting ducks on Braddock's Bay at night with the aid of a large lamp placed in the bow of their boat, which was then rowed down on the fowl until the butchers poured in their pot-shot. It is said that for days following the night shooting the bay was totally deserted by ducks. The year has been an uncommonly good one for woodcock, and a few of them remained here until quite recently. Grouse are scarce, but more quail are found in the county than have been seen here for years. A few birds are known to frequent certain fields not far from the city, but they have the reputation of being aware that they are sought for by a score or two of shooters, and the danger appears to have sharpened their wits and taught them to change their camping grounds daily.—E. R.

CANADIAN NON-EXPORT LAW.—The following provisions relate to the entire Dominion. It is a law passed in 1883 by the Dominion Parliament. Game authorities can act with the customs officers, so the exporter can be "gone for" any way: "The export of deer, wild turkeys and quail in the carcass or parts thereof, is hereby declared unlawful and prohibited, and any person exporting or attempting to export any such articles, shall, for each such offense, incur a penalty of \$100, and the articles so attempted to be exported shall be forfeited, and may, on reasonable cause of suspicion of intention to export the same, be seized by any officer of customs, and if such intention be proved, shall be dealt with as for breach of the customs laws.—Cautious Act, 1883.

WILDCAT FOR RABBIT.—Ithaca, N. Y., Dec. 10.—Mr. Frank Fuller, conductor on the G. & S. N. Y. R. R., shot and killed a few miles from here on Friday last a wildcat, three feet long and weighing eighteen pounds. He was hunting rabbits, and when he shot thought he was shooting a rabbit, but he soon found out his mistake. Wounded it with the first barrel and killed with the second. It made an effort to climb a tree after the first shot, but one of its forelegs was broken. My son Fred has mounted it, and it will attract considerable attention. It is nearly half a century since a wildcat was killed in this vicinity. Your correspondent, "Mark West," has often hunted over these grounds.—W. H. W.

MICHIGAN DEER.—A late issue of the Montgomery (Mich.) Index says: "While in Alpena last week D. D. Hanover informed us that he had shipped during the two months of hunting season, about 1,600 deer, and G. N. Blackburn also gave in his count at 24 tons, or about 1,200 saddles, making in all 2,800 deer, besides upward of 1,300 hides that they have brought, which would swell the amount killed in the eastern part of this county and all of Alpena county to at least 4,000. Besides the settlers and hunters, all get in their possession yet from one to a dozen hides. The deer cannot last long at such a rate, and the time will soon be when hunters will be compelled to look for other game."

THE OLD TIMERS.—Danville, N. Y., Dec. 15.—Editor Forest and Stream: I am gratified to notice that the extracts from my little pamphlet have drawn out two excellent articles on "Settling the Claims of the Latest Bears and Hunters." Bill Akker's story which are as interesting as anything published, and novel as a variation from the current sportsmen's narrations. I wish others would follow in same line, for there must be an extensive store of authentic old time incidents legitimately connected with the game annals of our country stored up, which should be preserved in print before the recollections of old settler times pass away into oblivion.—EPHRAIM BUCKNER PIERCE.

SMITHVILLE FLAYS N. Y., Dec. 9.—Gray squirrels are quite plentiful in this section now. Two months ago one could tramp all day and not see a squirrel; they are now migrating. Partridge (ruffed grouse) are also numerous. Fox hunting is fast becoming the winter pastime among the sportsmen here.—E. L. R.

FLORIDA WANTS A REFORM.—Onstega, Fla., Dec. 10.—Game is scarce in this part of Florida. We have a few ducks, but they are very wild on account of being shot at so much by darkies. We have a few quail and they are fat. We are badly in want of a good game law for this State.—J. F. S.

MAINE RABBITS.—Cherryfield, Me., Dec. 10.—There are some localities in this vicinity where rabbits can be found in great numbers. About two weeks since a party of three persons started one morning on a still-hunt for rabbits. They returned in the evening with forty-two rabbits and three ruffed grouse. One of the party had two snip shots at a deer, but failed to hit. Good sport can be had here within three-quarters of a mile of this village, shooting rabbits in front of a dog, which is enjoyed occasionally by myself and the "Doctor," with his fine rabbit dog Prince.—NAHQUAEGUS.

TENNESSEE QUAIL.—Grand View, Rhea Co., Tenn., Dec. 28.—Quail are unusually plenty this winter. They are never trapped nor hunted in this vicinity, neither do the winters kill here, as they sometimes do farther north. Their natural enemies here in winter are the hawk, owl, cats, and occasionally a gray fox. During the summer many eggs and young are destroyed by what we call the chicken snake, which is a large, clumsy-looking snake, from three to five feet in length, whose whole business seems to be to devour eggs, young birds and small chickens.—ANTLER.

NIAGARA, N. Y., Dec. 19.—On the 28th of November, while out looking for rabbits on Queenstown Heights, I saw what at first I thought to be a flock of rabbits, but on shooting one it proved to be a pine grosbeak. Our winter ducks are still out in the lake. The Game Commissioner from Buffalo, Mr. Roberts, has lately seized some illegal nets, and for the sake of future bass fishing, let us hope will keep on in the good work.

NORTH CAROLINA QUAIL.—New London, Conn., Dec. 31.—I have just returned from North Carolina. Quail not found as plenty as usual. The long drought of last summer was not favorable to the growth of the rag weeds and broom grass, so the quail cannot find shelter from the hawks except in the woods and thickets along the branches, and are hard to find except very early and late in day, when on feed.—D. B. H.

WISCONSIN DEER.—Appleton, Wis., Dec. 24.—Deer hunting has been a success (for the deer) in this locality, very few comparatively having been killed, although they were plenty; too noisy for still-hunting, all the better for next year's crop. Ruffed grouse were unusually abundant.—F. R.

Camp Fire Flickerings.

"That reminds me."

WHICH ARE THE BEST?

OUR issue of Dec. 20, 1883, contained, in a special supplement, the entire series of Camp-Fire Flickerings from the beginning of the column in July, 1882. The ninety-six stories were given in the order in which they were printed, and each one numbered. Of these ninety-six stories every reader is asked to select the ten which he thinks the best; to write down the numbers of these ten, one below the other, in their order of merit, putting the best first, the next best second, etc., and then to send the list to the FOREST AND STREAM. Each list should be signed with the name and post-office address of the voter. It is requested that the lists be sent on postal cards; if in envelopes they should be written on slips of paper the size of a postal card.

To send in this list of ten stories is all that the reader is asked to do.

There is no entrance fee. All who wish to do so are cordially invited to put in a vote. The balloting is not limited to subscribers, nor to those who buy the paper—the privilege is extended to the neighbors who borrow; the friend to whom it is sent after the subscriber has read it; yes, even to the postmaster who keeps it over Sunday and puts it into the subscriber's box Monday morning (and who is hereby warned to desist from this trick, for we have his name, and by and by the time will be ripe for civil service reform in that village); in short, this is an opportunity for those to vote who never voted before, and may never have a chance to vote again; without regard to age, sex or previous condition of non-sportsmanship.

Two sets of seven prizes each will be awarded, one to the writers of the winning stories, the other to the voters who send in the best lists. The method of determining the winners in each class was explained in our issue of Dec. 20.

The prizes for the writers and the prizes for the voters will be the same. They will be for each class as follows:

- FIRST PRIZE. A copy of the book "Sport with Gun and Rod," in embossed leather binding, or any other book or books of same value (\$15), at option of winners.
- SECOND PRIZE. "Sport with Gun and Rod," cloth binding, or any other book of same value (\$10), at option of winners.
- THIRD PRIZE. Norrie's "An American Angler's Book" (price \$5.50), or Stoucheaux's "Dog of the British Islands" (\$7.50), or Conroy's "Key to North American Birds" (\$7), or any other book or books of same value, at option of winners.
- FOURTH PRIZE. THE FOREST AND STREAM FOR ONE YEAR.
- FIFTH PRIZE. THE FOREST AND STREAM FOR SIX MONTHS.
- SIXTH PRIZE. "Training vs. Breaking," by S. T. Hammond (which, by the way, contains some capital stories).
- SEVENTH PRIZE. "Angling Talks," by Geo. Dawson.

In case of a tie the prize will be divided. No person will be awarded more than one prize. If two prizes are voted to the same individual he will be given the highest of them, and the other will pass to the next man on the list.

Ballots should be sent in as soon as is practicable. To give distant readers an opportunity to vote, lists will be received up to February 2, and as the editor of the American Kennel Register so often says, "none can be received later." The polls are open.

Sea and River Fishing.

THE ENGLISH AND AMERICAN TROUT.

Editor Forest and Stream: I have noticed your article on this subject, and also that of G. Y. S., your issue. The position of superiority is one that can only be decided by those familiar with both species, and even then their judgment may be influenced by questions of taste or by pleasant memories. Like 'G. Y. S.', I have taken trout in England, Scotland and America, and therefore am entitled to have opinions on this subject.

The fish are quite different and therefore easy to compare. The American brook trout does not frequent large streams, and requires colder water than the English trout. It is not so wary as a rule, and takes the fly more readily and does not need to be fished for so delicately as is done in England. There are said to be one or two exceptions to this rule, on certain streams, but there is no doubt of its truth. On many English streams the fish can only be taken with a dry fly, a practice unknown, so far as I know, in America. 'G. Y. S.' says as much when he remarks that the average British sportsman would find the trout in Maine 'more stupid and easier to kill, and decidedly a less worthy match for his skill than the English trout. With him I think there is but little difference in their edible qualities, but in their sporting value I think there is much.

The *Salmo fario* is superior to the *fountainis*, as a game fish. It is wrier, gamier, and therefore more satisfactory. It will fight harder, ounce for ounce, than the American fish, and I cannot agree with you that the latter is the handsomest fish. Like all charr the American trout is red-bellied, but it is not so graceful in form nor does it present as beautiful shades of color as the English trout. If the latter could be introduced into this country by some one, they would then be able to compare the gameness of the two fish, and I do not doubt that they would sustain my views in time. R. P.

TROUTING ON THE BIGOSH.

UNCLE BEN TAKES A LAKER.

A BOUT four miles west of our house there was a lake which Uncle Ben said contained some big lake trout, but which, according to his notions, were difficult to capture. The Colonel was anxious to take some of them, as he had never done so. The Doctor had never captured one, either, and had no desire to, for he said: "All the authorities agree that the fish has no game qualities, and why should we leave such excellent fishing as we have here to spend two or three days hauling fish only a few feet of water when they come up like waterlogged logs?"

"Just for a change," replied the Colonel. "One day is about like another on this stream; brook trout in nearly the same number and size, day after day. I am getting cloyed with the sport, and if we don't try the lakies, I am going to go up the little brook that comes in at the cedar swamp and wade it to see if I can't take some small trout. There must be many little fellows somewhere to keep up the supply of big ones that seem to fill the Bigosh, for we have not taken a fish of less than half a pound. A day with trout of three to four ounces would be an agreeable change to me."

"They asked for my opinion which was given as follows: 'The lake trout, or salmon trout, as it is sometimes called, is a fish of fair game qualities when taken in shallow water in the spring of the year, on the fly. They require colder water than brook trout, and so move into deep water in summer, and as they are usually taken by trolling with two or three pounds of lead above a spoon-hook, or a minnow gage, there is no chance to feel their rushes which are checked by the heavy sinker. Baiting a buoy, as is done in Adirondack waters, is the best way to feel the fish, because the sinker need not be over half an ounce. The Colonel has expressed my opinion when he said that a change would be desirable. We would then return to our brook trout with an increased relish. We would take our lake trout as we do a cracker between oysters, it would give a relish for what follows.'

"I think," replied the Colonel, "that we might go to the lake, to leave the Doctor to enjoy the river, but who knows how to take the lakies, and where will we get our tackle?"

"As I had some suitable hooks among my tackle, and had also fished for lakies in the lakes of Western New York and in the Adirondacks, I told the party that if Uncle Ben would take his time and put a boat on the lake, and then go to town and get some lines, I would go over with him and bait several buoys, and they could follow a few days afterward and we would then fish. This would give me a desirable chance to explore the lake alone and to collect small species of fish, and amuse myself in the woods. This was agreed to, and Jack then asked to go along. The boy never missed an opportunity to go where I went, and camping out opened a new field to him. Sleeping under the boat had no terrors for him, and he went.

The buoys were put out and minnows caught, cut up and thrown around them for two days, and the Colonel and Uncle Ben arrived on the third. By this time we had a comfortable break and had collected small species of fish, and went on to sleep under the boat the first night. The Colonel and I used our trout rods and lines with large hooks on them, but Uncle Ben and Jack had no rods, and so used hand lines. The anchor was dropped and the buoys were baited.

"I'd just like to see you get a twenty-five-pound laker on one of them slim poles," said Uncle Ben, whose respect for light rods had increased since the day that the Colonel landed that big trout with him, "but I guess you'll wish you had something to pull him in with (above you see through.) "Do they grow as big as that in the lake?" asked Jack.

"Yes, and bigger. Old Antoine, the Frenchman down at the mill, ketches one five years ago that weighed fifty pounds." "Did you see the fish?" asked I. "No, I didn't see it, but he said it weighed fifty pounds, and Bill Gardner said it was the biggest fish he ever saw." "Ten pounds weighed ten pounds," I suggested. "Ten pounds?" indignantly replied Uncle Ben; "why, Bill Gardner and I have taken lots of 'em that weighed twenty." "Actual weight, or guess weight?" I asked. "Actual weight and guess weight both; don't you suppose I know how heavy twenty pounds is?" "No doubt, I only wanted to know how the exact weight was found." The conversation was interrupted by the Colonel having a fish on his hook, which escaped when half way to the surface. It then landed one that would probably

weigh six pounds and which made some resistance, having only a half-ounce sinker on the hooker. Uncle Ben then raised his story of big trout, and said that he once had one within a foot of the surface which was half as long as the boat and would have weighed a hundred pounds, but it broke away and took part of his line. The fish had since been looked and seen by two other persons, but never had been captured. The Colonel winked at me and said in a low tone: "Let the old man alone or that trout will weigh a ton in a few minutes." Just then Uncle Ben felt a vigorous bite and raised his hand to feel if the fish was on. A few seconds more and another hard twitch was felt and he began hauling in.

"A big one," said he, "none of your little five-pounders," and then the fish seemed to come to a standstill and the old man continued, "like as not it's that big one! O, come in here, you won't break this line," and he tugged away, hand over hand, making a little progress. It's one of the fellows I'd like to see on your little poles," granted he, "you'd never land him if you had him on."

"Give him line and let him tire himself," said the Colonel. "Don't let that old man have it," said I. "O, yes," petulantly answered Uncle Ben, "give him line and let him get away; no such funny business for me. This new line cuts my fingers, but he's got to come." "Shall I help you?" asked Jack. Uncle Ben made no reply to this offer and tugged away. "He'll weigh a hundred pounds at least," said he. "I see him!" cried I, "and it is a big one." "So it is," answered the Colonel, winking at me. Uncle Ben peeped over the side for a look at his prize. Let me see him and dropping back in the seat, said: "The anchor! by Gosh!" FRED MATHER.

CAMP ON STATEN ISLAND.—There are a few gentlemen on Staten Island who are interested in pisciculture and have been stocking the fresh waters with carp and black bass. Prominent among them is Mr. Francis Endicott, President of the National Ood and Reel Association, and through his efforts Lakes O'Connor and Brady have been stocked with these fish. The New York *Sun* tells the following concerning their labors: "How do you like 'em?" "Why?" his friend at Lake O'Connor and stocked Lake Brady with bass. These bodies of water are not marked on many maps, but unless the weather is very dry, they may be found in the woods on the southern borders of Clifton. An Irishman was traveling on the north shore of Lake O'Connor not long ago. He saw a pisciculturist gentleman at work. "Tare an ewe, fwhat is he trying to do?" said he to a bystander. "He is planting carp," was the reply. "Oh, ay." "Don't you know the (their) labors, however, are of a commercial kind, and the shad, the herring or alewife, etc., it is necessary that the young, after hatching, should remain for some time in our fresh waters, feeding and growing, and of course, finding their natural food. The extent of the breeding and feeding area of any river basin is, therefore, necessarily the measure of its possible productivity. A given area when pressed to its maximum of production cannot provide for more than a given number of individuals. The extent of the production is, therefore, limited by the means by which we may determine permanent increased productivity. Hence arises the necessity for fishways, which are, in short, various constructions designed for the purpose of enabling different species of fish to surmount obstructions which would otherwise be impassable to them.

A fishway to be effective must fulfill certain conditions, which are clearly stated by Mr. C. G. Atkins in an admirable article on the subject of fishways, published in the annual report of the United States Fish Commission for 1872-'73, as follows: "First—It must be accessible; that is, the foot of the fishway must be so located that fish will readily find it. "Second—It must discharge a sufficient volume of water to attract fish to it. "Third—The water must be discharged with such moderate velocity that fish may easily enter and swim against the current. "To the conditions above stated, we may add: Fourth—The route to be traveled by the fish should be as short and as direct as possible, and the floor of the fishway should simulate as nearly as may be the bed of the stream. The first condition may be always fulfilled in the location, by arranging so as to have the discharge of water from the foot of the fishway or in the immediate vicinity of the obstruction. The second condition is more embarrassing, the larger the volume of water discharged through the fishway the better it will be. In the plans of fishways which are common throughout New England the volume of the discharge is necessarily limited by condition inherent in the constructions; is compelled to travel a circuitous channel, and usually is delivered from the fishway in such a sluggish current that it offers no sufficient invitation to the fish to enter and ascend before stated. The second culture of limited capacity for water is inherent in all of these fishway constructions. The attention of pisciculturists and fishway builders has been heretofore chiefly directed to different devices for controlling the action of gravity in the fishway. All these devices may be referred to one or two general forms: First—In what is known as the "step" or "pool and fall" fishway, the water is brought down from its elevation by a series of short drops or falls with the aid of the pool, the water entering them, as to bring it practically to rest after each drop, so that the whole volume of water is eventually delivered from the lower end of the fishway, with no greater acceleration than it obtains in the stream. This form of fishway is very common in England and upon the Continent. Possible some examples of such constructions may be found in the United States, but I have no information of any. Second—In what is known as the "inclined plane" fishway, the descent of the water is effected by a regular inclination of the floor of the fishway, instead of by "steps" or "pools and falls." In order to control the tendency of acceleration under the action of gravity, the base of the incline is made very long in proportion to the height, and by a series of alternating transverse or oblique partitions, the water is constrained to follow a narrow tortuous path with continual changes of direction; the friction developed in its movement being sufficient to overcome its tendency to acceleration. Of this second general form we have many examples in the United States, especially in New England. The common rectangular fishway, the Brackett, the Foster, Pike's, Atkins's, Swager's, Brewster's and Rogers' fishways, and many other designs that have been employed, each differing in minor details of construction, but all belonging to a common system. Most of these forms may be built either on an incline leading straight down from the dam, or with a return section so as to deliver the discharge from the fishway close up to the foot of the dam, or they may be built in spiral form and boxed over so as to be made secure against floods and ice. The fishway of Mr. J. D. Brewer is peculiar in the fact that the channel to be followed by the fish is a zig-zag, or zig-zag channel, in the floor of the incline, which is built either of masonry or strong timbers. The strength of the construction being such, it is presumed, as to prevent its destruction by floods or ice. The Roger's fishway is recessed into the dam, and boxes over the lower end. Arranging the exterior, however, be applied to any of the forms above indicated and has been proposed in several of them. The experience of fishway builders in New England has shown that for dam and fishway of eight or more, it is not allowable to build the incline with a rise of more than one foot in twelve to sixteen, requiring a length of incline of 140 feet for

A BIG BASS.—We had been fishing all day (my brother and I) with poor success, up and down stream, until but one fish remained in our bait can. "Take it," said I, "and wade out to that rock and cast." "I was soon out to the rock indicated, and, putting the bait carefully on the hook, made a long cast, not in the best of spirits. The frog fell noiselessly on the water, remained in sight a moment, and suddenly disappeared. Then came a tug, and a heavy rush showed that I had "hitched a big one." Now the sport began; first up stream he went, then down; now he tries to break water, but keeping a steady strain on the line, until his strength became less frequent, and, seeing my opportunity, I held him safely and soon have him on shore, to the great joy of us both. At the village store he tipped the scales at three pounds and two ounces, the largest bass caught at that place during the season. Fishing the river some time later, we heard a piping voice from the other side: "Yeer can't ketch 'nother four-pounder, an' yer needn't try," which was true, for we did not see a scale that day.—STEVENS.

New Publications.

"FISHING WITH THE FLY."

IN our notice of this charming little book, in our issue of Dec. 13, I did an unintentional injustice to the work by saying that it was mainly a collection of pleasant and instructive sketches which had already been printed. Of the twenty-two plates, we find, after a careful revision of them, that only four of them have so appeared, and that the others are original. We recognized parts of these sketches in our issue of Dec. 13, and also Mr. Van Selaen's. Then we found an excerpt from *Trout and Fly-fishing*, and *Roosevelt's Game Fish of the North*, and in addition to the beautiful title "The Orvis-Cheney Collection," in the hurry of office work we made the error. Having made it we cheerfully acknowledge it, and since time has permitted we have read many articles in the book with much pleasure, and can say that some of them are excellent and that the plates or flies are exquisite.

Fishculture.

A NEW SYSTEM OF FISHWAY-BUILDING.*

BY MARSHALL McDONALD.

IT is a well-established fact that the river fisheries of the Atlantic States have steadily decreased both in value and amount for many years past. In some instances certain species that were at one time common in certain of our rivers, are no longer taken. Indeed, the annual run of those fish which still continue their migration to the rivers, has undergone alarming decrease; and in many cases, because we could not find the motive force or material for organized fisheries. Several causes, probably, have concurred in producing this decrease.

First—The capture of the greater portion of the run each year, and the consequent have been left sufficient to maintain production under normal conditions.

Second—The erection of dams or other obstructions in the rivers, has in some cases absolutely excluded certain species from their spawning grounds; the result being eventually to exterminate the species referred to in those rivers. In all cases the existence of such obstructions, has determined a decrease in the natural productivity of the stream *pro tanto*, with the diminution of the breeding and feeding area.

The remedy for the condition of things above indicated is to be found in the erection of fishways.

First—In the enactment of such legislation as will control excessive, and prohibit destructive, modes of fishing.

Second—In compensating for the insufficient natural supply by artificial propagation and planting.

Third—In extending the area for breeding and feeding; by overcoming natural obstructions by means of fishways.

If the anadromous fishes only entered our rivers for the purpose of spawning, and their progeny spent no part of their life in our fresh waters, then the increase which we are endeavoring to attain by artificial propagation would be practically without limit. The fish culturist, in order to maintain supply, would only have to produce the young fry in numbers sufficient to replace losses by capture or by casualty.

As regards all the anadromous species, however, which are the objects of commercial fisheries, the salmonidae, the shad, the herring or alewife, etc., it is necessary that the young, after hatching, should remain for some time in our fresh waters, feeding and growing, and of course, finding their natural food. The extent of the breeding and feeding area of any river basin is, therefore, necessarily the measure of its possible productivity. A given area when pressed to its maximum of production cannot provide for more than a given number of individuals. The extent of the production is, therefore, limited by the means by which we may determine permanent increased productivity. Hence arises the necessity for fishways, which are, in short, various constructions designed for the purpose of enabling different species of fish to surmount obstructions which would otherwise be impassable to them.

A fishway to be effective must fulfill certain conditions, which are clearly stated by Mr. C. G. Atkins in an admirable article on the subject of fishways, published in the annual report of the United States Fish Commission for 1872-'73, as follows: "First—It must be accessible; that is, the foot of the fishway must be so located that fish will readily find it. "Second—It must discharge a sufficient volume of water to attract fish to it. "Third—The water must be discharged with such moderate velocity that fish may easily enter and swim against the current. "To the conditions above stated, we may add: Fourth—The route to be traveled by the fish should be as short and as direct as possible, and the floor of the fishway should simulate as nearly as may be the bed of the stream.

The first condition may be always fulfilled in the location, by arranging so as to have the discharge of water from the foot of the fishway or in the immediate vicinity of the obstruction. The second condition is more embarrassing, the larger the volume of water discharged through the fishway the better it will be. In the plans of fishways which are common throughout New England the volume of the discharge is necessarily limited by condition inherent in the constructions; is compelled to travel a circuitous channel, and usually is delivered from the fishway in such a sluggish current that it offers no sufficient invitation to the fish to enter and ascend before stated. The second culture of limited capacity for water is inherent in all of these fishway constructions.

The attention of pisciculturists and fishway builders has been heretofore chiefly directed to different devices for controlling the action of gravity in the fishway. All these devices may be referred to one or two general forms: First—In what is known as the "step" or "pool and fall" fishway, the water is brought down from its elevation by a series of short drops or falls with the aid of the pool, the water entering them, as to bring it practically to rest after each drop, so that the whole volume of water is eventually delivered from the lower end of the fishway, with no greater acceleration than it obtains in the stream. This form of fishway is very common in England and upon the Continent. Possible some examples of such constructions may be found in the United States, but I have no information of any.

Second—In what is known as the "inclined plane" fishway, the descent of the water is effected by a regular inclination of the floor of the fishway, instead of by "steps" or "pools and falls." In order to control the tendency of acceleration under the action of gravity, the base of the incline is made very long in proportion to the height, and by a series of alternating transverse or oblique partitions, the water is constrained to follow a narrow tortuous path with continual changes of direction; the friction developed in its movement being sufficient to overcome its tendency to acceleration.

Of this second general form we have many examples in the United States, especially in New England. The common rectangular fishway, the Brackett, the Foster, Pike's, Atkins's, Swager's, Brewster's and Rogers' fishways, and many other designs that have been employed, each differing in minor details of construction, but all belonging to a common system. Most of these forms may be built either on an incline leading straight down from the dam, or with a return section so as to deliver the discharge from the fishway close up to the foot of the dam, or they may be built in spiral form and boxed over so as to be made secure against floods and ice.

The fishway of Mr. J. D. Brewer is peculiar in the fact that the channel to be followed by the fish is a zig-zag, or zig-zag channel, in the floor of the incline, which is built either of masonry or strong timbers. The strength of the construction being such, it is presumed, as to prevent its destruction by floods or ice. The Roger's fishway is recessed into the dam, and boxes over the lower end. Arranging the exterior, however, be applied to any of the forms above indicated and has been proposed in several of them.

The experience of fishway builders in New England has shown that for dam and fishway of eight or more, it is not allowable to build the incline with a rise of more than one foot in twelve to sixteen, requiring a length of incline of 140 feet for

* This paper was read before the American Piscicultural Association at its last meeting, and its publication has been delayed because the cuts were not made before. At the meeting Col. McDonald illustrated his paper upon the Blackboard.

a ten-foot dam. The actual path, however, traveled by the water and traversed by the fish ascending, would be some two or three times the length of the incline, so that fish passing up an inclined plane fishway rising ten feet vertically, would necessarily travel a distance forty to fifty times the height of the dam. For example, in the fishway over the Hudley Falls dam on the Connecticut River, the total length of the incline is about 450 feet. The distance to be traveled by the fish ascending is not far short of 1,500 feet, to overcome an ascent of about 35 feet.

All the different designs of fishways constructed according to the inclined plane system, have when judiciously located proved more or less successful in passing certain species of fish. In all, however, the water must be kept clear and bright and the insignificant flow of water through them, constitute very serious objections.

FIXTURES.

BENCH SHOWS.

Jan. 2, 3, 4, 1894.—Meriden Country Association Bench Show, Meriden, Conn. Joshua Shaws, secretary, Meriden, Conn.
 Jan. 16, 17, 18 and 19.—St. John, New Brunswick, N. B. Wilson St. John, N. B.

Jan. 18.—The Cleveland Bench Show Association's Second Bench Show, Charles Lincoln, Superintendent, C. M. Munnall, Secretary, Cleveland, Ohio.

NEW ORLEANS BENCH SHOW.

NEW ORLEANS, Dec. 21.—The Bench Show opened here on Tuesday, the 18th inst., and as a dog show, is a decided success. The English setter and pointer classes are especially strong. Of the field trial winners in the recent contests a number are present, and Gath, Sue, Loudon, Foreman, Rex and others, are warmly admired for their good looks as well as for their record in the field. From a financial standpoint, however, the enterprise is a failure. Although there are many lovers of good dogs in New Orleans, the majority of the people seem hardly to understand the meaning of a bench show, and therefore the attendance is by no means what it should be, considering the character of the dogs exhibited and the arrangements of the show.

The pointers and setters were judged by Major J. M. Taylor, of Lexington, Kentucky, and the other classes by Mr. James Mortimer, of New York city.

In the mastiff class, the first prize was withheld, there being no dog shown which the judge deemed worthy of the place. Mr. Wade's Entolus, a very large dog, was the best dog shown in flesh. Turk II., belonging to Mr. R. Windsor Smith, of Atlanta, Georgia, is a very large dog, but is weak in loins and hind-quarters. Mr. Wade's Entolus got an "hc," but has obvious faults.

In Newfoundlanders only two were shown, and no prize was given. Mr. Douglas's Carlo is too small and has a curly coat, while Ben is only a big mongrel.

Two greyhounds were shown, (the first prize dog, Prince of Liverpool, being a very large dog, with a very good coat, neck and loins. He will compare favorably with almost any greyhound we have seen in this country. Lady, second prize, is rather straight in the shoulder and has a bad ear, but is on the whole a good bitch.)

In champion English setters, Mr. C. F. Crawford's Foreman easily beat Mr. Condon's Francis. English setter dogs made up a good class; Coleman's London was looking very well and so was Gath, who is a smaller dog, but full of courage. The English pointer class was a very good one, and quite as well as the winner, and think that the positions might have been reversed without doing any injustice.

The showing of English setter puppies was good. We consider Mr. Buford's Duke of Gladstone—Grace Darling puppy, so only received vice, somewhat better than the first prize winner.

In Gordon's Mr. Arlary's Jess had a walk-over in the champion class. In the dog class Mr. Ware's Max, who took second, should certainly have had first, if the class was judged according to the old style Gordon type. No prize was given in the bitch class. The single puppy shown took a first.

In champion Irish setters there was a single entry in each class and each received a prize. In the open dog class, second was withheld, first going to Mr. McKintosh's breeding.

In champion pointers, Mr. Thayer's Rex easily took first. Old Boy was exhibited by his owner, but withdrawn from competition. In the open classes there were a number of good animals. We could not possibly agree with a large way ahead of the others. She is a good bitch of the correct type, though as she was suckling a litter of puppies she did not show at her best.

In the beagle dog and bitch classes Mr. Wheeler's Rattler and Music dog alone and each secured first. The dog was looking very well. He has good chest, hack and loin and is good in head with plenty of bone and ear. Music was not up to her usual form, but she is a very good one.

Mr. Richard Gibson showed the only entries in champion fox-terriers. Belvoir Jinn has good legs, feet and shoulders, but stands somewhat high on his legs and is a little thick in skull. This is a nice little bitch, but is a trifle undershot. Greek, the winner in the open dog class, is a very good dog, a little small perhaps, but with lots of bone and good coat, feet and legs. Grip, who took second, is a nicely marked dog with a good coat, but he is snipy, has open feet and a large ear. Jack, who received vice, has a good head and ear, but a wide chest, is thin in coat and light in bone. In bitch class Lyra was first. She is a very good bitch with good legs and feet, a working jacket and a good terrier expression. She is a little weak in jaw, and rather snail.

In collies, the winner, Scott, is only a fair dog. His skull is thick and ear buds, but if Babe had not been clipped and blind in one eye, he would have taken first instead of second.

In bull-terriers Young Bill was looking remarkably well, and with ease. Strick, second, was very badly shown.

Of the black and tans, Bessy was the best, a very good one but not looking so well as at London. Topsy shows age and hard work. Dit-Fas should have been in the toy class.

Two Bedlington terriers were shown. Blucher is a very good dog of the correct type. Trip (166), by a mistake, was entered among bull-terriers.

In hard-haired Scotch terriers, Mr. Farrel's Jack, a fairly good terrier with a coat a little bit soft, took first. Garry-coon, a very good dog, was in the second prize class. Lyra was first shown he had a black nose, which has since become white. No prize was given, therefore.

In champion pups, Judy III. was the only entry. She has a very good head, and is a very good dog. In the open dog class Dogie, the only entry, is a medium size specimen. He is too plain in face, has a bad neck and badly carried ear.

Toy terriers were a very good class and quite up to the average of our best bench shows.

In the miscellaneous class, all received honorable mention. A word should be said about the catalogue, which so abounds in mistakes as to be worse than useless. The proofs were not read and the entries were made with the greatest carelessness.

LIST OF AWARDS.

MASTIFFS.—1st, W. W. Smith (Turk II.); High com. W. Wade (Bertha, A.K.R. 151).

GREYHOUNDS.—1st, C. Handy (Prince of Denver); 2d, J. Foster (Topsy).

ENGLISH SETTERS.—CHAMPION.—Dog: 1st, C. F. Crawford (Foreman). OPEN CLASS.—Dog: 1st, J. Crawford (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy). Bitches.—1st, W. H. Coleman (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy). POINTERS.—CHAMPION.—Dog: 1st, C. F. Crawford (Foreman). OPEN CLASS.—Dog: 1st, J. Crawford (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy). Bitches.—1st, W. H. Coleman (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy).

IRISH SETTERS.—CHAMPION.—Dog: 1st, L. H. Hart (Topsy). Bitches.—1st, W. H. Coleman (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy).

FOX-TERRIERS.—CHAMPION.—Dog: 1st, J. L. Hart (Topsy). Bitches.—1st, W. H. Coleman (Gath); 2d, W. H. Coleman (London). Very high com., E. H. Small (Rex) and H. V. B. (Bessy and Topsy).

BEAGLES.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—CHAMPION.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

COLLIES.—Dog: 1st, F. T. Morehead (Scott); 2d, A. L. Redden (Babe).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

FOX-TERRIERS.—Dog: 1st, F. C. Wheeler (Rattler). Bitches.—1st, F. C. Wheeler (Merrilee).

and shoulders. In small sized dogs, first went to a very nice young dog, rather wiry in coat, but quickly claimed at £20, catalogue price—and a cheap dog, it is. In small sized bitches first went to Messrs. L. & W. Tuthart's Diana, the best bitch of the show. In the next class, in wire hair fox-terriers first in both classes went to the Earl of Lonsdale's Briggs and Champion Voca.

The pointers were one of the best classes in the show, and we considered it one of the best shows of pointers that has been seen for years. However, the judges' decisions were in these classes very badly received. Mr. Norris's Graphic winning first and special for the best in the show. The majority of the pointers were liver and white. The lemon colored pointers were very few, and were given away at the close of the show. In small-sized dogs, Mr. Taylor's Young Wagg, which was exhibited at London, Canada, stood first, but like many other decisions we could not agree with this one, as we fancy far more such dogs, deficient in body; he walks stily, and in sport with the face movement about him we like to see in a sporting dog.

Setters turned out in good force and good quality. Mr. Shortnose having, as usual lately, a very good time of it, winning first in chamions with Novette. In the open dog class Mr. Llewellyn won with a very good black and white. He has a good body, chest, shoulders, and a remarkably long, level head which, for a dog, might be a little stronger than is desired. In the second prize class, Mr. Grant's dog, like his sire in color. He would be better were he a little shorter in back. The bitches were a remarkable good class. Mr. Shortnose's winning first again with Novette, and also the special for the best bitch in the show. There were several very good ones in this class. Mr. Grant's Novette was very good in Peggotty. The black and tans were only moderately good classes, not up to the quality shown in the English setter classes. In champion Irish setters, Garratoun once more took first, but his nose was to be going wrong, and we heard one gentleman remark "if it is not faked it ought to be." The open dogs were a fairly good class; first went to Bob, a good typical dog, but rather weak in his quarters, winning first at Dublin only the week before, but he is not in the condition he was at Dublin. In bitches, Miss L. Lady Palmerston and second to Bella Kate of Omagh (the Shannon's Bella), who is showing age, and ought to be kept at home, as she is only now the remains of one of the best bitches ever exhibited.

The well known Mickey Free won easily in Irish setter spicams. Mr. Hockey winning two equal firsts in bitches with Hilda and Lady. We prefer the former, being the best of the two. In the second prize class, Mr. Grant's dog, was particularly good in that respect. Chumber spaniels were another class that brought forth a lot of grumbling, and not without cause. John o' Gaunt ought to have been first, but he was not in the condition he was at Dublin. In bitches, Miss L. Lady Palmerston and second to Bella Kate of Omagh (the Shannon's Bella), who is showing age, and ought to be kept at home, as she is only now the remains of one of the best bitches ever exhibited.

J. M. AVENT'S BLACK AND WHITE ENGLISH SETTER DOG "POARTER."
 Won Second in E. F. T. C. Derby, and divided Third Prize with "Pride of Dixie," Puppy Sweepstakes, Southern States Field Trials, 1888.

dogs. Mr. Leavesley hid a live quail in a little bush some distance from the dogs, which were then sent on toward it. Cap soon found but would not point it. Ola coming up pointed staunchly, even when the bird fluttered, but in poor style, tail curved and low and head down. They were then taken up, and Ola given the heat and second prize, Cap taking third under the rule.

SUMMARY.
ALL-AGED STAKES.

Third annual trial of the Gilroy Rod and Gun Club, run Dec. 17, 1883, open to all setters and pointers owned on the Pacific slope. Three prizes, entrance \$5. Judge, H. D. Bartlett, Esq., of Gilroy.

First Series.

- E. H. Farmer's black and white setter bitch Queen (Belton II.—Belle), *beat*.
- Wm. Hedeman's black and white setter dog Sport (Belton II.—Nellie).
- L. G. Horton's lemon and white setter dog Cap (Count Warwick—Flora, native), *beat*.
- J. J. Nickle's black and white setter dog Duke (Joe—Queen).
- E. W. Paxton's black and white setter dog Romeo (Belton II.—Nellie), *beat*.
- P. C. Wilkinson's red and white setter dog Beau (native).
- P. G. Anzar's black, white and tan setter bitch Ola (Count Warwick—Leah), *a bye*.

Second Series.

- Queen beat Ola.
 - Cap *beat* Romeo.
- TIE FOR FIRST PLACE.**
- Queen beat Cap and won first prize.
- TIE FOR SECOND PLACE.**
- Ola beat Cap and won second prize, Cap taking third.

PUPPY STAKES.
JUNO AND FANNIE.

At 11:40 on Tuesday the first brace of puppies was put down between the last two heats of the All-Aged Stake. Juno on the right, handled by Mr. Leavesley; Fannie on the left, under Mr. Gilroy. Soon after being sent on a pair of birds flushed wild before Mr. Gilroy, who killed one. Fannie steady to shot, Juno at Mr. Leavesley's heel, where she remained through most of the heat. Fannie is a very pretty, cautious creature, is inclined to work body scent, and will have a good nose in aged form. Moving on through ferns, Fannie soon made game, and at the root of a scrubby oak drew to point. The bird soon flushed, Mr. Gilroy winging it, both bitches standing to shot. Ordered on, Juno ran a little to left and flushed a bird, chasing it. Fannie, sent to retrieve the winged bird, soon found and pointed, holding her point until the bird ran, when she retrieved it nicely. Passing on, Mr. Gilroy put a bird out from sage brush and killed, both bitches steady. Juno, sent to retrieve, pointed dead uncertainly and retrieved very well. They were ordered up at 12:35 and Fannie given the heat.

MAUDE AND BELLE.

At 3:15 Maude, a Gordon-English setter bitch, under Mr. Leavesley's care, on the right, and Belle, a nice little smooth-coated bitch, under Mr. Gilroy, were started. Maude quartering fairly, Belle doing nothing. After walking a half mile in ferns, Mr. Leavesley kicked up and missed a bird, both bitches breaking shot and Belle chasing. She was called in, and the handlers moving on, put up another quail, both bitches breaking wing. Several birds were successfully flushed and shot at, the bitches breaking shot each time. Maude stopping to order only. Coming down the hillside a bird was killed which Belle retrieved by sight nicely, and a moment after another was shot which fell two hundred yards away, beyond a fence, which Maude retrieved. A live quail was then hidden and the brace sent to it, but neither would point, and at 4:35 they were ordered up, Maude getting the heat.

WEDNESDAY.

CAP AND MARX.

On Wednesday morning new ground was chosen about eight miles east of Gilroy, on the ranch of Mr. Laird. Birds were scarce here than on Tuesday, and no satisfactory work was done, except in the heat between Cap and Fannie. The running brace, Cap, handled by Mr. Horton, and Marx, owned by Mr. E. H. Farmer, but handled by Mr. Geo. Holloway,

were cast off at 10:52. Soon after starting the dogs, running down into a little gulch, flushed a bird, both unsteady, and several miles were then walked before meeting game. Cap showing good speed and style and fair obedience, Marx not so fast and very rank, ranging in half the time from behind his handler. At last in heavy chemical a few birds were located and followed up, Marx flushing one from a little clump of bushes about an old log and not standing to wing. Passing on through a fence Mr. Holloway killed a bird which flew from a tree top, Marx breaking shot and retrieving nicely. Moving on through chemical a bird rose and was missed by Mr. Horton and afterward killed by Mr. Holloway, both dogs breaking shot despite loud orders from the handlers, Cap retrieving nicely. Another quail was then put up, Horton killing, both dogs standing to order. At 12:33 they were retired, Cap winning the heat.

ROSE, A BYE.

Mr. C. M. Owen's black Gordon-English setter bitch Rose was the odd dog in the drawing, and had a bye.

FANNIE AND ROSE.

At 12:53, after luncheon, Fannie, under Mr. Leavesley, and Rose, handled by Mr. Gilroy, ran the first heat of the second series. Both worked in fairly good style but slowly. Each made a flush across wind, and neither pointed. Each chased once. At 1:37 the brace was ordered up and decision reserved until after the next heat, when Fannie was given the heat.

MAUDE AND CAP.

The second heat of the second series began at 1:50. The dogs under the same handlers as when they ran before. Soon Mr. Gilroy killed a bird from a tree, Cap dropping to word, Maude unsteady. Maude retrieved fairly well. Cap made game in a little gulch, but the quail flushed wild, Mr. Gilroy killing. Both steady to word, Cap retrieving nicely. At 1:50 Cap was given the heat.

CAP AND FANNIE.

At 2 P. M. these dogs were cast off to run for first prize. They worked immediately toward a steep chemical-covered bluff, and each pointed a single bird staunchly. Mr. Horton put up his bird, missing, Cap steady to wing and shot, Fannie wavering when her bird rose. Moving across the face of the bluff two birds were flushed, both dogs steady, and thereafter each stood to wing under two flushed birds. At 2:32 Cap was given the heat and first prize.

FANNIE AND MAUDE.

This brace was worked on a hidden live quail, Fannie pointing well. Maude refusing either to point or back, Fannie was given second prize.

After testing Juno and Rose on the hidden quail, the judge decided that neither could, in reason, compete with Maude, and awarded the latter third prize.

SUMMARY.

PUPPY STAKE.

Third annual trials of the Gilroy Rod and Gun Club, run at Gilroy, Dec. 18, 19, 1887. Open to all setters and pointers whelped on or after Jan. 1 of the year preceding the trials. Three prizes; entrance \$5; judge, H. D. Bartlett, Esq., Gilroy, Cal.

First Series.

- C. V. B. Kaeding's black, white and tan setter bitch Fannie, 10 months (Traylor's Fred—Loca's Gypsy) *beat*.
- J. H. Brock's black and white setter bitch Juno, 30 months (MacGregor—Lulu Laverack).
- J. M. Donahie's black and tan Gordon-English setter bitch Maude, 22 months (Joe—Juno) *beat*.
- John Paine's black and tan bitch Belle, 25 months.
- L. G. Horton's lemon and white setter dog Cap, 22 months (Count Warwick—Flora, native) *beat*.
- E. H. Farmer's black and white setter dog Marx, 30 months (Joe—Queen).
- C. M. Owen's black Gordon-English setter bitch Rose (Joe—Juno) *a bye*.

Second Series.

- Fannie beat Rose.
 - Cap beat Maude.
- TIE FOR FIRST PLACE.**
- Cap beat Fannie and won first prize.
- TIE FOR SECOND PLACE.**
- Fannie beat Maude and won second prize, Maude taking third.

POINTERS vs. SETTERS.

Editor Forest and Stream:
 In your issue of the 6th inst. an article appears, headed "Pointers and Setters," which, although its evident aim is fair play, is likely to lead many of your readers to the conclusion that setters are superior to pointers. This I don't believe, hence my intrusion on your valuable space.

I have had considerable experience with both breeds, and I honestly think, for all shooting, the pointer is the most useful dog. Even in field trial work, which does not test all the powers of a dog, I am satisfied that when fairly represented at a given number of contests, the pointer will hold his own against the setter. The late High Point trials was the only place, I believe, where the breed of pointers was anywhere near as largely represented as that of setters. I admit that the former did not show up as well as the latter, as a class, on that occasion, but I also think I know the reason why they did not, because in their class the best pointers were unfortunately drawn against the poorest ones generally, and you know a dog's work will not show so well against an opponent as his own. In that is very much his inferior as against one nearly his equal. In the first series of heats Don, the best field pointer we know of, ran against Lord Seton, a dog of little more than one season's experience. Lalla Rookh, a bitch capable of doing work as good as ever I witnessed, ran against Bill, a very ordinary dog. Bang Bang, a dog of grand natural ability, who only wants more experience on game to make him a rattier, ran against Don Juan, a dog who although a tip top all day killing dog, is far away from a field trial dog. Crockett, who on a previous occasion made it hot for one of the winners of this, the greatest contest of all, was all off and beaten by a bitch of three weeks' experience on game. How different was the work of Don in his heat with Gath to what it appeared against Seton, or the work of Lalla Rookh against Bang Bang or Donner J., to what it appeared against Christianus Bill. On the other hand, the setters were most fortunate in being drawn to the very best advantage for a good showing. Carrie J. against Gus Bondhu, London against Lady Payne, Gath against Grouse Dale, etc. I fully agree with you that the drawing of setters and pointers separately in a stake is unfair to both, and believe it was particularly unfortunate this time for the pointers. I hope in future to see the drawing promiscuous.

Even if setters had beaten pointers in proportion to their greater representation at field trials in this country, and their far higher cultivation of late years, it would only have proven them better for field trial work alone. The field trial does not pretend to test endurance. Victory in a short spurt at a field trial might turn to defeat in a whole day's work on prairie chickens in August, or a day on quail in North Carolina in October, or on woodcock in July; which I believe a pointer is naturally better adapted to stand than a setter. But the setters have not beaten the pointers in proportion to their advantages of numbers, improvements, etc. Last year at High Point, out of five pointers against five times as many setters in the all-aged stake, two of the former came in winners and one was withdrawn. In the Derby, of the same meeting, I can only remember four pointers, and three came in winners of first, second and divided third prizes. Don beat all the setters at the chicken trials, which I believe to have been the nearest to a test of endurance of any field trial I ever heard of, owing to the heat and scarcity of birds.

The setter Gath I believe to be the best of his breed in this country and Don the best pointer—in the field. Gath only beat Don by the merest trifle, and, judging from the dog's looks, I am inclined to think that in a six hours' race the trifle would be in the pointer's favor. It is claimed for the setter that his coat protects him in cover. My experience leads me to think the opposite; his long hair catches briars, burrs and the other pricklers that do not seem to affect the pointer; therefore I claim that the setter's long hair is more injury than service to him in this way. It is certainly a burden to him both in the field and the kennel in hot weather, and when running, at least, he needs no protection from cold, so the value of his coat in winter does not offset the inconvenience of it in summer time. I never saw a place yet that I could send a setter but I could also send a pointer, and I have never known the latter to receive any more, if as much, injury from bad cover as the former.

I believe the pointer is easier to break, easier to handle and will retain his training better than the setter. I believe a pointer will commence to hunt earlier and continue useful to a greater age than the setter, and to show my earnestness in this belief, I will hunt my old pointer bitch Grace, now in her thirteenth year, against any setter bitch in America of the

J. M. AVENT'S BLACK, WHITE AND TAN ENGLISH SETTER DOG "RUSH GLADSTONE."
Winner of the National Field Trials Derby.

same or nearly the same age, that has raised nearly the same number of litters of pups, for \$300 of my own money. If a larger bet is desired, I know parties who are willing to make it much larger. This I think is a fair offer, and a good chance to test the relative merits of pointer and setter with regard to their lasting qualities. I would like a six hour or a whole day race, and although my bitch is deaf and blind of one eye, I would ask no odds of any setter bitch with two good eyes and good ears. I will take the issue according to field trial rules, or finding alone, as may be desired, and guarantee a lively time to any comer. I have no prejudice against setters. I love a good dog of either breed, but I want to see the noble pointer get fair play.

THOMASVILLE, North Carolina.

THE KENNEL HOSPITAL.
V.—THE TREATMENT OF DISEASE.

There are certain general rules which are applicable to most cases of injury or disease. The first thing to do with a sick dog is to put him in a comfortable place, taking care that if the disease be a contagious one, he is isolated from other dogs, or, if his disease be attended with danger to man, he is safely secured.

The comfort of a dog depends somewhat on his habits. Many pet dogs, when separated from their owners, fret or sulk to an extent which may injuriously affect their recovery. These peculiarities are not to be treated as mere whims, and disregarded. They must be carefully looked to. The essential comforts are an equable temperature, a dry bed, fresh air, and quiet. The next thing to do is to remove any sort of irritation, or, if a dog in fits should be protected from light and noise; water should be kept away from an animal with acute irritation of stomach; a collar should not be left on a dog with a sore throat, nor should he be tied up. Having tended to the patient's comfort, and removed all annoyances, we must find out if any obstructions exist to any of the functions of the body, and, if so, remove them. Sometimes, instead of obstructions, we find excessive activity and a consequent drain upon the system. Loss of blood is a very evident drain, but any other fluid flowing from the body in excess, may cause nearly as pronounced an effect. Bitches suckling an extra large number of pups often suffer injuriously from the drain of milk. Long-continued or violent diarrhoea, excessive action of the kidneys, or great suppuration from a wound or an abscess, are all drains upon the system, which require judicious checking. Should great pain exist, we must try to alleviate it; and we do so by local soothing applications, or in some cases by the administration of drugs. In diseases of any duration we must sustain the animal's bodily strength, as debility is unfavorable to the proper termination of all diseases. In short, the principle to be followed in treating disease is to assist nature by all means in our power—by removing the cause, inducing comfort, sustaining strength, guarding against all irritations, and anticipating and counteracting any complications likely to arise. A rational attention to these indications is far more likely to be beneficial to the animal than any imitative rule of treatment. Good nursing is most important, but it consists not in fussiness and constant interference with the patient, but in doing everything which we know to be beneficial and nothing more. It requires a big confidence in nature, and must be directed more by the brain than the heart.

Dieting in disease is of the utmost importance. Food should never be forced upon an animal until it is evident that the want of it is causing injury. It is better for a dog to voluntarily eat one ounce than be forced to eat ten. Care should be taken not to sicken an animal by leaving food constantly before it. A few minutes' coaxing will often induce a dog to eat that has positively refused all previous attempts to make him. Sometimes the repeated insertion of a piece of meat between the back teeth will induce a dog to bite and swallow it. Once he swallows a piece he will usually repeat the operation. Of all things for easy digestion and nutritive value, raw lean flesh is the best. In the worst cases, when appetite has utterly gone, beef tea and broth may have to be given; and it should be remembered that of these the clear infusions are best. A thickened broth is always indigestible,

The administration of alcohol in the form of wine or brandy is sometimes advisable. In cases of great prostration it may be given in a little beef tea or water. I prefer it always mixed with a nutritive fluid, not with plain water. The use of stimulants is, however, greatly abused. Their repeated administration to sick dogs induces derangement of the stomach, and retards the return of a healthy appetite. Brand's Essence of Beef is often prescribed; it is a nutritive and stimulant of great value. In making beef tea the majority of people trust to prolonged boiling, and estimate the product according to its dark color and strong smell. This is an error. The proper proceeding is to cut lean meat into thin pieces, place it in cold water to which a little salt has been added, and let it stand for some time, hours if possible. Then cover the vessel with a lid and put in the oven, or empty the meat and water into a saucepan, bring it slowly to the boil, and boil for five minutes. The result is a straw-colored fluid capable of being directly absorbed through the walls of the stomach. The dark flocculent particles of beef tea are not desirable, and should be strained out when the patient's stomach is very irritable. Jelly, especially firm jelly, is simply a much additional indigestible material. Gelatine, whether obtained by boiling tendinous meat or by adding the manufactured article, is of no value as a feeding material, and with dogs has not the effect, as in man, of sometimes enticing the appetite by its pretty appearance.

THE ACTION AND USES OF DRUGS.

In treating disease we derive considerable assistance from the judicious use of medicines. Unfortunately, in dog practice, drugs are employed in the most reckless and ignorant manner. Nearly every keep-dog-man has a few prescriptions, which he values highly, and treats in about the same intelligent manner that a savage does a charm. These formulae when seen, are found to be such as were used in human medicine about sixty years ago. They contain drugs the very name of which have almost been forgotten, and the actions of which save that they are poisonous are not understood by any one. In modern *medicæ medicæ* we employ some drugs the action of which is direct and certain; we know what they will do and how they do it. Examples of these we have in the agents which, acting upon kidneys and bowels, excite their action, and which we group under the terms diuretics and purgatives. There is, however, a class of agents called alteratives, which act we do not know how. To say that they "alter disease action" is simply to beg the question, or to say, as other authors say it, that "they neutralize morbid materials or processes in the blood," is simply to state what in most cases they certainly do not. They are a group of dangerous articles, nearly all poisonous, and, strange to say, the most sought after by stable-men and kennel-men. Arsenic, mercury, and antimony are three of these agents; and, although there are cases of disease in which observation has shown them to be useful, their mode of action is a mystery, and we employ them empirically. When we do not know how a medicine acts, it is better to let it alone, unless a large number of reliable observations or trustworthy records enable us to say that it is valuable in certain definite conditions. There are a number of drugs which may be usefully employed, and which can do little harm. These are the agents the amateur should trust to. Some medicines, simple and plain in their action, may be mischievous as inducing an action in the dog not required—such are emetics, i. e., drugs which cause vomiting. How is it that emetics are still largely used for dogs—that the treatment of distemper, for instance, is so often commenced by their administration? The reason is simply that the practice of canine medicine is usually a servile imitation of human practice, but about fifty years behind the time. A generation since an emetic was almost indispensable to open the campaign against diseases. Now it is hardly ever used but by the canine medical amateur, who does as his grandfather did, knowing nothing and caring less as to the why and wherefore of his practice.

Selection of Medicines.—Having made up our minds that it is desirable to produce a certain action upon the patient, we desire to select the drug best suited for the purpose. Now all medicines act after being absorbed, and their actions are lost if they are speedily ejected from the stomach. We must remember that vomiting in dogs is easily induced, and that therefore it is advisable to select drugs free from nau-seous smell or taste,

or likely to irritate the stomach. Some medicines can be beneficially mixed with the dog's food, but care should be taken so to do this that the animal does not discover it. There are cases in which the detection of medicine by a dog is followed by a suspicious refusal to eat similar food for a long time, and this abstention might be most regrettable in a case of disease. Some medicines act best on an empty stomach, in fact all are more rapidly absorbed on that condition; and we have only to remember that rapid absorption is not always advisable. Arsenic and nux vomica are drugs that should always be given when the stomach contains food, as then their violent action on the system is avoided.

Administration of Medicine.—Drugs are given to dogs either in the form of powders, pills, or draughts. Powders are very simple, and if small and tasteless are easily given by throwing them into the back of the mouth. Larger powders, not of a disagreeable taste or smell, may be mixed with the food. Pills are the handiest form in which drugs can be given, because we are certain of the exact quantity an animal gets when he swallows it. Powders mixed in food may be left in whole or in part, and draughts may be spilled. Of course there are many agents which cannot be made into pills. When possible we should adopt that form. Pills may be given by force or artifice. To force a pill, open the dog's mouth by pressing his cheeks between his teeth with the left hand, then drop the pill as far back as possible, and give it a push with the finger of the right hand. This method is more easily effected with a large pill. To deceive a dog into taking a pill, the medicine should be in as small a compass as possible, and buried in some article which the animal is likely to bolt. Meat is best. The surest way of doing it is to cut three pieces of meat about the size of hazel nuts—cubes, not thin slices. Make a hole in one piece, and bury the pill in it. First give a piece without the pill, so that the animal on biting it finds nothing unusual. The first piece is always received with suspicion and bitten. Next give the piece containing the pill, and at the same time show the third piece, which causes the dog to more quickly bolt the all-important morsel that he may get the third bite.

Fluid medicines may be given from a spoon or a bottle when they are of a nature such as to prohibit their being added to articles of food. In using a spoon, force the mouth open with the left hand, and with the right place the spoon against the roof of the mouth. By firmly keeping the spoon against the upper jaw the animal's head is kept up, and the chances of any fluid being spilt are lessened. Large dogs and bad tempered ones are more easily drenched by first placing a tape muzzle on the nose and then using a bottle. The head is raised, the lip on the side drawn up above the tape so as to form a funnel in which the fluid is poured a little at a time. Fluids should never be forced on a dog with a sore throat, as they may then cause choking. Caustic or irritant substances, such as ammonia or turpentine, should always be well diluted in a good solvent before being given, and volatile substances, such as ether, should never be mixed with warm water, as there is not only great loss of the agent, but the fumes are very irritating. Medicines may also be administered by injection under the skin, by rubbing them into the skin and by enema. There are so few cases in the dog in which these methods are advisable that we need here enter into no details. The more easily and quietly medicines are given the better. Those who know most about them employ them least.

THE AMERICAN ENGLISH BEAGLE CLUB.

RECEPTION has been taken by the FOREST AND STREAM, and "O. W. R." to the name "American English Beagle Club," and the suggestion offered to prune it down to simply the "Beagle Club," as being sufficiently definite.

The A. E. B. C. was organized to advance the interests of the English Beagle in America, and to educate fanciers as to the form, style and belongings of this breed alone.

We do not propose to take up if the bench-leg beagle, nor to prescribe his points; neither do we intend to devote our efforts for the benefit of that peculiar dog, the American beagle; we leave them in the hands of their friends.

From the foregoing it will be seen that there are three recognized varieties, and if "The Beagle Club" was fixed upon as the name of the association, where would we draw the line?

CLEARING OUT FROM THE ANCHORAGE.

A NOVEMBER DASH IN A SEVEN-TONNER.

PATLE debang, slam bang, squeak, kachuk! "A-s-station, Lou! Problem!" he roared, swinging the door wide open and eyeing the sole occupant of the car with a mixed expression of wonder and curiosity, as I gathered my various belongings and swung round for the exit. No blame to that conductor if he eyed me for a second time, apparently anxious to "locate" such an exceptional rooster. What with the outward rig of a city cockney, a valise puffed to its utmost capacity, a pair of yacht shoes strapped on top, a long coffin-like bundle half concealing a blanket in the folds of a crumpled oil skin, newspapers and packages, pipe and fragrant weed bursting the boom in all pocket flaps, and in addition that far way look of anxious expectancy of a man trying to catch a train, my make-up as a total must have appeared like a strange cross between an emigrant, an exile, and something perfectly unclassifiable in the range of a car conductor's experience. Luffing sharp around sunny corners, and carefully piloting my portable yachting rigs and chattels down the steep companion leading to the street, I gave sheet and drove for the great iron bridge, scanning the opposite shore for signs of a train making preparations to get under way. There was a crowd on the bridge. What's up? Eolier. The "draw" was just opening, and glancing at the ever widening chasm which separated me from the train I had scientifically calculated to catch to a second, sundry mental objections rose to the surface. Did you ever know of a drawbridge that wasn't open when you were in a hurry, and always closed tight when you had plenty of time? Finally the draw was swung to, and with a scowl at the politician up in the cockpit controlling the revolution of the span, I was quickly hustled across by the tide of humanity bound the same way. Slaving dangerously close round a fragrant peanut stand on the corner I scudded for the depot at top speed, but the instant that elegant structure of barlike dash was opened to range, a spiffed blast rent the air and high pressure puffs shooting skyward from the engine's stack told the tale of sad disappointment, Missed! And all on account of that

middle span of the bridge. There was no help for it, one of the roustabouts volunteered the information that "there warn't going for to be no train for some time, Mister," so with a feel at my pockets and a fresh grip on the bundles, a course was shaped down the street and slowly I trilled up hill and down hill past the old Morris estate, just parks dear to the Teuton heart, until the last outlying houses had been left in the wake and then steering across meadows and flats brought up in front of the club grounds, struck aback with a warning legend: "No admittance except for members." It was do or die, and down came the bars, as no members were in sight, then a balance out along the staging, and at last drop went the packages and bundles on the well-kept float from which the members shove off to their yachts and I took a glance about to grasp the state of affairs in general. It was a dreary, cold, blasty November day, enough to frighten auzht but hardened sinners from such a scheme as a five days' cruise to the eastward. The wind piped viciously from the northwest, the sky was overcast with leaden clouds, portending heavy snow. The grounds of the club looked forbidding and deserted. Boats were hauled out and stored up in their lonesome berths for winter. The club house wore a sleepy, woebegone mien, and but for the muscular form of the janitor or shipkeeper, who stood in the doorway, life seemed extinct in the surroundings. A string of bathing shanties about the point dubbed Morris Beach stood gaunt and grim, a hollow mockery to the times. A stiff seending by in the grasp of the outgoing tide was quickly swept beyond view, the greenhorns in her seeking to bring her by the wind for an impossible beat home through the Kite, whence they had come, a last rose of summer left over from the prolific bush of Harleianite excursion crowds. A few yachts were still lugging at their moorings, ever and anon jumping their noses into the sharp-capped, impudent, little seas, which spanked tiny showers of spray over the rail in return. There was a musical slating of restless corollae, whipped against the spars in that quick rhythm which sends a thrill of joy to the heart in anticipation of a glorious sail to come.

Bold and high, with an air of business all over, set off from the rest of the little fleet by a brilliant black side and a rig of more than usual smartness, with mainsail flapping violently to the blasts, whose dark track could be followed far across the waters, with burgee defiantly flung to the breeze, jib hauled out on the bowsprit, bright and resplendent in all the glories of a full state of commission, with dingy bobbing to a trailing painter, and two hands busily engaged on the forecsteele—there lay the smart little vessel bound to the eastward, blow high or blow low, for the closing cruise of the season. A few overhead girations with the traveling bag, which, by the way, nearly took me off my pinning, and the good lookout kept aboard the cutter soon sent the dingy ashore at my feet. A few strokes from the amateur far at the blades and we dashed alongside, just abaft the main rigging, and proceeded to climb aboard by the shroud chainter. One hasty glance in admiration of the clear flush deck, broad straight gangways, mahogany skylights, and the stye about the after end, one quick look aloft and then down below to shed boiled shirts, stiff leather shoes, and the other abominations of an overtrout civilization ashore. The little yacht, though but 32ft. loadline, and 75cft. beam, was a regular stunner of her kind. Below she had standing height, with a hat on under the beams clear fore and aft, from stern to post. The forecsteele was roomy, with all the facilities for the unfettered display of culinary talent and a berth for the cook besides. The main cabin was between bulkheads of its own, with pantry and—wonder if I can get off that favorit-piece of furniture upon which the "luxuriant" yacht owner dotes—a-a buffet and etagere! How is that for comfort and luxury! Enough to make any one intending to a cutter, I should think. Plain English for those Hungarobobs is "lockers," but such common furniture contents a yacht in the eyes of many people, because lockers are not supposed to cost so much as those tangled foreign complications. The sofas were 7ft. long, 22in. across, and there was 3ft. of floor, with a swinging table in the center. The companion ladder broad in the stern, on each side of which there were big "wardrobes" for hanging up oilskins and clothing. The ladder had a hand back, and swung easily and noiselessly around on hinges, forming the door to the after

GIL BLAS—This cutter has been purchased by a member of the Knickerbocker C. C. She was built by Kirby, of Rye, in 1881, from designs by C. P. Kinniburgh. Length over all 24ft. 6in., on loadline, 23ft. 6in.; beam, 52 1/2 in.; draft, 4ft. 6 in.; keel, 30 1/2 in.; mast, deck to hounds, 20ft.; boom, 23 1/2 ft.; cut, 14 1/2 ft.; bowsprit, outboard, 9ft. She has been out on the hard at South Brooklyn for a long time, her rigging being in excellent order.

THE FOURTH CUTTER—Besides the three new cutters mentioned in last issue we hear that Mr. Cranston, of this city, is to have a cutter similar to Oriva in proportions, and that the new cutter to be built this year than ever before. The foregoing, with the addition of the battery, to be shipped by steamer in spring from England, makes a total of five before the year has fairly begun.

NEW SINGLEHAND YAWL.—W. P. Stephens has got out the drawings and molds for a handsome little yacht of cutter proportions for a gentleman now in Florida. The keel will be stretched this week in the boat to be off early in spring. Length over all, 22ft.; on waterline, 18ft.; beam extreme, 6 1/2; draft, 4 1/2; 1,000 lbs. iron on the keel. She will be rigged as a yawl for general knockabout sailing, singlehanded.

STEAM YACHTS.—Mr. St. Clare J. Byrne, known in America as the designer of Mr. Bennett's Namouva, by far the best model and best planned steam yacht out of an American port, advises the public of his professional address elsewhere.

NEWARK Y. C.—The burgee of this club is a blue triangular field with wide red border, except along the luff. It is plain, pretty, and easily made out at a long distance. The club has issued cards for New Year.

NEW CUTTER.—We learn of another new cutter of about twenty tons for a New York gentleman. The plans are now being perfected, and details will be given later on.

SCHOONERS.—Frequent space our review of schooner racing last year goes over till next week.

JLEEN.—We last heard from this cutter in Smithtown harbor, Dec. 25, on her cruise down the coast.

Canoeing.

FIXTURES.

Winter Campfire.—Jan. 5, 1884, 8 P. M., at 23 East Fourteenth street. Subject—Sails, Rigging, Steering Gear and Paddles.

Secretaries of canoe clubs are requested to send to Foxess and Stream their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to Foxess and Stream their addresses, with logs of cruises, maps and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

HARTFORD C. C.

Winter Campfire.—Jan. 5, 1884, 8 P. M., at 23 East Fourteenth street. Subject—Sails, Rigging, Steering Gear and Paddles.

COM. L. O. JONES; Secretary. A.W. Dodd, Signal—Dark blue field with gold letters.

AMATEUR CANOE BUILDING.

OF the many who seek their pleasure on the water and among boats, a large proportion that of their delight, less in sailing than in working on their beloved craft, desiring, building, altering and rigging. For this work, requiring as it does skill and practice in no small degree, they are usually prepared, as the time for it is taken at old moments; they lack the practical knowledge and training required by the professional builder only after years of careful and patient work; hence from those who build the craft for a livelihood it is not always readily given to the amateur; and as to the other resource, that help to be derived from books, while there are several and of no small value, they are not so readily accessible, and are more costly than the information required by the beginner in boat building.

Having experienced most of the trials and mishaps that attend the tyro in his efforts, we hope in the following chapters to give such help as he most needs. With the professional builder we have nothing to do, he has acquired, through his training an accuracy of eye and dexterity of hand that enable him to shorten or to dispense altogether with many of the operations we shall describe, but the amateur, working in these matters, must make up for them by patience and care, even at the expense of time, and to aid him in this, we shall give such instructions as have proved best suited to his wants.

It might seem necessary, before proceeding further, to say what a canoe is, but we will not attempt here to task in which many older canoeists have failed, trusting to the following articles to define, among other things, the term we will use, and the comparative limited sense in which it has been employed in England and America for the past fifteen or twenty years, without any regard to the many savage members of the same family, from kayak to dugout.

On starting to build a canoe, the first question that arises is, "What kind of canoe do you want?" and the answer may be given by the canoeist himself, in doing which the following summary of the principal varieties of canoes and the main features of each, may guide him. There are, strictly speaking, four classes of canoes, and we will mention them in order of importance, a canoe of 14ft., 27in., is most commonly used. She should have a flat floor, little or no keel, ends rounded, the hull less than 10 feet, the keel straight, the gunwale and paddle, a canoe 11ft., 20in., with flat floor, good bearings, stern post, nearly upright, model full enough to carry crew and stores easily, a keel of 2 to 3 in., or a flat keel, with a few ribs, heavy and open water canoe 11ft., 25in. to 11ft., 31 1/2 in., fitted with the longest boat of greater or less weight. The tyro will be safe in following either of these types, according to his purpose, as they are the results of long practice by canoeists.

DISPLACEMENT.—Any object floating in water will sink until it displaces a weight of water equal to its own weight, thus with a canoe, if the hull weighs 100 lbs., and it displaces 100 lbs. of water, it will sink until it displaces 238 lbs. of water, or 33 cubic feet, as one cubic foot of fresh water weighs 62.5 lbs.

Now, if that portion of our canoe which is below her proposed waterline, weighs 100 lbs., and it displaces 100 lbs. of water, the boat will sink deeper than was intended, diminishing the freeboard and increasing the draft. This fault is found in some of the smaller canoes, and when they are loaded, they sink so deep as to be hard to paddle and unsafe in rough water. To guard against it, a rather full model is desirable for cruising, and a fair weight of stores, being hardly necessary to calculate the displacement, as is done with the larger boats. If, in making a model, a block of wood is taken 14in. long, 2 1/2 in. wide, and 1 1/2 in. thick, it will contain 17.5 cu. in., and if our model, when cut from this block, contains but 5 cu. in., it will be 5/17.5 of the original block. This fraction .28 is called the ratio of displacement, and expresses the proportion between the bulk of the

boat below water and a solid whose dimensions are the length on loadline, the beam on loadline, and the depth from loadline to the keel on loadline. If the draft of a canoe varies from 25 to 30, the former being called "light displacement" and the latter "heavy displacement" boats.

The displacement can be obtained if desired by first weighing the entire block, and after cutting out the model weighing that also, the ratio of one to the other being the coefficient of displacement mentioned above.

DRIFT.

In the first class of canoes referred to, it is important to have the draft as light as is possible, as they are used often in very shallow water, and a heavy draft would be a disadvantage. The keel should be about 1 1/2 in. more. Canoes of the second class usually draw 6 in. exclusive of keel, which varies from 1 to 3 in. the latter being a flat floor, or dead-water. The sides should be vertical or slightly flaring, the "umble lion" or rolling in of the upper strake detracting from stability, and being of no use.

This is the distance from the water to the deck, and in most cases it is less than it should be. The "least freeboard," or the distance from the water to the lowest point of the deck, may be 4.5 and 6 in. respectively for each of the classes.

The curve of the gunwale from the bow downward to the middle of the boat, and up again at the stern, is called the sheer. The height of the bow above the point where the freeboard is least, is usually 3 in. in the first class of canoes, and 4 in. in the latter two, the stern being about 2 in. lower than the bow in each.

ROCKER.

This is the curve of the keel upward from a straight line, and should be about 3 in. for a 14 ft. boat.

GUNWALE SECTION.

This is a section across the boat at its greatest beam, and on its shape the model of the boat largely depends. As a canoe must carry a comparatively heavy load on a light draft, and must sail with little ballast, a flat floor is desirable. The sides should be vertical or slightly flaring, the "umble lion" or rolling in of the upper strake detracting from stability, and being of no use.

With these leading points defined on, we are ready to go ahead with the design, which we shall do next week.

THE LOG BOOK.

IV.—A CANOE CRUISE IN THE ADIRONDACKS.

OUR party consisted of three: W., a younger brother of the age of 17; F., a young friend of the age of 15; and myself. W.'s boat was an Everson Shadow, one of his last. F.'s was a Rye, a fine canoe of 14 ft. 27 in., and I had a new one of 14 ft. 27 in. had sent out from the boat house at San Francisco for this trip. Leaving Sing Sing on the night of the 14th of June, 1883, by rail-road, we found ourselves at Hudson on the next morning at 7 A.M. in time to get a first rate breakfast. After breakfast, we strolled around town and went to the express office to see about our canoes, which we had sent by express the day before. They had arrived safely, and, after paying express charges on them, returned to the hotel to inquire for a conveyance to the Old Forge House, on the Fulton Lakes, from which we expected to make our first start.

On inquiring for conveyance for ourselves and canoes, we were referred to Frank Barrett, who had been ordered, aged to take us and our canoes to the Old Forge for \$10. Laying in a stock of provisions that evening, we turned in with expectations of getting away bright and early on the following morning.

After a good night's rest, we started at 6 o'clock, and, after breakfast and settling our bill, we all three went to the station, where we found Frank Barrett with a large farm wagon, into which we packed our canoes and provisions. After seeing them securely fastened, we ourselves got into another wagon, a part of which was occupied by three other gentlemen, who were going to the Fulton Lakes for a fishing expedition. They were a jolly set, and before proceeding much further we found that, on account of rattlesnake poison, they were getting still more nervous. Frank and I, on our way to the station, Lawrence, from here on to the Old Forge we found the road in horrible condition, and I had to follow on foot behind the wagon, to get a better view of the road. It was a very tedious and hard trip over the road we at last arrived at the Old Forge at 9:50 P. M.

My arrival here we immediately unpacked our boats to see how they had stood the trip, and found them all right, with the exception of a small hole in the deck of my canoe, made by chafing. After finishing our supper and getting our gear ready, we packed our camera out and took some views of the surrounding houses and scenery.

We spent the day here, resting and laying plans as to what our course should be. We concluded to take Ned Ball as a guide to Big Moose Lake, and on our return from there to continue right on to Third Lake, and then to Bubb's Lake. Having everything packed on the following morning, we started for Big Moose Lake. Passing through the Pond, which is the outlet for this chain of lakes, we arrived at San Dominick's Camp at 11:30, where we took lunch and also met our companions of the wagon. We then took our gear and started for the first of our camps, the one between Third Lake and Bubb's Lake. This carry was about one mile long. After crossing Bubb's, which is quite small, we came to the second carry, which we made easily, and then entered Moose Lake, another pond.

Crossing this we arrived at another carry which brought us to the San Dominick's Camp, where we had our dinner. We then started for our last carry, which brought us into the pretty Big Moose Lake. Crossing the lake for about one and one-half miles we came to our camp, where we had our dinner. We then started for our last carry, which brought us into the pretty Big Moose Lake. Crossing the lake for about one and one-half miles we came to our camp, where we had our dinner.

On the following day we concluded that we might as well return to the Forge, so about noon, packing our things, we started for the above place to arrive at the Forge 3 o'clock P. M. The carry was very numerous here and in fact everywhere, and we had to use a preparation of oil and tar to keep them off, which really did not do much good. On the second day we had a very hard carry, and on the following day, having everything in readiness, we started for our long trip through the lake region, passing as before, through the Pond, through First, Second, Third, and Fourth lakes, where we stopped a short while at Jack Shepherd's camp to get a glass of beer.

On the way here we stopped at Sam Jim's camp, and gained considerable information of the surrounding country. Our advance scout looked on in wonder all through here, and it took a good deal of good nature to answer the numerous questions put to us. From here we went on to the next camp, where we had our dinner. We then started for our last carry, which brought us into the pretty Big Moose Lake. Crossing the lake for about one and one-half miles we came to our camp, where we had our dinner.

On the following day we concluded that we might as well return to the Forge, so about noon, packing our things, we started for the above place to arrive at the Forge 3 o'clock P. M. The carry was very numerous here and in fact everywhere, and we had to use a preparation of oil and tar to keep them off, which really did not do much good. On the second day we had a very hard carry, and on the following day, having everything in readiness, we started for our long trip through the lake region, passing as before, through the Pond, through First, Second, Third, and Fourth lakes, where we stopped a short while at Jack Shepherd's camp to get a glass of beer.

staying all night at the camp, and sleeping in a small hut on the side hill. Crossing Eighth as we did the rest, we came to the highest of our hills. First stopping for a while to get a bath in the lake here, which we thoroughly enjoyed, we started on the roughest and hardest carry we had yet had. We had nearly all day to make our way, as we had to return as many as three times to get all our things over. We had a great deal of baggage, consisting of blankets, two pairs, fishing tackle, frying pan, kettles, cooking utensils, cooking stove, and several spurs, which, taken all together, amounted to a considerable load. Our canoes, however, were very clumsy to carry, as we had no regular carrying gear, but those that were carried, were carried in a very awkward manner, and which did not fit our boats at all. It was nearly dark at the time we arrived at the Brown's Track Inn, but we concluded to go on and find a good place to make our camp. Winding down an inclined plane, thinking we never would reach the end, we came into the lonely Hago Lake, away off on which we could just see Kenaw's Hotel. Finding a good place to make our camp, and with a good view of the door of the hotel which to the surprise of all hands, who had been watching our white-laten rigged sails with great curiosity, wondering what they possibly could belong to. We here obtained a pretty view of Blue Mountain.

On the following day we decided to take a side trip to Eagle Lake, Sawana, and Blue Mountain Lakes. Starting pretty early we passed up the lake, and just before entering the Marion River, which joins the Raquette and Ontonagon lakes, we met the daily steamer which gave us three loud shrieks of her whistle as a salute as we passed one another.

Entering the Marion, we paddled on this curious stream called a river, but being more properly a slough, it being in no place much more than a hundred feet, and in some places scarcely twenty. We found the stream in most places anything but interesting, being very marshy along the shores, and in other places it was quite rocky, and in some places it was very shallow. We had to make other places. After passing a short distance up here we arrived at the camp between Ontonagon Lake and the Marion River.

On the morning following our arrival here, we decided to take a trip up Blue Mountain, having heard a great deal of the fine look of the mountain, and in fact, we had a very good view of it. We had to make other places. After passing a short distance up here we arrived at the camp between Ontonagon Lake and the Marion River.

THE GALLEY FIRE.

A FISHING OUTFIT.

I have been a regular and attentive reader of your valuable paper for some time past, and have read with intense interest the various articles, both on the water and on the shore, which have appeared in the several numbers, but they, one and all, lack that detail which, in my humble opinion, adds zest to the narrative, and causes it to sink, when read, into a mere "how-do-you-do" and "how-do-you-do" article, and the only thing that I can say is, in your issue of Nov. 22, under heading of "The Galley Fire," you speak of "camp cookery," and of the "camp cook," whose duty it is to "cook" for the party, and to "manage" the "cookery" of the land. The man owning the sled said that he had never seen down the stream, but was always carried around, and gave me to understand that it was very dangerous to undertake the passage.

Further on you speak of "poisons" to "beginners." Though not exactly a beginner, yet I am conceiving that there are many in which I wish to be informed, for I never expect to be too old to learn. The provision, that of course varies according to taste and fancy, "bread and butter" is the staple article, the stove being, as you say, "a very cooking utensil, their character and number; vessel for food for the Jack lamp; kind of bait used, and how and where used; obtained; and the various articles necessary to the outfit, such as the "sleeping outfit; the gun, ammunition and dog; and last, though not least, the kind of boat and character of equipment."

Now, however, it is necessary to give some of the fishing trip of a week or more to be disposed of, and how transported from one point to another on a "carry" where space and weight is limited? Miss Anastasia emphatically proclaims, "I go in for comfort." I emphatically disagree with her, and I think it would be better to be guided by the number of the articles that can be carried along. If some of your many correspondents who have traveled will be so good as to send me their views and suggestions on these points, I will be highly appreciated.

WINNER CAMP-FIRE.—The next meeting will be held on No. 23 East Fourth-street, Kit Kat Club rooms, on Saturday, Jan. 5, 1884. The Secretary writes that he has received a list of names, and has addressed a carte of oranges as a Christmas present to the Winter Campfire. Say from me that I should be very happy to meet with you, but as that is impossible I will let them to remember that there is a long contest in Florida, on the Anclote River, three miles from its mouth. Any canoeist coming this way will easily find his way to the mouth of the river, which is a very narrow channel, and some two miles of shore, the mouth of the river, the east from it. We have also received from Capt. Kendall some maps of the western part of Florida.

SAK FRANCISCO C. C.—We have received from the canoeists a photo of the entire fleet answering under paddles. The names are mostly of the old Santos type, with great sheer, and the blades of all the paddles are old instead of being square on the ends, as with the "San Francisco C." may well be proud of the personnel of their fleet, as, with one or two exceptions, they are as fine a looking lot of men as any club in the country can boast of.

ANSWERS TO CORRESPONDENTS. J. P. New York.—We do not know where you can dispose of the numbers. R. E. Chicago.—For a shark skin write to the taxidermist who is in the city. J. H. Watsonville, Pa.—Send copy of paper. You will be notified in time for renewal of your subscription. L. N. C. Trenton, N. J.—I cannot give you the address. Our list of open game seasons will furnish the required information. The "Boat" article in your issue of Dec. 12, is not the same as "Anti-Boat" and a signature which we believe to have been a fiction. The letters sent to the address have been returned. "Anti-Boat" and his own name, and your name are anonymous. The bulletin will be announced. Our new edition of the "Boat" is now in the hands of GREENE, FREESTON, & Co. I number of pounds of lead in ounces, standard size: No. 1, 89; 2, 84; 3, 78; 4, 72; 5, 66; 6, 60; 7, 54; 8, 48; 9, 42; 10, 36; 11, 30; 12, 24; 13, 18; 14, 12; 15, 6. The corresponding weight of the Shot by Company's make compares with the Standard. See our issue of Oct. 4, 1883, for full discussion of the sizes of shot. 2. Two wads will secure better shooting than one.

THE MILD POWER CURES. HUMPHREYS' OMBOPATHIC SPECIFICS.

- In use 30 years.—Each number the special prescription of an eminent physician.—The only simple, safe and sure Remedies for the prompt relief of the following diseases. PRICE. 1. Fevers, Congestion, Inflammation, &c. 25 2. Worms, Worm Fever, Worm Colic, &c. 25 3. Crying Colic, or Teething of Infants 25 4. Diarrhea of Children or Adults 25 5. Urinary Weakness, or Straining the 50 30. Disease of the Heart, Palpitation, 1.00 Sold by druggists, or sent the Case of Single Vial, free of charge, on receipt of price, sent for Dr. Humphreys' Book on Diseases, (34 pages, also Illustrated Catalogue FREE.) Address, Humphreys' Homeopathic Medicine Co., 10 Fulton Street, New York.

"Highest Quality" Fish Hooks.

Anglers are so familiar with our name and Trade Mark and the quality of our goods, that we have no hesitation in calling them to witness to the excellence of all hooks made by us. Though our hooks have always been fully equal to any ever made, about five years ago we came to the conclusion that anglers would welcome a very high grade of fish hooks—something far beyond what they had ever used. Consequently we perfected arrangements for the manufacture of what has become so widely and favorably known as "Abbey & Imbrie's Highest Quality" fish hooks. All boxes containing these hooks have our trade mark and the words "Abbey & Imbrie's Highest Quality," distinctly printed on the label. Also the name of the hook, viz.: "Sproat," "O'Shaughnessy," "Aberdeen," "Carlisle," "Sneek Kendall," or "American Trout." When "snelled" on silk worm gut or gimp the hooks are put up in packages containing one-half dozen of hooks. Each one-half dozen is labeled.

Our goods can be obtained of any first-class dealer anywhere. If there is no first-class dealer in your town or city let us know. We fill no orders from anglers residing in cities where a dealer keeps our goods in stock. If anglers insist on seeing the label on the goods they purchase, they will protect themselves and us from a growing and flagrant imposition.

ABBEY & IMBRIE,

Manufacturers of every description of

Fine Fishing Tackle,

48 & 50 MAIDEN LANE, AND 33 & 35 LIBERTY STREET, NEW YORK.

JAS. F. MARSTERS, 55 Court Street, Brooklyn. MANUFACTURER AND DEALER OF Fine Fishing Tackle.

First Quality Goods at lower prices than any other house in America. Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., \$1.00; 130ft., \$1.25; 190ft., \$1.50; 240ft., \$1.75; 300ft., \$2.00; 400ft., \$2.50; 500ft., \$3.00. Any of the above Reels with Drags, 25 cts. extra; nickel plated, 50 cts. extra. Brass Click Reels, 20yds., 30 cts.; 20yds., 75 cts.; 60yds., \$1.00; nickel plated, 30 cts. extra. Marsters' celebrated Hooks snelled on gum, Limerick, Kirby Limerick, Sproat, Carlisle, Chester, O'Shaughnessy, Kinsey, Aberdeen, Sneek, Bend, and all other hooks. Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 3 cts.; 3yds., 5 cts.; 5yds., 15 cts.; 10 cts.; Double Twisted Leaders, 3 length, 2 cts.; 2 cts.; treble twisted, 3 length, 10 cts.; Trout Flies, 50 cts. per doz.; Black Bass Flies, \$1.00 per doz.; Trout and Black Bass Bait Rods, 9ft. long, \$1.25 to \$5.00. Trout and Black Bass Fly Rods, 10ft. long, \$1.50 to \$10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue. Established 50 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

AUDUBON'S Birds of America.

We have obtained and now offer for sale singly a number of the plates of this magnificent work. These plates are one of the edition of 1859, and represent the birds as life size. The sheets are elephant folio, and the paper heavy. The drawings were made from nature, and for accuracy of delineation fidelity to detail and accessories.

Audubon's Birds have never been equalled.

Superb Ornament

For a sportsman's dining room, and no more beautiful and appropriate gift could be found for the lover of nature than one of these. The constantly increasing scarcity of this work makes these large plates each year more valuable. There are represented many species of Ducks, Gulls, Grouse, Snipe, Herons and small birds almost without number. These plates are so large that they cannot be sent by mail without danger of being crushed, and the best method of sending them will be on rollers by express.

- LIST OF BIRDS REPRESENTED: Black Vulture and Head of Deer. Red-tail Hawk. Jer Falcon. Sparrow Hawk. Swallow-tailed Kite. White-headed Eagle. Pigeon Hawk. Black-winged Hawk. Duck Hawk. Fish Hawk. Barn Owl. Crow. Fish Crow. Blue Jay. Crow Blackbird. Redwing Blackbird. Baltimore Oriole. Orchard Oriole. Boat-tail Grackle. Rusty Grackle. Nuttall's Marsh Wren. Common Marsh Wren. Crested Titmouse. For price of plates address Forest and Stream Publishing Co., 39 Park Row, New York.

DAVENPORT'S SINGLE OR DOUBLE REVOLVING CLAY PIGEON TRAP.

This Trap gives as many different angles of flight (except toward shooter) of birds as any live-trap system.

The price is reduced to \$10.00.

The double bird attachment works as well as the single. Can throw the bird any distance apart desired.

THE TRAPS ARE WARRANTED.

Upon trial if not found as represented or satisfactory can be returned at my expense. Send for card of rules and circulars to

A. F. MARTINS, Manufacturer, DAVENPORT, N. Y.

KYNOCH'S Patent "Perfect" Brass Shells, MANUFACTURED BY KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and clatter, and admit of a heavier charge, as owing to the thin metal, inside of meter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool (as represented in cuts) and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsman's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., SOLE AMERICAN AGENTS 101 & 103 Duane Street, New York. WILLIAM READ & SONS, Boston, Mass. Agent for New England States

UPTHEGROVE & McLELLAN, VALPARAISO, IND. HOLABIRD SHOOTING SUITS

Of Waterproof Duck, Irish Postlain and Corduroy. Unequaled in Convenience, Style, or Workmanship. WRITE FOR CIRCULAR.

THIS IS our Skeleton Coat or Game Bag; weighs but 15 ounces, has seven pockets and game pockets. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. It can be worn over or under an ordinary coat. We will mail it to you for \$4.00. Send breast measure.

A. K. R.

The "AMERICAN KENNEL REGISTER" is a monthly record of the pedigrees, etc., of sporting and pet dogs. The first volume (1883) contains the records of 668 dogs. Blanks for registration of pedigrees, sales, breeding, etc., are furnished on receipt of stamped and directed envelope. The Register also contains prize lists of all bench shows and field trials. Subscription, \$1 per year. Forest and Stream Pub. Co., New York.

STRONG CARTRIDGE CO. NEW HAVEN, CONN. MANUFACTURERS OF

Paper Shot Shells, Breech-Loading Cannon, &c. Our Shells cannot be excelled by any in the country. Our Cannon is an entirely new thing, and the most complete yacht Cannon in the world.

---	--

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

SELECTING A RANGE.

THERE are many points to be borne in mind while making a choice of a rifle range, but the leading one is ever that of safety. Bullets are deadly, indiscriminating things, and there should be no risk taken in connection with them. A marker who cannot get into the path of a bullet is more likely to live on than the marker who is simply told that he should not expose himself. A rule is very good so long as it is observed, but if that rule takes the form of a marking pit, out of which the spotter or marker cannot poke his head to see what is going on at the firing points, so much the better.

Ever keeping in mind this fact of safety to those who shoot, to those who assist the marksman, and those, too, who have no interest in the shooting, but who may perchance get into the way of the flying bullets, a few simple precautions will enable those in search of a range to make a satisfactory selection. If the range is for off-hand shooting only, then a stretch of 800 yards will be found sufficient, but if it is intended for military practice, then one of at least 500 yards' shooting distance should be secured. It will be unwise to carry the range to an inconvenient distance from ready means of transportation simply to secure a space for the extreme long ranges of 1,000 yards, etc. The percentage of those who shoot at the off-hand ranges, or even at the mid-ranges, is so much greater than those who prefer the long ranges, that the greatest good of the greatest number will lead to the choice of a good short range. If the long range is there, too, so much the better.

A natural barrier for missing shots in the form of a hill or other rising ground is to be looked for. Sometimes it is found easy to secure a range looking over the water, and if it be not a navigable sheet, this is a very good choice, though the land barrier is the better. A hill with a very slight inclina-

tion should not be chosen, since there is a tendency to ricochet shots, and the least bit of flat pebble may send a swift bullet deflected over the hilltop, perchance to do mischief a half mile off. In any case, with such a natural hill the chance of these dangerous ricochet shots will be reduced if a few low furrows are run across the face of the hill, or if obstructions are placed upon it. If it be found necessary to construct such a bullet barrier, no false economy should lead to any stinting of proper expense at the start. The long butt at Creedmoor costs thousands of dollars through extensive slides of the earth which had been loosely cast up. A parapet of planking twenty-five feet high is a good bullet checker. It should be built of two-inch plank, securely fastened to heavy timbers, and a space of from two to three feet allowed between the two plank sheathings, the space to be filled in with broken stone. Repairs are readily made to this style of barrier, and if attended to as soon as necessary, the repairs will cost little, and keep the fence in good, safe order. Wire ropes in front and heavy timber braces in the rear will keep the fence secure against any heavy winds.

The ground for a range should be level, if possible, but if this be difficult to secure, then the firing points may be brought to a level with the targets by grading up, or by earthen mounds. Sometimes it is found cheaper to erect wooden platforms upon which the marksmen may stand or lie.

The direction of the targets from the firing points according to the points of the compass is important. The range should run from the firing points north to the targets. This will keep the sun to the back and have it shining upon the target face instead of in the faces of the shooters. A veering to the eastward may not do much harm, since the chances are that the bulk of the shooting will be done during the afternoon hours. It is desirable to have easy and quick means of access from the firing points to the targets. In shooting across a sheet of water as is sometimes done, this may not be very readily provided, but it is an essential which should not be overlooked. Telephones are now introduced, and permit quick conveyance of any instructions from those in charge of the practice or match to the markers in the butts.

To enable those at practice to make ready observation of any change in the direction or force of the wind, it will be well to have a number of flags at various points about the grounds. They should be placed on flag staffs above the embankment at the rear of the targets, and also on lower staffs near the firing points with a few placed between. If made of light stuff and cut to a point, these will be very sensitive and aid the shooter materially, especially at long range.

The distances from the target should be accurately marked off, after measurements by a competent surveyor. Short posts are excellent, and on them should be indicated the target number or letter. This will aid greatly in squadding the shooting group. On ranges where there is a growth of grass requiring frequent mowing, it has been found a good plan to mark the firing points with flat stones, not projecting above the surface of the soil.

It is not desirable to have the range in a gully, where there is a continued set to the currents of air, nor get in such an exposed position that the winds keep up a continual hurricane. A place where there is a variation of wind as to direction and force is to be preferred, as more likely to give the range patrons a wide experience in calculating windage.

Having selected the range, the next consideration will be the choice of targets. Iron is the best material for hard usage, but it is not always found advisable to use it, and canvas targets have many warm advocates. The particular arrangement in order to secure accuracy and promptness in signalling the value of the shots is largely a matter of choice. Rifle pits in which the marker may remain secure from any chance of getting hit are the best arrangement, but swanpy land may make them unavailable, and then other forms of mantlets and protective shields must be adopted. The consideration of these, with the whole subject of targets, may be left to another article on the fitting up of ranges.

THE VOTING ON THE FLICKERINGS goes bravely on. The ballots come from every nook and corner of the vast expanse of territory represented by our subscription list; all save the far-off land beyond the Sierra Nevadas, whence we confidently expect returns before the expiration of the time. Feb. 1, when the polls will close. As the labor of counting the ballots will be no inconsiderable task, it is requested that votes be sent in at once. The directions to voters were repeated in our last issue.

SNARED BIRDS.

ONE of the gravest problems of game bird protection is how to stop the sale of snared grouse and trapped quail. There are laws in plenty, but unfortunately each statute is either so framed that it gives to the snarer and the dealer all the license they want, or else from lack of enforcement it is a dead letter, as useless and purposeless as a gun without powder. Here in New York the great game markets, which draw their supplies from all the surrounding States and from the far West, are always well stocked with strangled birds. The dealers advertise for game that has been snared; they prefer it to that which has been shot; it brings a higher price. So the illegally captured game comes in from different parts of New York State and from other sections, and the dealers hang it up on their books.

When the "spy" comes around, the dealer folds his arms and says: "Yes, those are snared birds; now, what are you going to do about it? Do you want to arrest me and have me prove that these birds were not snared in this State?" As it is a very simple thing for the aggrieved marksman to show the judge and jury how perfectly innocent he is, and to make it appear that the birds came from somewhere on the other side of the Himalayas, the "spies" soon grow weary of well-doing, and the game stalls are piled high with fresh consignments of unlawful plunder.

The defect of the law is that it forbids only the traffic in birds snared in the State. This is the loophole through which game is dragged by the crate and cartload. Now what would be the working of a law which should prohibit entirely the sale of all snared grouse and trapped quail, no matter where they come from? Would that be any more effective than the present statute?

"What are you going to do about it?"

THE CUVIER CLUB of Cincinnati held its annual meeting last Saturday evening, at which the following officers were elected: President, Colonel L. A. Harris; First Vice-President, H. C. Culbertson; Second Vice-President, A. W. Gazlay; Third Vice-President, Henry Hanna; Secretary, J. F. Blackburn; Board of Trustees, James Gordon, P. Roach and Henry Hanna. The secretary's report made a very creditable showing for the work and progress of the club during the past year. The extended report of the trustees, which reaches us too late for insertion in this issue, will be given next week. The Cuvier Club has a membership of nearly seven hundred, and is a very influential organization. It is proposed to establish elsewhere auxiliary clubs, which as branches of the Cuvier may have all the advantages of its prestige and strength. This is an important movement and if properly directed will greatly strengthen the interests of the intelligent and common-sense sportsmen of Ohio.

NEW YORK GAME LAW COMMITTEES.—The Assembly Committee on Game Laws is made up as follows: Messrs. O'Neil, of Franklin; Seeber, of Jefferson; Geddes, of Onondaga; Barager, of Tioga; Howland, of Cayuga; Moore, of Richmond; Murphy, of New York; Rosenthal, of New York, and Johnston, of Ulster. The members of the Senate Committee are Messrs. Otis, Gilbert and Van Schaick. We hope that these gentlemen will scrutinize carefully any measure that may be submitted to them. Unless there is some good reason to look for decided improvement in the law, and we are not at present aware of any foundation upon which to base a hope of this, by all means let this year be conspicuous by the absence of the game law tinker.

AN AMERICAN FISHERIES EXHIBITION has been suggested. In the ninth annual report of the Boston Fish Bureau, Mr. W. A. Wilcox, the secretary, says: "We trust the day is not far distant when we shall have a World's Fish Fair in this country, and Boston is the place for it."

AMATEUR PHOTOGRAPHS.

WE have received a number of photographs in exchange for the two views taken from our office windows, and find them very charming and suggestive pictures of camp life and pleasure travel. We repeat that we have taken, with amateur outfit, two views from the windows of the FOREST AND STREAM office, and shall be glad to exchange one or both of them for amateurs' photographs of camp scenes and other pictures made by the sportsman tourist. The views are 5x8 in. No. 1 is an instantaneous picture. It shows the north side of the Post Office, Manhattan street, a strip of the City Hall Park, and a varnish sign over on Broadway. There is also a pie wagon delivering pies to the stand on the Post Office corner, with a fat pedestrian in close proximity. No. 2 shows the front of the old City Hall, with the roof of the new County Court House, other public buildings, the top of Stewart's old wholesale store, and a slice of the American News Co.'s building in Chambers street.

across their breasts, signifying that they took the words to their hearts. Every one now commenced the Pipe-song, and the Bear-woman passed the pipe-stem over different parts of the sick woman's body, after which she arose and left the lodge.

The man then took a common pipe which had been lighted and blew three whiffs of smoke toward the sky, three to the ground and three on the bear-pipe-stem, and then repeated much the same prayer as that said in the ceremony of the o-kan. Three drums were then produced, the war song commenced, and the old man, rattle in hand, danced three times from his seat to the doorway and back. This was an entirely new dance to the writer, and was intended to imitate the movements of the bear. The old man stood very slightly, kept all his feet very close together, and stamped his feet like one giving a benediction, and danced back and forth in time to the music in quick, sudden steps. He then took the pipe-stem, and holding it in front of him, went through the same performance. Afterward the pipe-stem was handed to the guests, and each one holding it aloft for a few seconds made a short prayer. The person who sat on the left of the writer prayed for a continuance of life for his wives and children, the person on the right prayed for success in horse stealing. This concluded the ceremony.

DOWN THE YUKON ON A RAFT.

BY Lieut. FREDK SCHWATKA, U. S. ARMY.
Third Paper.

LOOKING out upon Lake Lindeman a most beautiful Alpine-like sheet of water was presented to our view, while at our feet came in a mountain creek entirely too swift and powerful to wade with safety, and over which a green willow tree was supposed to do duty as a foot-log. My first attempt to pass over it had not taken us into the rushing waters. I wished to get a notion of the river, and a ramble among the woods next day to inspect for raft timber showed a number of bear, caribou and other game tracks, but nothing could be seen of the representatives themselves. A few gulls and terns were seen on the lake, and a small flock of pretty harlequin ducks gave us a long but unsuccessful shot. The interior lakes gave Roli, the cook, a couple of green-winged teal, duck and drake, as a reward for a late evening stroll—for it must be remembered we were close enough to the water to enter the lake at any time, and in darkness even at midnight, when course prying could be had.

Two of the Takh-heesh or "Stick" Indians who had come with us had stored away in this vicinity a couple of the most dilapidated looking craft that ever were seen and a traveler called upon to stretch his conscience and call "canoes." The only thing that ever kept them afloat was the possible reason, as the Irishman said, "That for every hole where the water could come in there was half a dozen where it could run out." The canoes, called by most of the white people "cottonwood" canoes, are really, I believe, made from a sort of poplar, and as the trees are not very large, the material "runs out," so to speak, along the waist, where a greater amount is required to reach around, and this deficiency is made up by substituting strips tacked or sewed on as gunwales and the crevices amply chinked with gum. At bow and stern some rude attempt is made to warp them into canoe lines, and this necessitates a number of cracks, all smeared with gum. The thin bottom is a perfect gridiron of splits, all kept together by the gum, and the preparation of the gum increases with the canoe's age. These were the fragile craft that were brought to me with a tender to transport my effects (nearly three tons) the length of the lake, about ten miles, and they had the assurance to offer to do it in two days. I gave them a couple of loads of material that could be lost without damage, weighing 300 to 400 pounds, and as at that time I did not know the length of the lake I thought I would await their return before further progress. A southern gale setting in shortly after their departure, with running waves on the lake a foot or two high, was too terrible a storm for the little craft, and we never saw anything of them or their owners until three days later, when the men came creeping back overland—the gale still raging—to explain matters that required no explanation. In the meantime the best logs available, rather small ones of stunted spruce and rotunted pine, had been floated down the little stream and tracked up and down along the shores of the lake and raft made of them three or four formidable looking rafts, some made of fifteen by thirty feet. The lashings used on the loads of the Indian packers were put to duty in binding the logs together, but the greatest reliance was placed in wooden pins uniting them through auger holes bored in both. A deck was made on the corduroy plan of light seasoned pine poles, and high enough to prevent wetting the effects in ordinary sized waves, while a pole was rigged with a wall tent for a sail, and an oat bow and stern with which to do the steering.

The raining of the 14th of June to the craft was completed, when we found that, as a number of us had surmised, it was not of sufficient buoyancy to hold all the effects and the whole party of whites and natives. The next day only three white men, picked with reference to weight as anything else, were placed in charge, about half the stores were put on the deck, the raft swung into the current of the stream to float her out into the lake, and as the rude sail was spread, the primitive craft commenced a journey that measured over 4,300 miles before she could get to the end and bark were laid to rest on the bottom, nearly 500 miles of those secrets were given up to geographical science through the medium of her staunch and trusty bones. As she slowly obeyed her motive power, the wind began blowing harder and harder, until the craft was pitching like a vessel laboring in an ocean storm; but despite this the middle of the afternoon saw her journey across the lake completed, and this without any damage to her load. The men had had a hard time of it, however, and had been compelled to take in their sail, for when this was lashed down over the stores there was enough surface presented to drive them along at a good round gait, especially when near the bold, rocky shores, where all their vigilance and muscle were needed to keep from being dashed to pieces in the breakers. They had started with half a dozen stout poles, but in poling through the rocks occasionally one would cramp between a couple of submerged stones and be wrested from their hands before it could be extricated as the raft swept by.

The rest of the *personnel*, white and native, scrambled over the mountain spurs on the east side of the lake, wading through bog and tangled underbrush, then up steep slippery granite rocks on to the ridge tops bristling with fallen timber, the one common suffering being from the mosquitoes. The rest of the stores not taken on the raft found their way slowly along by means of the two Valencian canoes, previously described, in the hands of our own Indians. We

found that Lake Lindeman was drained by a small river from 50 to 60 or 75 yards wide, and but little over a mile long. It was for the whole length a perfect repetition of rapids, shoals, cascades, boulders, bars and drift timber. Right in the center of it the worst cascade was spilt by a huge projecting boulder, just at a sudden bend of the stream, and either channel was barely large enough to allow the raft to pass if it came end on, otherwise it would be sure to jump. Through this narrow chute the raft was "shot" June 16, and although our predictions were verified at the cascade, a few minutes' energetic work pried it off, with the loss of a side-log or head-on from the new logs, with so little damage done, and where we at once commenced towing its dimensions on a scale commensurate with our entire load, *personnel* and *material*.

One of the delights of raft making is standing a greater part of the day in ice water just off the mountain tops, and in strange contrast with this annoyance was the mosquitoes' buzzing around the head while the feet were freezing. A number of larger logs were secured and built into the raft on a plan of fifteen by forty, but really sixteen by forty-two, taking into account the projections and the projections. The general measurements were made. These dimensions were never afterward changed. Two decks were now made separated by a central space, where two cumbersome oars being rigged it was possible to row the ponderous craft at the rate of nearly a mile an hour, and these side oars were often afterward used to reach a camping place on the beach of a lake when the wind had failed us or set in ahead. The bow and stern steering oars were still retained, and we thus had surplus oars for either service. The two steersmen were never employed once. There was only one fault with the new construction and that was that none of the logs extended the whole length of the raft, and it seemed to be nearer two rafts slightly dovetailed in the center so as to unite them than one of solid build.

One of the Takh-heesh Indians that visited us on this portage between the two lakes stammered like a horse-fiddle, and I note it as the only case of that great family with an impediment in their speech. The impediment in their honesty was usually absent.

The new lake on which we found ourselves, and which was about thirty miles long, I called Lake Bennett, after that friend of geographical research who had done more for its extension than any living American not actually undergoing the hardships of the explorers themselves. To its right were the same old blue-ice glaciers, but in pretty relief were the red rocks sticking through them. Similarly colored rocks on the lake's beach and near by showing iron as their coloring matter. I named them the "Iron-tipped Mountains."

On the morning of the 19th of June the naval constructors reported that their work was done, and the raft was immediately put in commission, the load put on, bow and stern line cast loose and, after rowing for two or three hundred yards to get past the mud flats deposited by the stream, the old wall tent was spread from its ridge pole hauled to the top of the ridge mast, and the journey resumed. The scenery along Lake Bennett is very much like the narrow inland passages of Alaska visited by tourists, except that there is constantly low timber on the hills. There was a fair wind in our favor so we started, but accompanied with a disagreeable rain which made things very unpleasant, as we had no sign of a cover on our open boat. Under this wind we made about a mile and a half an hour, and as it kept increasing we dashed along at the dizzy gait of two to two and a half miles an hour.

This increasing wind, however, also had its defects, for on long, unprotected stretches of the lake the water was swelling into waves that gave us the appearance of riding on a vessel, not that she would strike a leak or a rock, but in her ambitious explorations might spread herself over the lake and her contents over its bottom. By 3 in the afternoon the waves were dashing high over the stern, and, having no logs run clear through, she was working in the center like an accordion, and with as much distraction to her occupants. Still it was too important to take advantage of every possible breath of wind in the right direction; and we held her nose to the north until about 5 in the afternoon, when a perit storm was howling from the west, and the rowing space so that no one could stand, let alone sit down here to work at the oars, and as a few of the faithful pins commenced snapping we headed her for the shore at as sharp an angle as it was possible to make, running before the wind, or about two points of the compass. This soon brought us to a rough, rocky beach strewn with boulders along the water's edge and the waves dashing over them in a boiling sheet of water that looked threatening enough; but a line was soon gotten ashore while two or three kept the raft off with poles, the remainder of the party tracked her back about half a mile to a sheltered cove where she was beached, and we began looking around for enough long logs to run the whole length of the raft. Four quite large ones were found and all the next day, the 20th, was occupied in cutting them down, clearing a way for them through the timber to the water's edge, and prying, pulling and pushing them there and then incorporating them into the raft. Two were used for side logs and two for the center, and when they were ready it was evident that a much needed improvement had been made. It was just made in time, too, for our tools were going to pieces rapidly, the last auger had slipped the nut that held it in the handle and it could not be withdrawn to clear the shavings, but a hand-vice was screwed on, and this too fell overboard on the outer edge of the raft in eight or ten feet of water. A magnet was placed on the end of a long pole and we fished for the instrument that we could not see, but without avail. "Billy," our half-breed Chilkat interpreter, was a result that a much needed improvement had been made. It was just made in time, too, for our tools were going to pieces rapidly, the last auger had slipped the nut that held it in the handle and it could not be withdrawn to clear the shavings, but a hand-vice was screwed on, and this too fell overboard on the outer edge of the raft in eight or ten feet of water. A magnet was placed on the end of a long pole and we fished for the instrument that we could not see, but without avail.

A magnet was placed on the end of a long pole and we fished for the instrument that we could not see, but without avail.

On the 21st we started early, with a good breeze behind us which, on the long stretches, gave us very heavy seas and which we tested the raft very thoroughly, with a result much to our satisfaction. It no longer conformed to the surface of the waves, but remained rigidly intact, the helmsman getting considerably splashed as a consequence. The high red rocks that I have mentioned finally culminated in one bold beetling pinnacle, well isolated from the rest and quite noticeable for many miles along the lake, and which

I called Richards's Rock, after Vice-Admiral Richards of the Royal Navy. The country was becoming a little more open as we neared the northern end of the lake, and, indeed, more picturesque in its relief from the everlasting bold nature of the mountain scenery. At 5 in the afternoon the northern end or outlet of the lake was reached, and as we entered a river 100 to 200 yards wide and started forward at a speed of three or four miles an hour—and which really seemed ten times as fast as lake traveling since we were so much nearer the shore, where we could see our relative motion much plainer—our spirits ascended and the whole brilliant prospects when we should be rid of the lakes were joyously discussed and not ended when we grounded and ran up on a mud flat that took us two hours of hard work, standing waist deep in ice water, to get off.

This short stretch of the river, nearly two miles long, is called by the natives "the place where the caribou cross," and at certain seasons of the year these animals—the wood-land reindeer—pass over this part of the river in large numbers in their migrations to their different feeding grounds that the seasons open and close. Unfortunately for us it was not at this time of the year, although a dejected Takh-heesh camp not far away of two families had an archeological ham of reindeer hanging in front of their brush tent, which we did not care to buy. The numerous tracks confirmed the Indian stories, however, and as I looked at our skeleton score and chewed on the Government bacon, I wished sincerely that June was one of their months of migration, and the 21st or 22d about the time of their maximum strength. The very few Indians living in this part of the country, the Takh-heesh—subsist mostly on these animals and mountain goats, and even an occasional moose wandering into their district, while black bear form no immaterial part of their commissary. You would expect to find such followers of the chase the very hardiest of all Indians, conformable to the same rule in other countries, that places the hunter above the fisher, but this is not so along this great river, where it appears that the further down the Indian gets, and the more he subsists entirely on fish, the harder, the more robust, the more demanding and impudent he becomes. After prying our raft off from the soft mud flats, we spread our sail at the beach of the little lake and went into camp after having been on the water (or in it) for over thirteen hours.

The country was now decidedly opening, and it was evident that we were getting out of the mountains. Many flat level places were appearing, the hills were less steep and the snow was melting from their tops. Pretty wild rose blossoms were found along the banks of the beach, with many wild onions with which we stuffed the wrought-iron grouse that we killed, and altogether a general change of venue for the better. There were a number of rheumatic grasshoppers that feebly jumped along in the cold Alpine air, as if to tempt us to go fishing, and in fact every thing that we needed for that recreation was to be had except the fish. A number of lines put out over night rewarded us with a large salmon trout, being the first fish we had caught on the trip.

The new lake now turned abruptly to the east and our old dependence, the south wind, was short but little use to us, in fact we did not get off of this short eastern stretch of ten or twelve miles for four or five days, so that we were obliged. Of course, these protracted delays gave us many chances for rambles around the country, some of which we improved. Everywhere we came in contact with the grouse of these regions, all of them with broods, and while the little chicks went scurrying through the tall grass to hunt a hiding place, the old ones walked along in front of the intruder often but a few feet, seemingly devoid of fear, and probably never having heard a shot fired. The temptation to kill them was great after having been so long without any real success, and the appetizing demands in the rough out-of-door life of an explorer. A mess of them ruthlessly destroyed by our Indians who had no fears of the game law, no sportsman's qualms of conscience or compassion of any sort, lowered our desire to the zero of the scale, for they were tougher than leather and as tasteless as shavings; and after that first mess we were willing to allow them all the rights guaranteed by the Constitution to a higher grade of animals. Quite a number of marmots were seen by our Indians, but their holes were so shallow that the Indians catch them for fur and food (in fact, everything living is used for the latter purpose) by means of running nooses put over their holes, choking the little animal as he tries to make his exit from home. A finely-split crow quill, running the whole length of the rib of the feather, is used for the noose proper, and the instant this is sprung it closes by its own flexibility. The rest is a sinew string tied to a bush near the hole. Nearly all the blankets of this tribe of Indians are made from these marmot skins, and they are exceedingly warm, but they are very hard to come by, and however, is lost by the ventilated condition in which they maintain them, as it costs labor to mend them, but nothing to sit around and shiver. The few Takh-heesh that had been near us at Caribou Crossing suddenly disappeared the night after we camped on the little lake, and as our gum canoe, that we towed along the raft and used for emergencies, faded from view at the same eclipse, we were forced to associate the two events together and chronicle these fellows as inclined to appropriation, and very fortunate circumstances that they were not worried for the use of one after another until we could purchase a substitute, although we hardly thought such a thing possible at the time, so much had we used the one that ran away with our friends.

The 23d of June we got across the little lake, the wind dying down as we went through its short draining river, having made only three miles. The next day, the 24th, the wind seemed to keep swinging around in a circle, and although we made five miles, I think we made as many landings, so often did the wind blow in a new direction, and on both sides of these lakes could be seen a series of terraces rising one above the other, and evidently the ancient beaches of the lakes when their outlets were closed much higher than at present, and when, probably, great bodies of ice on their surface plowed up the beach into these terraces. The next day, the 25th, it was the same light with a billowing wind from 6:30 in the morning until 9 at night, but we managed to make twelve miles, and better than all, got on our old course pointing northward.

At one of our stoppages our Indians amused themselves watching government matches that they had never seen in such quick succession. In a few minutes a result was reached, and some dried dead spruce tree on fire, and these combustible things to the living ones above them, soon sent up great billows of dense resinous smoke that must have been visible for miles, and which lasted for a number of minutes after we had gotten away. Before camping that evening we could see a very distinct smoke, apparently six or seven miles ahead, but really

ten or fifteen, which our Indians told us was an answer to the one that had been accidentally made in the forenoon by them, the Tabk-heesh who made the second one evidently thinking that there were Chinuk traders in the country, this being a very usual name for them when thus engaged. It was worthy of note as extending this peculiarity of signals, so common among the Indians of the Plains, to these far off tribes, but I was not able to find out whether they carried it to such an intricacy of different meanings by compound smokes. It is very doubtful if they do as the necessity for such can hardly arise. This new lake on which we had taken up our northward course is called by the Indians of the country the Tabk-cochah and connecting with it there is a different name with them), and receives a river coming in from the south, which, followed up to one of its sources, gives a pass to the waters of the Pacific. This stream, which hypothetical map-makers have drawn in full waving lines to fill out their maps, and which they have dubbed the Tab-co see ("Alaska and its Resources"), when it is not known by any such name, either by the Indians of the country or the name of the first explorer (really there can only be one geographical explorer to river, so excuse the tautology) to name it such, is said to be by the Indians smaller than the one we came over, and therefore we could consider that we were on the Yukon proper so far.

THE GUN SWAP.

"Hail! hail of snakes and brother Steets,
Fro Maidenkind to Johnny Goets,
If there's a hole in 'at your coats,
I rede ye not in 'at your coats,
A child's among you, takin' notes,
And, faith, he'll prent it."

SOMEbody has said, *Non sinitis semper sapientes*, or "words to that effect," and the occasional follies of men who are generally wise are oftentimes the source of much amusement to those who are in a state of complete sanity. Indeed, most frequently our merriment comes either from our own weaknesses or those of our friends. It is thus that folly is not an unmitigated evil, though candor compels me to say that I think it far safer to expect substantial enjoyment from wisdom than from its counterpart, notwithstanding we are told that the wisest men sometimes relish a little nonsense, and practice it besides. The source would be a rather stupid work, if not occasionally enlivened by a departure from the right line of calculating reason. He, therefore, who, while meaning and doing no harm, affords amusement to his associates, is not to be classed as an enemy to society, or as one who is worthless in the sphere in which he moves. I have known some really great men who had idiosyncrasies apparently inconsistent with their characters which afforded diversion to those who were far from being their equals in intellectual points, and who, in their turn, exhibited far more folly than that at which they laughed. Indeed, every neighborhood has its man who stands out prominent for some particular quality, and this quality is now and then on the ludicrous side of the line of human action. Such a one is often the butt of his fellows, and his conduct seems to amuse as well as interest those who hear of it or witness it.

Among my sporting friends is one whom I have often mentioned in the columns of the FOREST AND STREAM, using Mud as his *nom de plume*. Now Mud is not his name. He bears, as a given name, that of a man—a statesman—born on the soil of Virginia, and developed into the brilliant proportions of one of the mightiest orators of the century in the State of Kentucky, by which State he was often honored with a seat in each of the halls of the Federal Congress. The remaining part of the name was once regarded as the sweet fortification on which he could have rendering it safe from attack, unless the enemy sailed, or used a battering ram, or resorted to such strategy as the Greeks employed in the siege of Troy. Mud is a man of intelligence, has had superior educational and social advantages, possesses high moral and physical courage, and is controlled by a sense of duty, which is unyielding. With all these commendable qualities he occasionally—nay, very often—startles his friends by the commission of acts not very complimentary to his understanding.

Mud is the owner of a Scott Premier, 16-bore and 28 inches long. It is a beautiful little gun, and worthy of an attention which is rarely given to it. Mud is scrupulously neat in his person—almost dandyish—and yet he allows "Little Ann" to become very foul and to remain so. In this deplorable condition he often takes it into the field, and in such cases at least, fails to get as many birds as his bag will hold. Frequently when he hits, the wound is only a flesh one, and the game he kills expresses it—"limping" to the ground. Besides this his eye is not always clear nor his aim steady—not from whisky—and, like many others, he charges the fault of his mishaps to the wrong cause. On a recent occasion he went out on a bird hunt, with his neighbor and kinsman, Teedel, and met with such poor success that he became disgusted with his gun, and came to the conclusion that he would get rid of it as soon as an opportunity presented itself.

One of our town physicians, Quint Wovington, having determined to relax himself somewhat from the uses of pills and plasters, ordered a 16-bore gun from a well-known dealer in Boston. In due time the gun came, together with the bill. It was not expensive—the charge being only \$85. For certain reasons—not had ones—he concluded to play off on those who chance to see it, and accordingly placed the figure 16 just before 35, so as to make it appear that he had paid \$355. Dr. Quint called on Teedel to come in and look at it. After inspecting it a while, Quint asked what he thought it was worth. He replied, that if it had been from first hands he should suppose not more than \$50; still less if it was from second hands. To this surprise was expressed, and the bill exhibited. Then Teedel told him to send the gun back, for the charge was exorbitant. The *pin-france*—was it not one—was confessed.

It was suggested then, that he send over for his cousin Mud, and let him take a look. Quite promptly this erect specimen of humanity made his appearance, picked up the gun, and gave it an exceedingly critical inspection. After the first admiring glance he tried the locks, then threw the gun to his face, then looked closely at it all over, unbreached it, peered at the bolts, closed it, sighted along the barrels, inspected the sight, viewed the stock, opened and looked through the barrels from each end, took it to the light, re-examined minutely in every particular, and expressed his high appreciation of the beauty, finish and handiness of the

fowling piece, and the mechanical excellence exhibited in the workmanship. His next step was to inquire of Quint what he gave for it. To this inquiry the owner replied, that it was "second-hand," and then handed him the bill.

Mud then looked over the gun, and gave it another look, his eye sparkling with delight, as his delicate proportions came to view. He was enamored. His cupidity was aroused. He had in his hand a gun which, if he owned it, would enable him to triumph over all competition in his hunts. Right, cylinder; left, "not for ball." That was just what he needed. That choke barrel would bring down the bird at long range after he had "grassed" on the right. His score to be increased, he proceeded to bringing up the rear as usual, he could boast how he had left Teedel, Duffrey, Wells, and Jim L. G. far behind. His mind was active as to the means by which he could get that gun from Dr. Quint. At last after speaking in high terms of the elegance of the little beauty, he ventured, very timidly—for his conscience was smiting him a little—to say that he was the owner of a very fine Scott, which cost \$250, and would be willing to exchange. Then he proposed squarely to swap. Quint said he didn't know anything of Mud's gun, that he had very little use for a gun of any sort, and he supposed one would do him as well as another. Mud was still looking at the gun with intense delight, his back being toward the counting room, in which sat listening his kinsman Teedel. So soon as the swap was proposed, Teedel showed himself to Quint, "unbeknownst" to Mud, and "gave him the wink." Quint then protested again that he had but very little use for a gun any way, that a gun was all he wanted, that he was foolish to have invested so much, that he was always happy to accommodate his friends, and especially his kinsmen, and if he knew anything of the weapon offered in swap he might be disposed, as a matter of kindness, to make the trade. Mud's anxiety was on a strain, and knowing Quint's confidence in the judgment of Teedel, he told him that T. knew the gun, and would say to him that it was as he represented it. Then Q. called to T. and asked the question. To this inquiry the answer came that it was a nice gun, and that he had long wanted it himself. He advised the trade, and that if he was willing, he (T.) would pay him for his outlay, get Mud's gun, and with the money Quint could purchase a less expensive article. With this assurance the Pill Roller reluctantly consented to the exchange.

Mud, being intent on getting an excellent bargain, now wanted the shells, loading tools and all the gear. After a little bargaining, the deal was made. Mud was highly delighted. He indulged in the following audible soliloquy: "Well, I may be stuck, but a trade is a trade, you know, Quint. I never back out when I have agreed; I always stick. Of course, you won't back. Yes, a trade's a trade, Quint. This is a very fine gun. I am satisfied. You got it cheap. But mine is a Scott premier, you know. That means the best quality. It cost originally \$250, and is in good fix. Well, T., now you're ready to go home. I'll take the gun along, Quint, and deliver the other to Teedel. Will that suit?"

"Yes, cousin Mud. I am afraid I'm cheated. It was foolish in me to pay so much for a gun, anyhow. But, I don't back out. A trade's a trade."

Putting the gun on his shoulder, and telling Quint that he would get the other articles during the afternoon, he stalked proudly out of the store, accompanied by Teedel, and sought the retreat of his home, glowing with an anticipatory joy. On his way, he walked along the sidewalk, he was "full" of the excellences of his trade. Indeed, he got upon the verge of bragging what he could now do in the stubble and sedge and brush. When they reached the gate at his dwelling—for land is not so valuable with us that private residences are on the walk, but stand from thirty to seventy feet back—he stopped and said to his companion, "I am satisfied with my trade, and you must come and get the other gun. But what did Quint pay for this one? I expect he told you. He said he got a small discount. What did he pay? It makes no difference, of course—for a trade's a trade."

"Yes, he told me, but it is best that I keep the price to myself, for if I should let you know, it might dissatisfy you."

"Oh, no, it wouldn't. We have made a firm trade, and I always stick."

They had reached the piazza of the house, and T. then said: "Now, Mud, a trade's a trade. You must not recant. He told me, and, as you ask, I feel justified in letting you know, but I fear you will be dissatisfied."

"No danger at all. I know this is a very fine gun. I can't be deceived. I am too good a judge of mechanism for that. I assure you."

"Well, then, he paid just \$35 for it!" At this announcement, Mud turned to himself to an unusual perpendicular, disengaged clouded away his smiles of joy, and with an emphatic gesture he held forward the "fine gun," saying: "Take it. It is a cheat, a swindle. I'll not be defrauded in that way."

"No, sir! Excuse me. A trade's a trade." So overpowering was Mud's disappointment and humiliation that, without another word, he opened the door, entered, slammed the shutter in T.'s face, and left him standing in utter amazement at the conduct of the shrewd trader.

After he got indoors Mud placed the "stumbling block of offense" upon a settee, covered it well with shawls and overcoats, and with gloom in his heart and on his brow, moodily asked how long it was to dinner. "Few and short were the words he said," and so soon as the cravings of his ever voracious stomach were satisfied, he quickly left the dining room, took up the covered gun, and, with "take you, miserable gun," tread, went off his way to the *locus in quo* the swap was made. Quint met his scowling face with his blandest smile, and meekly inquired why the temperaged—why "so foul the fiery plague within."

"Sir, you and T. have practiced a fraud upon me. You have combined to swindle me. You have entered into a base conspiracy, sir, to victimize me. But I'll show you that you can't compass me in this way. I'll take you, miserable gun, and I'll have it. You only paid \$35 for it. If I could find a justice of the peace I would have both of you arrested, and held to answer a charge of 'obtaining goods on false pretense.' The cheat was bad enough. [He was beginning to cool off a little]. But T. will tell Wells and Mr. Duffrey, and I'll never hear the last of it. The fact is, I expect Wells will tell the readers of the FOREST AND STREAM of it, and I shall get notoriety, if not reputation, by so doing. I'll reflect upon you, and I'll have the door bell rung at you."

Sure enough, Teedel did tell Duffrey and Wells, and Wells "took notes" of the transaction and sends them to the FOREST AND STREAM. All over this section the fame of the

exploit has gone, and when Mud meets a friend one of the first inquiries made of him is: "Have you a gun you want to swap?" We told it on him to Jo Duffrey's in Clintman county, last week, whose house, on "Hickory Mountain," we visited to find amusement among the words which George Leach left in that section when he was "grooming" his dogs for the show at High Point. Some account of that trip I hope to find time to prepare before many days for the amusement of the readers of the FOREST AND STREAM. Perhaps I should not use the word "amusement," for it is far from being certain that the description will contain anything likely to produce that result. Nevertheless I shall try to furnish something in regard to it, which I trust will not displease. WELLS.

ROCKINGHAM, N. C., Dec. 25, 1883.

SKY PICTURES.

THE morning and evening glow in the heavens has been ascribed by the wise men to cosmic dust, etc. What its cause may be it is not our purpose to conjecture, but the effect as seen by the writer from a looting box on the James River, has made an impression that will remain through life, as one of the grandest displays that Nature has ever permitted him to enjoy.

The lantern was moored some distance below us, say a quarter of a mile, and though it was still a good three hours to daylight, we were astir, and a few minutes later pulled off from the yacht. An early start was necessary, as the heavens would soon take on their gorgeous coloring, and the fowl were not obliged to wait for daybreak, but would begin to trade with the first red glow in the east.

The moon had long since set, and save for the brilliant sparkle and flash of the silver lamps above, the darkness would have been intense. The throbbing water mirrored the stars in its depths, and returned flush for flash and sparkle for sparkle, until we seemed to float suspended amid the starry worlds. It is impossible to resolve into words the keen sensations of mingled awe and rapture which take possession of one at such times. It will suffice if the reader of this sketch may perchance touch a responsive chord in the calm surface of the RIVER, and remember the memory of like scenes will paint for him the picture.

At last we are reclining in the narrow box, and listening to the ripples as they sweep against its sides; we hear their subdued laughter as they dance by, and again they seem to sob away into the darkness, borne by the resistless flow of the river in its journey toward the sea. *Wish-sh-sh-sh-whi-whi-u-u-u-u-u-u-u-u* overhead in the still, cool air the rush of wings comes down to us, and while the pulsations grow fainter, the heavenly fires begin to burn and a wondrous glow fills the eastern skies. A few fleecy clouds, but a moment before invisible, are warmed into life and glow like burnished gold in the zenith. The color deepens to a blood-red near the horizon, and shafts of gorgeous lutes stream out and upward like banners until, lost in a bluish soft orange, they fade into the steely blue of the firmament. The deacons stand out in silhouette against the red, the pulsations grow fainter, the heavenly fires begin to burn and a wondrous glow fills the eastern skies. A few fleecy clouds, but a moment before invisible, are warmed into life and glow like burnished gold in the zenith. lower growth in which towering broad-leaved ferns and the famed flowering shrub known as the manganita predominated. As for the exhibit made by the human element in the place it was but trivial; the showing embracing nothing mentionable beyond a small village wherein we were quartered, a meager sprinkling of outlying huts and cabins conventionally termed ranches, and a fishery or two.

Our staple shooting was furnished us, I scarcely need say, by the valley quail. Notably abundant everywhere in the golden State, the bird in question thereby secured this privilege of crossing our path in a locality of similar nature, we hastened to dismount and let our horses, discovering in the meantime that those proceedings on our part had been taken by the game as a signal to start off on a headlong scamper for the nearest cover. Making our way into the thicket after the fugitives, a nervous whistle usually sounded by them at the time apprised us that they were still lustily footing it away from us, and hence, in our endeavors to overtake them and put them up, we were of necessity committed to a not a little precipitous and wearing ascent, the pressing forward as best we could, we seldom failed to flush the birds at last, although, so far as the great majority of them were concerned, they were quite certain to take the precaution to rise well out of range, leaving us to content ourselves with such shooting as a few of the biggards might offer us. When convinced that we should be rapid for the effort, we were of course prompt to proceed with a fresh aggressive movement upon the game. But we could seldom decide that this was to our advantage, as having been the object of the birds, they generally adopted a line of tactics that secured them from a repetition of the infliction completely, either winging their way entirely beyond the point to be followed by our vision, or buying themselves in the topmost recesses of some clump of colossal evergreens in the vicinity where they were virtually secure from detection. Hence, as a rule, we came out of an engagement with this biped relatively light-handed. Indeed, we regarded ourselves as signally fortunate if the count of the bag reached even a half dozen heads. If these returns were undoubtedly of the character of success, they were wholly and indignantly accepted by us. The truth is, whether from the season or whatsoever other cause, the birds provided but indifferent material for the pot, and in taking after them the chief end sought by us was the practice they gave in snap-shooting, and wherein we were fain to consider that they filled the bill as satisfactorily as we could rightly desire.

In our perambulations after the valley quail, it was incidentally a frequent experience with us to put up that long-legged bird of our own known to the naturalist as the Californian hare. In the early part of the season, the hare was the "jackass rabbit," and as I scarcely need say, it is but one of several of our hares of larger growth and more elaborately patterned auricular appendages familiarly distinguished by this title. Like many of its kind, this species struts abroad voluntarily only after nightfall, and passes the day in the shelter of its form. For the most part its bed was fixed hereabouts under a bush standing in the open, although occasionally it couched itself among the herbage in the vicinity of a clearing or a meadow. As a rule, the first caught sight of the creature, it was usually the distance of thirty or forty feet of us and moving at but moderate speed, and when, if we were minded to attempt to bag it, we experienced, as will be surmised, but little difficulty in carrying out our purpose. But it was wholly requisite that time should be taken by the forelock in the matter, since realizing in a moment or two the full scope of the situation, the animal struck out in a series of leaps of genuine kangaroo pattern, and in the twinkling of an eye was beyond the grasp of the pot, where it had anything whatever to apprehend from us. Not being disposed to take the word of others relative to their gastronomic qualifications, I for my part did my best at first to cut short the earthy career of these creatures whenever the chance came about. But at length, with the experience derived from sundry trials of the eating they afforded, I was led to see the error of my ways. The truth is, it must be set down to the lasting disparagement of this quadruped, that we could not assist in its consumption, for the reason that the cook dealt with it in whatever fashion of the season it may, it invariably turns out that the product of his toil consists of a mere mess of sawdust and fillidressings. Having duly mastered this fact at length, I joined with my friend in recognizing that the starting of the rodent was to be regarded as a welcome incident simply in a spectacular sense; and when as it chanced that the presence of our dog put the animal fully to its mettle in taking leave of us, our observant attitude indeed met with abundant reward.

The California gray squirrel was also to be enumerated among the feral denizens of the uplands of the promontory, and from time to time we were prompted to try conclusions with this creature. Although common to all the more heavily-timbered portions of the area indicated, the animal at this particular period was greatly given to frequenting the redwood groves; the ripened seeds of this tree constituting a specially prized article of diet with it. Learning in the course of our rambles that a certain clump of redwoods, but distant from the village, was a resort in marked favor with the squirrels, we accordingly ascended the summit of our hounds with them. After the cardinal rule of this branch of sport, our visits to the spot were timed early in the day, and as the use of both sorts of weapons was commended to us, we added rifles to our ordinary outfit of shotguns. On nearing the clump we rarely failed to discover several squirrels in open sight on the ground beneath the trees, busied with the search for fallen seeds. These members of the fraternity mutually claimed our earliest attention, and as, with the exercise of the eye, we also, they were to be approached within the distance of forty or fifty feet, our favorite arm at the time was the shotgun.

With the finish of this preliminary skirmish we next set ourselves, of course, to the task of looking up shooting in the trees, and when the famed altitude of the redwood is borne in mind, it will be understood that the rifle was declared to be the fittest weapon for the work. While engaged in the actual business of feeding, the squirrels mainly escaped our notice. This was for the reason that in seeking their fare they naturally prosecuted their researches among the

most luxuriant portions of the trees where the seed cones grew, and so kept themselves in mazes of leafage that were virtually impenetrable to the eye beneath. But when their repast was over our opportunity came, for under these circumstances it was their wont to betake themselves to some dry branch exposed to the sunshine, and where, having stretched themselves out at full length, they proceeded to indulge in a comfortable nap, and thus offered us a comparatively easy mark, of no dissimulation by the distance we were reduced to solely hunting measures. Being as it thus was, work for the illustrious Captain Scott of "Iron notoriety, the depletion wrought by us mortals of commoner strain among the ranks of these skyward slumberers, went, as may be guessed, to no very murderous lengths. Nevertheless we were now and then so fortunate as to aim where we intended the bullet should go, and what with the results of the combined use of our fowling pieces and rifles, the stay of an hour or two in the clump rarely failed to yield us a sufficiency of squirrels to furnish our table later on with a most appetizing stew. Before dismissing this creature from our notice, a word should be said concerning its rare physical attractions with which it is endowed. In this connection it is indeed difficult to overpraise it; its figure being at once ample and of immitably graceful contour, while it boasts of a light gray coat of the finest and softest description, and likewise of a brush one with its coat in texture and color, so generously patterned withal, that when carried upright after the usual squirrel habit, it constitutes a veritable penguin. In brief, our finds in the quadruped in question are examples of creature care and finish that is literally one of a kind, and takes the observer accordingly. I need not say that the tourist from the East with a taste for outdoor studies regards his introduction to this squirrel as a truly priceless experience, and henceforth he bears an animal image in his mind that he intuitively mates with the brook trout and wood duck.

W. L. TRIFANY.

SOUTHWESTWARD HO!

IN consulting the columns of sportsmen's journals I am surprised that the majority of sketches treat of field sports in the East and Northwest. The great Southwest is decidedly one of the most inviting countries on the American continent for sportsmen to visit. It has the most delightful climate in the world. At this writing we stand on the threshold of midwinter, and yet the weather up to this point has been a succession of pleasant days. The magnificent southern sun glazes the high mountains with a cordial warmth is upon all the landscape. The prairies, the woodlands and the softly sloping hills lie fold after fold before us, veiled by the most transparent haze. The world is bustling in sunlight, and the face of nature seems lighted up with a benignant smile. Such a climate makes existence a delight.

It seems strange that sportsmen should plan winter hunts to the cold, inhospitable climes of the Northwest, when the Southwest, with its mild and equable climate, offers so many greater attractions. There is more game and of a greater variety, and it is more easily hunted in States like Texas, Florida, Mississippi and Louisiana than in the cold belt of States comprising Michigan, Wisconsin and the Territories. In the month of October there were published in the FOREST AND STREAM a few hunting notes written by me from Denison, Texas. They were the means of attracting to this section two gentlemen, Mr. Simpson, of the oil regions, Pennsylvania, and Mr. E. T. Bailey, who resides in Connecticut. Mr. Simpson has hunted in several of the Northwestern States at intervals for a number of years, and he declares that this is the finest game country that he ever visited. No latitude can explain his delight. "Why," said he, "if the sportsmen of the Northern and Eastern States had every idea of what a magnificent country this is, they would flock here in thousands. Michigan and Wisconsin are nowhere." Making some little allowance for Mr. Simpson's enthusiasm, he echoed the sentiments of every one who visits here from the North. It is a veritable paradise for the sportsman. The climate is warmer than all New England, is comparatively an unsettled State, and besides that nature has made it the natural asylum for game. Its vast tracts of uninhabited country extending many hundred miles, affords a safe cover, and will for a number of years yet to come. There are solitary woods that have never echoed the sound of the pioneer's axe. There are immense wilds, where still roam the elk, deer, bear and buffalo in all their native freedom. A country stretching in lonely monotony and silence for miles away on every hand.

I am not an out-and-out hunter, and endeavor to confine myself to facts, but if some of my brother sportsmen could sit with me at the camp-fire and listen to truthful stories of game that I saw in a day's tramp in Texas, they would not believe their ears. It would be the story of the garden where naked Eve and her consort were kissed and caressed by the soft-eyed deer that roamed, in unnumbered herds, the hills and valleys of paradise. I have seen deer so plentiful in Leon county that the hunter could count a hundred in a day, and so gentle as to be approached within a few yards without showing any sign of alarm. The International Railway has penetrated that section of country, the tide of civilization has followed, and we suppose "the good old days" are gone forever. With the advent of the iron rail the game is doomed. Civilization is not friendly to the inhabitants of the woods.

The Texas and Pacific Railway penetrates the finest section of game country in the States. There are rich wastes where deer roam in a boundless park, and antelope dot the plains like stars at midnight sky. Great flocks of ducks and geese winter in the lakes and lagoons. On the head waters of the Brazos the bear, panther and Mexican lion are frequently met with. An old hunter who lived there solitary and alone for two years in a log cabin deserted by a ranchman, says that the mountain streams abound with speckled trout. There is an unbroken wilderness, neglected wastes, broad prairies too wide for the eye to measure, rolling in a succession of graceful swales. There the honey bee has established his hives. Want a grand thing it would be to cut loose from civilization and spend a season in the pathless and almost unknown country of the upper Brazos.

We cannot conceive a kind of life more calculated to put both mind and body in a healthful tone. Hunting and war parties of Comanches sometimes traverse the country, but of late years they have not disturbed the ranchmen, hunters and trappers, who are met there in isolated cases. On the coast there are many surpassingly beautiful sheets of water affording rare sport to the lovers of the rod. Thousands of water fowl, the wild goose and duck make these waters

their home. It is the choice feeding grounds of the plover and snipe. We believe that Bob White thrives better in Texas than in most States. We judge this from the multitude of coveys that fly up from every field and meadow on the approach of the sportsman. On the vast prairies that stretch out like inland seas, pinnated grouse thrive and multiply. Florida is frequently mentioned by tourists as a superior hunting country, but Texas is its peer, as those who have visited the two sections can testify. A feature of the country are the open woods. Among these openings are some of the most glorious landscapes of the Southwest; the scenery is, for miles together, like that of a fine park diversified by hill and dale, trees grouped and single. Deer and wild turkey are numerous in these post-oc openings. There are two kinds of wolves, the black and prairie wolf, and the coyote, a smaller species, between the wolf and fox. "The march of civilization" as it is called, is thinning out the game in many sections. I am progressive, but every lover of field sports must loathe with sorrow upon the encroachments of civilization which year by year creeps toward the setting sun. In a few years, the game, like the Indian, will disappear from the face of the earth, and the noblest sport that ever excited the ambition of man will exist in tradition and story only.

No longer than nine years ago four day's travel from this point would bring the wayfarer to the buffalo country. In the Pan Handle country and the great grassy plains watered by the Canadian, the Red River and their tributary streams, the noblest game that a sportsman could desire, was the pride of the sportsman, roamed wild and free. Parties of buffalo hunters made Denison their starting point. Thousands and tens of thousands of buffalo were killed and their bodies left bleeding on the plains. I have seen as many as nine wagon loads of buffalo pelts arrive here in one day from the Pan Handle region. Denison, Sherman, Gainsville, Fort Worth, Henrietta and Fort Griffin were the marts and places of trade for the buffalo hunters. The success attending the business stimulated further enterprise, and an apparently boundless field of profit was opened. Ex-Mayor Winn of this city, who turned buffalo hunter, told me that over two hundred camps were established. Just imagine two and three men to every camp, each man killing some days as high as twenty buffalo; is it a wonder that the buffalo has disappeared, and that their former haunts are deserted and silent? The Indian killed for food and raiment, the white man for profit, and his greed has well nigh exterminated the buffalo. The buffalo has disappeared from Texas forever, and the hunting of this noble game is but a memory of the past. But thank God, the deer, the antelope, and in my estimation, the noblest of all game, the wild turkey, will be left to us for many years yet. There will be splendid sport for the lovers of dog and gun in Texas for the next twenty-five years. Strangers can have no idea of the vast extent of the country, and the immense amount of game within its borders. The ideal hunter and trapper of the prolific volumes of Cooper, Irving and Parkman still roams our primitive woods; clad in buckskin and moccasins, he still practices in a homely manner the virtues of hospitality, the uncounted but indistinct kindness and hospitality of the border.

Old hunters are puzzled to account for the large increase of game this season. Not for many years have deer and wild turkey been so plentiful. To quote a veteran Nimrod, "the woods are full of them." Our market is glutted with delicious venison and wild turkey. We are cured with the admirable market hunter and the netter of quail. I edit a sportsman's column in the Denison *Sunday Gazette*, and am waging a bitter war against the quail netter; indeed, you will remember in my language a more forcible man polite. The Denison Gun Club will petition our representatives, Col. Foster, to frame a game law for this country, and then our sportsmen will make it lively for quail netters. There are game laws existing in some countries, but on paper only, they are never enforced. We never heard of a person being arrested for violating a game law in Texas, but the sportsmen of Denison are fully alive to the situation and are determined to put a stop to the practice of killing game out of season, and other flagrant violations affecting the existence of the game.

If the sportsmen of our country do not do something for the protection of game, and that right speedily, it is only a question of a few years that field sports will be a thing of the past. Heaven bless you, Mr. Editor (don't know your name), for the noble stand that you have taken on the question. I wish my arm was long enough to reach from Texas to New York. I would take your hand in mine and say: "Shake, on that; you are doing a noble work; never let up until pot and market hunters, trout hogs, quail netters, yellowlegs and all other unscrupulous game thieves are just deserts." That is why I like your paper, and I am glad to see you back home. Mr. Editor, you are a man after my own heart. You are the kind of man we bank on in Texas. May your shadow never grow less.

I must tell you how we are situated in Denison. We are only four miles from the line of the Indian Territory. The beautiful, wonderful, Indian country which you have no doubt heard and read so much of. Like Texas, it is the natural home of wild game. It is the hunting ground of our sport and nearly every day of immigrants are engaged in the pursuit of game. Hither live the Chickasaws, Choctaws, Creeks and Cherokees who have linked themselves with civilization. Here the Indian tribes pushed beyond the Mississippi have made their last stand. It is their home, their country, and it will be a disgrace that will go down to future ages if any legislation is enacted looking to the opening this country to white settlement. The tribes are governed by wise and humane laws. They have school houses, places of worship, good houses, and as a general thing are happy. In some future issue of the FOREST AND STREAM I intend to give my impressions of the Indian Territory, and correct many erroneous ideas that hold in regard to this people.

Do not the readers of the FOREST AND STREAM envy me when I tell them that in three hours' drive I can reach one of the finest game regions in the United States? Some idea may be formed from the following:

Last week a party of four hunters, Messrs. Black, Hallford, Bacon and McIntosh, who reside in the Territory, on the western shore of Denison, left Denison Tuesday night and went to Engle Lake, distant from Denison twenty miles. They were gone three days, and in that time five deer and fifty-seven wild turkeys were killed. Twenty-seven turkeys were shot on the roost in one night. In the same locality there are several lakes, and if I was put on oath, I would swear to the best of my ability, that I have seen more ducks there than there are inhabitants of your city. The numbers would baffle the oldest duck hunter. Anywhere within a distance of five, ten and fifteen miles of Denison in the

Territory, deer and turkey can be readily numbers.

I am "mashed" on "Nessmuk" and "Yo," they are the cleverest writers to the FOREST AND STREAM, and I have frequently wished they would spend a little of their leisure time in this latitude. "Nessmuk," however, is a water animal, and our muddy waters are not fit to kiss the prober of his "Sairy Gamp." But there are many beautiful crystal streams in Texas and the Territory that would afford abundant pleasure and adventure to the canoeist. And what glorious time the editor of the FOREST AND STREAM could have down here on a day like this when the air is full of balm and sweetness, and the wind that steals down upon us from the South is fragrant with the breath of flowers. But dear FOREST AND STREAM, as you cannot come I will do the next best thing: wish you a merry Christmas and happy New Year!

POLK BURBANKS.

WHERE TO CAMP NEXT SUMMER.

None of your issues of September last a party asked the question, "Where can we find a good hunting and fishing ground for a month's camping next summer?" Firmly believing we have great hunting and fishing properties in the Territory for the purpose in America, I will proceed to partially describe it and how to get there. Go to Denver, Colo., and there do your outfitting. Take the Denver & Rio Grande Railroad for Wagon Wheel Gap. For the benefit of sportsmen who may wish to recuperate a broken-down constitution, as well as to hunt and fish, I wish to say that the Hot Springs as well as other mineral springs of this wonderful region are known to have great curative properties. These waters are so varied in their medicinal qualities that no odds what the patient may be suffering with he may here find waters suited to his peculiar condition, and receive great benefit, if not perfect health. Your Eastern readers, unacquainted with the present condition of Colorado, will at once exclaim, "Indian! Indian!" No Rocky Mountains for me! No Utah reservation for me! To such I will merely say that there is no more danger from Indians than there is in the wilds of New York. Since the railroads have penetrated the Ute country the Utes have left, or rather been removed to Uintah reservation, near Salt Lake, Utah, some 700 miles away, where they are closely guarded by plenty of soldiers to keep them in subjection. At Wagon Wheel Gap you will find a good hotel, with all the accommodations necessary for a summer resort.

Wagon Wheel Gap is an historic name. In 1848 when Gen. Fremont, in his expedition to the Pacific, was wending his way through the narrow cañon of the Rio Grande River winter; overtook him, and he was compelled to winter at this point and left some broken wagons, which were found during late years, and hence the name of Wagon Wheel Gap.

Fishing is so immense, that the truth will appear like a fable. Of course close to the hotels the trout have been thinned out to a certain extent, but one good fisherman can leave the depot in the morning and return by sundown with thirty pounds of trout, from a half pound to five pounds in weight. The largest trout caught near the hotel the past summer weighed six and a quarter pounds. This trout was skinned and the skin preserved and sent to the Cuvier Club of Cincinnati. I saw this fish, and outside of California never saw its equal. The Denver and Rio Grande Railroad Company has wisely begun restocking all the streams in this vicinity. So it will be before long these streams will be fished out. The Rio Grande River is beyond doubt the finest trout stream in the world. For twenty-five miles east and west from Wagon Wheel Gap this river affords sport to the true fisherman, such as he reads about or hears talked about in his club but never finds elsewhere.

There are many creeks in this vicinity, all running into the Rio Grande, which afford the very best trout fishing. By carrying plenty of the great preservative, "Keg Magnus," you can preserve your trout and in four days had them in New York fresh and solid.

Game of all kinds is very abundant. Elk can always be found; deer and antelope are very plentiful. The Colorado law allows you to kill at any time enough to supply yourself with meat. Bear are plenty, both cinnamon and grizzly. Small game can be found in great abundance. The Rocky Mountain grouse affords fine sport. On the highest peaks you can find the mountain sheep, the most cunning of all wild animals.

Camping parties will find the officers of the railroad at Denver, who will give all possible information and the very best rates for themselves, and carry free all camp outfit such as tents, canteens, dogs and a reasonable amount of baggage, besides stop trains anywhere to let off or take on parties. These advantages are so entirely unknown in the East that I think they should be mentioned. There are many more points on the main line of this road between Denver and Salt Lake—many of which I visited during the past summer—some of which I may mention in the near future if acceptable. Q. VAN HEMMEL, M. D.

INDIANAPOLIS, IND., December, 1883.

FELIS DOMESTICUS.—"Let Hercules himself do what he may, the cat will mew." One summer while spending my vacation with my family at a farm on Long Island, much complaint was made regarding a cat belonging to the house that had the annoying habit of sucking eggs. The cat was semi-wild and voted a nuisance to be abated, but without means could not be got at handily, but he effectively suppressed. The writer was requested to shoot her with a pistol he had with him, an old-fashioned navy revolver, but no good opportunity proffered for some time, until one day word was brought that the outlaw was asleep under some currant bushes in the garden. Out I went, found her presenting a good shot, which was made, she receiving some just back of the shoulder, which stunned her long enough to allow another shot through the head, and the cat lay apparently lifeless. I took her to the farm, had her sent to the butcher but returned with the information that no cat could be found. The next day she was reported as being seen in the edge of a wheat field close by the house, and I went out to finish my—to me—murderous job. I flushed my quarry, which made a beak for the barn close by, and as she ran through an interstice of the underpinning, I fired, striking her a raking shot, which I felt ended all (no joke intended), and was more assured of it when a few days after I saw her hands completely cut off with a well "cut" the barn. Shortly after I returned to the city, leaving the family to finish their outing. About a week after my return, I received a letter from my wife saying the cat had been found in the barn with a litter of four fine kittens. Is not this tough? Cats I mean.—REYNOLDS (Boston).

Natural History.

THE WHITE-WINGED GULL.

Editor Forest and Stream:

IN FOREST AND STREAM, of Oct. 11, 1883, Mr. William Brewster has continued a lengthy argument made in the endeavor to convince the public that the author of "The Birds of Maine," is ignorant, incompetent, and not to be credited.

His article betrays loss of temper, savors of vituperation, and abounds with an accusation that cannot be overlooked. He claims that I published later on the white-winged gull was framed upon information submitted to me by him, and thereupon accuses me of a "breach of confidence."

After reading this I wrote to Mr. Brewster for an explanation of his extraordinary charge. He replies that he has no explanations to make further than those contained in his letter to FOREST AND STREAM.

The particular form of gull in question I had mentioned (in "The Birds of Maine," and later in an article written for FOREST AND STREAM on "The White-winged Gull," *Larus leucopterus*), as properly referable to the species *leucopterus*, believing that ornithologists who have otherwise referred it were in error. Mr. Brewster is the latest writer in error, and in correcting his first mistake he now goes to the extreme of not referring the gull to any known species, but proposes a new name, as an additional synonym for subsequent writers to quote in connection with his own name, if he can induce ornithologists to recognize his views as tenable, and to overlook the fact that he has ignored the law of custom in regard to priority of names. The gull corresponds to that long since described as *Larus chrocephalus*, a name to which it is now entitled if not referable to the species *leucopterus*.

The opinion I have expressed in regard to this gull was based upon my own observations and notes. As to Mr. Brewster's article ("On an Apparently New Gull from Eastern North America," Bull. Nuttall Orn. Club, October, 1883), I was ignorant of its contents until after publication. And the opinions and conclusions he declares therein, prove to be widely opposed to my own views.

By correspondence, and waiting a time with patience, I have extended to him ample opportunity to make an honorable amendment for his charge of a "breach of confidence," but he fails to do so.

I have simplified this to say—his accusation is false. I regret that Mr. Brewster was unable to continue a discussion originated by himself, without losing his temper, descending to personal abuse, and becoming guilty of making a charge as base as it was unwarranted.

PORTLAND, ME.

EVERETT SMITH.

A TAME CROW.

THE article in the last FOREST AND STREAM entitled, "Interesting Pets," reminds me of a tame crow once owned by a friend of mine, Mr. A. W. Chapin, of this place. He recognized Mr. C. as his master with as much apparent fidelity and intelligence as the most faithful dog. The crow was his constant companion when out of doors, following him far from home, always docile and under his complete control, yet wary and shy if strangers made advances toward a better acquaintance.

Upon several occasions the bird accompanied his owner a distance of twenty miles to a neighboring village, keeping within sight of his carriage, but occasionally lighting upon fences by the roadside, until he arrived at the place of destination. While there he would remain at or near the carriage until his master was ready to depart for home, when he would return with him in the same manner.

He was very mischievous, and was an inveterate thief, often purloining articles other than food, such as spoons, dishes, small articles of household goods, etc., in fact, anything within his reach which his versatile friend took time to, and which he was able to carry away. At one time while Mr. C. was engaged in a field, the crow espied a vest belonging to one of the laborers, in which was a watch with a loose chain. He flew to the place where the garment was, possessed himself of the watch, and carried it many rods before dropping it.

It was undoubtedly this unfortunate and evil propensity which ended his brief career as a domestic bird, for one frosty morning near the close of his first year of life he came to an untimely end. Although the cause of his death was always shrouded in mystery, there were good grounds for the theory that some of his enraged victims who were employed at my friend's hotel killed him in a moment of wrath.

J. F. SPRAGUE.

MENSON, ME., Jan. 1, 1884.

A LEAST BITTERN.—While shooting rail on Onondaga Lake last fall, my bitch flushed a heron, which I shot, but cannot place. I did not take measurements at the time, as I usually do, and therefore those I send herein, being taken from the mounted bird, undoubtedly will not be exact: Length, 11 inches; wing, 5 inches; bill, 1 1/2 inches. Color: top of head and back, black, with reddish tinge; broad stripe of brownish yellow on side of neck, two white stripes and one of yellow on front of neck; under parts yellowish white; wings, purplish black. Although the cause of its death was always shrouded in mystery, there were good grounds for the theory that some of his enraged victims who were employed at my friend's hotel killed him in a moment of wrath.

PROVIDES ARCTICUS IN MASSACHUSETTS.—Editor Forest and Stream: I am pleased to record a very fine capture, which I do not recall as being on previous record. While on a recent trip to Boston I saw in the taxidermist's shop of Mr. R. P. Searle, 576 Washington street, Boston, Mass., a fine specimen of the black-backed three-toed woodpecker (*Picoides arcticus* (Sw. Gr.)). Mr. Searle informed me that it was shot by a Mr. William Cooper, half way between Milton and Dorchester, about as near as he could recollect, the second Saturday in August, 1883. This fine bird is still in Mr. Searle's possession. The bird is much more common than its neighbor, the white-backed or banded three-toed woodpecker. Several instances of its capture in New England, and especially in this State, are on record. It is, however, a rare and valuable find, and well worthy of record.—W. A. STEARNS (Amherst, Dec. 31, 1883).

UNREASONABLE BREEDING OF SQUIRRELS.—Jan. 4.—Editor Forest and Stream: In your issue of Jan. 3, 1884, my attention was attracted to a note by Mr. Geo. K. Jenny, of Michigan, entitled "What Does It Mean?" Mr. Jenny states that while shooting in the good country of Michigan last autumn, "almost every bunch of squirrels" killed by him, contained "from one to three" pregnant females. I, also, met with a similar experience while collecting in the vicinity of Aldie, Loudoun county, Va. I quote from my journal as follows: "Sept. 12, 1883. During this forenoon while shooting in a hardwood grove, I noticed a gray squirrel (*Sciurus carolinensis* Auct.) 'cutting' in the top of a beech tree. After a while I killed it, and found it to be a female and, as I supposed, in good condition. When I came to dress it for my improvised dinner, I was surprised to find that she contained three young, measuring while in their embryonic position, about one inch in length." I mentioned this fact to some of the native sportsmen, and was told that they had noticed its frequent occurrence this year for the first time. Concerning the cause of this autumnal breeding I have no theory to advance, save that proposed by Mr. Jenny, that it might betoken "an open winter," and that so far (Dec. 11) this theory has not been refuted by fact. It would, I think, be interesting to learn the experience of others with the *Sciurus* during the past fall, and hope some of your readers will respond.—LOUIS A. ZIEGLER (111 East Seventy-second street, New York city).

LE IOY, N. Y., Jan. 6.—Editor Forest and Stream: In your last issue (Jan. 3) Mr. Jenny, of Marietta, O., mentions killing female squirrels that were pregnant during the months of September and October. By reference to my "field book" I find that on Sept. 11 I shot a large blue female squirrel, whose glands were full of milk, and on Sept. 21 a gray female in the same condition. Both of them had families which they were rearing at the time very evidently. I think other shooters found the same thing as I remember. Squirrels were very scarce early in the fall and, although our law allows the killing of them after August 1, I was unable to find any until the 14th of September, though making two or three visits to the woods in the meantime in their domestic duties, and so kept out of sight until later in the season? They were fully as plenty the last of October as in other years. At what time do the females bring forth their young in this latitude?—F. M. COMSTOCK.

NOTE ON THE EIDER DUCK.—The eider duck, better known as the "mojak" to the settlers along the shores of the Gulf of St. Lawrence, is still breeding on Mingan Island—otherwise Bald Island, on account of the total absence of all trees upon its surface. It is situated on the north shore of the Gulf, only eleven miles from the Hudson Bay Company's post of Mingan, and within seven miles of the fishing establishment of Long Point, where during prosperous seasons large numbers of fishermen spend their summer. These people, in company with the Mingan Indians, make frequent raids upon the breeding grounds of all sea birds, particularly those frequenting Bald Island, as it is most accessible and easy to explore. During a few days' stay on this interesting spot, in the beginning of August of last year, the vestiges of eider duck nests were still here and there to be found, consisting of a few handfuls of soft gray down, so much have consisted the lining of the last surviving nidification. Some frequently female eider ducks in their dull brown summer plumage, but learned that the fine and conspicuously colored males are only shot there during the spring migration. If these beautiful birds were less molested by the resident settlers, who value them highly for their flesh, there is no doubt but that they could be counted in flocks instead of a few scattered individuals. The largest number I saw there, by the aid of a field glass, was twenty-three, which were at daybreak feeding on the outer reef of Mingan Island.—CHAS. LINDEN.

CARDINAL GROSBILLS IN WINTER.—While out shooting Christmas, I saw a pair of cardinal grosbeaks and shot the male, but the female flew away, and although I looked for it about two hours, I could not find it. The male was not a very good specimen. It had lost some of its tail feathers, and they were just beginning to grow out again. They were the first of this species I ever saw around here.—H. C. KIRKPATRICK (Meadville, Crawford County, Pa.).

"SWALLOW-TAILED KITE IN MAINE."—An item was published in the issue of Nov. 6, 1883, to the effect that Mr. Mark Hardy, of Portland, Me., had received a swallow-tailed kite, which it was implied, had been captured in that State. Captain Bendire tells us that, on the contrary, the kite had been sent to Mr. Hardy from the West.

ANGER TO THE ADIRONDACK WOODS.—It would be unfortunate if in the present discussion as to the best means of saving the Adirondack Woods, the notion were allowed to prevail that it is quite enough to buy the woods and stop the lumberers from working there, and prevent the running of railways where the sparks may cause fire. For the real and final cause of the ruin of the forest is fire, and whatever cause which conflagration may be traced to must be the subject of preventive legislation, no matter what may be the effect on individuals or the interests of the present inhabitants of that section. Short as it is in way a good thing, and recreation and camping-out most valuable to weary brains, but even for these ends the forest must be preserved intact, and the chief cause of the fires which menace it is the intentional firing to create "slashes" or open spaces where young undergrowth may furnish food for the deer and game for the hunter. This is mainly in the interest of the still-hunter, who is the greatest enemy of the deer, his killing, with his bows and the snow-fall, probably the cause of the annual loss of the aggregate of the sportsmen who go into the forest for recreation and sport combined, during the months when camping out is a pleasure. In a long personal acquaintance with the Adirondack country we have known few fires arising from carelessness compared to the number intentionally lighted by the professional hunters and guides. To prevent this mischief it is not enough to purchase the land, and to have the means of proper protection, but burn where it is most convenient to him to go for the deer. Lumbering in the forest should be absolutely stopped, because it is the cutting of the trees that litters the ground with the dry branches which furnish the fuel for the great fires. The practices which make it profitable to set fires must also be stopped, if any good is to be accomplished by the desired legislation.—N. Y. Evening Post.

Game Bag and Gun.

SNARED BIRDS.

Editor Forest and Stream:

In your issue of Jan. 3, your correspondent "Walter" takes me to task for not preventing the sale of the great quantities of snared and trapped game birds daily offered for sale in the county of New York. I fear that "Walter" has labored under a misapprehension or possibly neglected to familiarize himself with the law, before holding me responsible for that which according to the Game Laws, it would be impossible for any one to prevent. The Laws of 1870, chap. 531, sec. 11, provide that—

No person shall, at any time or place within this State, take or kill any ruffed grouse, commonly called partridge, or any pinated grouse, commonly called prairie chicken, or any spruce grouse, commonly called Canada partridge, or any quail, with any net, trap or snare, or set any such net, trap or snare for the purpose of taking or killing any of such birds; nor shall any person willfully sell, or expose for sale, or have in his or her possession, any of the said birds, after the same shall have been so taken or killed. Any person violating any of the provisions herein contained shall be deemed guilty of a misdemeanor, and in addition thereto shall be liable to a penalty of ten dollars for each bird so taken and killed or had in his possession, and it shall be lawful for any person to take and destroy any such nets, traps or snares, whenever found set.

He will here see that the above law applies only to birds trapped or snared in this State, and to such birds trapped or snared, and willfully had in possession or offered for sale as such; and that it does not apply to birds offered here for sale coming from other States, and I know of no law that does. Under the circumstances, it would be not only very difficult, but impossible to go into the markets and pick out the birds trapped or snared in the State of New York only, and prove that the seller had knowledge of that fact. It would seem to me that the surest way to remedy the evil, so far as the birds of this State are concerned, would be to hold the individual responsible in whose districts said trapping and snaring is done. If your correspondent can suggest any way by which I can overcome the above mentioned difficulties, I would be very happy to hear from him.

JOSEPH H. GOODWIN, JR.,

Fish and Game Protector of the Second District.

ON A CUBAN CATTLE FARM.

FOR the sake of variety, it may be uninteresting to your readers to throw in among the racy stories of field sports, a relation of an off day in which the tables were turned and man for once at least, became the object of a chase, when he did not hunt, but was hunted; a day in which he did not invariably pursue game, but was sometimes the game pursued. A relation of how in his perambulations he was induced to take a horn too much, and how he tumbled about in the most unspontaneous and ridiculous manner, as the result used under such indiscretions.

"That confounded whisky flask! I don't carry it." I already hear some of your readers exclaiming. No, a bit of it. I assure you that the writer, who was the subject of a day and a night of nothing stronger than water on a day, and was consequently not in the least inebriated, though quite upset by the "wearing of the green," and it happened in this wise.

The day broke clear as crystal on a cattle farm in Bejuel, and the meadow larks were singing cheerily as we took to the fields in the confident expectation of good sport among the quail, which were heard calling to each other in various directions on their feeding grounds. Our red Irish bitch sniffed the morning atmosphere with evident joyful anticipations of the reward to come. Scarcely had we turned into a field of ripening weeds and loosed the dog, when she struck the birds and stopped with such suddenness that she nearly turned a somersault backward and pointed over her shoulder. Dismounting and tying our horses, we put up a fine bevy and brought four of them to bag, between our two guns, and marked the rest down in an adjoining field of high grass in which many cattle were grazing.

We worked this field well, though the high grass made it, heavy work for the dog; scattered in it the birds could not easily get together again, and when found, got up singly and gave us half an hour or more. We noticed that some of the bulls did not at all like the color of our dog, and several times showed resentment at her near proximity, she invariably taking refuge from their pursuit behind her master, in whose protection she seemed to have unlimited confidence. Under ordinary circumstances her confidence would not have been misplaced, but unfortunately on this particular day, her master was clad in a new grass-colored shooting suit that was nearly as provoking to the bulls as was the color of the dog, and they had hinted as much several times by sullen looks and howlings, as we passed near to them. Thinking it to be mere idle threatening, I gave no heed to them, but when about leaving the field, passing near to one of them, I suddenly heard a rushing and simultaneously a warning cry from my companion. A rapid glance behind discovered the burly head and horns lowered in full charge within two feet of me. The wink of an eye is no adequate comparison of the time I occupied in protruding sideways upon my right foot, a most active movement, the bull's velocity was still greater. Though my personal avoirdupois escaped those wicked points, yet my fingering coat-tails were not so fortunate. I never before had any just idea of the strength of the material of which these suits are made, but now am willing to make affidavit in favor of their manufacturers, though I would humbly suggest that they might be safer among the bulls, with buttons and sleeves more loosely sewed on.

In an instant I was performing revolutions, gun in hand, over the bulls' back with an agility that would break the heart of an ordinary circus athlete with envy. Never before nor since did I take a horn that elevated me so suddenly or so high. My personal dignity was annihilated in a jiffy, and I was transformed into a trifle light as air, and traveling through it at the rate of a mile a minute. Of what retrospective memories crowded upon me in that brief space of absence from this earthly sphere, I retain but a confused idea. The first that I distinctly remember of however, is the moment when my head was trying to make a hole in the ground, and of the lively satisfaction I felt on realizing that the bull considered me small potatoes, quite unworthy of his further attentions. In that critical moment I even gratefully accepted his estimate of my importance in the scale of man

ole, and even felt considerably humiliated in the measure of brains on reflecting upon how I persistently flirted that new green suit into the very eyes of the noble beasts in spite of their frequent protests. Finally peering over the tall grass, to whose kindly offices I was indebted for the soft place in which I fell, and for shielding my hiding place from those glaring eyeballs, I discovered the faithful dog anxiously inquiring about to know what had become of her master, and a gray streak leading out of the field marked the line of retreat where another pair of coat-tails had been.

The roar of a cannon, and various numbers of my body showed me of them to have been broken or disabled. A bad scare and lame neck, shoulder and hand (putting in their appearance the next day) made up the sum of casualties for the encounter.

The subscriber was in no hurry to show himself above that grass, and did not care much about who owned that bull, feeling just then that he himself had not lost any toro, and had no inclination to look for other people's property. Besides, he "wanted to go home," lest there might be some one sick in the family.

Shoulder remembering that there might be game in the next field into which his companion had vanished, and having heard it said that it would be an unskillful sportsman who notified the game of his approach, he sneaked away stooping low in the grass, so that the game might not discover his movements.

Since that day he has been counseling all his friends to be prudent in the "wearing of the green," when John Bull puts on a sullen look, to take heed lest some of their idols should get badly broken, and remove their shooting jackets to the safer distance. Above all to be sure that if they continuously flirt the objectionable color provokingly in his very eyes, Irish settlers will only endanger their American friends without finding any safe refuge behind them. NEMO.

HAVANA, Dec. 29, 1883.

THE CHOICE OF HUNTING RIFLES.

DENVER, Col., Dec. 27, 1883.

Editor Forest and Stream:

Your columns have in the last three or four weeks contained considerable discussion about rifles, growing out of a call by some one for a more effective—in weight—magazine arm. I have no doubt that if enough of the men who buy rifles want such a weapon it will be provided for them, but I know that the game killers of the West are not, by a large majority, admirers of any kind of magazine gun. They are afraid of them and consider them unreliable. Once in a while you find a hunter who is partial to the magazine rifle and carries it habitually, but such belong to a very small minority.

I will relate one instance to illustrate how prejudices or preferences grow.

I was one of twenty-six men who set out in pursuit of a band of hostile Indians. We were well armed, but not uniformly. There were good reasons to believe that the Indians would expect pursuit, and consequently our progress should be with caution. There were strict orders against straggling and firing. Most of the guns were carried slung to the saddle horn, with the muzzle downward. During the night that ended our fourth day's march one of the men, who carried a magazine rifle, discovered that it would not work. His announcement caused others with similar arms to examine their condition, and the result was that not one magazine rifle was in a condition to be fired a single time in any emergency. The jolting had imbedded the cartridges into each other, point and butt, to such an extent that the machinery was completely and most effectually disabled. The fact created a panic, and more than half the force was not a magazine rifle, and I believe all carried Sharps except one, who had a Springfield army musket converted into a breech-loader and familiarly known as a needle gun.

It may be said that this was a remarkable case—the carrying of loaded guns for three days on horseback. Granted that it was. Guns are wanted for just such emergencies, and for countless others. We did not know but that at any moment in all of those four days we might be fired upon by a concealed foe, and consequently needed our guns at the instant. In fact, we expected it, and when the fact was revealed that in such an emergency all our men who carried magazine rifles would have been completely defenseless, the effect was simply paralyzing. Only the man who has "been there" can realize it. It is possible these arms would not have been disabled in one day's march, or in two days or three days, but it is certain that they were "played out" at the end of the fourth day, and not one of those twenty-six men would ever again trust that kind of gun.

The man who is expert in handling a gun can lead it at the breach about as fast as it is ever necessary to fire, whether at men or other animals. He has his cartridges in a belt about his waist, and can finger them and the machinery of his piece rapidly enough to make his target dizzy if it is an animate object. The pump-handle arrangement for loading is more speedy, of course, for a tyro, and he can keep up a terrible rattle, if the old thing works, until his magazine is empty, and then he may have time to climb a tree.

Middle-aged and alert readers will remember that a regiment more in the Army of the Shenandoah, twenty odd years ago, were armed with magazine rifles as an experiment. The men succeeded in killing and wounding more of themselves and their friends than they did of the enemy, and as a simple measure of self-preservation the arms had to be taken away from them. W. N. B.

Editor Forest and Stream:

Having spent some fourteen years in the West, and having hunted large game in Kansas, Nebraska, Wyoming, Colorado, New Mexico and Arizona, I hope that "Straight Stock's" prediction respecting the coming 40-cal., with powder 1 to lead 3 (or 4) caliber, and charge proportioned exactly right, in my opinion, may be verified.

The experience I have gained in long-range shooting at large game will last me the balance of my lifetime. It is neither humane nor satisfactory when closely scanned—better allow the game to go unfrightened than to open a fusilade at over 200 yards to obtain the range. The 40-90-270 has a flat trajectory up to 200 yards, and will kill buffalo or elk, for in '75 I tried them both (see "Hunting Wapiti on the Loup," in FOREST AND STREAM of May 4 and 11, 1879).

I could never use a patched express ball with satisfaction, on account of a powder crust forming in front of shell, even when using Curtis & Harvey's powder, which crust would wrinkle or tear the patch.

I much prefer the naked express ball, with hollow but a trifle over one-sixteenth inch in diameter and extending

two-thirds the length of the ball, and clean my rifle the first opportunity after firing. By the way, every hunting rifle should have a wiping-rod about it. G. N. B.

DELMOS, Kan., January, 1884.

Editor Forest and Stream:

Is it a foregone conclusion that the ammunition for the 40-90 repeater now being discussed should be straight shells, or contain a 500-grain bullet?

On the contrary, in order to avoid lengthening out the breech frame of the new rifle to an inordinate length and thereby lengthening the gun for the same length of barrel, would it not be better to adapt a "bottle-necked" shell to this rifle, the "bottle" part to be made larger than those of this style now made for Sharps and Remington special rifles?

Again, are we not looking for a "hunting rifle" to have high velocity and flat trajectory at hunting distances, and would we therefore want the 500-grain bullet? Would we not rather want a light ball of not more than 300 grains weight, and would not this ball, driven by the 40 grains powder, more nearly fill the ball and have all the killing power necessary?

We now have cartridges of 40-90 size, carrying a bullet of 370 grains, and they only measure about 32 inches in length to the point of the bullet; by enlarging the bottle part to a greater diameter, this cartridge even could be shortened, so that we would not be compelled to use a 4-inch cartridge.

We already have a repeater with breech mechanism adapted to take cartridges about 28 inches long, so that the lengthening necessary to take in the 33-inch new shell would be but three-quarters of an inch, and certainly this can be done on almost any of the forms of breech mechanism of the lever type without weakening them, especially in those that have an automatic-locking arrangement that locks the bolt and holds it in place.

Another point in favor of the short cartridge is to save as much length as possible, in order to be able to put a considerable number in the magazine. The shorter the cartridge, the more the magazine will hold and the more shots there will be reserve for or rapid firing from the magazine.

Again, if the 500 grain bullet should be wanted for special long-range firing or for work on heavy game close at hand, could not the same size shell be used, the quantity of powder compressed or diminished enough to allow the 500-grain bullet to be seated deep enough not to lengthen the cartridge?

We might not then have a 40-90-500 rifle, but we would have a rifle that would have enough powder to carry the long and heavy ball at great distances, and with great killing power even at these distances, or enough to drive the heavy ball through a large and dangerous game at short distances, when the paralyzing effect of a heavy blow and great penetration also might be needed.

Let me say that the increase in the charge of powder up to 90 grains was not recommended because the lighter charges did not give enough killing power when the ball hit, but because the trajectory was not as flat as it might be, and the heavier charge would drive the ball swifter, and, therefore, in a much flatter trajectory. That the light charges give killing power enough ordinarily will, I think, be admitted when it is known that the Government 45-75-105 cartridge in the carbine will send a bullet through five inches of pine, and then bury itself in the dirt with a vicious thud, at 1,200 yards; this I have seen myself repeatedly at long-range target firing.

Let us hear from others interested, for by such means we learn what is best suited for our work and attract the attention of makers to our wants. C. D.

WYOMING, December, 1883.

Editor Forest and Stream:

Call attention to one or two misprints in an article upon this subject which appeared in your last issue, otherwise a wrong impression might be produced. It should read 60 grains instead of "160 grains," 32-inch barrel instead of "32-inch bore," and some less important, as "on" instead of "on it," defect instead of "effect," etc.

I notice that I have omitted to give the extreme diameter of the Globe or Lyman patent shot (No. 3 in diagram). This is a little less than 3/4 inch, and the larger aperture (this one generally used) is about 1 1/4 inches diameter. You have corresponded with "Peabody-Martini," who seems so skeptical as to the practical utility and effectiveness of the 40-90-500 cartridge upon game, and who would attempt to throw ridicule upon the practical experience of "non-theoretic game shots" and the lessons derived therefrom, setting up in opposition thereto his personal (and as we would infer, rather limited) experience upon a few antelope and possibly deer, is hardly deserving of an answer.

Before saying more let it be distinctly understood that this is a discussion of the merits of the hunting rifle, and that anything which relates to the use of the rifle for target purposes only is entirely foreign to it, and should be as far as possible kept out of it.

As your correspondent seems so desirous of knowing where are made rifles—single loaders—which will use this cartridge satisfactorily, and more especially because in so doing I give praise where it is due, I will attempt to enlighten him.

Such a rifle is made entirely by hand, by F. W. Freund, of Cheyenne, Wyo. Ter., and is known as "Friend's Patent Improved Sharps Rifle." It is several years old, and an information exhibition at the office of E. L. Richards & Co., 52 Broad street, New York.

These are perhaps the favorite rifle in the West with those who can afford so expensive a luxury and to whom they are known, for only a comparatively small number of them have been made. They are of .40 and .45 caliber, their advantages over other single rifles are manifold, and I consider that for a single shot there is no more effective rifle made—it being understood for reasons enumerated that my preference is given to the repeater. They are what they claim to be, "an improvement upon the Sharps rifle," what higher praise could be given to a rifle? As to penetration, I would almost guarantee your correspondent that a 40-90 improved Sharps will throw a 500-grain bullet clean through three antelope standing side by side every time. There is nothing so remarkable in this when we consider how small and how lightly built these animals are. They are not so solidly built inside as a deer for example. Any one who has shot any number of them has probably heard the sound produced by the bullet striking an antelope. It is very different from the thud of a bullet striking a buffalo, and resembles more the sound which is borne to you when a barrel has been lit some distance off.

I do not know anything about scientific target shooting, and care but little for it, having drunk deeply of the delights of that other distinct science, game shooting with a rifle.

Consequently, I will not make any statements concerning

ing the former, but I think that I can confidently assure your correspondent (in which I feel that I will be borne out by the very large majority who have "practically tested them upon game," having never before heard this objection urged against them) that a .40-90 Starns will throw a 500-grain bullet point on as far as any of us would care to shoot a game. Further than that I know not, nor do I.

PHILADELPHIA.

D. M. B.

PHILADELPHIA NOTES.

WE are to have Dr. Alfred Edmund Rehm, of Berlin, the eminent zoologist, to lecture for us in about a week. On Jan. 16 his subject will be "Our Migrating Birds, at Home and Abroad." On the 23d of the same month, "Settlers and Exiles in Siberia," and on the 29th, "Character Sketches from the Lives of Monkeys." These discourses will prove very interesting to lovers of natural history, and will doubtless be well attended.

Mr. William Kern, of Forest Hill, Cumberland county, N. J., has purchased all the wild cattle on Holly Beach, N. J., and will shortly begin the work of running them down and shooting them. The cattle on this beach have become very wild, are as fleet as deer, and the bulls and cows with calves are very dangerous to approach. They have been running at large on the island for years, and have multiplied greatly. A few years since the firm of Gladding Brothers, of Philadelphia, had the right of shooting them out as well as a bad job, as they found it too expensive and dangerous. Mr. Kern seems to mean business. However, as he has provided a large wagon for transporting his "game," and is now putting up a slaughter-house on the grounds for preparing the carcasses for market.

From the interior of this State comes the unwelcome news that the late rains have not caused the snow to disappear, and the ground is still shrouded with an icy covering, made so by the freezing wind. The prospect of a good season in Pennsylvania game will no doubt suffer, and it behooves the different inter-state protective societies to take steps toward curing for it. The new party of the West Jersey Game Protective Association are making active preparations for liberating a great many quail in the lower counties of the State, many more birds, I learn, than have been put out for years past.

PHILADELPHIA, JAN. 6.

QUAIL, BEAR AND GROUSE.

GAME of all varieties, both fur and feather, has not for many years been more numerous here in the central portion of Pennsylvania than during the past season. This region contains very few pot or professional hunters and all the old hunters of the hills are excellent game protectors. They know nothing of improved repeating rifles, take no knock in fancy birds, and are in the habit of shooting what "Kynoch's patent perfect" they could not get for the life of themselves tell you what it is. These old fellows are a most excellent class of men and with the flintlocks of their daddies they will venture to shoot only at a gray squirrel, a grouse ("pheasant," they say) or some other game of equal size, when it is at rest. I have often accompanied a hunter in his squirreling trips into the hills, and have had some royal sport on these occasions, but he would say, "If you fellows come over here and shoot me, you will have your answer."

I have tried to persuade some of these backward sportsmen that to shoot quail in a legal and sportsmanlike manner would be more plausible than to have them perish by cold and hunger in the deep snows of winter; but they persist in saying, "No quail shooting on my land," and during winter each farmer will have a bevy of the little innocents to care for and feed. One man had a flock of twenty come to his barnyard every day last winter, and he fed with the domestic fowls; it was a most beautiful sight to behold, and the person who would have attempted to shoot them during the day, in a small patch of woodland, where they stayed "between meals," would have had himself plugged with lead from the farmer's rifle. Another man in the same valley kept a strict supervision over a flock of seventy quail during the past season, and was to the man that would encroach upon his domain in pursuit of them. One day a party from a neighboring town came out gunning and rambled leisurely over the farmer's fields. Unhitching a horse he had hooked to a wagon in his cornfield, the farmer started in pursuit of the abominable town fellows, and leaping fences in a grand old fox-hunting style he drove them entirely away.

Thus these men men serve as game protectors in a certain measure, and to have any quail shooting we are obliged to hunt on the lowlands and along the creek.

Your correspondent, "Homo," some time ago mentioned the killing of a bear in the vicinity of Millburg. A great many bears have been trapped and shot on the Jack's and the Slide mountains, in this county, during the past season; but the one captured near Millburg deserves special mention as being an unusually large and a ferocious animal. The bear was taken in a log trap the first night it had been opened for its reception. He had for years been prowling about the neighborhood, and for a long time eluded all the traps set for him. When found in the morning he was just about to escape, after having torn out three or four of the best logs in the den and broken several of his claws, which were of a monstrous size. On the breast of the bear was a white heart-shaped spot, and this several of the hunters who helped to slaughter him declared to be a signification of grizzly proclivities. Whether this be so or not your correspondent does not profess to know, but the opinion of the FOREST AND STREAM in the matter would serve as a decision in a question which has for some time bothered the heads of a number of trappers and woodmen hereabouts.

In the Seven Mountains, Millin county, a large number of deer were taken this season. Parties having cabins up there go into the mountains each fall for a two weeks' hunt, and generally come away with a good supply of venison; however, the hunters who have been out this fall declare that more deer were seen and missed than ever before during the hunting season. Three weeks ago a doe and a fawn were chased off Jack's Mountain, and they took refuge among a farmer's cattle in the barnyard. The doe was shot and the fawn escaped unhurt.

Wild turkeys and ruffed grouse were very numerous, a great many turkeys having been shot. Opposite the creek is a large ravine, grown up with bushes and sprouts of all sorts, and here during the winter season a great many grouse congregate and loiter about the warm springs which give rise to a small stream there. Grouse winter here untroubled, and during the shooting season they get up into the thickets and very few of them are shot, so this place is fairly

alive with grouse. If this article should happen to strike the eye of a sportsman who prides himself as being able to get "nine out of ten shots at grouse in the worst of cover" (as Camp-fire Flickering No. 53 says of the commercial traveller), to that gentleman I extend an invitation to come on next October and try his skill at grouse in Middlecreek Mountain cover. I have shot some few grouse, quail, etc., on the wing and have read Frank Forester's works on gun, shooting, and have spent a good deal of time trying to become a wingshot, but I am unable to hurt these grouse as they go tearing through brush and almost impenetrable space, in the most reckless manner, and at a rate which denotes that they don't care if they break their necks or dash the lives out of themselves against some object apparently in the way, and I am very lively whether any commercial traveler, with a fifteen-gauge gun and sixteen drams of powder, would very materially spot their plumage.

A predatory animal of the feline tribe has been making its headquarters about here this fall. One man, returning from the country store to his home at night, saw it and thought it was a wildcat; another man out hunting saw it in a field; he eyed it very closely for some time and pronounced it a lynx. The animal, perhaps with a view of forming a more intimate acquaintance with the man with the gun, moved slowly toward him, whereupon the hunter took flight, leaving the alleged lynx to enjoy life longer and to feast upon the fat of the land.

Several parties of men, boys and dogs have scoured the mountains north of us at various times for the purpose of endeavoring to capture it; but their efforts thus far have been unavailing, as they never got a glimpse of the monster, although its eties have distinctly been heard by reliable persons.

[The Indians of the Northwest coast believe a black bear with a white spot in its breast is much more dangerous than those without this mark. (Can any of our readers give us any further hints as to whether this belief has gained currency among hunters?)]

MASSACHUSETTS GAME NOTES.

FORTUNATELY for the sportsmen of Massachusetts the snow came on the 17th inst. and put a stop to the slaughter of partridges, for during the last three or four weeks of shooting the death rate was fearful. In a letter to FOREST AND STREAM at the opening of the season I predicted excellent partridge shooting, and the results have fully justified the prediction. I think I have never known of bigger bags of this most noble of our game birds, made hereabouts, than have been made by our local sportsmen in the present season, not in any game bird old date of 1871-5. There may, however, be a reason for this that all do not stop to consider. In those best partridge years of eight or ten years ago we had most excellent flights of woodcock, which helped wonderfully to draw the attention of sportsmen from the partridge. The past two seasons have been exceptionally dry, and the woodcock flight has been a complete failure both years.

The habit of keeping a record of our shooting has grown to be almost universal among our shooters and affords a great deal of satisfaction. The comparison of different years is very interesting. My own record the present year shows a little more than three partridges to one woodcock, while in looking back several years—I have forgotten the year—I find the record to be about six woodcock to one partridge. Quail have been quite plenty for this locality, and some very good bags have been made. We have already a very large body of snow, and it is probable that in the early part of winter they will be few, far and hard. We have a good stock of partridges left over and with another good breeding season like the past, good shooting will be assured. Mr. Slattuck's store is still the chosen rendezvous of our sportsmen, and about every evening finds the comfortable arm chairs filled with the "fraternity." Almost every sportsman has his little tin-bags which he would fain keep as a precious secret, but somehow they almost always leak out, and we find that the tale of the story finds its way to Slattuck's. Not long ago, our friend Jim D. and two others, had a capital day with the partridges, making the splendid bag of twenty. Now Jim is a good shot and a right jolly fellow, and when he has a good shot he never fails to report. On the occasion referred to he came in for his evening smoke, and wishing his report to sound very large said he bagged twenty partridges and two rabbits. Now if there is any one thing that would shock a Worcester sportsman it is the idea of mixing up rabbits with a nice bag of birds and, well—it is a safe bet that if he should ever kill another when out bird shooting he will never mention it at the rendezvous.

The "fur company" is way behind this year, and report faces very scarce. As the season is now more than half over I will give the score to date: "Uncle" Nathan Harrington, 2; A. B. F. Kinney, 2; John M. White, 1; John H. Thayer, 1; Honore Adams, 3; Leonard Rand, 3; A. P. Cutting, 1; D. C. Thayer, 1; Charles Thayer, 1; Asa R. Jacobs, 1—total, 15.

Now that bird shooting is over, the light brush gun will be cleaned and laid away and the heavy ten-gauge will take its place during the next eight months. Our club holds both the team badges of the State Association, Mr. W. S. Perry has challenged Mr. Negus, of Fall River, for the individual trophy-pigeon, and Mr. C. B. Holden has challenged George Tidwell, of Ashland, for the individual glass-bird badge, and Saturday, Jan. 12, has been fixed as the date of the match, which will be shot on the grounds of the Ashland Club.

The date of the match between Perry and Negus has not been named. The result of these matches will be looked for with much interest, as all four men are first-class shots.

It will without doubt be lively at our club house on Thursday afternoon, and we expect that our club will send a team to the great chess-tournament at Chicago next May, and the boys will need to keep up their practice.

E. SPRAGUE KNOWLES.

WORCESTER, Dec. 28, 1883.

Your correspondent "Mercurus" (who, I think, lives in the State of Massachusetts) says in his letter that your last issue that a market hunter he knows of has killed the past season one hundred and fifty partridges (ruffed grouse), and the people in that vicinity begin to realize that there will soon be very poor shooting in that neighborhood. I do not agree with "Mercurus" when he says there is no help for it, for I think there is a way to put a check to this thing, and it can easily be done if parties interested will take the trouble to see the members of the Legislature from their section and have our game law so amended the coming winter that a man

who hunts birds for the market, or for sale, shall first get a permit from the selectmen of the town in which he wishes to shoot, said permit stating the number of birds they may be allowed to kill each season, the number depending on the supply of game. This is a simple thing to do, and if we go to work with a will it can be brought about before it is too late. There is no reason why these fellows should be allowed to clean out the birds as they are now doing. If they want to hunt for the market, let them hunt to their hearts' content. Twenty of these fellows killed seventy-five per cent. of all the birds shot around here this season. They followed it every day during the whole season, and I think it is time something was done. They pay little attention to posted land, but with the law amended as above, they will be watched so closely that it will not be safe for them to exceed the number allowed very much. STRAIGHT HAND.

DEER HOUNDING IN ST. LAWRENCE.

Editor Forest and Stream:

A correspondent signing the letters "S. W. R.," writes you from Gouverneur, New York, as follows: "The deer on this side the woods have been quite plentiful this fall, and still-hunters and hunters with dogs have made good records." And again: "The law is partially enforced, but not half so well as it might be." Still again: "Forbidden, under a heavy penalty, the use of dogs and hounds to destroy the market-hunters' trade," etc. In these extracts the italics are mine.

Now, a word of explanation in the interest of game protection, is solicited: Does your correspondent by "this side the woods," mean to designate St. Lawrence county? The inquiry is quite pertinent, writing as he does from its geographical center. If he designates St. Lawrence, and assuming, in view of his complaint about the non-enforcement of the law, that his words "good records" are mal-apropos, of no allowance to his bosom's truth, there is yet the assertion of dogging, and your readers have a right to assume he has facts for it. Will he furnish them to the St. Lawrence Gun Club—several officers of which are his neighbors—or to Game Protector Leonard, of his district?

Your correspondent must know that on this side the woods—but not half so well as it might be—where deer is a crime, and the heavy penalties are denounced against it. He must know, too, that large numbers of the best citizens of his county are making organized effort at its prevention and punishment, and that the criminal jurisdiction of the courts is being extensively invoked to that end. Will he give the facts, and so contribute to the better enforcement of the laws? Come, let's have them.

The law that protect the game, it is its enforcement that may accomplish that result. The law is simply a declaration of what may not be done with impunity if law-abiding people will enforce it against the criminals. If they will not, it is an impeachment of their own loyalty, of their fidelity to the public interests. Add to these considerations, special interest in any reform, notably game and fish protection, and there can be no justification for inattention and inaction.

Thus may we have the facts. This may some impetus be given to the enforcement of the game law "half so well as it might be."

Let us put right in here, pat and plump, a line from the editorial page of FOREST AND STREAM—the number from which the above extracts are taken:

"Among all the other good resolutions for the year, suppose you adopt one something like this: To talk game protection less, and protect game more."

The false impressions to be gathered from your correspondent's letter should be corrected, as well in the interest of those visiting St. Lawrence for legitimate sport as of game protection. X.

JAN. 4, 1884.

KENT COUNTY CLUB.—Grand Rapids, Mich., Jan. 4.—The Kent County Sportsmen's Club, which has been in existence since 1878, held its annual meeting at Dr. E. S. Holmes's office last evening. The financial affairs of the club were found to be in a satisfactory condition. There are about forty members at present. The following officers were elected: Dr. E. S. Holmes, President; Harry Widdicombe, Vice-President; A. J. Holt, Secretary; George A. Gould, Treasurer; T. S. White and A. B. Richmond, Directors to fill vacancies. Messrs. J. C. Parker, E. M. Barnard, H. H. C. Gilbert and George Tidwell, who were appointed delegates to the annual meeting of the State Association to be held at Jackson next Tuesday. It was decided to continue giving bounties for the destruction of hawks and owls. Fifty-three bounties were paid last year. It is the opinion of the members that since the club began paying bounties the loss of game by predatory birds has largely decreased. The club is always on the watch against violators of our fish and game laws, and is doing what it can to secure "respect for law and obedience to the laws," and to make sportsmanship honorable.

MAINE GAME NOTES.—A deer was shot by the son of Mr. John Coburn, of Bethel, last month, with No. 6 shot—distance (estimated) ten rods. The deer ran about thirty rods and died. Charge struck him back of fore shoulders and bled him nicely. A few days ago Mr. Marshall Whitney, of Upton, was out on a hunt for caribou and deer near Umbagog Lake. He came upon a bear's den, and while in the act of waking up the bear by punching a pole into the breathing hole at the top of the den, the surface gave way and precipitated Mr. W. into the den, some six feet under the surface, almost into the bear's arms. Both hunter and bear were very much frightened, but the bear did not deem it safe to stay long, and with a leap and screech, he went up through the same hole about as quick as Mr. W. went in, so they changed places even, but Whitney lost his bear. Crows are wintering here, which is unusual, and quite scarce grobsneak. Also, pine grosbeaks and purple finches are abundant. I have never observed the grobsneak here so late in the winter before. The swamps seem to be full of them, and we often see from ten to twenty at a time.—J. G. R. (Bethel, Me. Jan. 1884).

A GOOD FLEA PREVENTIVE.—Visitors to Florida know full well how numerous the pesky flea is in that State, and that one's slumbers are terribly interfered with by them in some sections. A friend just returned from there told me he found a very effective remedy against them by placing between the sheets of his bed a small block of camphor. It would be well for tourists to take a supply with them.—Homo.

SEX OF GROUSE.—Onondaga County, N. Y., Dec. 29.—*Editor Forest and Stream:* Our game season virtually closed Wednesday, as it has rained all day to-day, and but few if any will care to tackle the brush to-morrow. Woodcock and partridge did not hatch well, owing no doubt to the excessive rains. This fall I have noticed particularly that the sexes of partridges killed by my friends and myself seem to be more evenly divided than in some years. For instance, last year one bag of nine birds contained eight cock birds. An hour's drive from here I can start twenty-five or thirty birds in a day's hunt, but owing to the rough ground and the distance of their first flight, we do not kill many. Yesterday started ten birds in a small gulf, but the steep sides and thick hemlocks prevented success—killed six rabbits and left the birds to winter over, hoping for better luck next September. Saw the first snowbirds (*Pedicularis nitida*) yesterday. No shore larks, pine finnets or redpolls yet.—WALT. MICKLE.

STATEN ISLAND.—The annual meeting of the Game and Fish Protective Association of Richmond county was held on Tuesday, Dec. 18, at the Vanderbilt House, Clifton, when the following members were elected for the ensuing year: Francis Endicott, President; Thomas E. Gill, First Vice-President; Robert W. Hopkins, Second Vice-President; G. D. L'Heureux, Treasurer; George Endicott, Secretary. Directors—Peter Polworth, Westfield; James H. Clark, Southfield; Harry C. Jouis, Middletown; Thomas J. Conroy, Northfield; Jeremiah Sullivan, Castleton. The Treasurer's report showed a handsome balance in the bank to the credit of the Association.

MEXICO.—Tuxtepec, Dec. 23.—We have a very fine winter climate, abundance of game, and would be pleased to see some sportsmen down here for a season's shooting and fishing. I am sure if they once came they would return again. It is only five days from New Orleans by steamer and any time after the first of December would be suitable for good sport.—O. M. M.

TEXAS.—Martin County, January, 1884.—We have had a very mild winter here so far, and antelope are very fat yet, but are not so plentiful as last winter, as there have been no hard northerly to drive them down off the plains. Some buffalo meat (dried) was brought in from the Sand Hills a few days ago. The buffalo are very scarce.—W. V.

TRAPPING QUAIL IN MISSISSIPPI.—New Orleans, La., *Editor Forest and Stream:* I wish to call the attention of the sportsmen of Canton, Miss., to the importance of stopping the shipment of live quail from their city to New Orleans by one Emile Nick.—EDWARD ODELL.

Sea and River Fishing.

IZAAK WALTON.

JUST two hundred years ago, the 15th of December last, Izaak Walton died. The charm of his writings on angling increases with age, and his simple yet elegant sentences will be read by scholars for centuries to come; even by those who care nothing whatever for angling, but who love to drink from the "well of pure English unadulterated." Perhaps the kindly spirit which pervades each chapter tempted to eulogize his great master as much as any other thing, and they certainly show a heart overflowing with kindness. The following beautiful lines by Mr. Westwood, well known to our readers from his "Bibliotheca Piscatoria," have just been received and will delight lovers of Walton.

IN MEMORIAM.

IZAAK WALTON, OBIT 15TH DECEMBER, 1683.

Father of anglers! when, two hundred years ago,
 Agone, death sealed thine eyes, his visage strove
 Grew touched—the legend tells—with sudden rapture
 He soaled thine eyes from tears and world's despoils
 With thy fingers, but he spared thy heart.
 "Some death, but dream through thine eyes to come
 Shall be thy portion, sweetest son," he said,
 "Dreams of accustomed fields and haunts of yore—
 Trout-dimpled pool, and babbling brook and burn—
 Dreams of old faces and familiar speech,
 And cordial gossamer and gossip by the way—
 Dreams of immortal moon—eternal May."
 So Fine-ear, bending, Izaak, o'er thy tomb—
 Through chink and crevice of the mouldering stone,
 Hears, as it were, a ripple and a rhyme—
 Hears quaint discourse—Piscator's homily,
 Venator's staid response, and, after pause,
 The piping minor of the milkmaid's song,
 With cadence of the nightingale and thrush,
 Or distant-sounding bay of other-hounds.
 Old Hiv, old sports of Lea-side and of Dove—
 The life we cherish and the sport we love.

BURNESS, Dec. 15, 1883. T. WESTWOOD.

THE MENHADEN QUESTION.

Editor Forest and Stream:
 Having been a hook and net fisherman for the last thirty years, I wish to give you my ideas of the scarcity of most of the food fish along the New England coasts.
 The menhaden is a migratory fish, and may be found in large schools from the straits of Gibraltar, southward along the coast of Africa, in the winter months. In the spring they return about the last of May or first of June, coming off our coasts to spawn. Soon after they arrive every inlet from Maine to North Carolina abounds with these fish. Five thousand barrels to every mile of the above named coasts is not a large estimate. Feeding on the large and small menhaden could be found the principal kinds of all our food fish—the halibut, cod, mackerel, bluefish, striped and rock bass. The menhaden makes the best known bait for all these.
 The swordfish, bonito, Spanish mackerel, sparginae, bluefish and mackerel, are fish that follow the menhaden to our shores in the spring of each year, and with those large schools our coasts was one vast belt of feed, which drew the food-fish to our coasts in reach of the fishermen. The market was then supplied at less than one-half of the present prices; that is, as I found the fishing thirty years ago. After it was found that the menhaden was valuable for its oil, sailing companies were formed to catch them; later, fourteen years ago, steamers were constructed for the business, and this gave them much advantage over the sailing fleets. Most of the vessels soon gave way to the steamers, for want of

fish. Now there are nearly 100 steamers, commanded by the most competent men, who meet these fish 200 or 300 miles south of Long Island as they are coming north to spawn. They fish for them with so much vigor that many are soon taken, and the remainder are frightened from the coast. As they have gradually disappeared, so have our food-fish, which have followed them.

Menhaden are to many of the fish what seeds and insects are to the birds—without them not many can be found. There should be a law to protect this fish on the coast of the North Atlantic States until the 1st of September of each year; or, what would be better still, an appropriation to pay the just value for the steam fishermen's property, and take the purse scales from the ocean. It would not probably cost more than \$2,000,000, and would be worth more to the public than all of the river and harbor appropriations for the last ten years.

The United States Fish Commissioners can never add many fish to our coast until the menhaden are protected to return and spawn. FISHERMAN.

WESTPORT HARBOR, MASS., Dec. 31.

ENGLISH AND AMERICAN TROUT.

Editor Forest and Stream:

With the compliments of the season I send you a screed on the American and English trout (the result of twenty-eight years' experience on each side of the pond), taking it for granted that the word "English" included Great Britain, Ireland and Scotland, as with the last two countries my first twenty-eight years of fishing life and love has to do.

With "G. Y. S." in your issue of Dec. 27, I think there is little if any difference in flavor and game qualities (taking size into consideration) of the two fish. The English trout has a decided advantage in Aldermanic proportions. It must be conceded that the more robust the trout the greater his vigor and staying powers, the English trout being more widely distributed than our American trout and indigenous to all waters.

And this brings me back between fifty and sixty years, to boyhood's days, and sets me down on the banks of the memory O'Leven, Fife-shire, Scotland, the river being (if memory is correct) from forty to fifty feet wide, with an average depth of five feet, every foot of which held its quota of trout of the finest quality and size. Of course, there were days in the year, and hours in the day, when the trout would reject your advances to a nearer acquaintance with distrust, and at the best of times you took the flust of tackle and the fish would swim to secure a good sized fish. From twelve to eighteen trout, and often half that number, varying in weight from half a pound to four and a half pounds each. One would as soon expect to throw in an anchor for a trout to swallow as to throw such a fly as we successfully throw at our American trout. If it was attempted you might expect to hear a chuckle come from the bottom and the words, "What are you giving us, old duffer?"

The anglers' tryst was at the Auchmuir Bridge, from where they would fish up the water about four miles to the lake, then fish down to the other side to the bridge, where stood the old inn, the anglers' retreat after the day's sport; where the haps and mishaps of the day were conned over, the fish counted and weighed, and the smell of the fish washed from the fishermen's hands. Eight years last summer a friend visiting the old home had a three days' fish on the water, and he reported little change from the days of old. The fish still come with both eyes open. He made a good creel over a few lusty fellows top-dressing each day's creed.

Another place of note was the Loch of Greenoch, and Loch Tom, about one mile up the moors from Greenoch, which yielded a good supply and some good specimens of the wary trout. At that time the otter was much used on the loch for the capture of trout, and a law was passed prohibiting its use, and nothing too soon, for had it been continued, the trout days of Loch Tom would have disappeared. There are other fishing resorts in Scotland equally as good, but as they do not come into my own experience, I will not mention them.

Now, Mr. Angler, a kingdom for a boat to pull across the channel to the little green isle and its trout streams. Take dear dirty Dublin as your objective point. Take a drive of ten or twelve miles over to Liffey Head, and you will find yourself on the nursery grounds of a trout river not to be despised. As you follow the rivulet down, other rivulets are joining hands until a brook is formed, and as the water increases in volume the trout increase in size. Follow on round its course of sixty or seventy miles, and if the signs are right you will be satisfied. The best and only signs follow are a good fly, an early morning and long glowing of the summer's day, etc. Nine months of the year the water was of a yellow color. The trout were called white trout. All the tributaries of the Liffey were well stocked with the white trout.

The River Dodder, a wide shoal stream, has an abundance of small trout of dark color, owing probably to the color of the water and the turb bottom over which it flowed for most of its course. The trout were well educated, and seldom exceeded one pound in weight. Its many tributaries flowing down from the mountains were full of small trout, which were seldom sought after by the angler. The Grand Canal, a sluggish stream with no other current than the passing of boats through the locks, turned out some noble trout. For three or four miles up from the city it was so perseveringly fished that for a good day's sport it was necessary to take the early morning train for a twelve or fifteen mile ride, equipped with a pair of minnow, a small bag of angle worms hung from a coat button, a few flies, and if the trout were not inclined to be so noble with the fly, give them a change and troll home-ward. The best trout that ever fondly attached themselves to my person to accompany me were taken from that water. They were great burly slashers of the John L. Sullivan pattern. "Blackguards" both of them.

Another stream flowing into the city, well noted for the quantity and quality of its trout, took its rise in the mountains a short distance from the head waters of the Liffey, and took its course about midway between the Dodder and the Liffey—one of the best trout streams I have ever been my lot to know, turning out more fish (great brown-back fellows) to its inches than any water I have ever fished. I have seen that stream for the last six miles of its course completely depleted. A company built two mills for the bleaching and manufacture of straw paper. After the mills got into operation there was not a living thing left in the water below them, and for days the surface of the water was covered with dead trout. A few years ago the two mills were shut down. (I will here quote from a letter received last summer): "You will be glad to hear that the old river is getting

as full of trout as it was in the days when you and I fished it together. A few mornings ago one of four pounds two ounces, two of two pounds, and several from half to one pound each, came home with me to stay. Several others from four to four and a half pounds were taken by other parties."

In all of these streams the fish were not easily fooled. They generally looked twice before they jumped once, and when they did come you had something to be proud of, and a lasting impression of conquering an adept in the manly art. All the Irish waters which I have known had its trout, the Shannon from Limerick to Castle Connell, the Shannon and Blackwater, and their tributaries in Galway, turned them out in numbers and size to satisfy the most fastidious. The summer of 1855 ended my experience in Irish water, and two months after killing my last Irish trout my first American trout came to creel, and he was a beauty in markings and game qualities, but, poor little thing, he looked like the last of his race. Another about the same size (seven ounces) made up my creel for the afternoon—that was in New Jersey. Since then my experience has been in parts of Connecticut, New York State, and Western Massachusetts, and the first thing that strikes the angler's notice in all the waters that I have fished, is that the trout are confined to mountain and spring brooks, which are at the opening of the season so crowded with fish that there is nothing for them to eat. The best fishing is to be had for a few weeks after the first of June, when you have only to drop an angle or a piece of sole together into the water, when a dozen or more trout would be seen to rush for the prize. History repeating itself, only changed from man to fish. Let him take who has the power, let him keep who can, the swiftest and strongest securing the coveted morsel, the next moment to find himself yanked skyward. By the time the summer is half over the brooks are half dry, some of them dry altogether, so that the fingerlings become dry, hungry and cold, and fall easy victims to the rapacity of the hog, one of whom I have seen exhibit a string of seventy-five trout which could comfortably go on a common breakfast saucer.

Such has been my experience in American trout fishing, and can be summed up in the same words the boy used with the old lady's pie: "Thankee, mam; it is very good if there was enough of it. Squise me, mam; I—I mean there is enough of it, such as it is." Now, I would not take one jot or tittle from our gamy little beauties, it is not their fault; if they are small and hungry, they would grow larger if they could, and with increase of size would give increase of caution, as well as game and enduring qualities; but so long as the fish are in the mountain and mountain brooks, they should be content with a hard lot and an early death.

Acclimatizing the English trout in American waters would be worth a trial. The Scotch waters will not reach as high a temperature as our American waters. If my memory serve me right, all the Irish waters I have named, the Liffey, the Dodder, the Grand Canal, and others, will reach as high a temperature as the Connecticut, the Merrimac, or the Hudson. The fish once acclimated, and with a good foothold, they could not be fished out with legitimate fishing, and in a few short years the coming angler would exclaim, "Eureka!" THOS. CHALMERS.

HOLYOKE, JED. 1, 1881.

TROUTING ON THE BIGOSH.

A FEW MORE TAKERS.

THERE was silence for a while after Uncle Ben's discovery. It was a silence that spread out from the boat and quieted the ripples all around, and became so oppressive that the fisherman forgot the circulation of blood around his ear drums. Its duration was short, for the Colonel hit a match on the side of the boat and gravely remarked: "We might as well smoke and stop fishing for a while, for the dropping of the anchor so suddenly has disturbed the fish below, and we will not get a bite in half an hour." Jack wanted to laugh, but a look from his father checked it in its youth, and it perished after reaching the smiling point. A few moments after he looked toward me and let me understand his appreciation of the situation by a six-inch grin and a wink, which I dared not return for fear of wounding the old man's feelings.

After the tobacco was burned the Colonel picked up my hook and examined it. "This," said he, "is a peculiar hook, and one that I do not remember to have seen before. It has the short barb and long bend of the 'sproat,' but to a greater degree. Where did you get it?"

"It is the form of hook used by Adirondack guides for taking lake trout. It probably would be called a 'sproat' by the trade but it is a hand-made hook which I understand is made by some of the best woodworkers in the pattern approved by the guides. It seems to be a good one, and, as you see, a true central draught hook." For a home-made hook it is not clumsy, I have owned this one for twenty years.

"But we are using gangs of hooks, don't you think a gang is better than a single one?"

"Perhaps it is, but somehow I am more in the habit of using a single hook and can usually hold my own with it. A gang appears like a cruel thing and as if it was taking an unfair advantage of the fish."

Poor Uncle Ben was silent and thoughtful and not until all our hooks were baited and overboard did he put his hand in the minnow pail for a bait. Wishing to divert his attention the Colonel asked him: "What is the name of this lake, Uncle Ben?"

"Well, it ain't got no name, as I know on, we call it 'the pond,' though when old Squire Smith owned it, forty years ago, they called it 'Smith's pond.' It is the only pond within twenty miles, and so it gets along without a name. The old Squire talked about putting a dam at the outlet and raising the pond; but he never did, and I am glad of it. The property is in the courts now, and it will be some time before a dam is built, if ever. I allers said it would spile the pond, and it would."

"It would spile the looks of it, certainly," said the Colonel, as he struck a fish so vigorously that his reel sang and the rod bent with the sudden strain. The fish tried hard to get near the anchor rope, and the Colonel tugged to keep it away, reeling in as fast as he could and keeping a steady strain on every thing. Once the fish bored down so strongly that it took off a few yards of line, but was checked, and in less than ten minutes from the time of striking the gaff brought a fine lake trout of about fifteen pounds on board.

Jack took two and I three, while Uncle Ben eclipsed us all by landing a trout on his hand line which would weigh five pounds more than the Colonel's. Now the old man laughed, and it did us all good to see his face light up with delight, and the frame of white fringe around his counte-

nance heightened the redness of his cheeks, as, with his favorite expletive, he said: "I knowed there was a big one down there waitin' for me. I knowed it!"

The morning had worn away, and as lunch time approached it only needed a hint that a visit to camp while the fish were resting in the middle of the day would be agreeable, and we went. As Jack and I strolled along the shore I saw him pick up a small turtle and hide it in his coat pocket, but made no remark on it, and he was not aware that it had been seen.

After lunch we lounged about, explored the woods, and caught more minnows for bait. About 4 o'clock we rowed out and tried it again, but the fish seemed in no mood to bite. The Colonel and I smoked, and Uncle Ben nodded. Jack was busy doing something with his hook which occupied him so long that I thought of offering to assist when I saw that he was stealthily hauling in Uncle Ben's line by an occasional pull. Soon after this the old man awoke suddenly and felt of his line and said, "That ere big minny is mighty lively, I thought I had a bite." A minute later and he was rapidly hauling in, and soon held up a small turtle. I looked at Jack, but he was too busy with his line to catch the glance of disapprobation, but he afterward seemed much surprised at the unusual catch. Later on I told him that he should not play tricks on older people, but the lesson was lost. He said he wanted to see the old man hop, but in this he was disappointed.

Fishculture.

A NEW SYSTEM OF FISHWAY-BUILDING.

BY MARSHALL McDONALD.

[CONCLUDED FROM PAGE 457.]

IF it be possible, by any practical construction, to deliver the whole volume of a stream, over a dam or other obstruction, with such moderate velocity that the weakest and least adventurous fish could readily swim against it, we would practically destroy the obstruction, and would establish for the migratory species a passage up to their spawning grounds as free and unrestrained as if no obstruction existed.

In practice, of course, this ideal can be realized only in exceptional cases, for industrial necessities or consideration of cost will necessarily limit the dimensions of the fishway, and the amount of water that may be discharged through it, but just in proportion as we approximate this ideal in our fishway constructions, do we approach more nearly the solution of the problem of free circulation of the anadromous fishes in continental waters.

When the Commission of Fisheries was inaugurated in the State of Virginia, in 1875, one of the most important questions presented to it was, how to make adequate provision to get the anadromous fish over the innumerable dams that obstruct the main water courses of the State, and all their tributaries.

The white shad (*Alosa sapidissima*) is one of the most important food fishes in all the tributaries of the Chesapeake, and in times past has furnished the motive of immense and profitable fisheries. The restoration and maintenance of this valuable fishery was one of the most serious questions presenting itself to the consideration of the Commission. The James and the Rappahannock rivers were obstructed at the head of the tide by insuperable dams, interposing effectual obstructions to the further upward migration of the anadromous species.

Years ago, before obstructions existed, the migration of the shad in James River extended into the heart of the Alleghenies two hundred and fifty miles above tide water, and in the Rappahannock to the very base of the Blue Ridge Mountains. The curtailment of the breeding area by the erection of dams on both rivers, had determined a corresponding reduction in the productive capacity of the streams, and in concurrence with the irrational and unrestrained methods of fishing pursued, had rendered franchises, once valuable, worthless, industries, once profitable, precarious and unproductive. A fishway that would freely pass shad up over these obstructions, and recover to production the breeding area of water from

which they had been excluded, promised the means of restoring these most valuable fisheries.

The gentlemen who were then Commissioners of Fisheries for the State of Virginia were pleased to select me to visit the Centennial Exposition at Philadelphia, with instructions to make a careful study of the models of all the forms of fishways there exhibited, with the view of finding one that would be adapted to our purpose. A careful study of all was made, and I was reluctantly forced to the conclusion that none of them fulfilled the necessary conditions of successful operation, and I returned discouraged, with the conviction that an efficient shadway was a thing of the future.

The conditions to be satisfied in a successful fishway construction are as follows:

First—The water should be delivered down a straight unobstructed channel.

Second—In sufficient volume to invite the entrance of fish. Third—With such moderate velocity as to permit their ready ascent.

Fourth—With a view to economy in construction it is important that the inclination or slope of the way should be much more considerable than in the ordinary inclined plane fishway.

How to construct so as to fulfill these conditions was the problem to be solved. Two methods suggested themselves. It was possible to make the water do work in its descent and thus control velocity. A fishway could be constructed on this principle by an evident modification of the ordinary turbine wheel, and such a fishway could be made to serve both as a passage way for fish and as a motive power for machinery. This idea, however, was soon abandoned for the double reason of its complexity, and the limitation of its application that would necessarily exist.

The second fruitful idea was that if each molecule of water could be compelled to traverse a constrained path, its final direction in any one circuit being against gravity, it could be brought to rest at a lower level—the friction developed in movement having neutralized in part the force of acceleration.

The molecule falling from its second position of rest through a similar circuit, and in succession through any number of circuits would finally reach any defined lower level with no greater velocity than that attained in the first circuit described. Were it practicable to subject every molecule of water passing through a fishway to the constrained movement above indicated, the result would be a descending current, the average velocity of which would not exceed the average velocity of a molecule in passing to consecutive positions of rest under the conditions above stated. How this idea has been realized in practical constructions, will be understood by references to the following figures and descriptions:

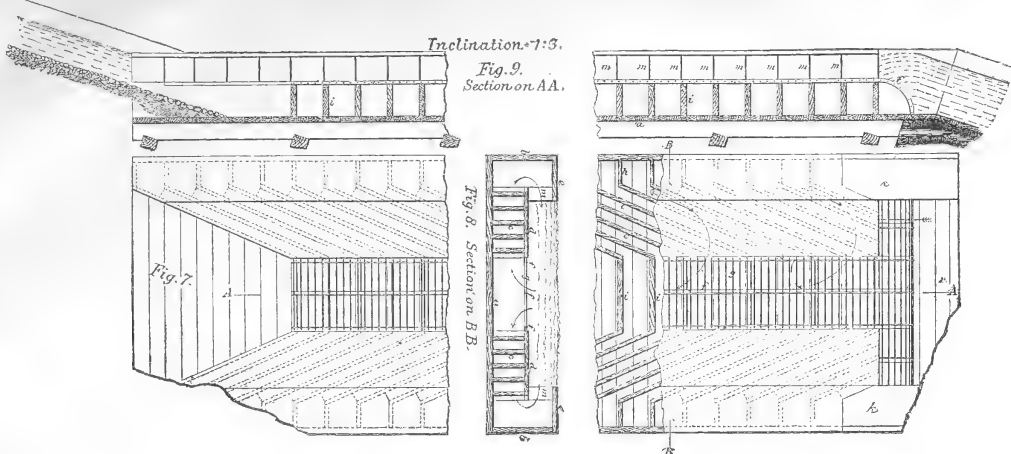

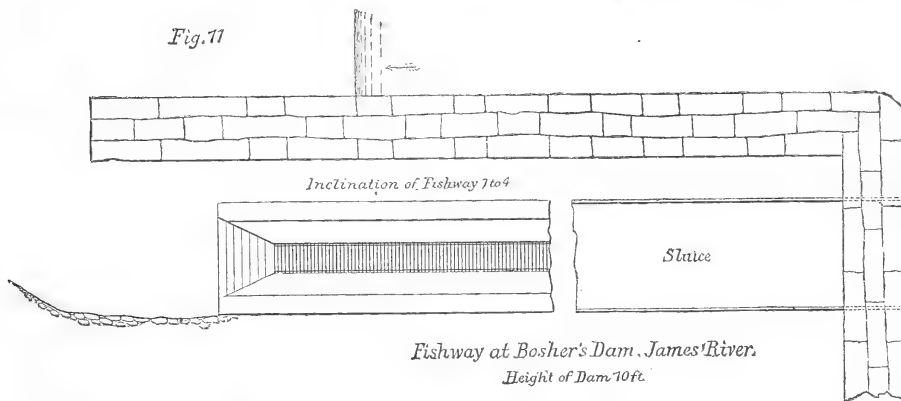

Fig. 7.

Fig. 8. Section on B B.

Fig. 9. Section on A A.

Fishway at Boshers Dam, James River.
Height of Dam 10 ft.

Fig. 12.

If we take a hemispherical bowl (fig. 1) and holding a marble at A, upon the edge of the bowl, we release it, it will fall under the influence of gravity through A1 to A2, coming to rest at A2, some distance below the edge of the bowl. The vertical distance between the positions A and A2, measures the force of acceleration that has been counteracted by friction by traveling the constrained path A, A1, A2.

If now, we take a number of similar bowls and cut them off to the line A, A2, and arrange them as in fig. 3, and start a marble at D1, it will pass from D1 to C1, reaching C1 with no greater velocity than that acquired in passing from A to A2. If, however, the marble was allowed to roll unobstructed from A to A1 down the incline plane D, C, (fig. 2) it will have acquired a velocity equal to 8/20, approximately.

We see, then, in this case how it is possible to deliver a molecule from a given position to a definite lower position, without the increase of velocity that would arise if the molecule fell freely under the action of gravity or rolled down a smooth incline. If it be possible to compel every molecule of water descending through a fishway to submit to the conditions above indicated, then the problem how to control the velocity of a descending current would be solved. Now to apply this to liquids, we arrange a series of bent tubes, shown in Fig. 4. By suitable arrangements we keep the longer branch of the higher tube of the series full of water. The water escaping from each tube will rise against gravity until it comes to rest, then falls into the longer branch of the adjacent tube in the series, and after passing through the entire series be finally discharged from the shorter branch of the lowest bent tube, with no greater velocity than it acquired in passing through the first member of the series.

Construct a series of these tubes with branches brought close together, cut away obliquely the upper end of the longer branch of each member of the series, so as to permit access of water; pack them side by side, in oblique position in an inclined sluice, as shown in Fig. 5, and we have the solution of the problem with which we started. For if we suppose a current of water to be running through the inclined trough or sluiceway, the first effect will be to fill the tubes with water and establish a flow through them; the water entering the longer branch of each tube will escape from the shorter branch with a velocity due to the head or vertical distance between

the two ends of the tube. This final direction being obliquely up the slope, each particle of water will describe a path as is indicated by the curved arrows shown in Fig. 5. The effect will be that he will have an ascending current in the sluice—on that side of the sluice where the shorter branches of the tubes are situated. The velocity of this ascending current will become less and less as we pass toward the middle of the sluice, where there will be a line or section of practically eddy water; and beyond a descending current, becoming more rapid as we pass to the further side of the sluice, where we find a current descending with uniform velocity, the maximum limit of which will be the velocity of the water escaping from the shorter branches, provided the supply of water and the capacity of the tubes are properly proportioned. The illustrations here given present briefly and graphically the principles applied in the McDonald system of fishway building.

The flexibility of the system adapts it to the widest range of conditions occurring in practice. An effective passage may be provided for the fish over the obstructions, with the supply of water that will flow through a cross section six inches square, or the fishway may be expanded so as to take the entire discharge of a river. Constructed roughly of boards, it furnishes at a nominal cost the means of re-establishing our innumerable trout streams to the natural conditions of reproduction.

These fishways may be made so light as to be readily portable, so that, in the season when the fish are not running, they may be stored away under shelter and thus protected from decay or destruction by ice or floods. In public parks and trout preserves, where considerations of cost are not controlling, the fishway may be built of iron in ornamental designs, and while serving its essential purpose, made to contribute to the picturesqueness of the landscape. Solidly built of stone and iron, and of dimensions proportioned to the volume of the stream, it may be made strong enough to resist the utmost force of floods and ice, and by furnishing an easy passage for shad, salmon, and other anadromous species of fish, make possible the restoration and maintenance of our valuable river fisheries, in spite of the obstructions which are the inevitable and necessary adjuncts of civilization.

As an example of construction, we have given in Fig. 6a the elevation, and in Fig. 6b, the plan of a double fishway built of

timbers. It consists of an inclined sluiceway of boards, the sides and bottom of which are supported by suitable framing. The sluice has in this case an inclination of one foot in three. The upper end is let into the dam so that its upper line is flush with the crest line of the dam. The lower end descends to the water below the dam, and is firmly anchored by being secured by bolts either to the rocky bed of the stream, or to piles suitably placed, or by other suitable means. Intermediate supports may be provided, by trestling, as shown in the figure, by log cribs or by rubble masonry. The incline flume or sluice thus established furnishes the foundation for the structure of the fishway proper which is placed within it.

Details of construction are given in Figures 7, 8 and 9, which are on a scale of one-fourth of an inch to the foot. The sub-structure having been established, we begin by setting up along the center line of the trough or sluice, the bulkheads I, I, I, and C, at intervals of twelve or fifteen inches. These are made of planks one and a half inches thick, two feet long and fifteen inches wide. These are firmly attached to the flooring of the sluice either by spikes or bolts. Posts H, H and C, of one and a half inch stuff, nine to twelve inches wide, and extending from the floor to the upper edge of the inclined trough, are now set up at similar intervals of twelve to fifteen inches, and firmly secured to the sides and bottom of the trough. To the posts H, H, and bulkheads I, I, the fifteen inch joists are securely nailed or bolted. The floor D, Fig. 8, of one and a half inch plank is next laid and nailed to the inclined joists as shown in Figures 7 and 8, upon the floor D. Next set up the short return bulkheads M, M, and C, Figures 8 and 9, securing the same to the parts H, H, and to the floor by nailing or other suitable means. The cap E, E, Fig. 8, made of a single two-inch plank is fastened securely to the sides H, H, the posts H, H, and the return bulkheads M, M, thus completing the construction.

We have here realized in timber the same construction and secured the same control of the descending current as shown in the experimental apparatus, figure 5. The course of the water is shown by the arrows. When a sufficient supply of water is brought to the head of the fishway, we will have an average depth of water way above the floor, D, of ten to twelve inches. Any excess of water over the amount need to fill the fishway will be shed over the sides, and the fish will continue in efficient operation in any stage of water.

MR. A. E. GODFREY'S LIVER AND WHITE POINTER DOG "DRAKE."

Winner of Third Prize and Cup for best Pointer, E. F. T. C. Derby, 1883.

awards, which were made by Mr. James Watson, of New York, were as follows:

ENGLISH SETTERS.—Dogs: 1st and special, E. A. Todd (Frank); 2d, W. Graham (—); High com., L. A. Gladding (—); Bitches: 1st, R. B. Puan (Mollie); 2d, W. E. Miller (Coin); High com., J. A. Broullie (—); Puppie: High com., W. E. Miller (Hetti Blue Blood—Coin).

IRISH SETTERS.—Dogs: 1st, J. Clarence Lester (Redd); Bitches: 1st and special, J. C. Lester (Baud); Puppie: 2d, Mrs. T. Fairclough (—); High com., J. A. Thomas (Rex).

GORDON SETTERS.—Dogs: High com., S. C. Padlock.

POINTERS.—Dogs: 1st and special, W. E. Miller (—); Bitches: 1st and special, F. Stevenson, Jr. (Mistral); High com., C. McKendrick (—).

FOXHOUNDS.—1st and 2d, E. A. Birdsey.

BEAGLES.—Dogs: 1st and 2d, E. A. Todd; Bitches: 1st and special, H. Jackson (—).

ST. BERNARDS—ROUCH COASTERS.—Dogs: 1st and special, R. Benson (Casar); 2d, Chequasset Kennel (Herman); Bitches: 1st, Chequasset Kennel (Nan); Puppie: 1st, R. Benson (San Pedro); 2d and high com., Messrs. White and Macdonald (Lancelot and Clairvaux).

SMOOTH COASTERS.—Bitches: 1st, W. G. Martin (Bramble II.).

STAMIELLS.—1st and special, A. C. Wilmending (Black Venus).

SPANIELS.—Dogs: 1st and special, R. & W. Livingston (Grand Duke); Bitches: 1st, R. & W. Livingston (Little Maggie).

TOY TERRIERS.—1st, O. H. Dall (Tiny Tim).

SCOTT TERRIERS.—2d, O. H. Dall (Teddy).

BULLDOGS.—Dogs: 1st, R. & W. Livingston (Boz); Bitches: 1st and special, R. & W. Livingston's Little Maggie.

PUGS.—Dogs: 1st, Chequasset Kennel (Young Toby); 2d, W. Scott (Ned); High com., O. H. Dall (Don); Bitches: 1st, W. Scott (Nellie); 2d, Chequasset Kennel (Tantums); High com., W. Scott (Beauty); Puppie: 1st and special, Chequasset Kennel (Treasure).

ITALIAN GREYHOUNDS.—High com., F. F. Ives (—).

SCOTCH COLLIES.—High com., C. H. Dall (Major).

SPECIAL PRIZES.
Special for best dog—R. Benson's Casar.
Special for best bitch—R. & W. Livingston's Sweet Briar.
Best puppy, any breed—R. & W. Livingston's Little Maggie.
Best litter of setter puppies—W. E. Miller's English setters.

AN ORTHODOX DOG.

MANY years ago, when living near Boston, I one day visited in a horse auction in that city, and found there for sale a black and white Newfoundland dog about two years old. I bought him for five dollars, the best bargain in dog flesh I ever made. Not knowing his name, I called him Shark. I took the dog to my place, and the first day he walked into the kitchen and carried away the roast of beef which was served up for dinner. I took him out for chastisement, and he showed fight. I subdued him, however, and from that time he recognized me as his master, and obeyed me in all things. He took charge of the place, allowed no tramps or suspicious looking people to enter the gates, nor would he permit any person to cross our fields or go over a fence. If any attempted it, he would turn them back with a growl, without touching them, unless they resisted, in which case he would hold them fast till relieved.

We had considerable fruit on the farm, and had been much annoyed by the depredations of the neighboring boys. One morning shortly after Shark came, I found two black and white prisoners in a cherry tree, and the dog guarding them at the foot of the tree. They were much alarmed, and crying bitterly. I called the dog off and allowed them to go, and neither they nor their companions ever returned. We had some horses at pasture in a field out of sight of the house, and one night our hired man heard Shark barking furiously in the pasture, and going to the spot, he found the dog had driven three horses into a fence corner and was sitting in front of them calling for help. Some horses having been stolen about that time in our neighborhood, I concluded that a horse thief had been in my pasture, and had been driven off by the dog.

Shark formed a strong attachment to a younger brother of mine, about six or eight years old, he attended the boy to school in the morning and brought him home at night, and once when a neighbor's cat killed some rabbits belonging to the boy, Shark, although usually on good terms with cats, pursued and killed this depredator, and then carried the body to the house where she belonged, and hid it on the door-step.

The dog evidently thought he was doing right, and did not choose to conceal his action; but the owner of poor puss was very angry until it was explained to her, that nothing but justice had been done.

All this faithful vigilance made the dog some enemies, and one day he came home wounded in the head by a charge of shot, which endangered his eyes. We placed him under the care of an oculist, who saved the dog's sight, but after this he was very much afraid of firearms, and the sight of a gun or the report of one, would drive him in the house for refuge. He also seemed to associate the sound of guns with thunder, and fled to the cellar at the approach of a thunder storm. Except these things, he feared nothing, and would tackle the biggest dog in the town, who offered him an insult. Of small dogs he took no notice, but was always ready to fight a big

bully, and I never saw him whipped, though there was one bulldog in the village with which Shark had many drawn battles, and after a while a sort of armed neutrality prevailed between them, attended with many protests and growls. Shark was a fine swimmer and loved the water, but owing to clumsiness was useless as a ducking dog. He would attend me when I bathed and sailed, and I have seen him swim after my boat for half a mile.

In our neighborhood there were two churches, one of the Calvinistic persuasion, or as they call it in New England, Orthodox; the other Unitarian. We had pews in each house, and attended each in turn, and both Reverend Doctors often visited us. Shark would follow the carriage on Sunday to the Unitarian Church, but would not enter. He would, however, always come to our pew in the Orthodox Church, and sleep through the service in a decorous manner. It was the habit of certain old women in this church, when any good, strong, Calvinistic doctrines were given from the pulpit, to signify their approbation by sighs and groans. Curiously enough, Shark would do the same. When the old women around him sighed and groaned, his sighs and groans were responsive.

So he gained the name of an Orthodox dog. This conduct puzzled me much, but I finally accounted for it in this way: The Unitarian divine disliked and feared dogs, and when he approached our house it was with hesitation. This Shark noticed, and after his doggish hind, suspected and disliked the worthy man, and seeing him in his church, refused to enter it or listen to his preaching.

The Orthodox Doctor took little or no notice of the dog, and came boldly in at the gates. So Shark excepted his visits, and had no objection to his person or doctrines. The intelligence displayed by this dog was so great, that since knowing him I have believed that dogs have reasoning powers, and are possibly immortal souls. The poet tells us that the poor Indian

"thinks, translated to a purer sky,
His faithful dog shall bear his company."

Mr. Hamerton in his "Chapters on Animals" remarks, that if the life of the dog was as long as that of the man, its intellect might be cultivated to an extent of which at present we have no idea.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal: 1. Name and residence of owner, 2. Breed, 3. Sex, 4. Age or years, 5. Date of birth, of breeding or of death. 6. Name and residence of owner, 7. Sex, with his sire and dam, 8. Owner of sire, 9. Dam, with her sire and dam, 10. Owner of dam.

All names must be plainly written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

See instructions at head of this column.
Dec. By Mr. Walter P. Russell, Bath, Me., for liver cocker spaniel dog, whelped Jan. 6, 1883 (Diamond—Quail).
Edith. By Mr. Walter P. Russell, Bath, Me., for black pointer spaniel bitch, whelped Aug. 24, 1883 (Brush II.—Olivia).
Coco. By Mr. P. Mosler, Nyack, N. Y., for black pointer dog, whelped June 18, 1883, by Gardner Mount Vernon, N. Y., for blue belton English setter dog, whelped Oct. 29, 1883, by Jesse (Cunliffe—Jessie) out of white (Hollo—Imported Sport).
Black Bess II. By Mr. H. G. Hammett, Newport, R. I., for black cocker spaniel bitch, whelped Aug. 10, 1883, by Doctor (Boh II.)—Black Bess out of Sweet (Hollo—Imported Sport).
Ruby. By Mr. Geo. M. Howe, Westborough, Mass., for liver and white cocker spaniel bitch, whelped March 26, 1883, by Snipe (Craigh—Red Rose).
Red Rose. By Mr. W. B. Rogers, Waynesburg, Pa., for red Irish setter bitch, whelped Sept. 22, 1883, by champion Viz out of champion Lady Clark.
Daisy Vernon. By Mr. L. Gardner, Mount Vernon, N. Y., for lemon belton English setter bitch, whelped Sept. 10, 1883, by Blue Duke (Blue Duke—Jolly May out of Bonnie II. (Cortwell—Margot)).
Elo. Tattler, Peep O' and Speltz. By Mr. E. W. Jester, St. George's, Del., for Maltese dog and fawn dog, and two fawn Italian greyhound bitches, whelped Dec. 10, 1883, by Datto (Rex—Italian) out of Pearl (Doughlass—Gipsie).
Mystic. By Mr. Benj. F. Clark, Manchester, N. H., for red Irish setter dog, whelped June 21, 1883 (Elio—Jug).
Waverley. By Mr. C. Fred, Crawford, Pawtucket, R. I., for black, white and tan English setter dog, whelped May 15, 1883, by Harri—belled out of Torrey C. (Whiting—Fannie).
Delaware. By Mr. C. Fred, Crawford, Pawtucket, R. I., for white, with lemon ears, English setter dog, whelped August, 1883 (Dashing Monarch—List).

NAMES CHANGED.

See instructions at head of this column.
Obo II. to Harwell Obo. Black spaniel dog, age and pedigree not given, owned by Mr. Geo. W. Leavitt, Jr., Boston, Mass.

BRED.

See instructions at head of this column.
Lampy—Swat. By Mr. J. F. Nesley's (Philadelphia, Pa.) pug bitch Laurel (Punch—Minnie).
Pearl—Entry Prince. By Mr. A. S. Bishop's (Hillsburgh, Pa.) English

setter bitch Pearl (Prince—Lill II.) to his Fairy Prince (Punface—Fairy II.), Dec. 8.

Blackie—Black Silk. The Riverside Cocker Spaniel Kennel's (Claremont, N. H.) imported cocker spaniel bitch Blackie (Rolf—Ella) to Black Silk (Obo—Obo II.), Dec. 29.

White—Beaufort. Mr. T. B. Dorsey's (Elliot City, Md.) pointer bitch Viola (Sensation—Lily) to Mr. C. H. Mason's Beaufort (Bow Beauty), Jan. 7.

Jolly Daisy—Bookeller. Mr. Thos. F. Conolly's (Flatbush, L. I.) English setter bitch Jolly Daisy (Druid—Jolly May) to Mr. W. A. Coaker's Bookkeeper (Druid—Booker's Ruby), Jan. 3.

Flagrant—Dashing Storm. Mr. C. R. Cheyne's (Tratragan, Can.) English setter bitch Flagrant (Paris II.—Princess), to Mr. R. W. Loyley's Dashing Storm (Royal setter), Dec. 28, 1882.

Gracie—Black Silk. The Riverside Cocker Spaniel Kennel's (Claremont, N. H.) cocker spaniel bitch Gracie (Snipe—Zuleta) to Black Silk (Obo—Obo II.), Dec. 29.

Bessie—Peter Black. Mr. Geo. E. Day's (Springfield, Mass.) liver pointer bitch Bessie to Mr. D. W. C. Parker's Peter Black (Peter—May), Dec. 29.

Water Lily—Beaufort. Mr. W. H. Moller's (New York) pointer bitch Water Lily (Kidmore's Dog—Kidmore's Dolly) to Mr. C. H. Mason's Beaufort (Bow Beauty), Dec. 29.

Black Bess II.—Obo II. Mr. H. G. Hammett's (Newport, R. I.) black cocker spaniel bitch Black Bess II. to Mr. J. P. Willey's Obo II. (A. K. R. 432), Dec. 29.

Negress—Obo II. Messrs. Pletcher & Leavitt's (Claremont, N. H.) black spaniel bitch Negress (A. K. R. 189) to Mr. J. P. Willey's Obo II. (A. K. R. 432), Dec. 29.

Obo II. Mr. F. P. Pletcher's (Claremont, N. H.) black cocker spaniel bitch Obo II. to Mr. J. P. Willey's Obo II. (A. K. R. 182), Jan. 3.

Hornet—Edge—Obo II. The Hornet Spaniel Club's cocker spaniel bitch Hornet (A. K. R. 20) to Mr. J. P. Willey's Obo II. (A. K. R. 432), Dec. 4.

Lady—Peter Black. Mr. John A. Graham's liver and white pointer bitch Lady S. (Marsh Ney—Tatula) to Joe Hindon, Nov. 6.

Bessie—Empress Jewel. Mr. J. O. Donner's (New York) English setter bitch Bessie (Ranger II.—Mallard's Belle) to Mr. E. A. Herzberg's Empress Jewel, Dec. 32.

Bessie II.—Victor. Mr. M. M. Nisley's (Elizabethtown, Pa.) beagle bitch Bessie II. (Blue Bell—Bessie) to his Victor (Victor—Bessie II.), Dec. 32.

Nellie II.—Ereman. Mr. C. Fred, Crawford's (Pawtucket, R. I.) English setter bitch Nellie II. (Count Noble—Rosalia) to his Ereman, Nov. 25.

WHELPS.

See instructions at head of this column.
Countess Belle. Mr. Edward Lothman (New York) English setter bitch Countess Belle, Dec. 29, 1883, seven all dogs, by Mr. E. A. Herzberg's Empress Jewel.

SALES.

See instructions at head of this column.
Milo. Mastiff dog, whelped Aug. 11, 1883, by Dianova (A. K. R. 543) out of Lodia, by the Ashmont Kennel, Dorchester, Mass., to Mr. Julius C. Gray, Worcester, Mass.

Con Oregon. Red Irish setter dog, whelped Aug. 25, 1883 (Ruby—Lyla Belle), by the Ashmont Kennel, Dorchester, Mass., to Mr. Sylvanus C. Gray, Worcester, Mass.

Lady Lilliput. Red Irish setter bitch, whelped January, 1883 (Glenn—Sylvan II.), by Mr. John Jessop, Lowell, Mass., to the Merrimack, New York.

Feather. Liver and white ticked imported cocker spaniel bitch, by the Riverside Cocker Spaniel Kennel, Claremont, N. H., to Mr. Geo. W. Leavitt, Jr., Boston, Mass.

Bang Bang—Zanetta Phelps. Lemon and white pointers, whelped Oct. 15, 1883, by Mr. W. F. Todd, Portland, Me., a dog to Mr. J. F. Randall, a bitch to Mr. R. G. Hall, a bitch to Mr. Chas. H. Nowell, same city, and a dog and bitch to Mr. F. F. Harris, Deering, Me.

Prince Castle. Black, white and tan English setter dog, whelped Oct. 28, 1883 (Prince—Dashing Belle), by Mr. E. W. Jester, St. George's, Del., to Mr. A. Richardson, Philadelphia, Pa.

Good Princess. Black, white and tan English setter bitch, whelped Oct. 28, 1883 (Prince—Dashing Belle), by Mr. E. W. Jester, St. George's, Del., to Mr. A. Richardson, Philadelphia, Pa.

Gravelly. Liver and white pointer bitch, whelped June, 1882 (Sensation—White's Grace), by the Westminster Kennel Club to Mr. Lilliput, New York.

Sensation—Lass whelp. Lemon and white pointer dog, whelped Sept. 11, 1883, by the Westminster Kennel Club to Mr. Frank R. Hitchcock, New York.

Chance II. Liver and white cocker spaniel dog, whelped Aug. 17, 1883 (Chance—Flora), by Mr. J. W. Rushforth, Yorkers, N. Y., to Mr. Rowley, New York.

Beauty. Liver and white cocker spaniel bitch, whelped Aug. 17, 1883 (Chance—Flora), by Mr. J. W. Rushforth, Yorkers, N. Y., to Mr. Rowley, New York.

Drizzle. Liver and white ticked pointer dog, whelped Oct. 30, 1883 (Becher—Vinnie II.), by Mr. Charles R. Sprou, Troy, N. Y., to Mr. W. H. White, Chichester, Philadelphia, Pa.

Alle II. Black, white and tan English setter bitch (Count Noble—Rosalia), by Mr. D. C. Sanborn, Dowling, Mich., to Mr. C. Fred Crawford, Pawtucket, R. I.

Scott and Bell. White, black and tan beagle dog and bitch, whelped Oct. 10, 1883 (Sport—Bessie), by Mr. M. M. Nisley, Elizabethtown, Pa., to Mr. A. J. Ward, Boston, Mass.

Nellie. White, black and tan beagle bitch, whelped Oct. 10, 1883 (Sport—Bessie), by Mr. M. M. Nisley, Elizabethtown, Pa., to Mr. A. J. Ward, Boston, Mass.

Lady. White, black and tan beagle bitch, whelped Oct. 10, 1883 (Sport—Bessie), by Mr. M. M. Nisley, Elizabethtown, Pa., to Mr. A. J. Ward, Boston, Mass.

(Sport—Bessie), by Mr. M. M. Nissley, Elizabethtown, Pa., to Mr. Minnece, High Spire, Pa.

PRESENTATIONS.

See instructions at head of this column.
Brownie. Liver, with white on breast, cocker spaniel bitch, whelped Aug. 17, 1883 (Chance—Flora), by Mr. J. R. Rusforth, Yonkers, N. Y., to Mr. Seymour Reynolds, same place.
Echo—Mey whelp. Red Irish setter bitch, whelped July 21, 1883, by Mr. B. F. Clark, Manchester, N. H., to Mr. Samuel Scranton, Olneyville, R. I.
Delaware. White, with lemon ears, English setter dog, whelped August, 1883 (Dashing Monarch—List), by Mr. J. C. Higgins, Delaware City, Del., to Mr. C. Fred. Crawford, Tawtucket, R. I.

DEATHS.

See instructions at head of this column.
Queen May. Black and white ticked pointer bitch, 6yrs. old (Native—Champion Fan), owned by the Westminster Kennel Club, Babylon, L. I.
Don. Lemon and white pointer dog, whelped May, 1883 (Sensation—Sal), owned by Mr. J. Hopkins Smith.

AMATEUR CANOE BUILDING. Second Paper.

DESIGNING.

TO go into the subject of designing at any length is outside of the scope of our present work, but a short description of the method of drawing and tools used, will enable the beginner to do all the work necessary for a small boat, and will also serve to introduce him to a most fascinating employment for his leisure hours, the importance of which to the intelligent and progressive yachtsman or boat sailor is now generally admitted.

The amateur will require a drawing-board, which for canoe work need be only a smooth piece of white pine three feet long, one foot six inches wide, and three-quarters of an inch thick; the lower and left hand edges being straight and at a right angle to each other; a T square about thirty-six inches long, one or two triangles of wood, or better of hard rubber, a pair of dividers with plain and pencil points, several ship curves of various patterns, scales and splines. These latter are long flexible strips of wood or rubber, and are used for drawing curves. They are usually held in place by lead weights at short intervals, but an easier and cheaper way is to confine them by small pins driven into the board. The best scales are those printed on strips of bristol board, eighteen inches long, costing twenty cents each. They may be had with any desired number of parts to the inch. The most convenient scale for a canoe drawing is two inches to the foot (one-sixth full size), or one and a half inches, in which case a common two-foot rule may be used, each division of one-eighth of an inch on which will represent one inch. For the sail plan the scale may be one-quarter of an inch to the foot.

A good paper for working drawings is the "roll detail paper" which is strong, buff in color and may be had of four or five feet in width and of any length. Some drawing pins are also needed to fasten the paper to the board, or if it is to remain there for some time, small copper tacks may be used, as the square and triangle will work over them more easily. A few pencils and an India rubber will complete the necessary outfit, a drawing pen being added if the drawings are to be inked in when completed, as they should be. If much work is proposed a few more curves may be added, a pair of small spacing dividers, bow pen and pencil.

Three views are always used in delineating a vessel, as shown in the annexed drawing, which represents a river canoe, the "Britannia." These are called the sheer plan, half breadth plan, and body plan. The sheer plan is a vertical section, lengthwise of the boat, showing the curve of stem and stern, the rabbet lines op, the sheer or deck line abc, and the buttock lines E F, G H, I K, as curved lines; and the water lines, Nos. 1, 2, 3, 4, and the frame lines, 1 to 13, as straight lines.

The half breadth plan shows the width of one side of the boat at the deck and at each of the water lines, these lines being curved (as well as the diagonals A B, C D), the frame and buttock lines being straight. The body plan shows the cross section at every frame line or square station (1 to 13); also, the line of the deck, abc, as it appears from a point directly in front of the boat. The lines in the right-hand half (1 to 7) are the sections of the forward body, and those to the left (8 to 13) the after body. The water lines, buttock lines and diagonals are all straight in this plan.

With the paper stretched as tightly as possible, and the board on a table of convenient height before us, the light coming from the upper left hand corner of the paper, we first draw a base line, A B, near the lower edge of the paper and in length equal to 14ft. on our scale, using the T square with its head held firmly against the left-hand edge of the board. Now starting at o, the right-hand end of the base line, we lay off with the dividers 14 spaces of 1ft. each, numbering them from 1 to 14 as in the drawing, and, shifting the T square to the lower edge of the board, we draw vertical lines at each point of division, or 15 in all, prolonging them sufficiently to cross the sheer plan above.

Now at a distance from A B equal to half the extreme beam, in this case 7 or 13 1/2 in, we draw a horizontal line; also the three buttock lines E F, G H and I K, each 4 in apart. Leaving a little space between the upper limit of the half breadth plan and the sheer plan, we draw the base line

difference between the "altitude" and "sight height" of a wedge, and he will then regret that he so confidently committed himself to figures which can be easily and justly shown to be a matter of fact, the difference in areas is upward of fifty square feet, or a little more than 10 per cent. of the area of the wedge, in favor of the half-cylinder—considering, incidentally, that the original stated height of less, as "De Capo" attempted to show.

The results of the experiments which "R. C. H." has lately made with a jury sail, are so very interesting and seem to give her designer reason to believe that he will not be disappointed in his expectations. The relative value of her performance would have been amply demonstrated had she been established by critical comparison; but as it is proposed to build from her lines on a large scale, there will doubtless be ample opportunity to test her in detail.

A CRUISING MAINSAIL.

Can you explain what is meant by a trysail, such as you say was found convenient on board the Heu for heavy weather?

[The trysail commonly used on board cutters is a small mainmast cut narrow with considerable hoist and a big foot. It is not in any sense a jury sail, but supplants the large racing mainsail and heavy boom for cruising in rough weather. Being loose on the hift, the head catches wind above the sea and steadies the boat when a reefed mainsail would be too low for the purpose. Having no boom, the rack of that heavy boom lifting is not a consideration. It is also the fact that the hift is not flying unexpectedly. Being entirely inboard it can be quickly reefed by the wind. It is supplied to all cutters in view of their seagoing habits and the fact that the hift is the smallest of men's undertakes. It is the custom in our yachts to cut down racing spars and bend a special sail of small sails all around. The cutter reaches the same result simply by having the big boom and the hift of a man-of-war trysail instead, reefing-boards and running out the No. 2 jib. The term trysail implies a storm sail in the merchant service, though it is also designated as a "sea sail" on the coast. It is the best of the trysails and mainmasts of a man-of-war. It is a splendid sail under which to lie-to when close reefed, as the clew is completely tied up and the head shores close in the most in the foot of the vessel. It can also be worked with greater facility short-handed than the boom mainsail, and saves racing canvas from being pulled out of shape through the wear and strain of a large reef. The hift would say: "No amount of sail to be without a hift, so no single-stroke at sea ought to be without a gaff trysail. Those who have wind, know why." The hift is expressed on the faces of the crew when that big plaything begins to riot at will and takes charge of the whole boat, and the feeling of relief after it has been lowered is a matter of course. Being of a different affair from Southerly drifting, and the gaff trysail is an article of out to good sailorman will overlook or underrate.]

YACHTING IN AMERICA.

[From the London Times.] THERE is a great deal of excitement in yachting circles and that means in American waters, that the racing results of the past season. Rumor brings word of a new and wonderful yacht in British waters, the Marjorie, whose speed has proved to be extraordinary, and whose performance has attracted the attention of the British Yacht Club. One would imagine her to be a knife blade, with utterly adequate amount of power. Be that as it may, her performance has been very remarkable, and has attracted the attention of the British Yacht Club. One would imagine her to be a knife blade, with utterly adequate amount of power. Be that as it may, her performance has been very remarkable, and has attracted the attention of the British Yacht Club.

So far as the centerboard sloop is concerned, the idea of the cutter is not so entirely new in American waters as many suppose. It is true that the American model, so called, has been conspicuous for its breadth of beam, shallow hull, and flatness of floor, leewardliness being guarded against by the use of a deep counterboard. But too much prominence has been given to the model prevalent at New York City. The America, the sloop Julia, and the famous schooner pilot-boats, many of them, have long been the models of the cutter. They are comparatively light draft, and they had the peculiarities which are supposed to characterize the American model. In and around New York Harbor, and in the Long Island Sound, and in the other famous waters for cruising, the light draft yachts, with broad beam and shallow holds, have been immensely popular. They were especially so at Boston, and there are other yachting centers besides New York. At Boston, the cruising gear, and is a different one. There is to be a large amount of cruising, and there are other yachting centers besides New York. At Boston, the cruising gear, and is a different one. There is to be a large amount of cruising, and there are other yachting centers besides New York.

At San Francisco, also, where the boats must be seaworthy to a high degree, owing to the rough waters and strong winds prevalent there, deep hulls are also preferred. The same is true of other yachting centers. It is around New York alone, in fact, that the flat-bottomed yachts of all sizes has been so predominant. It is around New York alone, in fact, that the flat-bottomed yachts of all sizes has been so predominant. It is around New York alone, in fact, that the flat-bottomed yachts of all sizes has been so predominant.

However, after all this is said, it must be confessed that throughout America like elsewhere, preference has always been placed upon width of beam. Beam is the one dimension that has escaped taxation in the rules of measurement. Sailing length, which is the length on the load water line, with a part of the overhang of the counter added, has been the dimension most severely taxed. Latterly, sail area has been taken somewhat into account by the different clubs, but beam has not been considered, except in a very different manner. So that even in the keel vessels, so popular in New England and at San Francisco, the hulls are wider than in English cutters. A comparison between the two will show that the English cutter is a more compact vessel than the American cutter.

affairs at a glance. The average relation of beam and depth of hold to length is, as appears from the following table, that the English cutter has been derived from those specimens with which we are acquainted in New York:

Table with 3 columns: Name of vessel, Length on water line, and Depth of hold. Includes English cutters, New York cutters, New York keel schooners, New York centerboard schooners, Boston cutters, Boston sloops, Boston schooners, and San Francisco sloops and schooners.

In the construction of the 1,375 yachts which appear in the American list for 1893, and which are the product of the English cutter, there, not enrolled in any regular club, the builders have not, of course, been influenced by set formulae in regulating dimensions so much as they have been in the measurements of other successful boats of approximate size. Nevertheless, the average good yachts of all the clubs have followed the formula given above. If the proportions given have been deviated from, it has been for some special reason of the owner.

The first shock given to American ideas as to beam was administered by an admirable little boat, the Madge, at New York in 1881. She was built at Govan in 1879, was 34ft. 10 in. long over all, 33ft. 4 in. long on the water, 24ft. beam, and 7 1/2 ft. draft, drawing 8 ft. of water, and registered 10 tons. Her builder was Thomas M. Madge, of New York Yacht Club course in the lower harbor and past San Luke Hook. To New York eyes she was a singular object, more like a flying fish than a sailing vessel. Her mast and rig were entirely new, and her hull was of a peculiar shape. Her hull was of a peculiar shape. Her hull was of a peculiar shape. Her hull was of a peculiar shape.

Great was the joy when, in the fall of 1882, at a great gathering of yachts from all parts of the Atlantic coast at New York, Mass., the cutter model was first seen. It was a very big beam centerboard sloop, the Vixen. The cutter on this occasion was the Madge, built in England in 1878, a victorious 34ft. long, 24ft. beam, 7 1/2 ft. draft, drawing 8 ft. of water, and registered 10 tons.

ously in the direction of the English model. Frequent war whoops are heard from the Forest and Stream, the principal yachting journal and advocate of the cutter in America, and boat builders are now carefully studying the possibility of a new kind of model, which shall combine the best of both the sloop and the cutter. Comparative models are under discussion. There is an impression, in the language of the day, that "centerboards must go." The tendency now is to build a boat with a deep keel and a high cabin top, and to consider the new rules for measurement for time allowances. The old system was based on the cubical contents of the hull, or, in other words, on the displacement. Length was taxed, and not width of beam. Nothing is now taken into account, except the sailing length of the hull and the sail area. The New York Yacht Club, the principal authority in the displacement, has been the first to adopt the new standard. This is its first year under the new rules. The sail area is regarded as a triangle; the base extends from the jibstay on the upper side of the keel to the boom on the lower side. The perpendicular is measured from the gaff top-stick on the mainmast to the upper side of the mainmast. The length of the vessel is measured from the forward side of stem at the water line to the end of mainmast. The formula is: Area of sail = 1/2 L x W x L.

On the result is based the time allowances. The Seawanhaka Club at New York which has given great encouragement to deep hulls, measures according to the formula: L x W x L + 1/2 sail area.

This all tends toward deeper boats. There is no doubt that a great deal of money will be spent this winter in experiments with deeper models. The present craze for deep hulls and the repairs are being willing to go a long way in the construction of new vessels.

COST OF YACHTS.—Building yachts in Great Britain is very much cheaper than with us. If the figures of the Field are correct, the cost of a 30-ton cutter in England is about \$10,000. The superior material, workmanship and especially in outfit, to the generally of yacht work turned out on this side of the Atlantic. The cost of a 30-ton cutter in America is about \$20,000. The cost of a 30-ton cutter in America is about \$20,000. The cost of a 30-ton cutter in America is about \$20,000.

VESTAL.—This English schooner, reported captured in our previous issue, fell over on her side owing to the giving away of shores and mooring lines, the tide being out at the time. Vestal was modelled after the schooner America. The mainmast flew out of the step and ripped up the deck. The repairs are to be effected. She is thirty years old, reported sound and in fair condition.

NAIDA.—This modern racing ten-tonner was caught out in the Irish Channel during the recent disastrous gales which visited the British coast. Her skipper, John McNeill, reports her a very fine sea-bow. Naida is 57ft. 6 in. long, 7ft. 6 in. beam and 8ft. draft, with 10 tons displacement.

MABEL.—Mr. Stebbins has just returned from Clayton, St. Lawrence River, and has left the necessary directions to have his complete outfit repaired. The outfit is a 24ft. water line and 18ft. beam, with 7 tons of iron on the keel and 5 tons inside. The draft with keel will be 7ft., which is not considered too much for lake service.

GIL BLANK.—The correct dimensions of this yacht, recently bought by Mr. Smith of the Knickerbocker Yacht Club, are: Length over all, 34ft.; on water line, 34ft.; beam, 8ft.; draft, 7ft.; ballast, 5,000 lbs. of which 3,000 lbs. on keel and 2,000 lbs. on deck. She is 47ft. over all. The dimensions given last week were taken with a wrong scale from the plans.

FINANCIAL.—The London Field estimates the average first cost of all yacht tonnage, big and little, sail and steam, at \$20 per ton of V. R. A. measurement. The value of the 3,000 yachts recorded in Lloyd's Register is placed at twenty-seven million dollars. Five thousand professional seamen are sailed every year by the fleet.

NEW YACHT CLUB.—It is contemplated to organize a new club, with headquarters at West New Brighton, Staten Island. There is good anchorage in the light between the steamship wharves, and the vicinity. Shipyard and boat-builders are also accessible.

CRUISES IN SMALL YACHTS.—For the information of many, we may say that this little volume, published recently in London, is a most interesting and useful work, and can only be had by ordering through newsdealers, or by sending P. O. order for \$1.50 direct to the publishers, Nisbet & Co., 15, Old Bailey, London, E.C.

REAL YACHTING.—Schooner Ranger, Mr. J. A. Morris, was in Norfolk Harbor Jan. 2, has been extensively cruising Chesapeake waters, and is bound South to the Gulf for the winter, with New Orleans as her port of call this spring.

WANTED.—Will "Sknkboat," of Easton, Md., please send address. It has been mislaid.

ANSWERS TO CORRESPONDENTS.

S. Harrington, Pa.—Which is the heaviest bird, the ruffed or the pinnated grouse? Ans. The pinnated.

G. S. Salt Lake City.—Can you inform me if what "Picket" calls the whooping crane in your issue is known West as the sandhill crane? Ans. No; the whooping crane is what with black wings.

Rizels, Brooklyn.—I, as I wish to buy a rifle please inform me if the Sharp's rifle is not being made, if so, your address; and if not, can test it in style of action? 3. Also in hunting such game as deer, squirrels, turkeys, etc., with a rifle, which is usually used, and which do you consider best to use, the open or the peep and globe sight? Which do you consider best to use in target practice in order to become a good shot? Ans. The peep and globe sight. Can be of any use.

What makes fly dreary is a good of motive? A motive to use Estabrook's press is to become a good writer. All stationers furnish them.—Advt.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, JANUARY 17, 1884.

VOL. XXI.—No. 25.
Nos. 23 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS.

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, and kindred subjects, than is contained in all other American publications put together.

YELLOWSTONE PARK MATTERS.

THE curious state of things existing in the Yellowstone National Park, as shown by the Washington dispatches printed in another column, is rather startling. The United States Government is defied, and the remarkable statement is made by the Secretary of the Interior that he has no power to enforce the regulations which he has made, and which he has ordered the Superintendent to see carried out. There is clearly a bitter quarrel among the individuals within the Park, the Superintendent standing on one side, while opposed to him is the representative of the Improvement Company. Each accuses the other of doing certain things that should not have been done, and many names are called. The Superintendent reports that the Improvement Company have seized upon the Park; that his fences are torn down by its employees; that the public lands are used to pasture its stock, so that during the winter that belonging to the Government must be removed from the region or else starve to death; that the large game is being killed for the benefit of the Company. He also alleges that the representative of the Company has openly boasted that he will have him (the Superintendent) removed.

A special agent sent out by the Secretary, reports that the Superintendent does not carry out his instructions, and that his assistants are, many of them, remiss in performing their duties, and incompetent; that game is being destroyed for the Hotel Company without let or hindrance by the Superintendent, and that no protection is afforded to the forests or the natural curiosities of the region.

To this the Superintendent replies in effect that the

Secretary's orders are not obeyed because he has no means of enforcing them, and that the simple issue of orders without the power to carry them out is useless.

It is quite apparent that matters in the Yellowstone Park are in a very unsatisfactory condition. As to what the real intentions or desires of the Superintendent may be, we know nothing, but assuming that he desires to do his duty, it is evident that it is impossible under the present state of affairs for him to properly protect the reservation.

In the existing unsettled condition of the law in regard to the Park, there is but one thing to be done to protect it. United States troops are needed there to carry out the orders given by the Secretary of the Interior to his subordinates. These subordinates are at present without any backing whatever except the moral force of their titles.

A year ago we requested the Secretary to call on the War Department for troops to protect the Park. The need for this protection now is more urgent than ever before. An effort has been made to care for the Park, and this effort has proved wholly abortive. The Government is now the laughing stock of the Improvement Company and the skin-hunters and trespassers. Speedy and energetic action will be needed in the spring to make these people understand that the Secretary of the Interior means what he says, and has the power to enforce his orders. Until some legislation bearing on the civil government of the Park shall have determined the proper legal means by which the violators of laws and rules shall be punished, there is no means of preventing these violations except by the use of troops.

The friends of the Park, and these are the people at large, would rejoice to see some vigorous measures taken by the Secretary of the Interior in behalf of their pleasure ground. Now that the Park has become so easily accessible, something must be done, and that soon.

TRIAL BY JURY.

A CASE was recently tried before C. R. Patchogue, Justice of the Peace of Patchogue, Suffolk county, New York, which shows very clearly how utterly futile are all attempts at protection under the present game law. The facts are these: At Sayville, L. I., Mr. E. R. Wilbur owns a farm of 100 acres, on which he has from time to time raised a few deer. These are never shot at, and, as they are regularly fed and cared for, have become very tame, breeding in summer immediately about the house, and manifesting not the slightest fear of man. On the farm, in conspicuous positions along the boundary fences, are seven signs worded according to the statute, forbidding trespass.

On the 20th day of last November one Sims Murdock was seen to cross the fence separating Mr. Wilbur's property from that adjoining. He had a gun in his hand and a dog with him, and in a few moments fired one barrel and then another. The owner approached him and found that he had in his hand a quail still warm and bleeding. Complaint was made against him for trespass under the game law. The trespass and the killing of the bird were admitted, and the only defense was that the defendant did not know to whom the land belonged or that it was posted. On trial, a clear case was made out against Murdock. In his defense he swore that he had lived six years at Sayville; that he lived within one mile of the plaintiff, and that he followed the bay for a living; that he did not know who owned the property, and that he had never seen the signs on the land. He further swore that he knew the boundaries of all the adjoining pieces of land, mentioning their owners' names and showing general familiarity with the place and the people. A highly intelligent jury of his peers condemned him to pay the plaintiff twenty-five cents damages.

Murdock's admission that he had lived at Sayville for six years, and that he was a bayman and fisherman, makes it impossible to believe that he could have failed to know the Wilbur place, or could have been ignorant of the existence of the sign boards. One of these was within a few feet of the place where he crossed the boundary fence, and in plain sight. The plea of the defendant's lawyer was the usual country lawyer's spread eagle buncombe about the oppression of the poor man by the rich.

The result of this case is to open all the preserves on Long Island to the poacher, who will very willingly pay a quarter of a dollar a piece for birds. At Islip the South Side Club has large preserves on which many quail have been turned out. How will they enjoy seeing their birds killed off by whom ever may take it into his head to go shooting on their land.

The trouble in this and all similar cases lies in the way in which the statute is framed. It reads: "Any person who shall knowingly trespass, etc." After the signs have been

put up, it is the business of people to know that they are there, and the presence of this word "knowingly" in the game law renders it of no effect whatever. Moreover, the leaving of the amount of the fine to be fixed by the jury is all wrong. The statute should fix the penalty and the jury should have no discretion in the matter whatever. It is but a year or two, since a man—a clergyman, God save the mark—was prosecuted by a land-holder of Suffolk county for trespass, and killing woodcock in June. The jury awarded the complainant six cents damages. We believe that the town of Southampton had the honor of producing this remarkable body.

Attempts made by land-holders to preserve the game are made still more discouraging by a statutory provision to the effect that, in any suit in a justice's court, if the defendant shall make a tender of any sum to the plaintiff, and the latter shall refuse it, the plaintiff shall be responsible for all costs in the case above the amount recovered, unless he recover more than the amount of the tender (Code of Civil Proceedings, Chap. XIX., 2, 893). In the Sayville case the defendant filed an offer to allow the complainant to take judgment against him for \$2 and costs, which offer was refused.

THE ADIRONDACKS.

A BILL was introduced at Albany last Tuesday by Senator Lansing, which provides for the protection of the Adirondack forests by the establishment of a State Park, to be fenced in and put in charge of a superintendent. The extent of the territory to be included in this park comprises 1,700,000 acres. Of this land the State now owns 750,000, or less than one-half. The bill (as reported in the press dispatches) provides that the State shall assume immediate active control of the forest lands, and that the remaining lands shall be sold to the State, the proceeds being used to pay the interest on the State debt, and the principal to be paid in 40 years. The bill also provides that the State shall assume the cost of the fences, and that the State shall assume the cost of the salaries of the superintendents and their assistants.

We hear much of the propriety of the proposition to assume State control of those lands shall terminate in a huge job; and again we urge that such a fear is not based on good grounds. The forests ought to be saved, even at great (but not exorbitant) cost, and in this day and generation most surely the man with the big pocket to fill ought not to stand in the way.

A WARNING FOR VIRGINIA.

THE concluding sentence of a communication on "The Quail of Virginia," printed on another page, is this: "Ignorance and selfishness is fast destroying a most royal hunting ground." We commend that statement to the consideration of the people of Virginia, concerning whose game grounds it is written. Woeful is that ignorance which will not forese the game extermination that must come; and stubborn is that selfishness which obstinately goes on "hogging" the fast-diminishing supplies of nature.

Are there not in the great State of Virginia a sufficient number of sportsmen, with eyes that can see beyond their gun muzzles, to combine for united effort and action? What is everybody's business is always nobody's business; an association of the right men ought to be founded in Virginia to make it their particular business to put a stop to the indiscriminate and imprudent game killing by home and foreign shooters.

DESIRABLE GAME GROUNDS are very rapidly passing into the hands of clubs. Is this to be deplored? If so, what is the remedy? As the bird snarers say, "What are you going to do about it?" We should be pleased to have the views of any thoughtful man who appreciates this movement, and what it means.

THE WAY OF NEWSPAPER OFFICES.—This bit of copy for the printer is written on the blank side of an anonymous letter from a man in Dorchester, Mass., who wants to know something about air-guns. We receive all sorts of anonymous communications from all sorts of people, and they all go the same way—to the waste basket, or are utilized in some other equally profitable manner. We expect to receive many more such unsigned letters, and this note is written not to prevent people sending them in, but only to explain to the writers why they never hear anything from them.

EUROPEAN FOREST SCHOOLS.

A STRIKING contrast with our helter-skelter treatment of forests is afforded by the careful training given by the Forest Schools of the continent of Europe, and particularly those of Germany, to those put in charge of this great public interest. We Americans have commonly taken it for granted that about all the qualifications needed for the woodman was an indisposition to "spare that tree," together with the muscle and skill to swing an axe (hitting twice in a place), and to skid the logs on a sled or split them into posts, rails or cordwood.

Only a few of our people have—at least until very lately—had the faintest idea that the relations of the forest to every department of industry are far-reaching and complex, and that, therefore, those who manage forests should understand these relations.

We are about to have this lesson scored in by the sharp switch of adversity. We are already suffering much, and are sure before long to suffer more because of this blindness. Even adversity may not open our eyes, because our vast loss will be the aggregate of so many little things that they may not be recognized as coming from one and the same source—and that is spoliation of the forests.

A few words from Bernard Palissy—whose insight into the physical universe seems so marvelous when we reflect that he lived more than 300 years ago—puts this very concretely:

"I cannot enough detest such a thing"—he was speaking of the greedy stripping off the forests by noblemen and high ecclesiastics from land under their control—"and can call it not a fault, but a curse and a misfortune to all France; because, when all the woods have been leveled there must be an end of all the arts, and artisans may be brought to put down in order the arts that would cease if there came to be an end of wood; but when I had written a great number of them, I could see no way to an end of my writing, and having considered all, I found that there was not a single one to be exercised without wood, that all navigation and all fisheries must cease, and that even the birds and several kinds of beasts which nourish themselves upon fruits must migrate to another kingdom, and that neither oxen, cows, nor any other bovine animals [perhaps he meant to include horses and mules] would be of service in a country where there was no wood." (*"L'Art de Devenir Riche,"* a work dedicated to the French people, quoted in Morley's "Life of Palissy," vol. I, p. 31).

Gathering up the results of the studies and experiments, pursued by many laborious investigators during the three centuries since the almost inspired Potter of Saintonge wrote the vigorous words just quoted, these Forest Schools have put together a body of theory and practice which comprises both the science and art of forestry. To master it requires talent and industry of a high order, and many years of patient application. After a brief classification of these schools, we will look in on them, and follow the pupils around at their studies and their work.

There are three leading theories, and three sorts of school based on these. The first theory is that since so many of the studies—botany, geology, chemistry, mathematics—are taught at the universities, it would be best to make the Forest School a department of the university, which has already instructors, museums, libraries and laboratories. Of this class are the Forest Schools at Giessen, Zürich and Munich.

The second idea is to locate a school in or near a large forest, so as to apply what is taught in actual practice. On this plan are carried on the schools at Neustadt-Eberswalde, Münden, Eisenach, Nancy (France) and others.

The third idea is to combine the study of Agriculture and Forestry in the same school, and while they give theoretical instruction aim principally at practice. Of this sort are the schools at Hohenheim, Vienna, St. Petersburg and Stockholm.

The sort of study and work which employs the students in most of these institutions is not of a primary character. In the public schools much elementary instruction in Agriculture and Forestry is given to those who are to be the future laborers in field and wood; but those who are to direct these toilers must be qualified to pursue quite advanced studies before joining these professional schools, e. g., at the Polytechnic School at Baden one must, if he wishes to enter the State Forestry service, be a citizen and must have taken a full course in a gymnasium (which is quite equivalent to a college course at a high-grade American college), and must then, for two years, pursue general studies in mathematics and physics preparatory to the special course in Forestry. If he fails in his examination upon the work of these two years he has only one more trial. If successful, he begins the special studies, which last two years longer, and then he is examined by directors of forests, professors of law, agriculture and mathematics. If successful, he is then given a position under the general district foresters as an assistant, and after further study and practice in this capacity, from six to ten years—according to the number of those competing with him—he will, if faithful, be appointed as a general district forester. Here are from ten to fourteen years of study and practice after one has the equivalent of a good American college education, before he can assume the full duties of a forester.

At Neustadt-Eberswalde, about twenty-four miles north-east from Berlin, is a well-equipped school upon the second

of the three ideas named above. It was organized in 1821, established as a department in the University of Berlin—that is, it was at first based upon the first of the three plans—but the superintendent, Dr. Pfeil, urged that it be made a separate institution (the second plan) and be located near some large forest. In this he was warmly seconded by Wilhelm and Alexander von Humboldt, and in 1830 the academy was moved to its present location, where it is near two large forest districts. Its course of instruction embraces three groups of subjects: First, *Fundamental*, divided into (a) natural sciences and (b) mathematics; second, *Principal* sciences, and third, *Secondary* sciences. To get an idea of the course, let us glance at the studies pursued and the work done in each of these departments: First, Natural Sciences. This includes general and theoretic chemistry, special inorganic and organic (applied) chemistry, physics and meteorology, mineralogy and geognosy (speculative geology), definition of minerals and rocks. The students have now learned something of the materials whose combinations and interactions under natural law are to furnish their life study. Next come investigations of living organisms. Botany in general and forest botany in particular; anatomy of plants, vegetable physiology and pathology. Microscopy comes in here to enable the pupils to see nature's small workshops, and botanical excursions are made. So much for plant life. Then, for the animal kingdom, we have general zoology, special study of vertebrates, and in order that forest insects may be understood, a course of instruction is devoted to the invertebrates. Some practice is given in making zoological preparations; thirty-two geological excursions of three hours each are made. In all, 840 hours of instruction are given in the Natural Sciences.

Under (b) Mathematics we have geodesy, or that branch of surveying which takes into account the curvature of the earth, and this, with interest and rent account, wood measuring, mathematical reviews, surveying and leveling and plan drawing, fill up the 440 hours of teaching in mathematics.

Under the second general head—*Principal Sciences*—we will just take a look, as it were, at the backs of the books in which they must delve and mine. The subjects are: Cultivation of forests, forest implements, geographical forest botany, protection of forests, forest usufruct. (By the way, that is just what we Americans most need to learn about forests. It means the right to use without lessening the value or substance. We have made spendthrift haste to squander principal as well as interest. Would that some wise head could have taught this same forest usufruct to our forefathers.) Then come technology, forest surveying and appraising, calculation of forest values and statistics, administration of forest and hunting, redemption of rights and usage, forest history, reviews and examinations. The total of 950 hours instruction in these subjects with hard names is filled out by eighty-eight forest excursions. Third come the secondary sciences. Under the head of Jurisprudence there are civil and criminal law, civil and criminal lawsuits and constitutional rights and jurisprudence. Total, 180 hours. Miscellaneous subjects in this third department are: Construction of roads, hunting; forty-eight shooting exercises of two hours each (the boys must like that); in all 340 hours teaching is given in these secondary sciences.

In all the three departments a grand total of 2,648 hours teaching is given—on an average almost five hours a day. Of course this means at least as many more hours spent in preparation for recitations.

If we only had had work similar to that done in these schools here in America during the last hundred years we should not be, as the most sober and best informed specialists say we are, upon the brink of a general timber famine. That means at least a billion dollars a year of direct loss—probably a good deal more—and of indirect damage in the way of climate, public health, water to float vessels, turn mill wheels and support vegetation, a sum total which only God knows, whose physical and moral law we have so dreadfully broken by our treatment of his great gift of the forest.

Much information on the subject treated in this article is to be found in Dr. Hough's Report on Forestry, United States Department of Agriculture, 1877.

THE MICHIGAN ASSOCIATION.

THE meeting of the Michigan Sportsman's Association was well attended, and the discussion of an interesting character. The principal subject before the convention was the appointment of a State Game Warden. Dr. Holmes, the president, read a paper urging the duty of the State to undertake the practical work of controlling its game, and he also suggested that it might be wise for the Association to provide a retreat for the game by securing the control of a large area of woodland in the Northern Peninsula. The election of officers was as follows:

Dr. E. S. Holmes, of Grand Rapids, President; S. A. Rogers, of Jackson, Secretary; N. A. Osgood, of Battle Creek, Treasurer. A. H. Mershon, Director for four years, and J. C. Parker, of Grand Rapids, for three years.

THE MASSACHUSETTS SOCIETY had a meeting in Boston last night to consider a plan for making uniform the New England game seasons. We shall give a fuller notice of the proceedings in our next issue.

AFTER CARIBOU.

NESTLED among low wooded hills lies the beautiful Basin of Gaspé. Its blue waters are seldom lashed to fury by the tempestuous winds of the North Atlantic; for the most part they sparkle blithely in the sun, and kiss the gentle slopes with a loverlike tenderness. Here the weather-beaten fisherman finds a safe anchorage for his strained and laboring bark, and the seaman, after having escaped the perils of the Labrador coast and of Anticosti, enters this port and feels secure. It is its quiet picturesque rather than any grandeur of the scenery that renders Gaspé so lovely. Rounded hills clad with evergreen forests, cultivated fields, down toward the water's edge, low white buildings that stand in the shadow of the woods or upon the shore, the tiny hamlet on the steep hillside, and the blue waters of the Basin, combine to make up a landscape which cannot fail to charm. The prospect is an attractive one at all seasons. In winter the green foliage of the firs upon the hillside forms heavy masses of color to relieve the brilliant whiteness of the universal snow. Over the ice-bound waters, sleighs drawn by swift-footed little horses, dash along with a cheery melody of jingling bells, and dog teams more deliberately haul their heavy loads, each guided by a fur-clad driver, on his snow shoes. The prospect is not less lovely when the sloping meadows have begun to take on their tender green, and the freed waters are alive with fish and fanned by the wings of migrating fowl, and all along the shore the fishermen are overhauling their craft and preparing nets and lures for the work which is at hand.

But summer is Gaspé's most delightful season. Now all the vegetation is in its fullest luxuriance. The thrifty crops are maturing. The harvest will soon be ripe for the sickle. Hillside and meadow and woodland are beautiful with a thousand delicate and fragrant wild flowers. In the fields and along the roadside you may pluck the blossoms of the lily, the violet, the Canada cornel, the purple vetch, and the ox-eyed daisy. The delicate pink bells of the linxæa nestle half concealed among their rounded leaves in the shadow of tree and rock, and in the burnt woods the creamy blossoms of the blueberry whiten the ground. Everywhere there is the rich green of the ferns and of sheeny velvet moss, and pale gray red-capped lichens. Summer is the season for work here. Basin and harbor are dotted with fishing craft. The tiny dory, the sharp-proved whale boat, and the heavy smack with red or white sails, hurry hither and thither, intent upon the capture of cod or mackerel, and their arrival and departure give an air of bustle to the scene which is observable at no other season of the year. Now, too, the salmon fishers arrive, and pole up the rivers which empty into the Basin, to capture these noble fish.

Autumn is not the least attractive of the seasons at Gaspé. The fishing is at an end. The gently sloping fields near the water have yielded their crop to the farmer, and their yellow stubbles lie warm in the afternoon sun. The wooded hills still preserve their never-changing dark green hue, but here and there among them are seen patches of pale yellow, which tell of the presence among the spruces of a poplar or a white birch, or a maple or a feathery larch. In the open places in the forest, where fire or the axe of the settler has cleared away the growing timber, the new growth is brown. Keen frosts have nipped the ferns, and the low shrubs which have replaced the forest trees, now flourish among their white rotting trunks. The yellow leaves of birch and poplar and ash reluctantly let go their hold upon the parent stem and slowly fall to earth. The waters of the Basin are not less blue now than in summer, but they are more changeful. Often the hurrying storm cloud casts over them its shadow, making them seem white, or pale gray, or heavy and leaden. The fishing boats which a month or two before swarmed here, have departed or are laid up—their occupation gone. A host of birds are starting on their southward journey. The shrill beat of the snipe is heard in the marsh, the whistle of the wild duck's wing comes quivering over the waters, the trumpet-like cry of the Canada goose echoes against the hillsides. Winter is at hand, and a universal restless movement pervading all nature, proclaims his coming. The frosts become sharper and more killing; a little snow falls and then melts again; harder frosts follow; more snow falls; the bay freezes over, and Gaspé settles down to six months of solitude.

My first visit to Gaspé was in autumn. I had been in search of ground where I might have a chance to kill a caribou or two, and through the great kindness of your delightful correspondent, Mr. J. U. Gregory, had been directed here. Gaspé is reached from Montreal, Quebec or Halifax by the Intercolonial Railway to Campbellton, thence by steamer, which sails on Tuesdays and Saturdays at five A. M. The run occupies about eighteen hours, though much depends upon the amount of freight carried by the vessel, and her consequent detention at way ports. The route lies along the north shore of the beautiful Baie des Chaleurs, a region famed for its salmon rivers and its picturesque scenery. The settlements are not numerous, and the only industry of importance is the fishing. This coast was at one time the most important fishing ground in America, but of late years the catch has greatly fallen off. The country has not prospered as it would seem it should have. The reason given for this is that, until within a short time, the fishing business has all been in the hands of a very few firms, who monopolized this and all the trade of the region. The inhabitants

were thus entirely in their power, were obliged to work for them, to sell them their fish and to purchase their supplies at their stores. In this way, it is said, the fishermen were constantly in debt for provisions and clothing, and their utmost exertions were unavailing to throw off the load. Then followed the mortgaging of their farms and small holdings, and in process of time these passed into the hands of their creditors. This could only result in one way—in the utter discouragement of the people. Many of them sold their possessions for what they would bring, and emigrated to Upper Canada or the United States, there to engage in farming, lumbering, or other occupations. This state of things in a less degree continues up to the present time, and more or less emigration is still taking place. Lately, however, a change for the better has come about. New people have gone into the fishing business, and there is more competition. As a consequence of this, the people receive better prices for their fish, and are able to purchase their supplies on better terms. Living, when judged by our American standard, is very cheap here. The prices of all commodities produced at home are very low, while those which are brought from without, such as flour, tobacco and similar articles, are not high.

Among the principal fishing houses are Chas. Robins & Co., Le Boutillier Bros., John & Elias Collas. The amount of fish exported by these firms is enormous. It is stated that they send out from 130,000 to 150,000 quintals of dried fish per annum, representing from 35,000,000 to 50,000,000 pounds of green dressed fish—a quantity inconceivably great.

The kindness of the gentleman to whom I had been recommended by Mr. Gregory, had made the arrangement of my hunt a very easy matter, so that on arriving at the Basin preparations were soon in train, and after one day's interval all was ready.

The sun had only just risen one bright October morning when we drove out of Gaspé. The frost of the night before had been sharp. The hard ground rang under the pony's hoofs, and the wheels crashed through thick ice in the puddles in the road. At Joseph Eden's house my bag and blankets were transferred to the cart, and we set out for the St. John's River. Two other carts, carrying the canoes and provisions, had gone on before. The York River flows into Gaspé Basin at its head, and the St. John's is the next stream to the westward, the portage between the two being about miles. The road between the two streams is fairly good, having been cut out and kept in repair for Lord Dufferin, who for several years leased the salmon fishing in the St. John's.

It was too cold to drive with comfort, but just the day for a walk. The clear air was fresh and bracing; there was the lovely view from the hillsides, and besides this, there was the possibility of seeing a caribou during the walk, and a strong probability of killing a partridge or two. The road crossed the river bottom of the York, and then ascending a steep hill through a spruce forest, passed into a clearing of burned woods, and continued west over the rolling hills. The greatest elevation above tide-water is about 500 feet. From several points, beautiful views are to be had of the Basin and its surrounding hills, and to the south three or four little lakes, half hidden by the surrounding trees, flashed brightly in the morning sun.

Caribou are occasionally killed in this burnt clearing, though it is too near the settlement for them to be found, except as stragglers. All along our path blueberries grew in great abundance. They had been nipped by the frosts, and the leaves still clinging to the stems were red, and the berries shrunken and wrinkled, but sweet and delicious to the taste. We were not the only berry pickers, for every now and then we could see where the bears had just been feasting on the fruit, and our progress started from the ground great numbers of birds gathered here for the same purpose. Robins and rusty grackles and woodpeckers and blue snowbirds were the most numerous, but one little white snowbird flew from the ground and alighted on a black stump by the roadside, from which he looked at me with soft, confiding eyes. I stood there within four feet of him and we gazed at each other for awhile. I had just come from a country still balmy with the soft breath of the late summer, and it was almost a shock to me to see this little winter bird, apparently at home. It made me realize what even the boreal vegetation had not yet succeeded in doing, that I had really "changed my skies."

It was afternoon when we reached the beautiful river, up which we were to proceed, and a little later the cart made its appearance. The two canoes, in which we were to ascend the stream, were what is styled the Gaspé canoe, built of thin poplar planks, and in shape very much like the Indian canoe, but less wide. They are beautifully graceful craft, and a very great improvement on the old-fashioned birch, much steeper, and, of course, more durable. Those which we had were constructed by Joseph Eden, who is one of the best canoe builders along the coast. Each canoe was furnished with a shoe of poplar planks, screwed to the bottom, to protect this from injury when it is dragged over the stones in the shallow riffles. When the water is low there is often not enough to float the loaded canoe in the shoaler places, and then the men step out, and, taking hold of the gunwale, lift and drag it along until the water becomes deep enough for them to resume the easier task of poling.

The water was very low now; lower, the men said, than it had been for many years, and it was supposed that the

work of ascending the river would be very difficult. For this reason it had been thought best to take two canoes and four men, so as to make the load for each craft a light one, and progress as rapid as possible. The few pounds of provisions and blankets which constituted all our baggage, were therefore divided as evenly as possible, and a little after one o'clock the crews stepped from the flat rock at the water's edge into the canoes and pushed off.

The St. John's River is a beautiful stream, flowing down to the sea between high hills. Its course is rapid, and foaming riffles and low falls succeed one another at frequent intervals. Between these there are long quiet reaches, where the water is not more than two or three feet deep, and occasionally salmon pools, which are from fifteen to thirty feet in depth. The water is marvellously clear, and one can distinguish each pebble that rests upon the bottom. Scarcely anywhere, except in Lake Tahoe, and in some of the hot springs in the Yellowstone Park, can I remember to have seen water so pellucid. The hills among which it flows are composed of a loose slate, sometimes changing to a friable laminated shell, or again, to a more heavily bedded solid limy rock, which, when recently fractured, gives forth a strong odor of petroleum. Usually the rock dips at an angle of about 45 degrees west to northwest, but in some places the beds are nearly horizontal. Much of the drift in the river bed has evidently come from these adjacent rocks, but some of it is quite unlike anything that I saw in the neighborhood. Numerous boulders, some of them very large, were composed of a very hard conglomerate of small pebbles cemented together by a fine, hard, sandy matrix. Blocks of a coarse green porphyry were abundant, as well as several different kinds of trachyte, one of which is dark purple, the crystals of orthoclase forming in a worn specimen beautifully regular sagittate markings.

As we poled slowly up the river, we saw numbers of large salmon lying in the pools, and usually there were to be seen not far from the salmon, from one to a dozen great trout. The latter, at the salmon's spawning time, accompany them continually, and eat all the spawn that they can secure. Both fish were out of season now, and we made no attempt to capture them.

We camped that night about a mile above the Owl Capes—so called because of the abundance of owls usually found near these prominent hills—having come about seven miles on the river, and thus having made good progress. The men had not been in the canoes half the time, and there had been much dragging of the craft over shallows and sandbars.

This was my first camp in the Canadian forests, and it was as different as possible from anything that I had ever seen before. The canoes having been beached, and their loads carried up above high-water mark, were turned over and emptied of what little water had been taken into them by the men's feet and left upside down to drain. Our tent—which was merely a light cotton lean, shaped like, and about the size of, one-half a common A tent, cut down through the ridge pole and uprights—was set up in a thick grove of larches, by tying its upper border to a cross-pole supported on the branches of two trees about ten feet apart, and its lower edge to pins driven in the ground three feet back from the cross-pole. The sloping walls thus covered the heads and shoulders of the occupants, whose feet would extend toward the fire. About six feet in front of the tent two stakes, four feet long, were driven in the ground, and against these were piled, one on top of the other, four green logs, each eight feet long and one in diameter. A huge fire was built in front of these back logs, which reflected a large portion of the heat into the tent, thus rendering it very warm, at times even uncomfortably so. From the spot where the beds were to be spread, all stumps, roots and inequalities were removed, and then a thick bed of fir boughs was spread on the ground, extending from the back of the tent, well out toward the fire. While these preparations for the camp were being made, two of the men were busy collecting a great pile of firewood, which was laid up close to the tent to replenish the fire from time to time during the night.

After supper, as we were stretched at ease upon the fragrant boughs before the fire, I began to make inquiries of Joseph and William as to the nature of the ground over which we were to hunt, and the game which we hoped to see. They told me that many years ago the country had been burned over, and was now again growing up with a low scattering growth of firs and spruce. There are, however, many wide valleys and hillsides, either quite bare of trees, or at least so scantily covered with them that the deer can be seen a long way off. At the same time this young growth affords excellent cover under which to approach the animals. Everywhere in these open spots, the so-called reindeer moss is abundant, and furnishes food for the deer, but they do not usually seek this until a snowfall has occurred. Until then, they remain in the thick woods, feeding upon the "pigeon berries" and other plants whose leaves are still green, and upon the moss which grows upon the trees. When, however, the ground is covered with snow, they leave the woods and resort to the open spots where they dig for the moss. They paw away the snow with their fore feet just as a horse digs to get at the grass, and the long, thin hoof makes an effective snow shovel. At this time of the year they collect in flocks sometimes numbering one hundred, and are then readily captured.

The caribou are great bullies, and do not hesitate to impose on the weaker members of the herd; this is especially

seen in the winter, when they are digging for the moss. If a small deer with great labor makes his way down to a good patch of the succulent lichen, some bigger one will be sure to come and drive his weaker brother from the spot, seizing upon his hole by the right of the stronger. This may perhaps explain the fact that the female caribou does not lose her horns until the spring. During the winter, when she is pregnant, she requires all the nourishment she can get, and were it not for the possession of these weapons of offense, she would be likely to be greatly imposed upon by the larger and stronger males, who probably have just about as much gallantry as the males of other species of deer—and no more. Her horns, however, enable her to hold her own in the struggle for food, and to beat off the big bullies.

Until a tracking snow falls, the chances for success in caribou hunting are not good. In the dense forest it is quite impossible to work out a track where the moss and leaves often show no signs. The work is slow, and the deer is very likely to see the hunter before it is observed by him. The winter, therefore, is the season chosen by those who live near the haunts of the caribou for laying in their supply of meat, and it sometimes happens that in a few days a small party may kill twenty or thirty deer. On the other hand, a very considerable proportion of those who come from a distance to hunt caribou here go away again without at all diminishing the stock of deer in the hills. I was told of a number of sportsmen who had in recent years visited Gaspé for this purpose, and was astonished and somewhat discouraged to hear of the utter want of success which they had had. One English gentleman who, by the way, has written a book to tell the world of his adventures with the rifle, shotgun and rod, was camped here a month without killing a single deer. His companion in that time killed just one. Another gentleman, in six weeks' hunting, killed four. Two young Americans hunted a month and saw none. The only really successful visiting hunters of whom I heard anything were two Englishmen, who sent up men to build their camp in August and moved up themselves in September, remaining until January. During their stay they are said to have killed fifty deer.

I sought for a reason for such ill-luck on the part of the strangers who hunted here, and, though the men were too loyal to their former employers to say that their failure to accomplish anything was due to their lack of skill, I concluded that this must be the explanation of much of this lack of success. Certainly as far as could be judged from what I heard, there was no dearth of game. But the men insisted that I must not expect to find the deer on the best hunting ground now. If we should have a snowstorm during our stay in camp, then I might hope to kill some caribou, otherwise it would be doubtful.

I was anxious to get a shot at these deer. I had never seen a caribou, though I had traveled in British Columbia and the Northern Rocky Mountains, where they are sometimes found. I was, however, familiar with the literature of the species, and now that I was in its home, felt a great desire to inspect it close at hand. It was long since I had started upon a hunt with so much anxiety to be successful and—absurd as it seems to tell it—I had twice since my departure from home dreamed of caribou—as if I had been a boy starting out on my first hunt. A single standing shot at one, within fair range, would, I felt, repay me for my trip. If I killed, my object would be accomplished; if I missed, I should have nothing to say, and would be content to turn about and go home.

[TO BE CONCLUDED.]

Yo.

THE FLICKERINGS.

IT is something of a task to read the ninety-six stories submitted for competition; more of an undertaking to select, among so many good ones, the ten that are best; and perhaps most difficult, after the ten have been finally determined, to arrange them in their order. To give all persons an opportunity to make the choice at their leisure, we purposely made a liberal allowance of time. The date set for receiving the last votes was Feb. 1.

An inspection of the ballots already sent in convinces us that the voters have exercised some pains in selecting the stories voted for. Very few cards contain any evidence of having been written at random; the list in almost every case is creditable. For the manner in which our friends have done their part in the balloting there is abundant cause for satisfaction.

At the same time, we hope that it will not be forgotten that the task of counting the ballots and determining the result will involve much time. All individuals who intend to vote are most respectfully requested to do so as early as they may find it practicable. We wish to announce the result just as soon as it can be determined after the balloting is over. Vote early. The polls close Feb. 1. Votes received on Feb. 2 will go to the waste basket.

A PROPOSED KANSAS ASSOCIATION.—Mr. J. D. Graham, of Manhattan, Kansas, with the Fish Commissioner of that State and others, proposes the formation of a State association for the protection of fish and game, and to that end he invites correspondence from game clubs and all persons interested in the matter.

ONE WAY.—Disseminate sound sportsmen's literature.

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

BY J. WILLARD SCHULTZ.

Eighth Paper.

NOT long ago, about the 1st of May, the first thunder of the season was heard. I went immediately to a Bear-man's lodge and found him drumming and singing the Thunder song. "To-norrow, my son, to-norrow," said the old fellow as I looked in at the doorway, "we will dance, come to-morrow, I am only singing now because my heart is glad." The next day, at the proper time, with a number of other guests, I entered the lodge.

The pipe-stem had already been unrolled. In front of the fire were two huge kettles of cooked berries and a large wooden bowlful of them was given to each guest. Each one, before eating, took a few of them in his fingers and rubbed them into the ground, saying, "Take pity all Above-people, look at us."

When all had finished eating a large black stone pipe-bowl was filled and fitted on the Bear-pipe-stem, the Bear-man then held it aloft and quietly, in a low voice, sang the Eastern, Thunder, listen, Old Man, Sun, all Above-people, all Above-animals, listen, take pity. You will smoke; the Bear-man fills his pipe. Let us not starve; make the berries large and sweet; let the bushes have a heavy load. Look at all the women and little children; look at us all; let us reach old age; let our lives be complete. Let us destroy our enemies, help the young men in the battles; man, woman, child, we all pray to you; take pity and give us good things.

He then took a pipe and danced with it as in the previous ceremony. At this time another storm had come up and the thunder crashed directly over our heads. "Listen," said the Bear-man, as he stopped dancing. "It hears us; we are not doing this uselessly; and he raised his face, animated with enthusiasm, toward the sky, his whole body trembling with excitement, and holding the pipe aloft once more repeated his prayer. All the rest of the people were also excited and waved their arms over their heads, saying, "Take pity." Good give us, good give us!" After this the pipe was handed to a guest on the right end of the circle. Another guest took a lighted brand from the fire and counted four "coups," at the end of each "coup" touching the bowl with the fire, and when he had repeated the last one the pipe was lighted. It was then smoked back and forth around the circle, each one as he received it for the first time repeating a prayer before he put the stem to his lips. When it was smoked out a hole was dug in the ground, the ashes carefully knocked into it and covered over, and the Thunder ceremony ended.

When people are so sick that they cannot leave their lodge they often send for a Bear-man to come and "doctor" them. Although certain roots and herbs are used for medicine, as before stated, the most efficacious remedy is thought to be the Iso-kin-uh-kin, the songs for the sick. These songs are not the property of any individual or gens, but may be sung by any one of the gens. They are repeated by the singer. The drum is always an accompaniment of the Iso-kin-uh-kin, with sometimes rattles, horn bells and whistles. All the women of the lodge join in the singing. Sometimes the chief doctor or singer blows upon the patient through a bird's wing-bone, after each breath uttering a loud "who!" Water is also blown in the form of spray. In cases of rheumatism and other diseases when the pain is very often acute in certain parts of the body it is remedied by the practice of cutting an incision or two with a knife. Blistering is done with hot rocks, and sometimes dried prickly pear thorns are inserted in the flesh, and burned, the thorn being consumed to the very point. People of one gens very seldom doctor people of another one. Although any one may be a doctor only one or two persons in a gens—those who have been very successful with patients—have much practice. Sometimes the doctor is a man and sometimes a woman. When one of these doctors is called upon to practice on a sick person it is customary to demand a present at the very beginning, a horse or a number of robes, after a day or two another present is exacted, and it often happens when a man's sickness is protracted that he is obliged to pay out his very last horse and other valuable property in doctor fees.

WINTER SHOOTING IN NORTHERN CALIFORNIA.

IN TWO PAPERS.—II.

PURSUING his way to the shores and marshes of Point Arcua, the summer found shooting awaiting him in much more than the body of a sick person. The game of the place, although it was exclusively of the feathered order. In the pools incident to the fresh marshes, mallards congregated. Along the courses of the salt creeks flights of ring-necked (*Fuligula ajacis*), green-winged teals, and widgeons continually swept to and fro. On the shallower reaches of the Gossier River numerous assemblages of bullheads and gosanders held their court. The deeper of the ponds to be met with on every band in the salt marshes, constituted resorts high in favor with the canvas-backs, and finally, as will be shown more fully in detail later, snipe were to be put up when the right spot was subjected to the method calculated to force them to reveal themselves.

Of these varieties of game the canvas-backs and mallards were, of course, by far the most prized by us, and accordingly our earliest as well as most protracted endeavors were given to their capture. But it was decreed that they were not to suffer appreciably at our hands. The truth is, we were unaccountably forced to reckon with the same cunning and shyness on the part of the birds here in this primitive California wild that they habitually evince in Eastern waters; and consequently such rough and ready methods as we were enabled to employ in our attempts to get the better of them came to but little. Whether we crept upon them, or hid in ambush for them, or as one of us sought to drive them within striking distance of the other, the expedient proved in the main to be equally at fault, and although our devotion to the work was unremittingly of the scope indicated throughout, we succeeded in bagging only a leggerly half dozen of the birds in all.

But as we were at length moved to measure ourselves with the ring-necks, teals and widgeons, for which our next choice ran, we fortunately had it in our power to enter upon the contest under conditions wholly commended to us, and consequently the outcome of the struggle was quite what we would have had it to be remembered that not the three kinds of birds named were to be met with winging their way

up and down the salt creeks of the place; these water courses being, as scarcely need be said, sources of approved food supply with them. As they thus sought their fare they followed the exact course of the stream and on a low plane, and hence it followed that the properly posted gunner was enabled to attack them to great advantage. Luckily, on the banks of the particular creek to which we were wont to repair in pursuit of this sport, a stranded log offered us a place of ambush not to be improved upon in any way, and turning the position to due account, we were soon in the full press of telling fire. Being the more plentiful species, and likewise the slowest of flight, the ring-necks, of course, contributed to our bag in the fullest measure. But the teals and widgeons were in no less a manner in it, as from time to time they were wont to take their place in the migratory feathered column, and being brought so near us that when requisite repeated shots were to be had at them within striking distance, their proverbial swiftness proved far less serviceable to them than might have been the case. An interval of an hour or two having been passed by us here, we were unavailingly able to boast of a bag of such satisfactory proportions that we were ready to start homeward. In pursuit of this end, as we proceeded, our first musketeer, which had been tethered in a thicket not far away, and having slung the spoils of our late engagement, fled fitfully together for carriage over their withers, we resumed the role of cavaliers and duly set forth in the direction indicated.

The route most conveniently to be taken by us now led directly to the Gossier River, which we reached after a little, and the bank of which we followed for a considerable stretch. As the river still in the shallower divisions of this stream were possessed of marked attractions for the bullheads and gosanders, and as we came upon the parts of it answering to this description they were quite invariably shown to be occupied by larger or smaller aggregations of the species referred to. After their usual singular custom in the choice of their aquatic accommodations, the quarters of the gosanders were located in the roughest and swiftest sections of the shoals, while conforming to the ordinary usage of duck life in this particular, the bullheads established themselves on the smoother adjoining spaces. Whether of one sort or the other, the purpose of the birds here seemed wholly that of seeking rest and the enjoyment of social intercourse. If gustatory projects had a place in their designs the casual observer, at least, failed to be apprised that such was the case. Being plentifully supplied with game at the time, we were naturally inclined to assume the offensive with these birds, and, indeed, once did so as they chanced to tempt us with shots of special interest. For the most part they noted our approach with comparative indifference, entering no graver protest against the act than to flutter or paddle off a short distance in an inert, dilatory way, and when, as will be understood, we regarded them as strictly tabooed. But at rare intervals, and for whatsoever reason, our presence on the scene was viewed with intense displeasure by them, and they bent all their energies to being effectually rid of us. In executing this purpose the bullheads made off over the water at the bullet-like pace which they are known to command at will, while their associates withdrew in a wild patastorial scramble, conducted partly on the surface of the stream and partly in the depths beneath, and under which circumstances both species, as we felt, were most suitably to be cultivated by us cartridge-wise. As for the tongue results of our attack, they were not very brilliant. Perhaps this would have been the case in any event; but it is only fair to state that in our pride we were vain to perform this part of our shooting on the backs of our musketeers, and since, with the invariable friskiness of this type of horse-flesh, the creatures invariably took the bringing of our guns to the shoulder as a signal to lead off in a jolly breakdown, it will be seen that the normal difficulty of our task was as nothing to those which we met through our condescension.

Our closing sporting experience in this section of the Point was due to the direct agency of our dog, who before rejoicing his domiciliary idiosyncrasy upon giving us a taste of his real quality by raiding a snipe bog. To this tract of territory we were brought incidentally, as we followed a trail bearing from the Gossier River, and leading toward a certain point in the uplands of the promontory, where the regularly-traveled highway was to be found, and thence, by the way. The arena of the question extended over several acres, and in the vernal season it was greatly frequented by cattle. As the result of this bovine occupation, it was intersected throughout by a thick network of deeply sunken paths, and which at this time, when pluvial influences largely shaped the weather, were everywhere filled to the brim with mire in that bewilderingly wide variety which is the special boast of the littoral divisions of our Pacific coast. The remainder of the arena was presented to us in an equally emphasized character, being made of knobs and hummocks ranging from ten to twelve feet in height, and which were wholly bare and naked in every part save their summits, where in signal defiance of their apparent capabilities in this line, they nourished growths of a noticeably delicate and graceful creeper, seemingly an ideally wrought out example of the dewberry tribe.

At the sight of this highly original piece of geographical landscape, and in company with me, once threw off the lethargic air which he had persistently worn throughout all the earlier stages of our campaign, and became the creature of totally another spirit; since now, according to his view, he could justifiably contribute to the shaping of the day's record. Agreeably to this fresh impulse given to his ideas, he thought proper at first to address us a few remarks, couched of course in the sign language of his race. These ran to the effect that it was only in the vocation of a snipe dog, proper that he had any vocation to shun—to look for either more or less from him was equally to mistake him. Further, that here was a tract of territory wherein he had performed wonders in his line of yore, and being so moved, wherein he was about to undertake to exploit himself again to the old purpose; and bringing his exordium to a close he straightway rushed at headlong speed into the morass upon his errand, while we not unobtrusively called our points on the edge of the arena in order to see how his enterprise prospered. The surface of the arena of his struggle being of the greatly broken character that it was, it inevitably followed that the creature was instantly lost to our sight, and hence in a direct way we saw nothing of his doings.

But as time went on evidence of felicitous exercise of his talents never failed to be forthcoming, as now in one part of the fen and now in another, wisps of snipe were to be seen taking to the air, and in the next instant, that could conceivably settle the question as to the origin of their uprising. The total number of the birds thus routed was, as will

be surmised, greater on some occasions than others, but at the lowest it never fell short of several dozen. Probably for the reason that they knew of no other place within easy reach where the accommodations offered them were as much to their liking as those furnished them here, they manifested extreme reluctance to abandon the fen outright. If any took this course the proportion was at best very meagre. The flight of by far the greater part of them was restricted to the area immediately over the bog, and within which space they incessantly rushed to and fro in the erratic fashion proper to the bred till they made sure that the fury of the four-footed ravager of their peace had spent itself, when they settled down into their old quarters. I need not say that as matters stood with us here, no shooting was offered us in the least worthy of the name. But with our independent attitude on the game score we took this grievance very lightly, and were above making any real effort to remedy it. Nevertheless, while we thus made so little of considerations with a direct bearing on the pot, we could not agree to be wholly remiss to our duty as students of marksmanship as an art. Hence, whenever it came about during the comparatively brief period that we were willing should constitute our stay here that a snipe neared us sufficiently to give the least warrant for the proceeding, we invariably opened an energetic fire upon it. That the demand made upon our steadiness of hand was in no wise lessened by the skittish temper of our musketeers will be understood. But in spite of this cross we managed now and then to so dispatch a cartridge that it proved superior to all adverse influences, and told in the way we desired for. While specifically one with its musketeer incident to the Atlantic States, the snipe here proved to be notably wanting in the choice edible characteristics so freely vaunted for the breed in the main. Whether its race or the season was chargeable with this merit on the part of the bird one could not say; but the fact remained that the dish which it furnished was but passable at the best.

W. L. TIFFANY.

Natural History.

A FOG RAINBOW.

WHILE duck shooting last November, on Sinepuxent Beach, Worcester county, Md., I was privileged to witness one of those rare and beautiful displays of nature, which till then I had never seen, nor even read of.

I have since learned from good authority that "fog rainbows" are known to scientists, and, though of infrequent occurrence, are well authenticated by reliable witnesses.

I am glad to know this fact, for without such endorsement I would hardly venture to report what I saw, fearing my eyes might have been at fault—no, I won't admit so much as that, for they were neither glazed with whisky nor befogged in the fumes of the "weed."

The morning had been very foggy; temperature mild; wind, none from any quarter; ducks and geese scarce; shooting nil.

So leaving my companion in the blind, I started on a tramp, partly to pass away the weary midday hours and partly to view old ocean—some three-fourths of a mile distant—whose billows, owing to a recent storm, were dashing wildly on the beach with a fearful roar.

I found the beach composed entirely of very white sand, but strewn with fragments of former wrecks, and many of them almost entirely buried in the sand.

What pen can depict the scenes of woe and human suffering that have been enacted and re-enacted on this dreary line of shore.

Our Government has wisely established life saving stations along the coast, which are connected by telegraphic wires, stretched on hollow iron posts.

After satisfying my curiosity in listening to the "breakers' roar," and watching their alternate advance and retreat up and along the sinuosities of the smooth, hard sand beach, I turned my back to the ocean and saw that a dense fog had enveloped both beach and Sound, and that a similar bank was also coming in from the restless sea. I started at once for my companion and shooting blind, and finally retracing my way made in coming out, as no landmarks were visible when my attention was attracted by a bright white arch on the landward fog bank.

It being something entirely new in my experience I stopped to examine it.

So seating myself on a part of a vessel's wreck, "A rotten carcass of a boat, not rigged, nor tacked, sail, nor mast; the very rats instinctively hid from it—I was led to see the end.

Soon the bright arch took on various shades, and presently all the colors of the rainbow were distinctly seen—not as brilliantly as is sometimes seen in the true rainbow, but so as to be clearly traced—not only on the fog bank, but also on the sand, thus forming a perfect circle or ring, two-thirds of which was on the fog and the remainder on the sand, reaching to my feet, so that my boots were embellished with rainbow tints.

But whether or not the traditional "pot of gold" was buried in the wreck on which I sat I do not know, and it did not then occur to me to dig for it. But I do know that a perfect ring of rainbow colors was formed on the fog bank and beach and that I stood on the periphery of the circle. The explanation of the phenomenon I leave to scientists.

The facts I have given as they occurred, and only add that I stood at the time as in a rift, but even the fog banks and that the sun was at my back as I looked at the unusual sight.

POTOMACREPSIS, N. Y.

NOTES ON THE RACCOON.

Editor Forest and Stream:

Perhaps the reader will say, "the raccoon is too well known to need any description," as they have been found more or less on every "maine to Florida."

Coons have been hunted by all classes, from the sportsman, thoroughbred hunter, and farmers' boys, down to the ragged urchin, who had the pluck and vim to follow in the wake of the Southern darkeys in their nightly raids through the Mississippi swamps. The coon is a good climber, and decidedly a night walker. He is easily caught in a steel trap, but the most approved method of hunting him is either moonlight or dark nights, with dog and gun, and occasionally an old shotgun added. I can well remember when a good 'coon dog was prized higher by any other dog, for the reason they were comparatively few. Any or every dog

could hunt woodchucks, or could chase 'coons out of a cornfield, but a dog that could follow a cold track, which might be six or eight hours old, and find the identical tree where the 'coon had laid up for the day, and that without missing such a dog, whether mongrel, cur or terrier, was considered an important acquisition by any live 'coon hunter.

The 'coon, like the bear, gets very fat when food is plenty and frequently are very poor when food is scarce, hence the difference in weight of individuals, which varies from sixteen to thirty-five pounds. The 'coon may be classed among the omnivorous animals. Almost an endless variety of food is included in his diet, such as berries, wild fruits, chestnuts, acorns, beechmast, green corn, frogs, lizards, crabs, snails, small fish, grubs, wasps, bees, kaves, eggs and young birds. The 'coon lays up, or hibernates, during the winter, or just so long as the deep snow prevents his foraging. Cold weather does not drive him in at all. It is from the lack of food that he climbs high up into the hollow trunk of some old tree, where he rolls himself up like a round ball, with his nose curled down under his feet, in which posture he may be said to lie squarely on the top of his own head. It is not known that he sleeps the whole time, but his supposition is that he does. Easy he lies, however, if not disturbed for six or eight weeks, or until the snow thaws and settles enough for easy traveling, when he is sure to awake and start out in search of food, frequently traveling long distances, following up and down small spring brooks fishing out crabs, snails or any other small creatures that may be found in such places. Sometimes a little of the last year's mast has laid over, which they find on the wet, bare spots where the snow has melted off. But the supply at such times is meagre, and however fat they may be starting off they soon become lean, and are then only hunted for the skins, which always yield prime fur during the winter months.

Raccoon skins have always been a quick sale at a moderate price, and there never was a shadow of reason why prime skins have not been valued at a higher figure. The fur of the northern 'coon, when caught in January or February, equals that of the beaver in strength and fineness, and when haired and properly dressed, none but an expert can detect any difference. I can remember as far back as when very good beaver hats were manufactured from a mixture of 'coon and muskrat furs.

It is seldom that the 'coon breeds more than once in two years. From four to six kits are produced at one birth, and are littered in March or April. The young, if not forcibly separated, remain with the mother through the first winter, or until February or March. Six young 'coons have been found in one tree with the dam, but there are not often more than four, which in February are about two-thirds grown. My opinion is that they do not arrive at their full growth until near three years old. ANTLER.

GRANDVIEW, TENN., Jan. 10.

LYNX IN NEW HAMPSHIRE.—Clarendon, N. H.—On Dec. 19, as Messrs. Strawn and Paul were fox hunting, they discovered a strange track, and at once concluded to try and capture the animal. As Scott, the hound, was in pursuit of a fox and nothing would tempt him to leave the trail until the fox was killed or run to earth, Mr. Strawn came to the village, found his young dog, and sent word to Mr. Charles Dole, who is quite a successful fox hunter, and who owns one of the writer's Old Watch puppies, a grand black and tan. On reaching the grounds both young dogs worked well, and soon his lordship was seen leaving a ledge, pursued by the black and tan. Mr. Dole says the lynx, for such it proved to be, did not seem to care for the dogs, and only kept a few rods ahead of them, and when Mr. Dole "got the drop" on him he was not more than forty rods ahead of the lynx. The lynx was brought to the village and put on exhibition, being a large for his locality. The following are his weight and measurements: Weight 21 pounds, height 18½ inches, chest 15 inches, head 14 inches, forearm 8½ inches, from tip of nose to end of tail 38 inches, tail 5½ inches.—BEAU.

BREEDING OF SQUIRRELS.—Brookfield, N. Y., Jan. 13.—*Editor Forest and Stream:* I have read the remarks concerning female squirrels being in a pregnant condition late in the fall and winter, and I would be glad to relate my experience in a few words. Last fall, during the month of October, I hunted gray squirrels for a week. The number of squirrels brought to bag amounted to forty-nine, thirty of which were females either in a pregnant condition or with the mammae glands full of milk. In this place it is notorious that I have killed a great many squirrels, but never have met with such a percentage of pregnant females, and can't help but think that it indicates a mild and open winter. Pine groesaks are abundant, very often seeing from ten to fifteen in the top of a pine or hemlock. Two boys shot a purple finch last week, an unusual occurrence so late in the winter.—GREENWING.

RANGE OF CARPODacus FRONTALIS.—Fort Lyon, Col., Jan. 9, 1884.—Dr. Coues, in his article on the crimson-fronted or house finch (*Carpodacus frontalis*), in your issue of Jan. 4, gives its eastern range as the foothills of the Rocky Mts. I killed a male and female of this place in 1883. The male is in my collection. The female was too badly shot to skin. She contained an egg with shell, which I did not measure, but took to be full size. These two are all of this bird I have seen here.—F.

A TAME PARTRIDGE.—Boston, Jan. 12.—*Editor Forest and Stream:* A tame partridge is owned by Mr. John F. Finn, 20 Amesbury street, Lawrence, Mass., and is kept in his saloon. It is quite tame and will feed from the hand, and is very fond of acorns and lettuce. Any of your readers who live in the vicinity of Lawrence can see it by calling on Mr. Finn. The bird has been in his possession about four months, and seems perfectly satisfied with its quarters.—T. B. M.

A BLACK FOX.—Malone, Franklin County, N. Y., Jan. 8, 1884.—Since writing to you last I have had the good fortune to see a black fox, a rarity in this life. I saw one as soon as I did his country. I did not shoot him, as my dog did not give him a chance to play, and I did not see him again. The dog was gone two days. A party was out yesterday, and started four foxes in fifteen minutes, and killed one. Snow is about a foot and a half deep.—Fox.

Game Bag and Gun.

IN THE HAUNTS OF THE GRIZZLY.

STILL-HUNTING AND TRAPPING IN WYOMING.

WHEN Lewis and Clark made their celebrated journey of exploration across the North American continent just eighty years ago, they encountered many large and ferocious bears, which they variously dubbed the white, brown and grizzly bear. Finally they came to the conclusion that they all belonged to the same species, but they still continued to speak of them by their various names. The student of natural history will find in their book many curious and valuable facts relating to these animals, truthfully narrated and without any varnish.

At that time grizzlies were abundant in the prairie countries along the Upper Missouri, and frequently made their lairs among the low willows of the river bottoms. As the country has become settled, the grizzly has either disappeared before the march of civilization, or, in common with other animals, has retired to the heavy forests on the slopes of the remotest mountains. It is now a very rare thing to see one out in "the open," and when so discovered he generally makes for cover at top speed.

The bear hunter need not picture himself mounted on his gallant pony, and from a safe distance pouring a stream of bullets into a defiant grizzly, for he might hunt in prairie countries for years and years and never get the chance. If he wants bear he must hunt him foot far back in the heavy timber, in the swamps and thickets at the head of the heavily wooded mountains. The grizzly comes trickling through the dense underbrush and fallen timber. Here, where progress is almost impossible and at the best slow and difficult, he will find bear paths following the densest and darkest part of the swamp. Here and there in the springy soil are bear-wallows filled with ice cold water and with a bottom of deep black mud. On the margin of one are the fresh footprints of the great beast, and perhaps the mud is still slowly settling from his recent visit. On the hunter goes with the utmost caution, pushing quietly through the heavy balsams until he reaches a point in the swamp where the trees press close a gloom over everything. Here, in a perfect tangle of pine balsam and fallen timber, at the foot of the tall pines he will find great circular nests dug deep in the warm "pine tags," as cosy and comfortable as can be. This is the den or lair of "Uncle Ephraim," the great bear. Rarely, however, is he to be found at home. No game is so shy and wary as he, and the hunter may daily force his way through the most tangled thickets, taking all the advantage of the wind and proceeding in perfect silence, and yet rarely or never see a grizzly.

It is almost unnecessary to add that the man who hunts bear in this fashion, trailing him patiently and carefully through these dense swamps, really takes his life in his hand. If the monster rises suddenly and charges, even a lucky shot through the heart will not always save the hunter from destruction; the brainshot is not always instant death; it is impossible to run; there is no time to climb; and with the brute at man's legs it is hard to do anything. One's aim may hang on iron nerve, quickness and accuracy of aim, and heavy metal. One stroke from those great claws and all is over!

If a grizzly is jumped and runs, the rapidity with which he gets through the snarl of vegetation is simply astonishing. One afternoon, just before sunset, while bear hunting afoot with a guide, we saw a grizzly slowly approaching. We were in a dense pine forest on a mountain slope, where the soil was light and rocky. When the grizzly was close, unfortunately the trees masked him so that I could see but a thin vertical slice of bear, and into that slice I put a bullet from my No. 12. With the crash of the rifle the bear disappeared as suddenly and completely as if the earth had opened and swallowed him up. We ran after him at the top of our speed to a little ridge beyond, but it was useless; he had simply vanished; there was no blood, and the stony soil revealed no trail. Blood signs need not be expected, however, with grizzlies, when in good condition, as the fat usually plugs up the wound.

A grizzly will sometimes lie quiet, when hidden in the brush, and allow the hunter to pass by at a few yards, as if in grin disdain of his enemy. When jumped under these circumstances the average bear will run, as will most dangerous animals the world over. One reason for this is plain. Bears, lions and tigers are essentially "night birds," and when suddenly started up under the broad glare of noonday, they are at first bewildered, and so shy that they, if jumped after darkness has settled down, their look is for safety for itself. Still the bear is uncertain in his temperament, and while one will run, the next charge with the utmost ferocity.

I had been bear hunting one morning for several hours with the usual lack of success, although we had threaded the most likely thickets. A heavy storm of rain and sleet coming on discouraged us so that we returned to our ponies and turned back for camp. Taking a short cut we rode into and endeavored to cross a very deep balsam swamp through which ran a little brook. Cold and weary, soaked with the heavy rain, we smashed our way noisily through, here jumping felled trees or mudholes, there dismounting to let the horse get through a bad spot alone.

In the very midst of the swamp we rode literally right on to a grizzly, the great beast rising up from his nest directly under the nose of the guide's horse. Here he had lain, hearing all the noise of our hasty and careless approach, yet making no sign and waiting us with supreme indifference. But when he jumped, most fortunately for us, he ran. We would have stood no chance mounted on our horses and hurled in by the tangled swamp.

We sprang from our ponies and ran after the bear, firing as we run. Then follows a mad chase through the muddy recesses of the swamp and out into the more open forest. Finally I get a good chance and give him a couple of explosive shells from my No. 12 near the tail, raking him fore and aft. He does not flinch, and as his shoulder as he rears to jump, give him a right and left in the shoulder as he rears to jump, some fallen trees, and thus finish him. He settles down in a life-like attitude on the logs and we come up and admire; but we do not go up and kick him—oh no! We divest him of his overcoat and hold our usual autopsy and track out the shots. Then we go back to our horses and find the carcass of an elk near where we had jumped him. This accounted for his lack of pugnacity; having made a heavy Thanksgiving dinner, he only wanted to be let alone.

The next afternoon I returned to the creek with my dog and the night grizzlies had covered the elk carcass with dirt and trash; one tip of a horn alone protruded above the tempo-

rary grave to show that a great elk lay beneath. Going down to leeward some forty or fifty yards we hid ourselves carefully and watched patiently but fruitlessly until after dark. The next morning we returned again. The elk had been dug up and nearly all devoured; it was in a high state of decomposition, and had evidently disagreed with some of the bears. We still hunted the swamp carefully, and found no willows, although the mud was still settling in the bear wallows.

Watching a carcass by daylight is of but little use. I have done it repeatedly until it was too dark to see the signs of my rifle, but never getting a shot thus; and most hunters avoid the same experience. The grizzly usually feeds at night, and no man in his senses would fire at him after dark when he could not be absolutely certain of his aim.

Last year three men, one an old pioneer, were prospecting near Elk Mountain, Wyoming. While in camp one bright moonlight night a large grizzly came near. They fired on him and the bear charged. Two of the men "treed" and the third ran into the tent, where the bear followed and killed him, and then retired to a jungle near by. The next morning the survivors followed into this jungle and found the bear the bear charged and wiped out the pioneer. The sole survivor then made tracks for the nearest ranch and help. The story was that these men had each been killed by a terrible bite on the left side of the body.

Female grizzlies are usually lighter in color than the male, and the average Western hunter, looking at their pelts, will call them "cinnaumon." The true cinnaumon is a variety of the black bear, although they grow sometimes to quite a size. Those I have jumped have run, although one showed fight when it was too late. We came on him while still hunting in the snow, and wounded him so he could not travel fast; when we caught up he turned on us, but as he did so he gave me the shot I wanted in the chest, and it was all over with him.

The ordinary black bear will run like a deer when jumped; but for all that he is not the harmless innocent he is sometimes represented to be, that any man can conquer with a walking-stick. The books are full of "bar-fites," of which he is the hero, and the following telegram cut from a recent paper shows what he is capable of, even east of the Alleghenies:

"WILKESBARRE, Pa., Dec. 29.—Yesterday afternoon the dead body of a man was found lying in the snow near the Pennsylvania Railroad track, below Retreat Station. The tracks of a bear were plainly distinguished, and the man's clothing and person gave evidence of a terrible struggle. The body has not been definitely recognized, but is supposed to be that of a track walker employed by the railroad company."

Trapping grizzly has its perils and excitements also. The trap employed is of the double spring pattern, with steel jaws, and weighs complete thirty-eight pounds. The springs are very powerful and have to be bent with levers. It is quite an art to set and place a trap cunningly, and trappers vary in their methods and are chary of explaining them. I will then pass this branch of the subject. Let us suppose therefore that the hunter has made his camp in a neighborhood remote of grizzlies, and that he has his traps set in a likely place for a bear. At the end of the trap chain is a ring about five inches in diameter, and this is driven about half a foot over the end of a heavy stick or log five inches through and six or eight feet long. The object of this "clog," as it is called, is to make a trail which can be readily followed and to hamper the bear sufficiently to prevent his going to a great distance away before the hunter can arrive. Great care must be taken that the chain be fastened to the extreme end of the clog, in such a way that the bear will not get away, and that so the brute a chance to use his enormous strength to tear himself loose. Neither must the clog be too large and heavy, or the same result will follow. It may be accepted as a maxim that a grizzly caught in such a trap will eventually get loose, and ordinarily in a few hours. He is generally caught by the extremity of the forepaw, just above the claws; the hold on him is not very great; his exertions to get away are tremendous, and result in so cutting and lacerating the foot that he is unable to get away, and he is so tired that he cannot get away. Two grizzlies that I caught got away; one was probably taken by the claws alone leaving some hairs only to tell the tale, the other leaving a small piece of his foot behind as a souvenir. Many had all but torn themselves loose; in one case the foot was almost cut through and only a small piece of skin the thickness of a man's little finger remained to hold the terribly infuriated monster to the much detested clog.

The traps are set far back in dense and gloomy forests near the tangled swamps, and grizzly love to make this their lair. The ground is covered with fallen timber and travel must be afoot and is slow and difficult. The bear on being caught starts off with a tremendous rush for the swamp which is close by. Here he catches on a rotten log for a second and ploughs a path through wide enough for a cart, here he hangs on two fallen trees fifty feet long, but he hangs for an instant only, moves the great trees to one side and rushes on. Next he strikes against a tree, and in his rage turns and swings his whole side out of it, leaving the fresh wood pierced with blood stains from his gums. Now he reaches the swamp and plunges deep into its recesses venting his rage on the balsams and poplars, absolutely chewing down saplings and even gnawing them into lengths like stove wood. All this time he is slowly but surely tearing his foot loose from the trap, and surely but not slowly is he working himself up into the most tremendous degree of rage and ferocity.

When you have thus trapped a thousand-pound grizzly, you are not so much as caught; you are simply caught the devil incarnate! Indeed, the question sometimes arises, not whether you have caught the bear, but whether you have not simply given him a first-class opportunity to catch you! Now let us see how this is. The grizzly thus caught, and thus worked up into the most formidable ferocity, has to be followed up afoot, first through a dense forest, and then carefully and laboriously into the heart of a tangled swamp, where one cannot see ten steps ahead, and where, if the finger should slip, the body rises. Usually in front and above, trap, clog and all, retreat would be absolutely impossible. Add to this that at the time of the hunter's arrival the bear may have just succeeded in tearing his foot loose, or may have just managed to break his chain, or may have just finished eating up the clog bodily, all of which things have happened in my experience. He would then be in a beautiful state of frenzy, and would be perfectly delighted to wipe out a hunter or two if only to quiet down his nerves. Furthermore, the bear may have just finished eating up the skin of his family, and the hunter takes the chance of running right on to several of these amiable animals at a time; so that, take it

all in all, he combines the excitement of still-hunting grizzly with that attaching to trapping him.

I had a trap set on the easily ascended slope of a mountain close to the edge of a birch swamp, where the whole region showed silent but expressive tokens of an abundance of grizzly. The next morning early I approached it afoot, having with me my guide, Charles W. Puffer. As we advanced noiselessly through the solemn forest a mountain grouse ran across our path with her tail spread out like that of a hen. We neared the trap and discovered that the dog was gone. The trail was quickly followed to the edge of the swamp, and then down into the very dense and tangled jungle. Here he had amused himself by breaking down saplings, chewing trees and digging great holes. We could not well get through here, and following along the edge of the swamp a little ways further, entered a narrow glade that led down into the brush. Here we struck his trail again, but found it very blind and difficult to follow. There was no sign of a dog, but the trail was like that of any bear, only that now and then a slight scratch on the ground or bruise on a tree would denote the message of a trap. He had broken loose from the dog! We turned, took the back track, and a little ways back found the remnants of the dog. This had been a stick of pine six or eight feet long and four or five inches thick; and this he had literally eaten into short pieces of stove wood.

Being thus freed of the dog, he had turned around the two springs, making a package only sixteen inches wide, then gathered up the whole thing like a small grip-sack under his arm and gone off on three legs rejoicing. The weight of the forty-two pound trap was a mere bagatelle to the great bear, and did not hamper him as much as my nine-pound rifle did me. The spot where he had accomplished this feat was all dug up, the underbrush smashed, and the freshly chewed down balsams were stained with blood from his jaws. An encouraging exhibition, forsooth, of the state of mind of our formidable game. We now turned and again took the trail, spilling out our cartridges and laboriously. Three mortal hours we followed it with our fingers on the trigger, our nerves all on tension, expecting the bear to jump at every minute. First it led into the heart of a gloomy swamp, where an ice-cold brook wandered through a tangled mass of young pines, balsams and fallen trees, overshadowed by great pines; then into a heavy forest; then out on to a bit of open prairie where amid the sage-brush we lost it on the hard baked soil. On the far side of the prairie we found a few scattered balsams and "slash" or "windfall" of heavy timber, where we had the utmost difficulty in tracking it through the snarl of fallen trees piled one on the other in impenetrable confusion. Finally it led into a little open glade of tall grass, all cut up with elk and bear tracks, and here we lost it. After much search we found it again at the foot of the glade where there was a dense jungle of "popples," balsams and young pines. As the dry water-courses, three or four feet deep, ran winding through the thickets and bays, this bear had to wade. In the very thickest part of the matted jungle he had left the gully, turned and come back a short ways along the edge of the bank and lay there hidden in the brush, watching his back track. He had our wind; he had heard our voices as we searched for the lost trail in the open glade; and he knew it was now his turn; he had set a trap for us; and the hunters were to be hunted.

Slowly and cautiously we follow down the gully, listening for breaking twigs and peering sharply into the impenetrable foliage that surrounds us. There is no sound save the swish of the trees overhead, as they are moved by the gentle breeze. The bear's trail shows plain and clear now, leading onward deeper into the jungle. Suddenly the silence is broken by a most tremendous and horrible roar that almost freezes the blood in our veins, and an enormous grizzly rears up on our right, not three gun-lengths away, and springs right at us. No fire nor shot can distinguish, no head nor leg, nothing but a monstrous blackness that comes crashing down at us through the balsams, with an awful roar of indescribable ferocity. There is no time for deliberation. Both rifles are pointed like lightning into the center of the great black mass, as it is absolutely impending over us, and crack simultaneously. There is no time for a second shot; the bear is right on us! Each man springs for his life. We run at right angles to each other some twenty yards, then swing round again. The bear lies struggling, furiously amid a tangle of broken balsams on the very spot that we had just left. I cannot see him clearly through the brush, so slap a solid ball through his hips, then reload and run over to Charlie, who is stuffing him with shots from his Winchester express. The grizzly now struggles to his forefeet, still roaring savagely, and makes tremendous efforts to get at us; but I now have a good front shot and put an explosive shell from my No. 12 into the back of his head, behind the head, and so kill him. When he is absolutely dead, then cry I: "Charlie, shake hands!"—and we shake!

This was a very narrow escape. If we had not broken down the bear by those first two shots, fired as he sprang, we would have had one or both of us. He was very large, being nine feet two inches long from nose to hind claws, and his fore leg was two feet round at the body.

We return that afternoon with our ponies and the teamster. We roll the grizzly out from the broken balsams, and I photograph him before his overcoat is taken off. Then I hold my usual longest "to ascertain the cause of his death." The two shots fired as he jumped had gone right through his heart, where my shell had exploded and had literally blown out the back part of it, then the fragments of the shell and the Winchester express bullet had gone clean through him and out at his back in one hole.

My shell is of No. 12 caliber, contains a bursting charge of 21 grains fine powder, and is driven by 120 grains F. G. Yet with his heart blown out by the terrible projectile, the bear had recovered enough from the shock to get up on his forefeet, and had taken considerable subsequent killing, and if he had caught one of us as he first fell he had vitality enough left to have made mien meat of us before expiring.

EDWARD H. LITCHFIELD.

BROOKLYN, JANUARY, 1884.

[We have been shown by Mr. Litchfield some excellent photographs of his camp and captured game; and have also had the pleasure of inspecting a number of his trophies at Bell's (the taxidermist) on Broadway. We saw there the heads of nine grizzlies, one of the black bear and another of a black cub. The grizzlies were of large size especially so. Several measured nine feet or more in length from tip to tip—from nose to hind claws as they lay on their backs ready for skinning. The largest measured thus nine feet and eight inches. In color they varied from a whitish yellow

to a rusty black; the males usually being the darker. The heads were of the same color, being all dark. The largest was about nineteen inches from the nose to the end of the skull and fourteen inches from ear to ear.]

GAME AND FORESTS IN THE PARK.

Editor Forest and Stream:

Knowing your paper to be a champion for the protection of the National Park, and being one of your subscribers, I take the liberty of addressing you concerning the preservation of the game and the timber of the Park. I hear it repeatedly remarked that there is no use in trying to protect the game for the reason that it is migratory, and after spending the warm season in the mountains of the Park, as soon as the snows came it would all leave for the foothills of the lower Yellowstone, there to be slaughtered without mercy by the hunters of that region. Now, I find that wherever there is a place of refuge, for elk, and moose are sure to find it; and I know that when the cow and calf elk have migrated to more comfortable regions the old bulls have successfully wintered here, as the dropped horns in the valleys of the Park will prove.

I am stationed at Soda Butte, on the east fork of the Yellowstone, as one of the assistant superintendents of the Park, and within the week I have seen over one hundred elk in one herd, quietly feeding on the southern slopes of the foothills and widely half a mile out of my cabin, but talking with some old hunters they said that formerly the elk had left here, all excepting the old bulls, before the 15th of November, but owing to their being hunted so much as soon as they left the confines of the Park, they had turned back for safety. This proves conclusively that the rigid enforcement of a strong protective law will be the preservation of the game in the Park; and I hope Congress will give us power the coming season to permit our cabin boys to hunt last. At present we have not the power to arrest violators of the laws, and only our presence has been the curb of restraint upon hunters, who question our authority, because there are no defined boundary lines to the Park. Still we have accomplished much; but not as much as a true sportsman would like to see.

What I have to say concerning the Park forests is that the timber is mostly resinous, and for two months of the season at least the climate is so dry that it is almost impossible to stop a fire once started. A railroad through the Park means the destruction of its forests, which go further to make up the matchless beauty of the Park scenery than any other one thing. Therefore I hope that the FOREST AND STREAM will enter a protest against any railroad company having the right of way through the Park.

ICHTHUS.

YELLOWSTONE NATIONAL PARK, Dec. 24, 1883.

THE U. S. GOVERNMENT DEFIED.

WASHINGTON, Jan. 10.—The Secretary of the Interior sends to the Senate to-day correspondence concerning matters in the Yellowstone Park, which had been called for by resolution. This resolution requested that copies of all leases, contracts, orders, instructions and regulations made or issued by the Interior Department or its predecessor since the last session of Congress in relation to the park, be transmitted to the Senate. In his letter of transmittal the Secretary says that the only authority granted for the privilege of locating hotels and furnishing transportation to visitors to the Park is contained in the law, executed March 9, 1883, to C. F. Hobart, Henry F. Douglas and Rufus Hatch, of the Yellowstone National Park Improvement Company.

He then says: "I beg leave to invite attention to the necessity of providing for the punishment of those who violate the regulations of the Department governing the Park. The greater part of the Park is in the Territory of Wyoming, but not within an organized county. It has been found impracticable to enforce the orders and compel the observance of the rules of the Department in respect to the occupation of the Park, in the absence of a judicial officer before whom offenders can be taken. The superintendent and his assistants can only call the attention of visitors to the law and regulations thereunder and request their observance, but if the visitor refuses to comply with such request the officer has no means of punishment." The Secretary states that game has been killed by visitors and hunters contrary to the rules of the Department, but that no punishment has been inflicted for such violations of the law, and adds: "If it is desirable to preserve the game in the park, the officials authorized to punish the infractions of the law and the rules of the Department. Power should be given not only to punish offenders, but to remove them from the Park, if, in the judgment of the Department, their presence in the Park is not desirable."

Included in the correspondence are copies of applications for privileges in the Park, among them being requests for permission to open trading stores, liquor shops, feed corral to keep dairies, and supply the Government with dairy products, to establish an observatory, to open stores for the sale of newspapers and fruit, and to build steamboats and other watercraft and operate them on Yellowstone Lake. A letter from W. Scott Smith, a special agent of the Department, is included in the correspondence. Mr. Smith reports that the superintendent has either failed to comprehend the importance of the duties of his office, or has intentionally disregarded them, and he says that in the private correspondence he has cast his eyes to the fact that hunting has been going on openly during the summer within the Park, and that hunters have been employed by the hotel company to go into the mountains and kill game to supply the company's guests and the company's camps. He reported that he found no officers of the Government guarding any of the natural curiosities, and that he had been informed by visitors that they had purchased choice specimens from the assistant superintendents.

In reply to Smith's charges, Superintendent Conger asserts that the Secretary obtained his information from Mr. Hobart, who, Conger says, has openly threatened to secure his removal. He charges that Hobart's hostility to him arises from the knowledge possessed by the latter, that he guards too closely the interests of the Park and the public to suit the company. In another letter he complains that the hotel company's people help and hinder themselves to whatever they can do outside the Government inclosures; that they cut timber, and allow their herds to overrun the Government grounds; that they willfully break down and destroy fences, erected by the superintendent, and that Hobart threatens to tear down the fences as often as they are erected. The consequence of the destruction of the fences, he says, is that the

pastures have been overrun by the company's herds and are so bare of grass that he will be compelled to secure the Government stock out of the Park and winter it, and also to purchase food for it at heavy cost. He closes his letter with this statement: "Hobart has boasted in my hearing of his influence with you, and that he had frequent letters from you; and he told one of my assistants that you had promised him that I should not visit Washington this winter, and he also said that the reason you would not write me was that you was not going to have my letters forwarded before Conger."

Secretary Teller replies to Superintendent Conger, blaming him for not conveying this information to him sooner, and for not making such charges when he saw him, and for waiting to communicate it in a private letter. He refuses to receive any private communications on public business, and says he has placed Conger's letter on file.

Other letters between the Department and Conger, and between the Department and Mr. Hobart and Rufus Hatch, with reference to alleged violations of the rules governing the Park, follow. The burden of the superintendent's communications is that he is powerless to prevent such violations. In one letter he says: "An order from the Secretary or the superintendent to this class of offenders is just about as effective as was the ancient Pope's bull against the comet." Hobart denies Smith's charges, and makes charges against Conger, from these in the denial of duty, and perversion of his official powers. Conger in some of his letters charges that the company is cutting timber, mining coal, erecting a telegraph line, etc., in violation of law. These charges Hobart denies, and Rufus Hatch calls attention to the statement that a telegraph line is being built under the authority of the company, denies such authority, and asks the Secretary to order the superintendent to prevent the construction of the line.

THE QUAIL OF VIRGINIA.

Editor Forest and Stream:

I have read many of the communications which have appeared in the FOREST AND STREAM during the past week, from those in the field and others, with much interest, and some misgivings as to the source of information, which I think in some cases is calculated to mislead. I allude particularly to hunting in Virginia, where I have hunted every fall for the past fifteen years. Most of these writers give the impression that game is constantly abundant there, and expenses low.

When I first commenced hunting in that State I could go out without a dog, getting and find from five to a dozen coveys of quail in a day, getting many good shots in the open, and always finding them easy to mark, and follow up. At that time a bag of over fifty was often made in a day by a good shot, over good dogs. Then but few good wing-shots were to be found among local sportsmen. Very few brace-loaders were used. Well trained dogs were scarce, and little appreciated. "Times have changed since then," and quail shooting is a different thing. As the local hunters progress in the science of shooting, the birds seem to become educated, yet, it is not fair to lay it all to local sportsmen. A few years ago a hunter from the North was a rarity. Now they are legion. I estimate the number of residents who can shoot well has increased at least ten-fold. Quail shooting in Virginia is now, as it is in most other closely hunted ground, very hard work, and very uncertain. It has been steadily becoming more unsatisfactory each succeeding year, and especially has this been noticeable during the last three or four seasons.

I hunted this fall in the counties of Bedford, Pittsylvania, Appomattox, Charlotte, Albemarle, King William and Hanover, the result of which I will give in as condensed form as possible. Two of us hunted together. My companion, with whom I have hunted for several years, is one of the best shots in brush or open that I ever knew. Both of us are untrained, but work in like wile and get up our dogs, but would give up a shot. Often they would take a second flight, thereby putting us completely at a loss where to find them. When our dogs would come to the place where we marked them down, they would make game and sometimes stand. During sixteen days spent in the field we found 71 coveys of quail, out of which we bagged 314 birds, an average of about twenty per day; four and a half for each covey. We also killed forty rabbies, which may count with some of our readers. To accomplish this cost me (my share alone) \$31.37. We had our own dogs, guns and outfit. The expense was only for railroad fares, livery, expense on dogs, board, etc. Wear and tear of guns, clothes, etc., cigars, "toddlies" and cocktails not counted in. We stayed with friends most of the time, where we had no board to pay. It will readily be seen that my share of the birds cost over 50 cents each.

A sportsman's outfit is now very expensive, and after one is fully equipped, the thing itself is costly. Making either of the following cities a central point from which to hunt, the railroad fare from New York to Richmond is \$10.50, Petersburg \$11.50, Norfolk \$7.50, Charlottesville \$10.95, Danville \$14, Lynchburg \$12.50. Local fares are 4 to 5 cents per mile. The Norfolk & Western Railroad, Richmond & Albemarle Railroad, Seaboard & Roanoke, and Washington & Virginia Midland, which may count with some of our readers, are all very accommodating. The Richmond & Danville carry dogs free. The Chesapeake & Ohio Railroad seemed to be a little mixed. If the owner of dogs is "going hunting," that is rigged in hunting suit and has his gun along he is allowed one dog free, extra ones at about half the cost of his ticket. If he should be dressed in such a way as not to give evidence that he is on a hunt, and if he has no gun, he is made to put his dogs in the hands of Express care. Country hotels charge from \$1.50 to \$2 per day. Board at farm houses, where it can be had is about \$5 per week or \$1 per day. Livery hire, buggy \$2.50 to \$3 per day. Saddle horse \$1 to \$1.50. Two-horse team and driver from \$5 to \$6. It is always necessary to fee servants prettily well if you would have your dogs well attended to.

I notice that one of your correspondents says that it may be safely estimated that there are scattered over 5,000 sportsmen from the North were scattered over Virginia and the

eastern shore of Maryland. This is not taking into account local shooters. I think his estimate rather a large one though this undoubtedly leaves those hunting all kinds of game. In those States there are many men who have plenty of time to hunt and put in all their spare time in that way. Many of these, I regret to say, are mere butchers, and go out only to slay and cripple all they can. Just suppose there are only 500 men hunting quail in Virginia every fair day during the season, which I think is a safe estimate; allowing that they average eight birds to each man, and that out of the open season there are forty-five fair days, 180,000 quail would be killed, representing 15,000 coveys of one dozen birds each. Hawks, foxes, etc., catch at least as many as they kill. Netting and trapping cannot be estimated.

Now is it not plain that unless there is less to destroy and more to protect poor little "Bob White," in a few years shooting privileges must be as costly and hard to obtain as in England? American sport in this line will be a thing of the past, and will degenerate into driving and covey hunting by an army of snobs. Game protection plain and simple, unity and fellow-feeling between the landowners and better class of sportsmen is what is needed. Not so much anxiety to kill, but more to preserve. Those who start out with selfishness in their hearts, determined to exterminate, and then seek new ground to repeat the same offense, should be suppressed by any means. As it is now, the regulation of game laws and shooting rights in Virginia seems to be everybody's and consequently nobody's business. Ignorance and selfishness are fast destroying a most royal hunting ground.

BENFORD.

LYNCHBURG, Va., December 1, 1883.

WINTER SHOOTING GROUNDS.

Editor Forest and Stream:
As I have had a splendid hunting season and charming trip, since I visited you, it is with much pleasure that a review is given, especially as the record is concerning new routes and of special interest to sportsmen. Leaving Washington by the Virginia Midland and going by way of Lynchburg, Danville, Greensboro, Salisbury, Charlotte to Atlanta, there are found along the line, known as the Piedmont in North Carolina, the best and most satisfactory hunting grounds for quail, pheasants, etc., that a sportsman can desire to course over. Mr. Slaughter, the general passenger agent of the line, is an enthusiastic lover of dog and gun, and with a sportsman's pride and fondness for pleasures of this kind, is greatly in sympathy with me. Leaving Washington, the ample facilities for the accommodation of hunters and facilities of the very best kind are provided for by his agents for taking care of dogs and outfits. Colonel Turk, the passenger agent of the line, is also an enthusiastic sportsman, and, though he is somewhat too large to do much amateur hunting in field, there is no man whom we know of that can do better justice to the fruits of a hunter's work than this same clever gentleman. He believes in dogs, and is fond of sportsmen's company, and therefore provides every facility possible for the comfort and success of those who shoot along the Piedmont Air Line.

Among the haunted mounds and familiar places of the old battle fields on the Virginia Midland, there are several points where quail abound, and some very nice work has been done by sportsmen in that region during the past month. At Greensboro, N. C., several parties from Philadelphia, New York, Cincinnati, Atlanta and elsewhere have been handsomely repaid for their tour thither, and success in the fields. The hotel at High Point was sold by the sheriff lately, and passed into hands that will keep it in good style. Game abounds thereabouts, and in sufficient quantity to furnish all the work and satisfaction that visitors may desire.

Between Salisbury and Old Forts, on the Western North Carolina Railroad, there are splendid ranges along the foot of Mount Mitchell, Black Mountain, and other points, so that a party of hunters cannot go amiss to stop anywhere for a few days' sport.

From having been a few snows, some ice and sharp frosts that have denuded the trees and flattened the sedge. The cedars, holly and evergreens are sheltering a good stock of pheasants, and in some quarters wild turkeys are plentiful, so that there is sufficient game in sight to satisfy any one, not only in quantity but also in quality and variety. All of the birds that I have seen thus far are plump, in fine condition and flavor, they having fed on rich wheat and plenty of grain during the luxuriant autumn season and open winter weather that has prevailed in this section.

With regard to the law concerning the shipping of game out of the State, there is nothing in it to prevent sportsmen from doing so. The penalty applies only to hucksters and traders, who if they were not prevented by law from doing so, would ere now have denuded the State of North Carolina of every edible bird within its limits. No attempt has ever been made to annoy visitors, who ship what they shoot and thereby exhibit to friends at home the result of their skill.

Concerning the fish laws of this State, the penalties are never applied; and the result is, the lazy scoundrels who kill fish with dynamite torpedoes, have ruined and destroyed the once populous fishing waters of all of western Carolina. So it is rare now to catch any fish worthy of the table, and the luxury is only secured occasionally, by purchasing the fruits of some lone fisherman's trot line or basket that he keeps set on his own preserves. Of this kind of fishing, we had on the great western coast of the horse weighing market, and hungry party made the most of the luxury. Such a rarity as black bass or trout are as seldom found hereabouts as grains of gold in the Hudson. Some of the most public-spirited citizens in this section are arranging to plant carp, and then we will have a chance to defend our fish against the powder fiend, for this industry will beget a disposition among the people to foster pisciculture and enforce the law against their destruction.

From having been to Atlanta the grounds have been visited by parties who have bagged splendid coveys and been delighted with the results. Some of the shooters tell me they couldn't help hitting birds even though they banged away with their eye shut. This report applies to any of the fields south of Spartanburg, King's Mountain, Gainesville, Toccoa, etc. I notice that a number of persons who are en route to Florida for the winter have had their tickets fixed by the Richmond and Danville Railroad people so that they can stop en route to enjoy a "spell of hunting" at any of the points which they may select. They combine hunting pleasures with tourists' and invalid's necessity, and are making the best of life.

Those who come from the Northwest will find splendid new fields and hunting grounds along a delightful line of railway that has just been opened up in this section, and

named the French Broad Route. The initial point is at Louisville, Ky. thence to Jorico, in the neighborhood of which—and about Coal Creek—there is an abundance of game that warrants any amount of time a sportsman may wish to expend in working the fields thereabouts. The mountain bushes and irregular ground are rather hard on dogs, tear up and scar their feet and noses; but if they are tough and not easily broken up by hard wear, a few days' sport thereabouts will well repay for the labor, etc.

From Jorico the line extends to Knoxville and Morristown, in East Tennessee; thence to Point Rock, Warm Springs, Asheville and up the French Broad to and across the Blue Ridge by the Western North Carolina Railroad to Salisbury. South of Morristown, along the Pigeon and French Broad, there are plenty of quails and pheasants, and as they have been disturbed very little by pot-hunters, the coursing and work necessary to make full and satisfactory bags is of an easy character that offers very inviting inducements to parties to make a call.

At Warm Springs horses can be secured from Sevier or Garrett, and John Saunders with his dead shot Leeman hair-trigger rifle, or MacFall with his infallible Henry repeater, are ready at an hour's warning to carry a daring hunter into the lair of bear, wolves, turkey and deer that harbor in the mountain fastnesses, within a radius of eight to twelve miles from that point. Pheasants abound in the thickets, but it requires sharp eyes and quick shots to bag them. Quail are not very plentiful on the plantations hereabouts, doubtless from the fact that the lands have been diverted from grain and applied to raising tobacco. In the mountains and interior valleys, among the barrels and other streams in this vicinity, quail abound, and the birds are in remarkably fine condition and flavor, as my own experience within the past week can attest.

At Asheville, enthusiastic sportsmen will find many kindred spirits. One of these is M. C. Klein, who is not only a remarkably fine shot but also a devoted nimrod, who knows the lair of every wild beast, and is lover of every covey of birds in the famous old "Buncombe district in North Carolina." He is not only a pleasure, than those which come from looking at exquisitely beautiful scenery, a tourist through this French Broad region would be well repaid for the trip. In all the grand mountain scenery of North America, the picturesque beauties of this rapid rolling stream, and the majestic mountains of this "Land of the Sky" are unequalled for variety and exquisite details of outline, form, height and splendor of color. Their shadows haunt the brains of poets, and fasten themselves on the words of artists in music. To the recollection of a hunter the musical echoes of his gun resound like delicious melodies of loved songs and strains of charming symphonies. There are joy, delight, health and pleasure in being amid these mountain fastnesses that make it worth all of life to live here; and so it occurs that when once a hunter hears the rebound of his gun's voice amid the angles of these hills, he wants to stay and linger among the fastnesses forever. With the blood of renewed life bounding in my veins, rejuvenating my youth, and making the fire of the mountains speak into my eyes and making my nerves like steel, tendons like whip cords, and muscles like hickory whips, you need not wonder that this old hunter is enthusiastic over every acre.

WARM SPRINGS, N. C.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:
To select a good hunting rifle, one in this advanced age, when one has twenty different makes and styles to select from, seems a very easy matter, but to choose one which will effectually do the work for which the purchaser intends it, can only be done after careful study and consideration.

The two most important points are: First, the kind of game you intend to hunt; second, the nature of the country in which the game is found, if open or thickly wooded. Then there are other matters, such as the weight, style of sight, etc., which only the party who is going to use the rifle can decide upon, if he wishes to be suited exactly. Like your correspondent, "Greenhorn," I do not "tie to" repeating rifles, and have yet to see the repeater that I would exchange any good single-shot rifle for. To my mind the only advantage they appear to have, is "rapidity of fire." This I claim is no special advantage, unless one is hunting dangerous animals or "for meat." If a hunter gets a good shot, and from lack of skill, or carelessness, misses his game, and cannot with the improved single breech-loader of the present day get in another shot before it gets out of range, I for one say let it go, give the game some sort of a chance, it will disappear soon enough without the aid of repeating rifles. Your correspondent "D. M. B." favors a .40-90 repeater. For reasons advanced by "Greenhorn" I do not think the .40-90 would be a general favorite; few men would care to carry an 11-pound 32-caliber rifle all day if the hunting had to be done on foot, and fewer still could make good shooting with it. The cartridges of the length required for a .40-90 would be very awkward to handle and carry about. If a repeater must be used (but I think the only time a man is justified in using one is when hunting the grizzly), would not a .50-70-.425 answer the purpose of a .40-90 as well or better? Let it be made of the half-magazine style, to carry say five shots. The recoil from this gun would not be felt, and the chances of accident from any weakness of the breech mechanism, or explosion in the magazine, would be materially lessened on account of the reduced charge and smaller number of shots.

Every one will, I think, admit that five effective shots are better than eight "less effective;" in other words that five shots from a .50-caliber will do more execution than eight from a .40-caliber, fired at any large game upon the run, or under any circumstances where a vital spot cannot be selected for a dead shot. Makers of magazine guns appear to have lost sight of this, and as long as a repeater was capable of discharging its sixteen or seventeen shots in as many seconds, it seemed to "pass" without regard to quantity of powder or lead; as long as the number of shots were there it was all right.

The .50-70 may not have quite as much penetration as the .40-90, but it has enough for all practical purposes, and this is more than balanced by its greatly superior "killing" qualities. I have never had an opportunity of hunting the large game of the West, my experience having been confined to black bear and moose. Of these I have killed a good number. On these animals I have tried all kinds of rifles, from the English express down to .40-caliber American rifles. I do not like express bullets, penetration is sacrificed to trajectory and the light ball does not kill dead. Proper ammunition is

hard to obtain, and as a rule the rifles are not so accurate as American rifles. I used a .44-75-405 Ballard for a long time, and found that as long as the game was stationary and in full sight, so I could select a vital spot for my mark, it worked admirably. On the other hand if in thick cover, or in motion, it was not so satisfactory, and many a mile have I had to travel after a wounded moose, which I have often found shot through and through.

Some years ago I became possessed of a Swinburn made by Wadley & Co., under Swinburn's patent, a sample gun, the only one I ever saw before or since, .50-caliber, 81 pounds. I use 70 grains of powder and 425 of lead, if a long bullet is used. I sometimes use a round bullet but do not know the exact weight; either are very effective, the long one has more penetration and nearly always goes through, no matter at what angle the ball strikes. The only difference I find is that the animal usually drops quicker to the round ball. This I account for from the fact that a greater shock is received from the round ball than from the long, the long ball cutting a clean hole, and the round "bearing" through bone and muscle, making a wound from which the blood flows fast. Indians prefer a good smooth-bore to any rifle taking a conical or elongated bullet for this reason, they say, "Little bullet make small hole, moose run long way; big bullet make big hole, moose not go far," and this I have proved on more than one occasion to be a fact.

GLOBE STEIR.

NEW GLASGOW, NORTA SCOTIA.

Editor Forest and Stream:

In your issue of Jan. 3 I find a communication on "The Choice of Hunting Rifles" from "Peabody-Martini," stating that there is a prospect of a rifle, single-loader, .25-caliber, being placed upon the market within a few months in which the defects now existing in small-bore rifles and cartridges will be remedied. I am glad of it. I have read the various communications on the subject of hunting rifles, and have only been slightly interested in the same. It is impossible for me to visit the "Rockies" to shoot grizzlies, or the north, or "siech," and have taken great satisfaction in shooting them with a Flobert .22. But I realized that there was something lacking in the rifle. I wanted one a little larger, and still not so large as a .32. Where to get a perfect one and perfect cartridges for the same I did not know, so I simply waited, and I have wondered if there are not more like myself who would be glad to get a breech-loader to take the place of the ancient squirrel rifle, muzzle-loader, knock at least a few birds for moose. But I am interested in squirrel and chambered for a shell strong enough to be reliable on a turkey at 150 or 200 yards, and with no nicking the bullet at the base to throw wide of the mark and "keyhole." With the rifle I now have I have made some splendid shots. One afternoon this fall in about an hour and a half I shot seven squirrels out of eleven shots, taking them all but one in the head. If there are others who would, like myself, desire to have such a rifle promised in "Peabody-Martini" communication, let them speak out. DROUGHTER.

Editor Forest and Stream:

The letters of "D. M. B.," "Greenhorn" and others have been very interesting to me, their experiences with slow bullets and high trajectory curves from the ordinary repeating rifles, and my own are identical, and the apathy evinced by the manufacturers of such rifles and cartridges, to the long-felt and crying necessity of something better, is only explainable on these premises, which I was forced to believe some day.

The manufacturers have all they can do to supply the present demand, have even advanced the prices of the old line of cartridges, and anything new would call for an extra expenditure for new tools, machinery, etc., etc. that would (they say) hardly be warrantable for the few. When reminded that the march of the multitude is always in the footsteps of the pioneers, they have claimed themselves to be the leaders, saying "ought not we, the manufacturers, to know more about rifles than the hunter or sportsman?" What it is known that the manufacturer or stock owner of the rifles never shot a deer, buffalo or other large game, and never won a first prize in a public target competition, then the uselessness of argument with such needs no comment, and all one has to do is to wait.

But new arms companies are springing up and the patient waiters are likely to soon have their reward. I lately received an invitation to visit the Bullard Repeating Arms Company, of Springfield, Mass., with the assurance of an .45-caliber repeating new in the way of .45 and .40 caliber cartridges for use in their repeating system. To my delight, among fourteen different sizes of cartridges, I was shown a .45-caliber straight shell with 85 grains of powder, 295 of lead; a .40-caliber with 90 to 95 grains of powder and 300 of lead, the latter was slightly bottle-shaped, and about the same length as the .45 government cartridge. We repaired to the 200 yards range. I desired to test the .45-caliber 85 grain cartridge, and to shoot without cleaning. In a few few shots I found the proper elevation, and then scored seven successive "bulls" at the regular Creedmoor target—8-inch bulls-eye. I then called for a regular government .45-caliber 70 grain cartridge, as it would fit in the same rifle, and, taking careful aim, the bullet struck the target 32 inches below the bulls-eye; this experiment I verified again and again, the 85-grain cartridge would shoot into the bulls-eye, while the regular .45 government, with the same sighting, would shoot 32 inches below the bulls-eye. I then called for a repeating rifle with a bright octagon barrel, the .40-90 No. 1, and the barrel not yet bored. I decided to test this one from a rest, and with both elbows on the table I carefully fired ten shots, then walked the 200 yards and as carefully measured them; seven of the shots were inside a 4-inch, while a 6-inch circle would contain the ten. The rifle was .25-inch barrel, full magazine, and weighed 10 1/2 pounds, and when fully charged would hold eleven shots. These rifles are sighted for "point blank" at 400 and at 200 yards; the .40-90 bullet will not be more than three inches lower, they told me. W. MILTON FAIRBOW.

NEWPORT, R. I.

Editor Forest and Stream:

Returning but very recently from a long trip, which has taken me twice across the continent, I found something awaiting my attention that may possibly be of interest to others; and hence I give the benefit to those who, like myself, may have been searching or wishing for different ammunition for their rifles, knowing that the columns of your valuable paper form the best means of reaching the majority. There is no doubt that many times individual sportsmen have been dissatisfied with their rifles, from the fact that, owing to their peculiar mechanism, but only one class of

Fifteen shots, 79yds., 85 grains powder, 285 grains lead, naked ball, without cleaning.

Twenty shots, 80yds., 75 grains powder, 225 grains lead, with cleaning; Bullard repeater.

ammunition could be used in them, this ammunition being the regular "factory ammunition" originally designed for them, and in the shells of which but only a certain quantity of powder and lead could be used. Even when the sportsman reloaded his own cartridges he was forced to adhere to the standard through his inability to procure other than the regular factory bullets; whereas, had he been able to procure other bullets of less weight, that would occupy just so much less space in the shells, as they were shorter than the standard, and the space so gained could have been utilized to contain more powder, and then they could have varied the proportions of powder and lead, and very probably improved the shooting of the rifle as a hunting gun for short and hunting distances.

It is my idea that the same gun can use two, and perhaps three grades of ammunition as occasion may require, and still maintain the same length of cartridge. By varying the length, and thereby, of course, the weight of the bullet, there might be light bullets and heavy charges of powder for short ranges, where the time for deviation and variation from wind, etc., would be but short; somewhat longer and heavier bullets, and nearly the same weight of powder for mid-ranges; and full-sized bullets, with their weight and length to keep them up to their true flight, and their proportion of powder for extreme ranges, and yet maintain the same length of cartridge, so that each would fit the chamber of the gun.

Then the hunter, being able to procure bullets of varying lengths and weights, could choose his ammunition for the work at hand; or have with him cartridges of varying power, and be able with the same gun to take either long or short shots at game, as they presented themselves.

In using ammunition of this kind, of course allowance would have to be made in sighting, no matter how the gun might be sighted. If sighted for one grade of ammunition, experiment and practice could only determine how much allowance to make when using that of another grade; but the gun being sighted for the standard ammunition, shooting with heavier charges of powder and lighter bullets would mainly tend to flatten the trajectory, and extend the "point blank," so as to cover a much greater "dangerous space" for game to obviate the necessity for such close estimation of distance as might be required with heavier bullets and lighter charges of powder; and the necessary allowances to be made would soon regulate themselves without any alterations of sight.

As a result of following up this idea in correspondence with rifle makers, I have received an answer showing that the idea was accepted to be experimented upon, the same idea having been previously experimented upon by the party to whom I wrote, and I quote from this answer for the "information of all concerned":

"Your letter of Aug. 21 came duly to hand and carefully noted, and I send you herewith the result of some of my experiments, etc. The target with holes in it I made with cast bullets of 285 grains weight and 85 grains powder at 79 yards. It is of fifteen consecutive shots. I got my range with five shots and put the remaining fifteen where you see them. This same bullet at 200 yards shot fully as well as the U. S. 405, and with same sighting shot two feet eight inches higher (that was from center of impact of ten shots of each kind), and it went to the target in a hurry. * * *

"The other target of twenty shots, as described, was shot with a .40-caliber repeater of our make, that never had a bullet through it before, at 80 yards. I sent the original to the —, and they are now making cartridges for us of that caliber of 75 grains powder, 225 lead. Have shot ten shots from this style cartridge at 200 yards, and all into a five-inch ring, and the trajectory was very flat—between eight and nine inches—and the bullet more than hurried down the range. It is 'the boss' for hunting. I am going to put the same bullet in a bottle-necked shell, with about ten grains more powder, and see what it will do."

I send you the two targets, which I hope may be published, as they explain themselves much better than pages of manuscript could.

I understand that cartridges of the above description will soon be on the market, and it is to be hoped they will succeed in satisfying the wants of hunters. It will be seen anyway that makers are desirous of pleasing and serving their customers with what is wanted, and that thereby the limits of "hunting ammunition" will be very widely increased. C. D.

WYOMING, December, 1883.

Editor Forest and Stream:

And still they all have their doubts and fancies for a .40-90 repeater and all are longing for the gun of the future. I quite agree with one of your correspondents as to the danger of all repeaters. I have used nearly all of them, both the lever and bolt guns. All alike are troubled with the failing, danger of the explosion of cartridges in the magazine. I have one now .44-40-200 Kennedy, the only gun that comes near perfection. It has done three years' hard shooting and

roughed it; has lain for ten days in thirty feet of water in Sable Lake, coming out in working order; yet it does not do hard shooting to suit me. This past season I purchased a Pieper gun, one barrel rifled, the other shot; caliber of rifle .44-40-200. I had the rifle reloaded to shoot .44-90-200 Sharps express cartridges. I can safely say a more destructive gun could not be placed in a gunner's hands, at either long or short range, using either buckshot or rifle barrel. As a bone breaker and hard shooter it is the best gun I ever saw. Its first cost was \$35, recharging \$1, express shells \$5 per 100.

But the gun of the future must be one that does away with percussion primers, which in the magazine of all repeaters will explode by sudden jars or friction. To that alone can be referred all of the explosions of magazine guns. It seems to me that in this electric age any manufacturer of guns could produce a gun with a battery concealed in the stock, which, by pressure of the trigger would send a direct current into the center of the cartridge as soon as one was thrown into the barrel and explosion would follow. For the percussion primer use a copper center or a small carbon point, then all danger of the coming magazine gun would be averted. The coming gun of the age will be the electric gun.

S. E. B.

MANSFIELD, Mich., Jan. 6, 1884.

Editor Forest and Stream:

In 1880 or '81 I proposed in your pages to obtain the desideratum by taking the Centennial Winchester as a basis. Substituting a .40-bore barrel, chambered for their .50-90 express ball, and using a ring between the outside of the .40 ball and the inside of the .50 shell, the end of the ring would abut against the shoulder in the barrel and would remain in the shell when fired; in fact, it would be a substitute for the bottle neck process which so much weakens the shell. The Winchester Company agreed to make me such a gun, but very fairly told me that it would not answer, and that they must have its price with the order, "as my executors might not like paying the bill." This rather discouraged me, and I did not give the order. The shell, they said, would not stand. I only proposed using a 220-grain express ball before 95 or 100 grains of powder, while in Mr. O. F. Winchester's letter to FOREST AND STREAM, Oct. 29, 1877, he says that they have fired 203 grains of powder and 1,750 grains of lead without injury to the gun or shell, and that at a slight increase of weight the shell might be made to stand any amount of powder and ball, but at an entirely uncalculated cost. This increase of cost would, I think, be cheerfully paid by the hunters of the West for a .40-90 repeater. I would recall to your readers the experience of Lt.-Col. Hills in India, or Tigers, using a 40-bore muzzle-loader, 220 express ball, and 100 to 120 grains of powder, which I gave in my former communication and which I think would bear republication in your paper. NEMO.

REBOUNDING LOCKS.

Editor Forest and Stream:

I wish to call attention of my brother sportsmen, all over the country, to a matter that I have known for a long time, but which may be new to some of them, and that is the extremely unsafe condition of a majority of the guns of the present day that have rebounding locks. In the days of the old muzzle-loader no good sportsman would carry his gun with the hammer down, resting on the caps, for if anything should catch the hammer and pull it up nearly to the half-cock notch, and then set the hammer free, it would fall on the cap with sufficient force to explode it. The quarter-cock, when introduced, remedied this matter in a measure, as then if careless sportsmen would persist in leaving the hammers on the caps the quarter-cock caught the hammer before it was pulled back far enough to explode the cap, or if it was pulled back of this and slipped off it caught on the quarter-cock, and the only danger the careless man had to encounter was that if anything hit the back of the hammer a smart blow it would fire the gun. Now, this very thing exists with the present rebounding lock, breech-loading gun, in a majority of instances, so far as the first case is concerned. Let each man experiment for himself; put an empty but capped shell in your gun; close it, then, keeping your finger off the trigger, pull the hammer up until it nearly catches at full cock and let it slip. I think you will find the result in many cases will be to convince you that you have a very dangerous gun instead of a very safe one, as you supposed you had.

Now, I will go further and say that I know from sad experience that a gun with rebounding hammers can be fired by striking the back of the hammer a smart blow, one of my oldest and most valued friends having lost his right arm by his gun being fired under the above circumstances. The accident occurred while on a recent duck-shooting expedition. He was shooting out of a deep box, buried in the mud, and while putting the gun down in the corner of the box struck the back of the hammer against a projecting

piece on the side of the box, with the above unfortunate result. I will add that he was using one of the best English guns. I do not wish to say of what makers, as my object is not to condemn any particular make of gun, but to call the attention of all sportsmen to this matter, and as the experiment is so easily made, they can soon satisfy themselves as to whether they have a safe gun or not.

I will only add that I am trying to catch my breath after your heavy broadside in reply to "Deep and Light Draft." When two people think as nearly alike as we do on the above subject, it is hard to get up a controversy, but I will give you one more gun on some future occasion. SINKBOAT.

EASTON, Md.

CONTRABAND CANADIAN DEER.

Editor Forest and Stream:

Eleven carcasses of deer shipped from Lake Megantic to Boston were seized here last week for infraction of the Customs law, referred to in your last issue, prohibiting the export of such game. They were sold by auction, realizing some \$70. This, I believe, is the third lot shipped by the same parties, and they may feel thankful that they escaped the \$100 fine to which each was liable. Every person domiciled in this Province is obliged to take out a hunters' license, costing \$20 for the season, in default of which he is liable to a fine of \$40. This may seem a little hard to residents of the United States, but the law was enacted to protect our game from pot-hunting expeditions; and in this locality would probably not be enforced against legitimate sportsmen.

The Maine Game Commissioners complain of the slaughter of game in that State by residents of this Province, and perhaps the unsettled condition of Northern Maine renders it more exposed to poachers from our side, still I think the enforcement of the law preventing persons from killing above a certain number of each kind of game, would do away with this evil, and probably could be as easily enforced as the license law suggested. We want a similar law, and vigorous

enforcement to make it pass one. Three deer, two caribou and one moose are known to any sportsman who can kill more does it for pecuniary profit, or else is made of a different clay from that in which the genuine sportsman is moulded.

I think Maine laws should be made conformable to ours as regards the commencement of the open season. September is the month par excellence for camping out, and if camping parties were restricted to legitimate sport, we question if more game would be killed than at present, while many more would be induced to avail themselves of this healthful recreation. Again, along the portion of the Maine boundary lying between the Megantic and Spider lakes, and the Magalloway and Chain of Ponds, large game such as moose and caribou are perhaps one day in Maine and the next in Canada, and as I know from experience have their feedings ground on both sides of the line. D. THOMAS.

SHERBORNE, Que., Jan. 5, 1884.

SHOOTING WITH THE PISTOL.

FOR several years I have had a great deal of pleasure hunting rabbits with no other weapon than a pistol. If you have a Smith & Wesson or a Stevens gallery pistol, then consider yourself well fixed, for I use only a little Sharps .22-caliber, and with it have killed as many as five in one evening, all shot through the head. First, before going out hunting, suppose you try your pistol and see if you really can hit a target the size of a rabbit. I'll wager a brace of quail shot with a pistol of either that plenty of men who to-day carry a pistol in their hip pocket can't hit a nail keg at ten paces, let alone the eye of a rabbit. Put up a target and shoot and shoot and shoot until you can confidently say you can hit what you shoot at, then you are ready for the field.

If there is a light snow on the ground so much the better, take your pistol and go hunting with it alone; leave your gun at home, for if you take it along, you will not only shoot rabbits with it, but you will be tempted to kill everything. Walk the hedges always with your pistol hand next to the hedge; the reason is obvious; any man knows that the less motion is made the more successful he will be. Walk slow, and when you see a rabbit, catch the sight and shoot quick, and if your aim has been good, you will lag that rabbit with as much pride as you did your first quail shot on the wind. Your pistol is not a hair trigger, therefore lean to steady your aim by pressure on the trigger and only give the final pull as you see the eye of a rabbit through the sights.

Be very careful. The gun is dangerous, but the pistol is far more so. Hunt alone, or at most with only one companion, always keep a cool head and never point your pistol (whether loaded or not) at anything you do not wish to kill. I read sending this note for fear some boy may read it and be led to hunt with a pistol and shoot himself. If any boy sees this I caution again, remember the little weapon will kill you just as easily (if pointed at your heart or head) as it does the rabbit; you are so confident of. Never trust yourself out with a crowd, but recollect what you have read and go alone. Handle your pistol as though it were a hand grenade or bombshell, and you will be comparatively safe.

When you get home, dress your game and put it to soak in salt and water for twenty-four hours, and then have it cooked to suit your fancy. I like them fried. Study the habits of your game and read all you can about the little rabbit, and in this alone you will find great pleasure. MARK.

MORNING SUN, Iowa.

SNOW GESE ON THE DELAWARE.

THE enclosed cutting from the Smyrna (Del.) Times repeats the report I have lately given of the presence of snow geese on the Delaware: "A large number of white wild geese, called by some Canada geese and by others Brandt, have been spending the winter thus far in the coves along Bombay Hook, and especially that near Collins's Beach. It is no uncommon thing for them to spend the winter, or part of it, in the Delaware Bay, but heretofore they have confined themselves mainly to the Jersey side, in the waters that make up its marshes. In the past eighteen or twenty years, Mr. Benson, in charge of the lighthouse, tells us he has not seen them so numerous in our waters as this winter. They are hard to come up with by sportsmen, and it cannot be successfully done only by a little deception. When the ice is breaking up the gunners get into a boat which is covered with ice, the men themselves being covered with sheets and carrying themselves in a reclining position, one manages an oar in the rear, in directing the drifting of the boat, and thus in this manner, close right among a flock. The hapless birds that have mistaken the craft for

an ice floe pay for their credulity usually by the loss of several of their number."

The journal errs in giving the name of this fowl Canada geese or brant. It is the Arctic or snow goose (*Anser hyperboreus*). As far as I can learn none have been killed by our Philadelphia sportsmen this season; but it appears from the account given that the Smyrna gunners are now taking advantage of the ice in the bay and paddling up on them. Capt. A. A. Gray, of Philadelphia, a season or two since succeeded in decoying them in the marshes where they resort to feed. But the flock will remain on the Delaware until early in the spring, when they will depart for their breeding grounds, which I think are in the main situated in the Pacific Arctic regions, as large numbers are seen every spring passing overland in the west, their course always pointing to the northwest. Your correspondent a few years since killed a pair while snipe shooting, one with each barrel as the geese flew over. This was about ten miles from Valparaiso, Ind. Hollabird will remember the incident, as he was "at the death." Hoos.

PHILADELPHIA, JAN. 12.

NOTES FROM MICHIGAN.

IT will be interesting to watch an attempt about to be made by a party of Detroiters at preserving a large section of country in Northern Michigan. For a number of years the party referred to have annually hunted on the grounds they propose to preserve; now they have gained from the owners of the land the exclusive shooting privileges. The territory they intend to take in is some eight or nine square miles surrounding Turtle Lake, so called from its resemblance in shape to a turtle. The land around the lake has been lumbered; it abounds in splendid cover for deer, and ruffed grouse are there by the thousands, while Turtle Lake itself swarms with fish, black bass predominating. The lake is a mile and a half long by a mile wide, snugly nestled in among the hills that surround it and is distant some forty miles from Alpena. By the way, "Alpena" is an Indian name and signifies a country wherein partridges are plentiful—a good partridge country. An old Indian told me some years since. And it is such a country, surely, as your correspondent can affirm, for, one afternoon while on a still-hunt for deer, he counted sixty-seven ruffed grouse flushed by him inside of three or four hours. With a fair show during the close season deer will go on and multiply rapidly around Turtle Lake, as the country is well watered, sprinkled here and there with hardwood, and affords ample cover and protection in its numerous swamps, slashings and woods. In fact the section is admirably fitted for the shelter of game, and has been, and now is, one of the very best hunting regions of our State. It remains to be seen what will come of the somewhat ambitious attempt of these or eight gentlemen who propose to be the pioneers in forming a game preserve right in the heart of the wilderness, and where game laws are virtually unknown. Be the experiment of preserving this particular tract successful or not, the influence will be for good, and will have a tendency to educate people in the necessities of the case. The value of game to a city we cannot have a game warden duly appointed by the State at once; for him we shall have to "bide a wee," or rather a year, until our next Legislature meets. It is hard to estimate the immense good such an officer can accomplish. The results of the efforts made by Mr. Higby as a missionary or warden of the State Sportsmen's Association but faintly prophesy what he could do if invested with authority by the people of the State. The impression that no doubt was felt in some quarters that he was working for the good of a select few would quickly give way to one of respect and awe among the law-breakers. Without knowing, I imagine he has met with skepticism as to the disinterestedness of the association. No doubt many of the ignorant "mossbacks" he labored with felt all the time that the association through him was endeavoring to attain some selfish result. A game warden backed by a commonwealth could certainly accomplish infinitely greater results than could one appointed by a private body of sportsmen. Had we a game warden now, I should like to whisper in his ear that brook trout from Lake Superior, caught through the ice, were exposed for sale in Mansfield Market, this city, within a week or so. Also that Christmas evening, venison was offered for sale at Bailey's Market. Both were out of season, but both were freely offered for sale. DELTA.

DETROIT, Mich., Jan. 12.

A DUCK HUNT IN TEXAS.

TO kill ducks one must have a duck gun, especially if they are deep water ducks—viz., canvas-backs, red-heads and bluebills—of the first two varieties we have met few here and my experience has chiefly been with bluebills. These ducks have names innumerable and I have often been struck with the fact when half a dozen hunters were together and each one would use a different name for them, scaup duck, bluebill, blackhead, black jack, nigger head, broadbill, and bullhead being among the most common; the large black head of the drake giving most of the names. Where they breed I know not, far north of Texas, but in winter they visit us in large flocks, in numbers far greater than any other duck. They feed in both deep and shallow water, are expert at diving and very tenacious of life. When crippled it is almost impossible for the retriever to catch them, and as they only show the top of the head and very little of their backs as they swim off it is difficult to shoot them again. They are swift on the wing and all in all it requires a good shot and a good gun to kill them with any certainty. On the other hand, they decoy easily and the mallard call attracts their attention at once. On our lakes we often see them resting on the open water in "rafts" of—I might say—millions, coming in late in the evening to feed on the grass flats. The noise made by them as they rise from these large rafts closely resembles distant thunder—not so very distant either. I had, with my fellow hunters, often discussed the necessity of getting an extra hard hitting gun to bring down and keep down these ducks, and last season procured an 8-gauge gun of a celebrated English make, 12 1/2 pounds in weight, 34-inch barrels. With this did better than I have had but I kept longing for something more effective. I then had built to order, by an American firm, a fine gun of about the same size as the above, except the barrels were thirty-six inches long. After carefully testing it both as to pattern and penetration, I found it inferior to my old gun. I then had a friend select from the stock of Henry C. Squires, of New York, a Greener for me on a large scale, 14 1/2 pounds, 8-gauge, 36-inch barrels, and in which I

use seven drams of strong black powder and 1 1/4 ounces No. 4 chilled shot.

With this gun I found that I could kill from one-fourth to one-third further than with any other gun I ever say, the great weight preventing any serious recoil, and being possessed of physical strength beyond the average of men I could wield it very readily. My friends insisted that I could not kill with it, and my better than with my old guns, but I never found one of them to be of this opinion after standing by me during a day's shooting, as I would, for the sake of argument, occasionally cut down a single duck which belonged to my companion before it came near enough for him to use his lighter gun. On one occasion I had four friends at my place, one from St. Louis, the others neighbors, and all good shots, better than I, two of them being, perhaps, the best in our section. We shot from 3 till 5:30 P. M., and at night one had ten, one twelve, one twenty-nine, one forty-five, and I had seven, and had any one of the men had my gun and I his I would probably have had about a dozen and a hundred. Since this episode the "big gun" has been treated with great respect, and my spirits have been considerably elevated by the possession of it. Many men think that so large a gun is unsportsmanlike, although used exclusively for ducks and geese, and yet they hammer away at quails, one-tenth the size of a duck, with a gun half or three-fourths as large as my Greener. The suggestion of a rule would require a man to abandon his Sharp's "gold reliable" or his Fletch or Lawton sixteen-pound elephant gun and face his game with one of Stephen's "hunter's pets," and which would cause Messrs. Grizzly & Co. to become cannibals in self-defense, and fat they would grow on their game.

To cut down a pair of bluebills at ninety yards is a pleasant thing, but you can't do it except very semi-occasionally with a light gun properly loaded, and if you raise your powder charge you raise a corresponding lump on your shoulder, skin your fingers and break the third commandment—and then you do it yet then often. J. S.

MARSHALL, Harrison County, Tenn.

THE CUVIER CLUB.

IN their report read at the annual meeting the trustees of the Cuvier Club say:

As the visitor who examines a thoughtful mind, looks through our cabinets at examples of game birds, who were once as familiar as the sparrows in our streets, but which are now so rare as to be almost practically extinct; and as he turns from these to look upon the quail and the grouse, which yet remain to us, he will intuitively ask himself whether these latter also are not destined soon to become almost practically extinct, and to be totally beyond reach as articles of food.

He will answer himself that their preservation for all purposes of food or sport depends wholly upon an enlightened public sentiment which will compel the enactment and observance of proper laws regarding them.

To create such a public sentiment regarding both fish and game, and thus to secure such laws and their observance, is the primary object of this club, and therefore the trustees deem it to be their duty to give the subject renewed discussion in this report, although they have discussed it largely in former reports.

In their view the subject can never become hackneyed or tedious until the deed is done and has been fully attained. They are certain that to the members of the Cuvier Club it can never prove to be a repugnant theme.

And they would impress upon members the fact that this topic should not only be discussed in the club-room, but elsewhere upon every fit occasion.

It will serve but little purpose toward gaining the final end, if the members are content simply to listen to these reports, and then to dismiss the subject from their minds and conversation when they leave the club-room. It ought to be talked of in such places, at such times and upon such occasions as will enlist other minds. Reforms are never gained by silence. Public sentiment is never created by secrecy. What we want is that the object of this club shall be so known in every circle of every society that there shall be universal approval of it, and after that it will not be long until such approval is manifested by favorable legislation.

The first thing to be said now is that already the public sentiment in the large cities of our country is far in advance of legislation. This is due, in a great measure, to the advance made by the cities in all which pertains to the athletic and outdoor life. The need of relaxation and physical exercise is being daily more and more impressed upon all our brain-workers and busy doers, and this is found in its most agreeable form through the medium of rod and gun. It does not take the devotee long to learn that there is a higher aspect to field sports than the mere pursuit and capture of the game. The animal food that therein is a food prepared which is carefully cared for and protected should prove the solution of many a problem of poverty, and he speedily becomes earnest in his desire for such protection.

For many reasons, which ought not to exist, but yet we are sorry to say, which do exist, this inspiration does not extend to the average legislator, and in consequence thereof the game laws, not only of our own State, but of the majority of the States, do not exhibit such thorough knowledge of the subject as its great importance and large interests demand.

The law of Ohio, as it has now fixed the close season for quail, is an example, we think, of ill-advised legislation. The season and the necessities of the subject are all against it. It provides an open season only of the thirty days of November.

During this period the quail are full grown and fit for the table; and an extension of the open period for the gun would not to any great extent diminish them. They can be furnished certainly, during November and December, at such prices as will bring them within the reach of even the most limited means. Being then at their best, and in the full flush of their season, it is proper that so long as they remain so, they should be lawful food.

The States adjoining Ohio have different and longer quail seasons, and the birds killed lawfully in those States find their way inevitably into the markets of this State, whereupon traffic in them and possession of them are prohibited, and then they become unlawful food. This should not be. It violates the first principles of game preservation. That principle is to protect the birds thoroughly during the period in which they are not fit for food, in order that their natural increase may be promoted and that they may be better and plentier during the period when they are fit for food. If it should become necessary to maintain an entirely close season for one or two years, in order to replenish the game, that would be a different question. But such was not the

announced purpose of the present law. It was put upon a different footing, and hence, we think, is objectionable, and should be changed.

The remedy for all such legislation is one which we have frequently suggested, but unfortunately we are powerless to do more now than repeat the suggestion. It is that there should be a committee appointed throughout the States, by the several Legislatures, which should recommend uniform legislation by the contiguous States, based upon latitude or isothermal lines. Such legislation would be productive of good in several ways.

Dealing in game, as a business, has become an established occupation, and when legitimately carried on is entitled to consideration as a regular commercial pursuit. However it may have been formerly, the game dealers in Cincinnati at least, are beginning to realize the fact that fully-organized slaughter of game means the destruction of their business, and the most of them are willing to co-operate with this club in the observance of a proper law. They know the reason and the requirements of such laws as well as we do, and any law which is not founded in reason and upon such requirements, is inimical to their business, and does not obtain their respect. There are constant temptations upon their part to violate it, and yet they do not desire to appear as law-breakers.

Such uniform legislation as we have suggested would remove all the difficulties growing out of the present state of things, and would enable us to know at all times who among them were the supporters of the laws, and who, if any, deserved to be prosecuted. When such prosecutions were had the offenders would stand alone. He would not then have the moral support derived from the knowledge that all his co-dealers were in full sympathy with him, and stood ready to assist him to the utmost. But he would know that they, too, condemned him. It would not be long before this respect for the law would extend from the dealers and commission merchants in the city to their consignors and customers in the country, and hence the pot-hunters, the snarers and the netters, and the country boy exterminators, would cease to find a market.

The past season has been the most prolific for years in quail. Throughout the whole scope of the country they have abounded. How far this is due to favorable weather and local causes, and how far to the influence of clubs like this, it is not possible to say, but we have a right to expect and hope that the cause in which we have engaged will be popularized to such an extent as to acquire complete recognition, and to be universally and comprehensively embodied in our laws. When that obtains, the birds will abound in the greatest profusion, and will be beyond the contingencies of bad seasons.

The Trustees have been frequently asked whether they would sanction the formation of clubs auxiliary to the Cuvier Club, by parties who would prefer that form of organization rather than to form independent clubs.

It is said, that the Cuvier Club has now become so widely known that in all things related to its objects "its name is a tower of strength," and that they desire to avail themselves of it.

The Trustees have decided to give their sanction hereafter, and will assist in establishing branches in any locality where it may be desired, and where they are confident that the objects of the club will be maintained, and its good name preserved.

PHILADELPHIA NOTES.

THE severe rainfall with which our immediate district and the Atlantic coast region was visited during the week, in a great measure caused the snow to disappear and we had begun to hope that, but we have a report in store that the entire State excepting directly around Philadelphia had been presented with the heaviest snow of the season by the clerk of the weather. In Maryland and Virginia also it has been very severe.

The West Jersey Game Protective Association is taking the proper steps for the care of the game in its territory. The coming spring at least 2,000 quail will be liberated I am told, and negotiations are now on foot to purchase a large number from Tennessee. These birds will be properly divided between the six counties over which the association has control, and each borough of these counties will have its allotment. I am informed that heretofore certain sections on particular lines of railroads were stocked with quail, and the more isolated places, where birds had suffered almost entire extinction from various causes, were neglected. This my informant—who is now one of the society's active working members—stated would be guarded against in the future.

To have in our own State, now that the Philadelphia Game Protective Society may be said to have gone out of existence, no one to prosecute a violation of our game laws. Apropos of the Pennsylvania law, there was a very important change made in it at the late long session of the Legislature. Ducks can only be shot from Sept. 1 until Jan. 1, and then only on Mondays, Wednesdays and Fridays of each week. No sailing on them with sailboats or tugs for the purpose of shooting in the water. This law, as it now applies only to inland streams of the State at present. Where a river or stream divides our State from another this does not take effect until the neighboring State adopts a similar one, when it will be in force as on interior waters. It will be seen from this the Delaware River, owing to its New Jersey shore, is yet open to every day shooting until New Jersey passes a similar act, which I have no doubt will soon be done. Non-residents of Pennsylvania cannot enter the State for the purpose of trapping wild pigeons unless a license of fifty dollars is paid to each county in which the trapping or netting is to be done. Rabbits are heretofore to be given two more weeks of grace before being hunted, Nov. 1 being the opening season. I cannot see why the quail should not have also been given the same additional close time. Our law then would be better in respect to the last mentioned. Not having the text of the new act before me, I can only write of it from recollection. The changes made are all good.

The suggestion was made a few days since, and it struck your correspondent as a feasible one, that the Philadelphia Kennel Club should obtain the old charter of the Game Protective Society of this city, if it is still in force, and reorganize under its powers and add the protection of the game of our State to its field of usefulness. Could not this be done? Your printer made me say running bagules in last issue of FOREST AND STREAM. It should have been winning bagules, referring to prize-winning dogs. There are several of them either on the way over or to be shortly sent. Hoos.

A BIG POT-HUNTER'S RAID.—A letter to the Memphis, Tenn., *Advertiser* records a pigeon massacre at a Missouri roost. The writer says: "Hearing that game was abundant on the line of the Kansas City Railroad, and having a fancy for that line of sport, we formed a party to go out and 'try our luck.' Near Augusta, Mo. (on Division P. O.), the roost of pigeons was represented to us to be 'perfectly enormous,' and to that point we proceeded. Our party consisted of Messrs. O. Huestis and H. B. Huestis, of Kansas City; Dr. R. Busby, of Tipton county, Tenn., and B. V. Thayer, of Memphis, together with a pilot to guide us to the hunting grounds. Early Thursday morning, with tent, blankets, and four days' rations in our wagon, we made the start over the hills and through the valleys. On the way we shot a few quail and exercised ourselves at various marks preparatory to attacking the immense pigeon roosts that we heard of." Dr. Busby, being ill, decided to leave and still hunt for deer. Before the light of the morning came our tent and all hands were in the wagon, and as the sun rose the birds began to fly over us, and all day at short intervals we were shooting right and left in the roost. The trees were literally crowded with them, every limb being filled, and they would sometimes so overload small trees as to break them down. They were so thick that it was an easy matter to kill fifty at a shot. When they flew the sound was like the firing of a gun, near at hand. Their roost occupies a space of about five miles long and three miles wide, and when the pigeons come in at night and leave in the morning they actually darken the earth around. At 10 o'clock the second night we had our wagon box full and left for a camping ground. En route we met Joe Bowlinghouse, an experienced hunter, whose luck that day brought him three fine deer. We soon pitched our tent, elevated our wagon pole, on which we stretched a deer, and like old experienced hands at the business, had a nice array of venison ready for broiling in a few minutes. If anything was ever relished by a hungry crowd, it was these roasts. At this juncture another crowd of hunters, with two tents filled with pigeons, came upon us and partook of what hospitality we had to extend them. At daybreak next morning we all started for Augusta, and got there a little after dark. When our pigeons were counted (three wagons), we had 5,415, and in our own we had 1,800. How is that for high?"

ARKANSAS' NEED OF A BETTER LAW.—Doland, Ill., Dec. 27.—Winter came on the 14th, and has been in earnest ever since. Not much that the sportsman can do now in the way of hunting, unless it be for rabbits, which are very plenty. I am informed that a party of three killed 103 in one day near this place. Snow is deep with a hard crust, which makes it hard for the sled. While to get a living, they have been very plenty in this section, but the farmer's boy is putting whole covers with the old musket while huddling behind a hedge. Messrs. Lisenby, Morgan and Thatcher returned a few days since from their Arkansas deer hunt. They report few deer but numbers of turkeys and squirrels. Their bag was two fine bucks, some half-dozen turkeys, some ducks and squirrels. The bucks fell to the rifle of the first named sportsman, who takes none of the credit to himself, but attributes it all to the better luck which he says is the "boss" repeater for deer. Several hunting parties have been in "Arkansas" from this State the past fall, and all report the same gloomy prospect for deer shooting there in future. "Deer were so slaughtered for their hides during the overflow of 1882, that few are found since." Won't the sportsmen of the State secure the passage of a practical game law at the convening of their next Legislature?—B. N. INAN.

RHODE ISLAND GAME.—Providence Jan. 11.—Quail and partridges have been unusually abundant the past season, and some very good bags have been made. Enough have escaped the pursuit of the hunter and the "snarers of the wicket" to insure an abundance for another season unless the winter is particularly unfavorable. From the 19th of December until within a few days the ground has been covered with snow to the depth of from twelve to eighteen inches, and the poor quail must have suffered for want of sufficient nourishment. Fortunately for the birds, the snow has now nearly disappeared, and it does not seem probable that we will have such another heavy fall of snow this winter. I have learned of several farmers and sportsmen supplying food for the quail while the snow was at its greatest depth. This practice, if more common, would add greatly to the comfort of the birds and increase the pleasures of the sportsman in the brilliant autumn time. Woodcock have been very scarce the past two seasons, whether owing to the drouth, summer shooting or a change of line of migration it is difficult to say. We fear that the prediction that they will become an extinct species may be realized within a few years.—F. H.

GAME WITHOUT HUNTING OR A GUN.—Vinton, Iowa.—It was Sunday, the Elder had a service five miles from town in the country. Some of the depth of five or six inches lay white on all the ground, and a heavy mist was in the air, covering field and fence and hazy with a delicate gauzy drapery. Being a brother minister I took a seat in the sleigh and went along. Rapidly and noiselessly we sped over the road, soothed and pleased with the bracing air and delightful scenery on every hand. To our left lay a strawstack and on it within easy range is a prairie chicken. We think—but no, it is the death, and we are going to church. On we glide, when suddenly we look to the right, and in that field to the right, just over the fence, more than fifty prairie chickens are sitting about on the ground. Some fluff their feathers out like great balls of down, others spread their tails and croon their necks and step about, while all seem to say, "We know it is Sunday and are not afraid." When within a few steps of them the beautiful birds rose one after another and in groups, and winged their rapid flight through the air.—K.

MICHIGAN.—Cedar Springs, Mich., Dec. 17.—*Editor Forest and Stream:* Quite a number of deer were killed near here last season. One man and his boy camped near Rice Lake about twelve miles north of here, and in less than a week killed nine deer. Ruffed grouse were quite plenty, but owing to the large territory they have to range over, few have been brought back. They move from place to place, and where you will find a flock one day, the next you will have your tramp for nothing. One great drawback with us is that we have no good dogs. Next season we hope to be able to give a better account of our shooting as we have ordered a brace of dogs of M. P. McKoon, and if they do as well as advertised, we look for fun ahead. We have noticed quite a number of fine flocks of quail in this vicinity, and if we have a mild winter they will be plenty another season.—W.

FEED THE QUAIL.—This is the season of the year when we feel like begging the farmers to feed the quail. A little corn or wheat during such a snow as we have had will pull many a flock through, and give plenty to breed next season. The average Indiana farmer, however, don't seem to care much for the quail on his farm, except when some hunter gets after them. Then he stands on a hill in his apple orchard and swears at the sportsman, and tells him that he wants to save "them that partridges," and to "take his blank dog and get out." If a man will argue with him, he (the farmer) will try to convince him that he is a great philanthropist, but the same man will sit in front of his log fire and toast his shins, and let every quail on his place starve to death, when the question of giving them an ear of corn comes up, that is if he has to go out into the snow to do it. There are some farmers who feed their quail, but they are as scarce as the fabled hen's teeth.—*Leansville (Ind.) Argus.*

GLENCOE, FLA., NEAR MOSQUITO INLET.—The weather so far this winter has been favorable for bringing Northerners as well as wild ducks down from the North. The thermometer on the 4th inst., at 9 A. M., was 81°; 6th, 7 A. M., 28°; 6th, 12 M., 57°. This is the coldest weather here for ten years past. Wild ducks are flying along the coast by the millions; they go about twelve miles south of the inlet, where they give the sportsman the best ducking in the United States. Large numbers are also killed by flying against the Cape Royal lighthouse. Quail are scarce here this year. Deer, bear and wildcats are numerous in Turnbull hammock south of us. Fishing never was better. The Ocean House, New Smyrna, has been purchased by Capt. F. W. Sams, an old sportsman and guide, and completely remodeled, now offering first-class accommodations.—SUNSHINE.

WHERE QUAIL "FREE."—Albany, Ga., Jan. 8, 1884.—Game may be found within a radius of ten miles of this place—deer, bear, turkeys, quail and squirrels. Deer and turkeys, as well as ducks, are killed by the negroes occasionally, and offered for sale in market. A friend and myself went out a few days ago with one gun between us and a good dog, hunted only until noon and killed fifteen quail. At this season they are found in the woods, and what was singular to me was that when flushed and shot they flew almost invariably lit in the pine or live oak trees, and when there it was impossible to see them. This section is a sportsman's paradise; excellent hotels or private boarding can be obtained, as well as living at reasonable prices, while the people are genial and hospitable. I have "no axe to grind."—ISSAQUENA.

NOTES FROM MAINE.—Oxford, Me., Jan. 9.—The recent heavy storms have proved very destructive to the game in this State, especially along the Androscoggin River. Snow has fallen deep enough for the partridges to bury up in, followed by heavy rains which imprison the birds, which soon die or fall prey to the foxes. A great curiosity in the shape of a bridge was found in the woods, and what was singular to me was that when flushed and shot they flew almost invariably lit in the pine or live oak trees, and when there it was impossible to see them. This section is a sportsman's paradise; excellent hotels or private boarding can be obtained, as well as living at reasonable prices, while the people are genial and hospitable. I have "no axe to grind."—ISSAQUENA.

A COLORADO GAME COUNTRY.—Grand Junction, Col., Dec. 30.—Two years ago this was a barren waste of sage, brush and greasewood. The coyote and Indian held undisputed sway. Now there is a town of 1,200 inhabitants. Game of all kinds is very abundant in the hills in almost any direction from Grand Junction. Deer are in great numbers. Two of us in a few days have supplied ourselves with venison for the winter, having killed twenty-three fine deer. The Roan, or Book Plateau, north of here, is a hunter's paradise. Game of all kinds abounds, and the streams are alive with trout. A party of us came partly across it this last summer, and the deer seemed to be in every hill, and from the way they would stand and gaze at us, never to have seen a man before.

AN IOWA SIDE HUNT.—Rippey, Iowa.—A side hunt was held Dec. 28. Twenty-one men on a side; captains, Jot, Law and Dr. W. Lovejoy. Game shot: 14 prairie chickens, 19 quail, 1 jack snipe, 2 horned owls, 1 eagle, 1 hawk, 3 crows, 1 woodpecker, 12 jays, 56 blackbirds, 1 gray squirrel, 8 fox squirrels and 55 rabbits. Law's side scored 955 points; Lovejoy's, 3,295. At the close of the hunt we had a grand banquet and a jolly good time. Game is very scarce here at present. The amount of game killed for the number of hunters is small. We propose to have it over again in the spring, when the ducks, geese, cranes and plover return on their way north.—WILD DOG.

COLD WEATHER SPORT.—Anoka, Minn., Jan. 2.—I began the year by shooting a fine wild duck yesterday, and to-day another fell at the crack of my gun. The Mississippi River is all frozen over, with the exception of a few air holes; and in these a flock of about fifteen ducks appear to have settled for the winter. I gave them until the 1st of January to leave, but as they have not improved the time, I have opened war against them. The thermometer was 16° below zero, and has been as low as 36°. I have to use single B shot in my 12-gauge Remington, as the nearest I can get to the ducks is seventy-five yards.—B.

YALLOHA, Sumpter County, Florida.—The hunting grounds mentioned in my note Nov. 8, are regarded as healthy and favorable for camping. High rolling ground, beautiful lakes. Do not camp on hamak land. Yalloha is at about center of Lake Harris, reached by boats in connection with railroads. I can furnish teams and experienced guides. We use light flat-bottomed skiffs. Wall tents will be comfortable.—E. R. BAWSON.

THE NEW YORK FANCIERS' CLUB will give its second annual exhibition in Madison Square Garden, this city, Jan. 23 to 30. The last show of the society was very successful, and a like success is anticipated for the coming exhibition. The secretary's address is Charles R. Harker, 62 Cortlandt street, New York.

SEVERAL ENGLISH PHEASANTS were shot in Orange county, N. Y., last fall. Probably they had strayed from the preserves which have been stocked with them. We have seen some of the mounted birds at Bell's, and they are magnificent trophies.

Sea and River Fishing.

TROUTING ON THE BIGOSH.

IN CAMP.

ONE morning the weather looked so threatening that none of the party thought it desirable to go on the lake, and the Colonel proposed that we put the shanty in good order to resist a storm. It had been hurriedly built by me and myself before the arrival of the Colonel and Uncle Ben, and was merely a shed of poles and boughs, not enough to ward off a light shower, but not thick enough to stand a heavy and continued rain. We had placed a heavy stick in the crotch of a tree, and supported the other end by lashing it to another tree with a grape vine. On this horizontal stick poles were slapped to the ground about a foot apart, and these were covered with leafy boughs, lapped like shingles. The sides were closed in the same manner, and the front left open. More boughs were used and laid on until our roof appeared to be water tight. While engaged in this work a whoop was heard which all recognized as proceeding from the Doctor, who, it may be remembered, had declined to come with the party to fish for lake trout. Soon we saw him on the opposite shore, and Jack volunteered to go for him with the boat.

"I thought he wouldn't stay alone long," said the Colonel, "for fishing alone is stupid business, and the Doctor likes good company too well to stand alone on a stream like a blue heron and have no one to speak to or help him enjoy the fishing, even if he has nothing to say."

"Don't you suppose the heron enjoys fishing alone?" I asked.

"Undoubtedly a heron does when he has no congenial company, but even herons are not as unsociable as they appear, or as Tenyson pictures them in the deserted mead where he describes them as 'fond of solitude,'" replied the Colonel. "The 'solitude' they love, as I understand it, is merely the absence of man, for I have seen herons when a dozen of them have been fishing within a few yards of each other. Besides they build their nests near each other and are by no means an unsociable bird in their way. Man is a sociable animal and likes to have his fellow man eat and smoke with him, and talk and smoke, and fish when he fishes. Do you like to fish alone?"

"Sometimes there is a pleasure in being alone on a stream occasionally, for then one sees more of life in the woods and waters than if he has some one to talk to. Two persons are never as still as one, and it is only when no suspicion of man's presence is felt that the loon swims unexpectedly around a point of land and gives you a close view of its motions. Only then does the raccoon venture in plain sight to wash the frog he has caught and which must be scrubbed before it is re-bled. Only then does the woodcock take courage to fly into her nest high up in a hole in the tree, and the birds go on with their courtships and house-keeping without restraint. A day or two of solitary fishing, as you call it, is really enjoyable and if a man has resources within himself he is never lonesome on the stream or in the forest."

"Yes," said the Colonel, "if a man enjoys it, but it seems to me that I remember something of an apostrophe to solitude by the lachrymose Alexander Selkirk wherein he asks the dame in plain terms where her charms are, and intimates that ages have beheld them in her face, but perhaps she was not in opera costume on his island."

"What possible connection has this with the question whether a man likes to fish alone or in company?" asked I. "You assure me that 'Don't you suppose the heron enjoys his own society, and had sought ours for relief.' I chimed that it might not be the case, and then you got off after a Robinson Crusoe, who could find no pleasure in life even with a goat, a monkey and a parrot. I am not so sure of the monkey, but then he had Friday, who was nearly as good as one. What Robinson really needed to make life enjoyable, if he really had a goat, a monkey and a parrot, was a human assent to that 'Don't you suppose the heron enjoys his own society, and had sought ours for relief.' I think the Doctor comes to see what fishing for lake trout is like, for he despises it without knowing anything about it. Here he comes and we will see."

The Doctor and Jack came up from the shore, bringing a basket full of canned goods which he had obtained from a party which met at the town on their way toward civilization, and as the assortment contained some needed articles he had no objection to that. "Don't you suppose the heron enjoys his own society, and had sought ours for relief." I chimed that it might not be the case, and then you got off after a Robinson Crusoe, who could find no pleasure in life even with a goat, a monkey and a parrot. I am not so sure of the monkey, but then he had Friday, who was nearly as good as one. What Robinson really needed to make life enjoyable, if he really had a goat, a monkey and a parrot, was a human assent to that "Don't you suppose the heron enjoys his own society, and had sought ours for relief." I think the Doctor comes to see what fishing for lake trout is like, for he despises it without knowing anything about it. Here he comes and we will see."

He was assured that, sport or no sport, we had enjoyed life, and on looking over our catch he expressed himself to the effect that there had been an extravagant expenditure of candle for an infinitesimal amount of game.

The Colonel sententiously remarked: "It is not all of fishing to fish."

"Colonel," said I, "if you would only follow the example of the late Artemus Ward, and make imaginary quotation marks in the air, when you do quote, we would then be able to separate your brilliant originalities from the gems of thought that have been crystallized by others." Or if you had merely added "Dawson" or "Chency" parenthetically we would reach the same result. Dawson gave us the appellation, and Chency has elaborated it most gracefully.* You evidently recognize its force and truthfulness, as both the Doctor and myself have done long ago.

The Colonel thought a moment, and then slowly said: "To appropriate a thing without the credit of quotation marks is a grave offense, which some people consider to be little less than a crime." Yes, but now we are talking of fishing, and let him take a Jack and I baited yesterday, and we will go up the inlet with a landing net and explore the stream."

"No more of that, Colonel, an 'thou lovest me, I plead guilty, you shall have the last soggy biscuit made in camp to-day." By the way," I said, "the Doctor with you on the lake and let him take a Jack and I baited yesterday, and we will go up the inlet with a landing net and explore the stream."

*As these conversations occurred over ten years ago, and "Fishing With the Fly," which contains Chency's and my own unpublished last month, I don't want telling the reader that I am guilty of an anachronism, and will ask him what he is going to do about it.

"Is there no buoy at the spot?"
 "No, the place is in deep water, and the buoy line was only fifty feet long and did not reach bottom, but we baited it liberally and you may get some fish."
 "Agreed," said the Doctor, "but let's try the lunch first, and then we will have strength to drag the monsters from the vasty deep." And the Colonel not only devoured the last biscuit, but the last five also.
 FRED MATHER.

TARPON AND RAVALLA.

Editor Forest and Stream:
 We opine that the time is not far distant when the capture of the tarpon will attract the attention of piscatorial experts; and as but little is known regarding the most attractive baits for this fish, I propose contributing my mite from time to time. In a recent interview with Colonel Hopkins, the civil engineer who accompanied the *New Orleans Times-Democrat* on recent exploration of the Florida Everglades, he informed me that as the party was descending Barney's River he dropped a spinner overboard, and in a few minutes it was seized by a large tarpon. The fish vaulted in the air, shook its head and escaped. An examination of the bait showed that the hooks had been straightened. This is the third time that I have known the fish to seize a spinner.

On several occasions I have referred in your columns to a fish of the southwest coast of Florida, known as ravalla. In size this fish ranges from one to thirty pounds. It takes an artificial fly and is a noble fighter; and I fancied that the accompanying communication might interest some of your readers.
 A. B. PUTCO.

Dr. C. J. Kenworthy:
 MY DEAR SIR—Until I read your paper for "Fishing with the Fly" I had never heard of the ravalla. I was writing to Prof. Jordan and I asked him if the fish was known by any other name as I could find it in none of his list of Florida fishes possessed by me. This is what he said about it: "The ravalla of Dr. Kenworthy is I suppose, the robalo *Centropomus undecimalis*. It is a fine fish that has never had justice done it. Robalo is the accepted Spanish orthography, although, as all Spaniards sound b more or less like v, ravalla is not far different."
 Jordan, in "Synopsis of Fishes of North America," says of the robalo: "Silyvery greenish above, lateral line black, very distinct; dorsal and caudal dusky, other fins yellowish; ventrals without dusky area. The orbital nearly entire. Third dorsal spine longer than the fourth. Second anal spine extremely short, about as long as third. Air bladder anteriorly with two long, slender, backward directed horns. Head, 3; depth, 4; D. VII, 1, 9; A. III, 6; Lat. 1. 70. A large food fish, abundant in West India, ranging northward to Southern California, Florida and Texas."
 Prof. J. is just home from Cuba and the Florida Keys, and says he has a rich harvest. He has twelve new species of fish from the Keys.
 Yours fraternally,
 A. N. CHENEY.

TO HOLEB FALLS.

ON a bright September day, when the foliage of autumn was taking on its golden hue, a party of Augusta gentlemen, with their rods and guns, started for a fifteen-day sporting expedition to Holeb Falls, on Moose River near the Canada line.

They were a jolly party of sportsmen, moderately skilled in the mysteries of woodcraft, seeking rest and change from active business life, expecting to fill their game bags with duck and grouse, and their creels with lusty trout; to live in the open air on the fat of the land; to enter the domain of Diana, the goddess of sylvan sport, and perchance crown their happiness with a moose's antlers, but not expecting, like Hercules, to capture the stag with golden horns and brazen feet.

The party consisted of Geo. A. Cony, of the Cony House, E. H. Walker, Esq., a Maine Central Railroad officer, and J. L. Colcord, a civil engineer—the chief huntsman of the party, a crack shot and a deft caster of the flies—who composed the first boat's crew. The second boat's crew was made up of Dr. Geo. W. Martin, a physician in active practice, with considerable experience in hunting and fishing, and an old-time sportsman, who has spent several years of his life on the Canada line; George Hunt, a successful merchant, as tough as a pine knot, who can see and shoot a bird whether he be on the earth or in the sky above, as well as the next man; and W. E. Potter, breeder of the famous trotting stallion Independence.

They left Augusta, Me., on time at 5 o'clock A. M., Sept. 17, 1881, with two boats, built in the Whitehall style, without keel, mounted on wiggins with springs, and made expressly for the purpose. Each drove by a pair of good horses, with three men in a boat, where they rode as comfortably as in a buggy. Each man took one pair of woolen blankets, rubber blanket, rubber coat, overcoat, one extra pair socks, rubber boots, and was dressed in a good, substantial hunting suit; also, soap, towels, comb, etc. The Doctor carried a little rubber bag with kit for mending clothes, a little plaster, physic, salve, etc. Colcord carried a little kit, consisting of screw driver, awl, pliers, whetstone, twine, silk, wire, wax, etc., for repairing tackle. The party had two tents, an equipment mess kit, one ax, one hatchet, compass, spring balance, two breech-loading shotguns, one B. M. rifle, ten fly-rods, reels, lines, flies, loaded cartridges, and everything necessary for such a trip, but not one ounce of superfluous luggage. The commissary stores were neatly and conveniently packed so as to be secure from dust and wet during the trip, and handy to use at every halt. They were calculated with the exactness of army rations, so as to last just fifteen days. After the first two days the meat rations, with the exception of a little salt pork, were to be furnished by the party in fish and game. The boats were loaded the same on wheels as in the water.

The party was organized and equipped so as to camp wherever night overtook them; always selecting a pleasant place where water for cooking and boughs for a good bed could be found. It was but a few minutes' work to tether and feed the horses, pitch the tents, build the fire, cook supper, pick boughs, lay them for a bed, and spread the blankets. The hour for "turning in" was 9 P. M., and for "turning out" was 5 A. M.

Just as the sun was rising over the Sidney hills, Walker made the first discovery on the voyage of a beautiful lake toward the east, whose silver surface was studded with several emerald green islands. It was, indeed, a fairy scene. But those of the party most familiar with the locality declared that "Walker's lake" was situated directly over Sidney bog.

The thick fog had settled down over the valley and the sun shining on it made it look, from the hill where it was first observed, just like a beautiful sheet of water surrounded by hills. The islands were clumps of trees that grew here and there, and showed their green tops above the fog. While the party were discussing the topography of the region, a west breeze sprung up and the magic lake vanished, leaving uncovered the face of the bog.

The horses followed the road rapidly, passing through Belgrade or Academy Hill, where the expedition had a good view of fine landscapes and beautiful ponds which are so numerous in this region of country. More than twenty large ponds can be seen from this hill. They halted beyond Smithfield village and took dinner by the roadside. After two hours' rest they resumed their journey through the old historic town of Norridgewock and up the east bank of the Kennebec River, passing the Norridgewock Falls, the site of the old Indian village, where now stands the monument erected in honor of their race. The expedition camped at North Anson. The weather was fine and a most enjoyable day had been passed on the road.

The expedition took a good early start in the morning, and with merry songs and light hearts went spanking along at a good road pace. The boys were in a jocular mood, for the ride was delightful, over one of the best roads in the State, and amid the most picturesque scenery to be found in New England. This was the same route taken by Gen. Arnold's army on the way to Quebec during the Revolutionary war. The day was pleasant, though quite warm. After a long drive they pitched their tents by the edge of a dense wood, near the roadside, some five miles above the forks of the Kennebec River.

An early breakfast was eaten the morning of Sept. 19, the tents were struck, and the sportsmen were soon on the road. It is twenty-five miles from this road to Moose River bridge. The party arrived at the bridge about noon, where they left the horses and wagons, and in ten minutes they were launched on the placid water of Moose River, and were soon on their way up stream. Cony and Martin were given charge of the boats, acting as captains, in consideration of their old age, and because they had been to "Holop," as the natives say, and knew the way. It is true Cony is bald-headed and getting old, but he is still a gamey old boy; full of pluck and a jolly good companion, and at times is as frisky as a colt. Martin was the oldest man in the party, but he went through the war with the best of his kind, and was a daisy, considering his great age. He is still good for a hard tramp, and can "throw the circling salmon fly as lusty as a boy."

Half an hour's row brought them to Wood Pond, some four miles long, which distance was passed in a short time and they again entered the river. This is a grand place for trout fishing in May and June. The best fishing is near the mouth of the stream where it empties into the pond. Very large trout are taken here, often weighing five or six pounds. About a hundred rods from here they came to the last house on the river.

It was here they passed the "Moose Horns, beyond which there is no law or Sunday." The sportsmen now entered the depths of the great northern woods, beyond the pale of civilization. A mile row up stream brought them to Attean Pond, which is about five miles in length, encircled by bold rocky shores, with mountains towering in the background, "corn and ploughed" in the distance, and a magnificent sheet of water is great with many beautiful islands, which rival in the splendor of scenery the "Isles of Greece, where Delos rose and Phœbus sprang." Still on went the swift-gliding boats, the occupants not unconscious of the grandeur around them. The boats soon crossed the lake and entered the river again, ascending which about a mile brought them in sight of Attean Falls. Here, on the lower carry, the tired sportsmen, after a ride of one hundred and twenty miles by land and twelve by water, pitched their tents and made soft beds for the first time, put together, the reels mounted, the leaders with flies attached and made ready for action. Not long after landing, half of the party were casting their flies above and below the falls, and trout were caught in abundance, ranging in size from one-half to two pounds. They made a royal repeat that night on fried trout.

Hunt took his double-barrelled breech-loader and went for game. He had the others waiting for him before he flushed a flock of ruffed grouse, which flew up into the trees around the little opening. In an instant crack went his gun and down fell the bird on the lowest limb, for so long as you shoot the lowest bird the others will not fly; in a second, crack, and the next in order fell; then crack, crack, and two more fell. He loads his gun, and as he steps forward to pick up his dead birds, two more rise with sudden whirr: one is cut down on the wing with the right barrel, before she gets far away; while the other, with a splash, strikes a streak of lightning through the beech trees, with the quickness of thought he turns his left barrel, and "with the eye of faith and finger of instinct" he brings down his sixth bird. Then he gathers up his game and in half an hour from the time he left camp returns in triumph with his contribution to the larder, which was already well supplied with trout. From this time to the end of the journey the boys lived like fighting cocks.

Attean Falls consists of two pitches, the upper and lower falls, with about 100 rods of dead water between them. There are two carries—roads over which boats and camp equipage are carried by the falls—the lower is short, not more than fifteen or twenty rods, but the upper carry is four times longer, rough and hard.

The best fishing in September is found at the head of the upper falls, in the smooth, rapid water just before it breaks over the ledge. This is the case with all the falls on Moose River. But in the falls and rapids the best fishing is at the foot of the falls and rapids. The fisherman should keep out of sight of the fish if he wishes to be successful, unless there is a ripple on the water. Trout are easily frightened. Any loud splashing on the water, or sudden movements will often keep them from biting for hours. Dr. Henshall gives a pretty caution to the angler:

"Approach with caution; let your tread be soft;
 Beware the bending bushes on the brink;
 Touch no branch nor twig, nor leaf disturb,
 For the flimsy tribe is wary."

Trout are a capricious fish at best; to catch them follow Izaak Walton's advice: "Be quiet and go-angling." Game and trout are always found in abundance about Attean Falls, and the party had good sport. They also had plenty of time to rest, the first time for four days. The weather was cold, with white frosts and some ice.

President Garfield died to-night, Sept. 20, but being beyond the Moose Horns, it was unknown and unfelt in that camp. The startling event, that was convulsing the whole continent with grief, caused no emotion there. The sad shock did not come to them for ten days, until they reached Moose River Bridge on their way home.

A large dead fir tree, whose boughs were dry as tinder, stood just above the fire. It occurred to the jolly and rollicking Potter that an illumination—a bonfire—would be a good thing during the evening; therefore he piled a lot of dry boughs which were found about the carry, around the base of the dead fir tree; and after the silent shades of night had pulled down her sable curtain, he fired off his show. The red flame shot upward, and in an instant forest, stream and falls were illuminated with a blaze more than seventy-five feet high. It was a grand sight, and the party enjoyed it highly. Potter was the life of the camp, full of fun and song, and when he started he was somewhat out of health; said he could not eat any breakfast, had not for a long time; his appetite was so poor that he feared he could not stand the hardships of the trip. But somehow, after the first day on the road he forgot all about that poor appetite, and began to eat like the King of the Cannibal Islands; and his appetite, that would do credit to an alligator, continued with him without "a skip or break" until he got on the woods. If it is true that the man who can see "sermons in running brooks" is most apt to go and look for them on Sundays in the fishing season; it is also true that there is no better place to find a lost appetite than in the woods of Northern Maine. To this fact the whole party are living witnesses, and add their testimony to Potter's.
 AUGUSTA, ME. PISCATOR.

[TO BE CONTINUED.]

A TROUTING REMINISCENCE.

IF there is one day's fishing in the year which the trout angler looks forward to more keenly than any other, it surely is the first day with the favorite old rod on the bank of some favorite stream. For weeks past the 15th of April had been to me the most important in the calendar; and I confess it was with a feeling of thankfulness that, for and myself, only one hour after leaving my home, in the heart of London, I got out of the train at a little wayside station. The rather at starting was all that could be desired—warm, dull, and with soft southwest wind—not that I ever let considerations of the wind or weather interfere with angling arrangements, for the simple reason that I have so often experienced the best sport on the most unkindly days. Just outside the station I saw two country urchins, and wanting a boy to carry my things when I was fishing, I asked if either of them would accompany me. They both volunteered at a moment, and I was in a fix.

"Pldize, sur," said the smaller of the two, "hay can't go; hay's gart ter carry chips."

"No I ain't neither, not without Oi loikes," said the rather larger small boy.

"Well, I cannot take both of you, and so we will toss up. One go to settle it. Now then, if it comes down head up you go, and if tail up you go."

The fates decided that the urchin who ought to have been "hair-ter chips" should be my gillie for the day, and a very capricious little gillie I found him. We had not gone a hundred yards, down a lovely lane leading to the inn by the water, before he called my attention to a bird's nest, and the next instant to the "old uns" flying about in an uneasy manner in the branches above us. He knew the exact state of their family arrangements. In fact, before the day was out I found he took a fatherly interest in the homes of all the young couples his sharp eyes had discovered. Seeing me admiring some lovely white loaves, he seemed to be taken with the moment, and promised me heaps of "keowills" when we got into the meadow over the river. Having arranged with the pleasant hostess that my gillie should fetch to me refreshments at lunch time, we walked on across the brow of the hill down to a little foot-bridge over the river. On this bridge I noticed two things—one was a very fine trout feeding at the tail of a stream; and the other was that the wind had gone round to the northeast, and was beginning to blow strong and cold. We went on a little way, and then I commenced by fishing down stream as the wind was so strong it was out of the question to fish up with a dry fly, as I had intended. At the top of the water I met an angler—one of "our members," who had just arrived on the scene. After a few words of greeting—for until then we had been acquaintances on paper only—I told him I would walk down stream and leave him to fish the upper part. I had marked some good fish rising, and told him so. I commenced about half a mile lower down, rigging up my finest cast with hare's ear as leader, red-quill hack, and blue dun as droppers. I had not fished twenty yards of water before I saw a good fish moving; part of his broad tail every now and then flapped out of the water. Throwing a long line, and kneeling on the bank, for the water was bright, I got my hare's ear to swing round with the current just above his nose. There was a big swirl, and then an instant tightening of my line fastened the minute sack-bend in his lip, only by the merest bit of skin, as I afterward found. Five minutes or more of good light, now up stream, now down, now out of the water, now boring into the weeds, and amid the breathless excitement of my gillie, at the second attempt I got him into the net—a pretty fish of two pounds good.

"He didn't loike coming out," said the admiring youngster. "He'll pldize the Lunnon folks." That's bigger an what my brother catches down at the bridge."

"What does your brother fish wi?"

"He fishes with a worm, he do; but I seen 'em cotched in a net loike that—and bigger uns, too."

Now, as every inch of our stream was "strictly preserved"—if numerous notices to that effect told the truth—this was not pleasant news. A little lower down I got a trout of about a pound, a beautifully plump, plucky fellow, which I was loth to put back as under our one and one-half pound standard. Then for an hour I could not rise a fish; perhaps it was fortunate I did not, if the landing net had been wanted. My boy had got tired of seeing me thrashing away for nothing, and I had forgotten all about his "loikes."

"Heisht!" cried a voice on the opposite bank. A Moor-

fish scattered screaming across the pool I was just about to fish, and then from the rushes emerged my landing net, followed by the head and shoulders of my fat-fleshed squire.

"O! guessed O knewed where her was," triumphantly.

The young rascal had left my bag somewhere behind on the bank, and had gone up to the weir bridge above, and then crept quietly down among the rushes on the other side, so that although actually only some twenty yards away, to all intents and purposes for which I had engaged him, he was a mile off!

"You small vagabond! What do you mean by carrying my net off like that. How am I to load a fish?"

"You won't get no more, O'n'thinkin'."

"And you won't get no lunch, my young friend, if you don't come backas fast as your legs will carry you!"

This had the desired effect, and the curly-headed youngster, with the ends of his torn corduroy breeches and his ragged little jacket flapping in the wind, was scattering off like the bird he had flushed with such ease.

"Stop! Now you are the one who had better go down to the inn and fetch some ale and bread and butter, and hard-baked eggs, and cheese, and don't forget the salt, or you'll have to go back for it."

With a vision of good things before him I knew he would be no longer absent than he could help; but even now he had not got far away before a quacking in the rushes caught his attention, and turning round to me he shouted: "Them's dab-chicks, them be!" But seeing I apparently did not heed him he started off in a good earnest, as if, proved, whistling and shouting at the colony of rooks busy in a ploughed field above him. Laughing to myself at the happy young fish hawk, I lit a pipe and determined to try a dry fly, as the wind had dropped. I got a dace or two, and then, in a bend of the stream above me, but hidden from view by some bushes, I heard a most tremendous splash. "By George! that must be that eight-ponder A. told me of chasing the small fry; I'll give him time to settle down again and then have a go at him, you may be sure," I thought, and I walked and fished every inch of the water—a deep, quiet, swirling pool, just the haunt for the "big one." For ten minutes I thrashed away; never did I fish more carefully in my life. But it was of no avail, so I decided to give up fishing until after lunch, and rest on the bank till my boy came back.

It is wonderful what inquisitive animals cows are. I had several times during the morning tried to frighten three or four fine Alderneys out of catching the nuisance of my flies when they came looking round for their fishing, and now, as I reclined on the grass, I have them all around me; gradually getting courage, they came closer, until one—the most intelligent cow I ever saw—came and rubbed her nose against my fishing stockings and peered into my creel. Presently, my boy appeared on the scene, pointing beneath his load.

"She's a knowin' un, she is," pointing to the cow which had been taking stock of me so closely; "she knows where the best grass is, and they can't keep her out of it neither."

And, while I spread out the lunch, he gave me some interesting sundry details about her history—how she was partial only to one particular milkmaid—how she led the other cows into scrapes and got off herself, and sundry other tricks she had. There she stood, watching us all the time, sleek, and fat, and pleasant smelling, but with a wicked look in her eye, which plainly showed mischief.

"How we did enjoy that lunch! Crisp, crusty bread; sweet, rich butter; and good beer; and now, as I recline on the grass, which had cooled in the stream, I will wait for it."

"I wonder what they will take," I said to myself, aloud.

"O!d' try a worm, if O'er yer' you," innocently suggested my boy, with his mouth full.

"I've a good mind to try one of McNeec's pike-smale flies for a change. Where is my bag?"

"Bag? why, O! left it there by that odd stump afore I went to look for that moorhen."

"Well, you may better go and find it, then."

He looked everywhere in vain, and I helped him.

"O! shouldn't wonder if that odd cow hadn't pushed un in the river!"

The remembrance of the big splash I had heard flashed across my mind, and, going to the spot, sure enough, under two feet of water was my black leather bag! To fish it out with the landing-net was the work of a second or two.

"O! thought as much. She's a cunning un, she is. O! thought she'd pay me out for runnin' at her this morning."

"And don't you think I ought to pay you out for running away and getting all my tackle and fly-bow soaked through in this way?" I asked, more in sorrow than in anger.

"Who'd a thought that odd cow'd a rolled un in the river?"

Who, indeed? Why, nobody but that "old cow" herself, standing here, coolly looking on, flicking the flies off with her tail, and say as plainly as possible—

"Perhaps, they may be out for you manners, young man."

I never look on that bagging with O! A thinking what a rise that "odd cow" took out of me!—R. B. Merston, in *Fishing Gazette*.

PISCATAQUIS SOCIETY.

AT the third annual meeting of the Piscataquis Game and Fish Protective Society, which was adjourned from June last, was held at J. F. Sprague's office in Monson, on Thursday, Dec. 26, when the following officers were elected: President, Dr. C. C. Hull, Monson. Vice-Presidents—Dana Crockett, Monson; J. B. Mathews, Portland. Secretary—E. R. Haynes, Monson. Treasurer—F. J. Wilkins, Monson. Counsel—J. F. Sprague, Monson. Executive Committee—J. F. Sprague, E. R. Haynes, E. R. Haynes, Monson. Directors—S. S. Cole, C. M. Cushing, A. J. Cushman, J. C. Tripp, Dr. W. L. Sampson, Monson; O. A. Dennen, M. Kinco; A. P. Buck, Foxcroft; G. A. Mathews, G. S. Cushing, F. B. Shedd, Lowell, Mass.; Hon. W. H. Osborne, Bridgewater, Mass. Honorary member for 1883, George F. Godfrey, Esq., of Bangor.

The executive committee reported that during the year they had purchased 50,000 trout fry (*Salmo fontinalis*) of the Mr. Kinco Hatching Works, and planted them in Lake Hebron, in Monson, the expenses of which are herewith annexed.

By the report of J. F. Sprague, Esq., counsel for the society, it appeared that three cases against poachers had been prosecuted by the society during the past year. Two of them were successful, but as they were tried prior to the law of 1883 relating to the disposal of fines and penalties, nothing is added to this society. The other case was against a taxidermist, who was acquitted in the Supreme Court at Dover, although the water was presented in an able manner by the County Attorney Col. Peaks.

In his report, Mr. Sprague said:

"And here permit me to suggest that our society as a

whole stands in the attitude of a public prosecutor, and in the performance of our duties we should exercise wisdom, discretion and courage. No man should be prosecuted simply because he is unpopular in a community, neither should a person who is morally and legally guilty of a violation of the fish and game laws escape, because he at the moment chances to be the favorite of a fickle populace, or because he may possess the wealth of a Croesus. * * *

In conclusion allow me to congratulate all who are co-laborers in this important work upon the fact that a change in public sentiment is apparent which is as wonderful as it is welcome. Many of our citizens who a few years ago joined in the state but well-known chorus that these laws were only for the benefit of the city sportsmen and detrimental to the interests of the poor man, are now among our staunchest friends and supporters; for all who give the subject an intelligent and unprejudiced consideration perceive at once that among the great multitude in our country, and especially in Western Piscataquis who annually derive profit from the various kinds of business that depend upon the visiting sportsmen, none are more directly benefited than are the hewers of wood, the drawers of water and the fillers of the soil. As a love for the 'gentle art' increases among the people the lawlessness and the disposition to poach upon our waters necessarily decreases in the same ratio. In this immediate vicinity and also around M. H. Lake I believe that now the reckless and determined poacher of either our fish or game is a rare exception, whereas only a short time ago he represented the majority. All these are encouraging signs of the times, and should stimulate us to renewed activity in the cause in which we are engaged. And yet there is much work to do in the future. We must labor to hold the advantage that we have gained. We must not, lie idle, or for any imaginary grievance 'sulk in our tents,' but press onward until we have secured a public sentiment favorable to our cause which shall be as invincible and as unwavering as a wall of adamantine."

SERAGO LAKE.—Portland, Me.—A recent note in the FOREST AND STREAM spoke of Sebago Lake as having "again been stocked." The lake is a splendid sheet of water some sixteen miles northwest from this city, of which it is the source of water supply. Its waters are very pure, cold and deep, and from them in years past many fine salmon trout have been taken, some of them weighing from fifteen to twenty pounds each. The spawning beds for these fish are in Crooked River, which discharges its water into the lake from the north. Until recently these beds have been the resort of poachers from the surrounding country, who, by the light of the torch, have speared and carried away large numbers of them. Of late, however, the Fish Commissioners have turned their attention more particularly to this locality, and have made it difficult for such fellows to exercise their "hogish" proclivities about the lake. The lake has not "again been stocked," nor has it ever been, except in the natural way, to my knowledge. During the last spring but few if any fish were taken from the lake, but as a natural consequence, if the spawning beds can be protected in a few years this will be excellent fishing ground.—G. J. B.

MICHIGAN.—Cedar Springs.—One thing we do have here fully up to the average, and that is good fishing. Within ten miles of here there are more than twenty-five lakes, most of them affording bass fishing, and quite a number are well stocked with pickerel. If the man that is fond of sunfish fishing will come and see me, I will take him to a lake where I will warrant him as long a string as he cares to catch; if he does not try enough, I will give him a whole lot more. Several of our small streams near here were stocked with brook trout three years ago and we expect next spring to "drop them a line," if they receive it all right will let you know. German carp have also been put in two small lakes, Pine and Streeter, but do not know with what success. Dr. Ford, an enthusiastic fisherman here, deserves the thanks of us all for his zeal and interest in restocking our streams and lakes.—W.

BROME LAKE.—Knowlton, Quebec.—A club has been formed to secure the protection of the fishing in this beautiful sheet of water. The lake is only sixty miles from Montreal, and has some big bass. Last summer three bass were caught in its waters which weighed respectively 6, 6½ and 7½ pounds.—FAIR FIN.

Fishculture.

REPORT OF THE FISH COMMISSIONER.

PART VIII. Report of the Commissioner of Fish and Fisheries of the United States for 1883 has lately been issued. It is a bulky volume, like most of its predecessors, containing 1,000 octavo pages. Among many noteworthy features of the year the following are prominent: The production and distribution of German carp and shad large numbers; the capture and export of the steamer Fish Hawk; the introduction to the notice of American fishermen of the gill net with glass ball floats for taking codfish on their winter spawning ground; the obtaining of fishery statistics for the United States, particularly in the International Fisheries Exhibition at Berlin; the use of the Fish Hawk in exploring the Gulf Stream and its fauna, especially in connection with the distribution of the tile fish; the exploration of the fisheries of the Atlantic coast of the United States, of the waters of the Gulf of Mexico, and of the entire coast of Western America from San Diego to Point Barrow in the Arctic Ocean; the collecting of complete series of fishes of the sea coast and lakes, especially of the Pacific, with duplicates for distribution to museums and educational establishments. These subjects are treated at length.

In Prof. Atwater's article on the chemical composition and value of fish for food, he continues his account of the investigations in which he has been engaged for some years past in closing the eyes, that the percentages of phosphorus in fish are not larger than in the flesh of other animals used for food, and even if more of it was contained in fish there is no evidence that it would be better brain food. Prof. Goode has added much to his materials for a history of the swiflet as a species of fish, since a portion of it appeared in our columns, and several papers accompany the article. Mr. R. E. Earle has an interesting article on the natural history and artificial propagation of the sea trout, which he was the first to hatch. The temperature of the water seems to have a decided effect upon the spawning time of this fish, and the ovaries do not develop very rapidly until the water reaches upward of 72 degrees. The spawning season on Long Island begins by the 30th of August and continues through September. In the Chesapeake a few ripe

fish are seen about June 1, and the spawning season begins two weeks later and continues throughout the summer. An article on the artificial propagation of fish, by J. F. Koltz, translated for the report, is very crude and reads like the production of one who has not had much experience, but has been reading old works on the subject.

The very valuable notes on the operations connected with the propagation of whitefish at Northville, Michigan, is made by Mr. Frank N. Clark. This gentleman has had an extensive experience in this work, and is probably the best manipulator of whitefish and their eggs in this country. He gives directions to spawners-takers Mr. Clark says: "Take eggs only from ripe fish, &c., those yielding their eggs by a gentle pressure of the hand on the anterior of the abdomen, including, of course, those from which the eggs are coozing. Discard the entire yield of any female when more than three have been taken; the eggs are spotted or milk-white when taken; likewise throw aside all females bearing broken eggs. Do not try to force all the eggs from each female manipulated, but only those which can be expelled by gentle pressure or stroking of the abdomen, each stroke commencing just forward of the pectoral fins and extending toward the ventricle, releasing the mass about midway between these two points. This will, however, expel nearly all the eggs if the fish is held on its side. The manipulation of the female is pinching or stripping process, but the female should be neither pinched or stripped, the process or operation consisting of a slow, gentle and crowding movement upward and forward with the hand, holding the fish by the sides of the head and the curve of the belly. Hold the vent of the female as near the bottom of the pan or receiving vessel as possible, as the eggs are very soft and tender when first taken and may be injured by dropping. Incline the fish to an angle of about 45 degrees; the eggs will then naturally settle toward the orifice and require less pressure for expulsion. The males, however, should not be held in this position, as in many instances the vital fluid will not stream directly into the pan, but cling to the fish and follow down to the end of the tail. Incline the female to a horizontal position, when the result of each fertilization will usually be driven directly into the pan. If the first or any subsequent ejection of milt from any male is streaked with blood, cast him aside. Mr. Clark's paper gives carefully prepared tables of the temperatures at which the fish were kept, in a horizontal position, when the result of each fertilization will usually be driven directly into the pan. If the first or any subsequent ejection of milt from any male is streaked with blood, cast him aside. Mr. Clark's paper gives carefully prepared tables of the temperatures at which the fish were kept, in a horizontal position, when the result of each fertilization will usually be driven directly into the pan. If the first or any subsequent ejection of milt from any male is streaked with blood, cast him aside. Mr. Clark's paper gives carefully prepared tables of the temperatures at which the fish were kept, in a horizontal position, when the result of each fertilization will usually be driven directly into the pan. If the first or any

and a surplus in the treasury. Thirteen new members were added the past year and two withdrawn. The next shoot occurs Jan. 18.

BOSTON GUN CLUB.—The Boston Gun Club (formerly the Raymond Sportsmen's Club) held its weekly shoot at the old range near the cemetery on Jan. 15 when several interesting matches were shot with the following result:

First Event—D. Kirkwood, first; W. B. Witherell and Brown, second; J. F. Witherell, third; J. F. Witherell and F. C. Webster, third.

Second Event—J. S. Sawyer and A. W. Law, divided first; J. Fleuthing and D. Kirkwood, second; W. B. Witherell and J. F. C. Webster, third.

Third Event—D. Kirkwood took first; W. B. Witherell and Sawyer, second; E. W. Law, third.

Fourth Event—D. Kirkwood, first; J. F. Witherell and Harold, second; Sawyer, third.

Fifth Event—J. F. Witherell, first; Harold and Kirkwood, second; Webster, third.

Sixth Event—E. W. Law, first; J. F. Witherell, second; Harold and Kirkwood, third.

ST. CLAIR SPORTSMEN'S CLUB.—St. Clair, Pa.—Second monthly contest at clay-pigeons; Ligovsky trap, third notch, 18 yds. rise; 4 traps. 11011111—3
C Sprouts 11011111—3 H L Daddow 01100101—5—31
C Evans 01101010—6

Upsets won the medals.
Third monthly contest:
C Farno 111101001—6 C Sprouts 01100100—3
C Evans 00001101—4 F Looze 00000100—1—14
Farno won the medal. Next contest Feb. 22.

JERSEY CITY HEIGHTS.—At the annual election of officers of the J. C. H. G. C. held at the rooms of the club, Rempler's Hotel, Jersey City Heights, on the 16th inst., the following officers were elected for the ensuing year: George B. Eaton, President; Justus Von Lengkeke, Vice President; A. Heritage, Secretary and Treasurer; W. H. Durdett, Jerry Maher, William Hughes, Executive Committee.

The meeting was well attended and great good feeling prevailed. The treasurer's report showed the club in splendid condition; grounds and all the paraphernalia of a good working club paid for, not a dollar of debt, and hundreds of dollars in the treasury. Speeches were made by the President, Vice-President, Secretary and Treasurer, and others. A resolution was unanimously passed to enter a team for the clay pigeon tournament at Chicago in May.—JACOBSTAFF.

MASSACHUSETTS CHAMPIONSHIP.—Ashland, Mass., Jan. 12.—C. B. Holden of Worcester, and G. W. Tidbury of Ashland, the present holder, shot for the individual championship glass ball badge here to-day. Holden won by a score of 46 out of 50, to 45.

MALDEN GUN CLUB.—The Malden, Mass., Gun Club held a shoot at its range in Wollaston, Jan. 13, when the three gold badges offered by the club were shot for. In the contest Mr. T. C. Fielding won the first prize, breaking seventeen birds out of twenty; A. F. Adams won second, breaking thirteen; and F. J. Scott took third, killing eleven.

PROVIDENCE, Jan. 14.—The following scores were made by the Narragansett Gun Club, at their three last weekly shoots. Dec. 27, double at 15 yds; 10 single and 5 pairs clay-pigeons; single at 18 yds., club badge.

4th notch:
G W Cary 11 10 01 01 01—15
E W Tinker 01100101 11 11 09 10 11—12
C B Potter 001010110 01 01 09 10 11—11
C B Perkins 011010110 01 09 10 w.
F O Welnsky 0100001010 w.
Mr. G. W. Cary won club badge.

Same day, Ligovsky State badge match; 25 clay-pigeons, 5 traps, 4th notch:
E W Tinker 11111101011111011111—23
G W Cary 11011111011111101111—22
George Barney 11011100111111101111—20
C H Perkins 110011011111000110 w.
C B Potter 11110000100010 w.
G W Cary, 11011; G W Cary, 11011. Mr. E. W. Tinker won State badge.

Jan. 3.—Club badge match:
E W Tinker 1110000101 11 11 10 11 11—14
W H Sheldon 01101010 10 10 01 11—12

C B Payne 11111111110101110 w.
J. B. Valentine 0111011010001101001 w.
W. H. Sheldon won State badge.

Yachting.

A ROMANCING REPORT.

THE following recently appeared in a lay paper: "The schooner yacht Fortuna, of the New York and Eastern Yacht clubs, has arrived out to St. Kitts, W. I., via Bermuda. She is bound for the eastward and up the Mediterranean. Letter received in this city say that on Thanksgiving Day, soon after leaving Boston, and when between the latitudes of Bermuda and Hatteras, she caught it heavily from the northeast, and being sufficient to oblige her to be obliged to heave to. The gale commenced just as the turkey was being carved, and the crockery, glass-ware, edibles, etc. were sent flying in all directions. For nearly an hour she lay to, all hands being shut up tightly, so much so that the crew were compelled to come from the fore-cabin to the cabin and up the after-companion-way to get on deck. It was a terrific gale, and the vessel she lay wide and was wet as a half-tide rock all the time. Her provisions were damaged, and the boys shut up below like herrings in a can. The vessel rolled and was lumpy. The crew were obliged to start sheet on her course for Bermuda. Advocates of heavy leaden keels, sharp bows and innamats stepped midships may learn something of her behavior in this issue be analyzed. For it is only an old story that is corroborated by "tons" of testimony taken from past experience. Skinning around in smooth water under a press of canvas is one thing; fighting with it in this broad Atlantic is another—and something of which present yacht designers, seemingly, have no conception whatever.

The foregoing piece of newspaper "padding," evidently written "against space," originated from a source to which no credence is attached and is not worthy of notice except in so far as it may be mis-lead to give unfavorable credit to the writer. Let us obtain the truth of the matter. For the present it is enough to say that Fortuna struck into the exceptionally heavy weather we have had off the coast, and as any sailor can readily suppose, such a small vessel had a pretty rough time of it, and no doubt occasionally shipped some green water. It is nothing extraordinary, and we would like to know whether it is not wet and uncomfortable in any of our yachts, that start sheet on her course for Bermuda. Advocates of heavy leaden keels, sharp bows and innamats stepped midships may learn something of her behavior in this issue be analyzed. For it is only an old story that is corroborated by "tons" of testimony taken from past experience. Skinning around in smooth water under a press of canvas is one thing; fighting with it in this broad Atlantic is another—and something of which present yacht designers, seemingly, have no conception whatever.

GENERAL PLANS OF CRUISING SHARPIE.

A SMALL CRUISING SHARPIE.

crew should have bored through wood. That the yacht "laid wide like a half-tide rock" we venture to believe totally devoid of truth, and a piece of wilful fabrication. The same can be said of the assertion that all hands were "stiffed" in a two hundred ton vessel, with the crew going in and out the companion.

As for the "advocates" of lead keels and a two hundred ton vessel, with such a purely relative term may mean, it is not over probable they will take their cue from a newspaper reporter, who, as we happen to know, has never in his life been to sea in a vessel with outside ballast and has never even as much as seen such a vessel at sea. Just how valuable suggestions from such a source are one need not emphasize. As for the tons of testimony against sea yachts, the accounts is all the other way. Our columns are filled with authentic and disinterested evidence the world over in favor of depth and low weight. A person who still talks about "skinning around in smooth waters" is, by his own testimony, wholly unaware of what the fleet of cutters do about British shores and in the Mediterranean, and hardly competent to lay critic with much success. It is to be regretted that such self-concealing compositions can be palmed off by a reporter upon the editor of even a lay journal, as no good can accrue from the circulation of rubbish which demonstrates a perfect veridicality with sea life and a liberal expansion of the truth in the anxiety to give vent to personal spleen. The Harveys, the Watsons, the Webbs, all experienced builders and seagoing yachtemen abroad and in our Eastern waters "seemingly have no conception whatever" of their business and the fury of the sea to which they have been brought up from babyhood. It remains for a penny-liner, who would leave fore-hatch open in a terrific gale, to dictate the model of our yachting. It will be a tolerably cold day when advice from such a source produces more than laughter. We have thought it worth while to give the quotation this notice to check whatever influence it may have had in circles which might be imposed upon even by a lubber who would keep fore-hatch open in a hurricane and expect dishes to remain on a table. For truthful testimony concerning outside ballast and deep draft, we refer to the various cruising experiences now being published in these columns.

WE publish this week general plans of a small sharpie of more than usual merit. This boat is now about finished for a gentleman fond of single-hull sailing and coasting along shore. Simplicity and moderate first cost have been aimed at with as much efficiency and power consistent with good speed in a boat of this bottom. The displacement of an ordinary sharpie has been considerably increased to gain in room and weight. Although the miship frame is kept dead flat on the floor, dead-ends from that point forward and has been adopted to obviate "pounding" at one end and to enable the water to close readily in the run. The floor line along the center is marked by the lowest line in the sheer plan and the rise of the floor at the side by the line above, the shaded portion between the two indicating the lead-rise of the floor. The total displacement is 22cu. ft., of which 500lbs. is represented by ballast. For safety and increasing the sail area an iron keel is attached from below. Should it be desired to ascend a creek for exploration this keel can be disconnected by unscrewing the nuts on the bolts holding it in place. The greatest breadth is located 11ft. from forward, where the loke is 4ft. 6in. wide across deck and 3ft. 6in. across the bottom. There is 4ft. headroom at after end of cabin hatch. The boat is finished with a hatch at aft to reach the stern occupying all the space abaft the cabin bulkhead. A berth and locker have been fitted below on the port side with a swing table opposite. The oil stove is shown by the dotted circle. Length on loadline is 16ft., over all 17ft., gangways each side the cabin hatch, measure 12in. wide. The rig has only one hal-lard which first hoists and then peaks up a leg-of-mutton sail bent to a 13ft. yard, stepped with jaws up and down a pole mast 10ft. 6in. above deck, traveling 13in. from the stem. The boom is 16ft. over all. Sail area 185sq. ft., with one line of reef hatches 3in. above the foot. The boat can be steered from deck or by sitting in the companion hatch. Draft 21in. with keel. Least freeboard 14in. The cabin is ceiled and finished in bright hardwood, sides of cabin house made of single pieces of ash, hatches and deck fittings of ash and mahogany. Total cost about \$270.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, \$2.

NEW YORK, JANUARY 24, 1884.

VOL. XXI.—No. 2.
Nos. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, \$4 per year; \$2 for six months; to a club of three annual subscribers, three copies for \$10; five copies for \$16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States and Canada. On sale by the American Exchange, 449 Strand, W. C., London, England. Subscription agents for Great Britain—Messrs. Samson Low, Marston, Searle and Rivington, 188 Fleet street, London.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices \$1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted. Address all communications, Forest and Stream Publishing Co., Nos. 39 and 40 Park Row, New York City.

THE DISASTER IN THE CITY OF COLUMBUS.

THE splendid steamship City of Columbus drove full speed on the Devil's Back, a well-known danger to navigation, off Gay Head, Martha's Vineyard, in the clear night of Jan. 18. Of the immediate cause of the disaster we will not speak. Investigation may disclose upon whom the blame is to be laid. But once more, for the thousandth time, the world has again to contemplate the perfect futility of expecting the saving of life through the means now provided by law. Over one hundred persons were drowned because they could not leave the ship.

It is one thing that the steamer should have been wrecked. It is another that those on board were compelled to die, with the shore within a stone's cast, for the lack of effective appliances of escape.

To the seaman, the idea of lowering a cockleshell of a yawl boat in a tossing sea, and the safe transfer of passengers half crazed with fear, madly rushing to the side in surging crowds, each one battling fiercely in the selfish struggle for life, is an idea at once so absurd and palpably impractical that all the intricate system of blundering supervision, established by the governmental authorities and enforced through the sinecurists and parasites of a vicious political system with spasmodic whim, appears like a pompous farce, a colossal sham practiced upon the unsuspecting, that comorants may feather their nests under the guise of law.

Who are these people upon whom the traveling public has to depend? It is difficult to restrain indignation at the impracticable officials whose utter incompetence to their task has been proven hundreds of times over and over again, but who live, draw fat salaries, and never puzzle their brains to the extent of a single thought of microscopic proportions. We have great men in Washington charged with the supervision of our steamships and their equipments. We have general boards of inspectors and local underlings by the score. The whole company of lazy self-complacents are of no more service to the people than so many dummies stuffed with straw. The combined wisdom, experience and induc-

tive faculties of the incapable crew to whom the public vainly looks for protection from the ignorance and recklessness of private people is unequal to grasp the simplest of simple provisions for the saving of human life in the most likely disasters to be expected in traveling by sea.

A vessel collides, she drives ashore, she catches fire and is consumed, she leaks, fills and sinks. What then? The passengers must have some practicable method of escaping!

And how do the law makers and dabblers meet the proposition? In making a tour about the vessel with mouth and eyes wide open, they are instructed by authority to count "four," "six," or "eight" on their fingers. So many boats slung inboard in a way they cannot be got out. Then heads come together, and a much-thumbed table of multiplication informs dull brains that "if" each boat holds twenty, then twenty time four makes eighty, twenty times six make one hundred and twenty, and so on. "Therefore" a lugubrious document is issued and the steamship certified properly equipped to safely carry so many innocents through all perils of the sea, as long so she does not meet those perils.

The instant the vessel is overtaken by misfortune the whole inspection service and the law authorizing its existence before us as partners in the crime of manslaughter through the gross, culpable incompetency, and mental debility which ordain such worthless, abortive and chimerical instruments of escape as a string of contemptible little dug-outs which can seldom be launched, never take their complement, are always totally unfit in every respect to perform the duty expected should they succeed in leaving the ship's side, and with rare exceptions only prolong and intensify the agony and swell the list of the lost. And why do those in power persist in figuring away on boats swung to davits, when wreck upon wreck demonstrates to the most obtuse wooden man the truths here stated? Because their salaries go on just the same, and why should they bother their heads any more than they can help? If laws and regulations and customs, passed down from the time the ark drove into bad weather, are at fault, surely no official can help it. It is nobody's concern. So it goes, and if wholesale sacrifices follow fast upon one another till doomsday, the owlish official will continue to creep around decks, make a chalk mark for every boat, multiply, and then go to bed to recuperate his exhausted brains or the vacancy where brains ought to be.

The ship owner is not free from blame. If he knows anything at all about the business of carrying passengers, he knows well the futility of trusting to boats and a mob of newly shipped steamship hands, firemen and cabin waiters. In furnishing his vessel with such humbugs he complies with the statutes of this world perhaps, but morally he is to a great degree responsible for not providing means of escape which shall be more than a mockery and the laughing stock of every cabin boy with three weeks' experience at sea.

As a method of clearing out from a sinking ship, the boats so ostentatiously paraded in certificates of inspection might as well be replaced by old hats.

Nothing short of rafts of large area, incorporated in the superstructure of the vessel, indestructible, automatic in their action, and provisioned and supplied with directions to proceed upon such rafts at once in an emergency, upon which the passengers can be driven and herded like cattle, can ever offer a fair chance of retreat to a large number of people unacquainted with the sea. A fourth-class mechanic can compose the arrangement required.

How many hundreds of victims is the sea to swallow, and how many families are to be bowed down in grief, before arrant humbug gives way to a few common-sense devices which ordinary experience dictates?

IN ANOTHER COLUMN we print a circular from the Migration Committee of the American Ornithologists' Union. The need of extended observation on the migration of birds is so pressing that it will be a satisfaction to all who are interested in ornithology to learn of the energetic action that is being taken by the Union. A glance at the names of those who have been chosen as superintendents of the various districts, shows that the selections have been made with care, and that these superintendents are competent as well as energetic and enthusiastic ornithologists. We are satisfied from our knowledge of those who have this matter in hand that the work will be well done and hope that all collectors will do what they can to aid the work. Full credit will be given to those who are willing to help it along, and if a large number of workers shall be enlisted the results cannot fail to be of value.

FEED THE BIRDS.

FEED the game, now that the surface of the whole country is deeply covered with snow. Build little shelters among the cedars in the old pastures, at the borders of the swamp, and in the edges of the wood, beneath which the birds may take refuge during the snowfall. Scatter, around and beneath these, a little corn, oats, buckwheat or screenings. Carry out a bushel of hayseed from the barn, and make little trails from the shelter in different directions, so that all the birds that pass near the place will be likely to cross one or more of them. Food is so scarce now that they will follow up these trails, picking among the stuff in their search for the seeds of weeds, until they come to the place where the food is.

An easy method of making a shelter is by placing two old logs six or eight feet apart and throwing a few fence rails across them. On the rails lay some short brush. This will furnish a warm, dry place for the birds to live, and if you supply them with a little food at intervals they will stay there all winter. Great, tender-hearted old "Nessmuk" provides for the birds and the beasts about his home among the Pennsylvania hills, and has told us how much delight he takes in seeing his beneficiaries come by day and by night to feed on the stores which he places about his house. Let each one of our readers do something during this bitter weather for the wild creatures about his home, and he will find that the good that he does, even to the least of these, will be a source of much pleasure to him.

ENGLISH VS. AMERICAN.—Ultra-fashionable society is often ridiculed because it apes the way of our cousins across the water. The humorous papers are fond of holding up for our amusement the American young and old folks who devote their time to a self-transformation into something outlandish and foreign. The tendency to imitate England has invaded that vast and undefined sphere of activity denominated the "sporting world." Old-fashioned American "sports" are going out of favor. Turkey shooting matches, once the pride and joy of the solid men in the community, have lost favor, and in some States are under the ban of the law. Side hunts are conspicuous for their rarity. Gander-pulling is one of the lost arts. And what have we in their place? The pursuit of the odoriferous anise-seed bag, or perhaps the mad rush after the hobbled fox—a caricature of the English fox hunting. Out in Missouri they have introduced from Great Britain the "carted stag" sport. At Kansas City the other day a captured deer was let out from confinement, and a gang of forty dogs with a number of horses and humans set out in pursuit, and in due time ran the beast down.

"DEADHEADS."—We are in receipt of frequent applications from individuals who wish to act as regular correspondents. They request credentials, that they may obtain free passes or reduced rates over the railroad lines and may "deadhead" at the hotels. Our uniform reply to all applications of this kind is that we have no such accredited correspondents, and never give credentials. We used to furnish such certificates, and one man has been beating his way all over the West and Northwest on credentials given from this office nearly ten years ago. We now give certificates to no one unless directly connected with this office. We cannot afford to let deadhead advertisements of railroads and hotels cumber our valuable advertising pages, and we don't propose to let every man who wants a free ride pay for it by puffs in our reading columns. Sportsmen tourists like to be informed about routes and hotel accommodations. We are always glad to have such particulars for publication, when they are written to give information.

THE CLAY TOURNAMENT.—Active preparations are made for the clay-pigeon tournament which will be held in Chicago next May. We understand from the managers that much interest in the event has been manifested in different sections of the country, and from all sides come reports of teams in training. We take pleasure in noting the growing favor of the clay-pigeon. Will correspondents who have experimented with different sizes of shot in clay-pigeon shooting give us the results of their tests?

MR. ROWLAND E. ROBINSON, whose notes on the snow-walkers are printed in our Natural History columns, has a readable paper on "The Merino Sheep in America" in the February Century, and one on winter fishing in Lippincott's.

AFTER CARIBOU.

[CONCLUDED FROM PAGE 491.]

WE rose next morning soon after daylight. The night had been cold, and along the margin of the river, except where the current was most swift, there was a skim of ice—in some places almost thick enough to bear a man's weight. We made fair time during the day, reaching Mink Point soon after 11 o'clock, and camping shortly before dark about two miles above the Wading Place. This is a long stretch of shallow rapids, over which, at almost all stages of water, it is necessary to drag the canoes. On the sand and gravel banks along the river we saw many caribou tracks, none of them very recently made, however, and also the tracks of a cow and calf moose. Just opposite where we camped, I found upon the bank the track of a good-sized moose, which had certainly been made some time after noon of that day. As I have said, the previous night had been very cold, and the wet ground had frozen hard. This moose track had been made in the fine alluvial mud at the edge of the wood, and from the appearance of the track it was plain that the earth had not been frozen since it was made. The track was close under the woods on the north side of the stream, so that the sun could not have reached it before 10 o'clock. The footprints sank nearly an inch into the mud before they reached a bottom hard enough to support the animal's weight; hence the ground must have been quite soft, and so exposed to the sun for two, and perhaps four, hours before the moose had stepped on it. Above the track grew a lot of young larches which were dropping one by one their yellow needles, and in the hoof prints were half a dozen of these, not pressed into the dirt, but lying lightly upon it. From all this I concluded that the track had been made not more than an hour or two before I discovered it, and possibly somewhat less. The clang of the iron-shod poles upon the rocks of the river bed was audible at the distance of half a mile, and any game that might be along the shore would thus be warned of the canoe's approach long before it could be seen by us.

Our camp here was again a pleasant one among a thick growth of young larches—here called junipers—and spruces. The night was again bitter cold—down to zero, Fahrenheit, the men said—and ice made three inches thick in the quiet pools and salmon holes. At all events, when, in the gray of the morning, I went down to the river side to wash, a heavy mist was rising from the water, and hair and beard froze stiff as soon as wet. I was astonished to see how little covering the men used at night. I carried a pair of heavy northwest blankets, which weighed, when new, fourteen pounds, and a "comfortable" or cotton quilt—one of the best protections against cold, by the way, that I know of—but none of the men had more than a single light blanket, and one slept under a cotton counterpane. They depended almost wholly upon the fire for warmth, and when, after four or five hours, it had burned down so as to give out but little heat, the cold would awaken them and they would pile on the logs and smoke a pipe until the fire was again burning well, and then lie down and go to sleep again. The reason for this dependence on the fire is obvious enough. The only means of travel through these forests is by the canoe or on foot. When the canoe has been left, everything—blankets, cooking utensils, provisions, tools and ammunition—must be packed through the forest on men's backs. It is, therefore, of the utmost importance that no superfluous articles shall be carried. Weight tells here, and the men prefer to make their blankets of the firewood, everywhere abundant, rather than to add a few pounds to their load.

The air was so keen this morning that to sit in the canoe meant to suffer with cold. I therefore walked all day along the beaches and gravel bars, crossing the river from time to time in the shallow riffles. The stones of the river bed were covered two or three inches deep with loose, slushy anchor ice, here called "lully," which made walking over them rather difficult. It was almost impossible to proceed through the woods, which came down to the river's edge, on account of the fallen timber. We had nine miles further to go before reaching a camp at the mouth of Indian Fork, where we were to leave the canoes and walk across the hills to a permanent camp, about which the hunting was to be done. During the day many tracks of caribou and moose were seen along the river, but none of them were particularly fresh. At 2 o'clock we reached the cabin at the Fork, and almost immediately William and Albert took each a load of provisions and went up the very steep hill immediately behind the camp, leaving their burdens on the comparatively level land above and then returned.

Early next morning all hands started up the hill with the packs for the permanent camp. The climb of the first hill was very difficult. It is so steep that to get on at all, one has to cling to the trees and bushes, and pull one's self up. The frozen moss slipped under the foot, and every few moments it was necessary to stop and take breath. After about a thousand feet of this climbing has been done, the trail leads through the forest over undulating hills with no very steep pitches. Then the dense forest is left behind, and we come to a more open country, dotted with low spruces. In the valleys which intersect the rolling hills a little coarse grass grows, and the white reindeer moss carpets the ground. It is to these and similar places that the caribou come to feed when heavy snows have covered the forest vegetation. As we walked through the spruces on these hills, we observed many places where the deer had passed along within a very short time, but no

life except an occasional rabbit and a few Canada jays was seen. We reached camp about noon, and after dinner I started with Joseph for Murray's Brook, four miles distant. Nothing was seen during the walk, and before dark we were at the camp again.

Immediately after breakfast next day, I set out with Joseph and William for the Big Mountain, the famous hunting ground of this region, and about six miles from the camp. Just after crossing Murray's Brook, as we were passing through some heavy timber, we flushed from the trail a spruce partridge, which alighted on a limb about eight feet from the ground. William was at first going to throw his axe at it, but Joseph urged him to spare it. A pole was cut and trimmed, and a noose made from a bit of salmon twine tied to the end of it. While this was being done, the simple little bird sat cuddled up on the limb, unconscious of danger, not even looking at us. When all was ready, William took the pole, and stepping quickly up to the tree passed the noose over its head, and dragged the innocent fowl from its perch.

A little later we reached the burnt country. Here the trees stood further apart, and there were little open spaces, overgrown only by low bushes, so that one could see for a hundred yards or more in any direction. The country became more and more open as we advanced and everywhere there were abundant fresh signs of caribou. At length we stopped on the edge of a valley nearly half a mile wide, on the other side of which rose the Big Mountain. This valley is quite open and level. A few scattering spruces grow in it, but these are not enough to obstruct the view. On the opposite side, the foothills of the Big Mountain rise steeply. They are white with the reindeer moss and dotted with dark evergreens. We sat down here for a while, and carefully looked over all the ground before us, but as no game was to be discovered, soon moved on down the north side of the valley, walking among the trees on the steep slope. We had gone but half a mile when Joseph, who was a few steps in advance of me, on coming to the top of a little hill overlooking a new stretch of country, suddenly turned and whispered, "Caribou." In a moment I was beside him, and far down the valley saw a deer walking away from us toward a long spruce-covered point, which ran out from the north side of the valley. A moment later several others were distinguished among the trees on this point. Climbing higher up on the hillside so as to be better covered by the trees, we hurried on, but several times, on reaching open places where there were no trees, were obliged to stop and wait.

There were four of the deer, and they now worked out into the middle of the broad valley from which they could command a wide outlook, and if we tried to move toward them through the scattered trees there was danger that they might see us. There was no hurry, for unless frightened by us, there was no likelihood that the deer would move away from where they now were. The one first seen was easily recognized among the others by its paler color and smaller size. It was thought to be a doe, and was evidently a stranger to the other three, who seemed anxious to investigate it. They would walk up to and smell it, and then would playfully bite at its sides, and when it moved out of their way, would chase it a few steps. The two larger bucks seemed to be a little jealous of one another, though perhaps it was only their playfulness. Once or twice they drew off and charged each other, coming together with a smart clash of horns that was distinctly heard where we knelt. They would then push for a short time, and then separate and begin to nibble the grass. The four moved here and there, sometimes taking a bite, and then walking a few steps, then chasing one another or having a little fight, and always unconscious that from the top of the hill less than half a mile distant three pairs of hostile eyes were intently watching their movements.

At length they moved a little further down the valley, behind a wooded point, and so out of our sight. It took but a few moments to run to the point of the hills beneath which they were, and when I peeped over a bushy spruce on the top of the ridge, I saw there, not one hundred and fifty yards away, the biggest buck standing in the middle of the valley, his head down, apparently half asleep. Carefully slipping along from tree to tree, I came within a hundred yards of him, and when I looked out he was still there. I was to have my desire—a standing shot at a hundred yards.

I was now anxious to make good shooting. I wanted the caribou, and then the two men were looking on, and I did not wish to be humiliated by missing so easy a shot before them. But as is often the case when one is over anxious, I failed to place my ball just where I wished to, and shot an inch too low, striking the humerus just above the elbow, the ball glancing back and passing in above the brisket, but too far back to touch the heart. The deer came to his knees, and then with a mighty effort recovered himself and stood with his right foreleg swinging helplessly. Twenty yards beyond the big buck stood a smaller one. At the report of the gun he looked up, and as he stared about for the cause of the noise a ball struck him in the heart, and he fell and never moved again. Away to the left, and facing down the valley, stood the new comer. When the last one fell it turned its head and looked back at it, so that the head and neck completely covered the shoulder and heart, and I could not fire at it. For some little time it stood there looking, and I waited for it to change its attitude. Then I whistled and it raised its

head. I fired and it gave a sudden start, and spread its feet a little. I felt pretty sure from this that I had hit it in the right spot, but it did not at once fall, and as the men urged me to shoot again, I fired twice more, and then it fell. The big buck still kept his legs, and the men begged me to shoot him again. Another shot finished his career.

All this time the fourth buck had been standing, partly hidden by a tree, and watching the death of his comrades. I would not shoot at him, for we already had as much meat as we could use and carry out of the woods. We started down the hill toward the dead caribou, and it was not until we were within thirty or forty yards of him that the remaining one started. He then began to suspect that there was something wrong, and throwing up his white tail, trotted gracefully off up the opposite slope, stopping once, when about 200 yards away, to look back. No doubt he has since plumed himself greatly on his superior sagacity in escaping the threatened danger. It may be inferred by the hunters who read these pages that caribou are fools, and I am quite willing to agree that those which I saw deserved no better name. It would be too much to say, however, that they always act in this way. The men told me that they were usually shy and difficult of approach, and that the senses of smell and hearing are particularly keen in this species. On this occasion the wind was in our favor, and on the yielding moss we were able to walk noiselessly. Moreover, it is certain that for seven or eight months before our coming not a gun had been fired in these hills, and it is possible that the animals which I killed had never before heard the report of a rifle. Elk and deer will sometimes act just as these caribou did, though I think I never had to do with any animals except buffalo that were less alive to the dangers from a gun than these.

We found the game not at all in good order. The rutting season being just over, and all the dead animals being males, there was no superfluous fat upon them, though none were absolutely lean. The two bucks were everywhere a deep clove brown, except the neck, which was gray, and the belly, under surface of the tail, and a narrow margin above the hoof which parts were white. The small stranger was much paler, more nearly the color of a Virginia deer in his autumn dress, but curiously dappled upon the flanks, the markings resembling faint large spots, such as the young caribou have. Similar markings on a much smaller scale I have sometimes seen upon the adult Virginia deer. In both cases they are, no doubt, instances of reversion to the color markings of some spotted ancestor.

It took some time to butcher the three deer, and while doing so it was discovered that only the first three shots had been required to kill the deer, and that all the subsequent ones were unnecessary. The first shot at the big buck had pierced his lungs, and the first at the small stranger had cut the point of his heart. Both would have been fatal. We returned to camp with a good load of meat and skins, and were there by 2 o'clock.

Joseph asserted that the spruce partridge had brought us luck. He said that the Indians consider it a good omen to see a partridge in the morning when they are going hunting, and they think the sight of the spruce partridge will bring particularly good luck. They have a saying that "the red eye never tells a lie," the allusion, of course, being to the strip of naked red skin above the eye of the spruce grouse. It was now seen also that certain dreams had foretold the killing of the deer. Two nights before Joseph had dreamed that he saw two horses, one of which had a red belt about it; this was interpreted to mean that we should see caribou, and draw blood from them. The previous night John had dreamed that he had seen a gray horse galloping very fast, and at breakfast that day he had predicted that we would see caribou galloping.

On Saturday we started out for a load of meat. The morning was one of the coldest we had felt, but it was clear, and just before we passed out of the forest the sun climbed over the distant peaks. The scene that we beheld as we came out to the spruce-clad hills was one of rare beauty. Each branch and spray and twig of the evergreens seemed coated with silver and tipped with jewels, and the slanting rays of the sun were reflected from the frost crystals with a brightness which I have no words to tell of. The air was full of tiny particles of frozen moisture, which sparkled for a moment and disappeared, and then, as the light struck them at the right angle, sparkled again with the clear white radiance of a diamond. Everywhere toward the sun these glittering particles filled the air, thick as the snow flakes in a winter's storm, and, like these, always falling and always replaced by others from above. The sight was one of incomparable brilliancy and strangeness.

After showing John and Albert where the meat was, we made a long round of about sixteen miles before reaching camp. On the trail, less than a quarter of a mile from the cabin, we saw where a bull, cow and calf moose had been along during the previous day, but we saw nothing larger than spruce grouse during the tramp. Two of these were captured by the usual device, a pole with a noose on the end, and I at once began to look about for caribou, but on this occasion the "red eye's" reputation for veracity suffered. The last grouse caught was quite wild, and flew three times from one tree to another, but finally thrust its head into the noose while standing on a spruce bough with its wings half spread, clucking and jerking its tail as if just about to take wing.

Sunday was spent in the camp, and Monday we started back. Two of the men were sent down to the mouth of the Indian Fork by the river, which was by this time almost frozen over, while Joseph and William, taking their packs, went with me over to Murray Brook, and leaving their loads there, took a little round along the brook and over to Joseph's Hollow. We saw no deer, but stumbled upon a hungry Labrador Indian, who, like ourselves, was hunting. He talked a sort of barbaric French, only a part of which was intelligible. A month before, three families had been lured by a fishing vessel at Pabos, and since then had been traveling up the river of that name, on their way to the caribou grounds. In all this time they had killed only four deer, and half a dozen porcupines. They had gone hungry many times, and this morning the Indian said, "gas wanger." We took him back with us to the camp at the mouth of the Indian Fork, and loaded him up with about seventy-five pounds of provisions. He was extremely polite, took off his cap and said "merci," and then put his pack on his back and started for the hills.

The next morning when we rose it was raining hard, and five inches of snow covered the ground. The river was rising fast and we made a good run down, and the following day reached Gaspé. Yo.

Camp Fire Flickerings.

"That reminds me."
THE VOTING.

"RIGHT smart of votes, I should allow," remarked the Visitor.

"Guess so," was the reply.

"Reckon there's a bigger heap than you were counting on."

"Calculate not," said the editor.

"Expect they may be coming in yet?" said the Visitor, interrogatively.

"I fancy that your imagination is in accordance with the facts in the case."

"Any of those postmasters vote?" asked the Visitor.

"Yes, several; and one or two who say they are postmaster's clerks; and as their votes were mailed on the Monday morning after the scheme was announced, the subscribers who subsequently received those papers probably found the Supplement pretty well thumbed."

"The voters all settle on about the same stories, don't they?" was the next question.

"Not by any manner of means. The first mail Friday morning, December 21, brought in three lists, and no one story was mentioned on any two of them; in other words, thirty different stories were voted for. By the time the balloting closes there will not be twenty stories of the ninety-six that have not been named at least once as the best. When a card comes in from some one I know, I look over the stories to see which have been named; and it is quite entertaining to observe how the lists are made up. For example, a New England man has picked out all the stories relating to Yankeeedom; a Colorado hunter has selected the 'big game' yarns, a Pennsylvania clergyman's list is almost wholly made up of angling incidents; a correspondent whose initials are often appended to discussions of rifle calibers, has picked out the anecdotes about loading and shooting; and so it goes. The ladies all vote for the owl stories."

"So the women do vote, do they?"

"Just read these notes," said the editor, handing to the Visitor several scraps of letters, and the other read:

"PATERSON, N. J., Dec. 27.—*Editor Forest and Stream:* I inclose two guesses at your 'Camp-Fire Flickerings.' One I made by virtue of the authority in me vested as a regular subscriber; the other was made by Mrs. S., my better half, who claims a right to guess, being a part of myself and a regular borrower of FOREST AND STREAM, frequently borrowing it from me and reading it before I get a chance at it—a sort of postmaster's trade. We have a little private wager as to the merits of our respective guesses, and shall await the result of the guessing tournament with anxious anticipation."

"LOWELL, Mass., Jan. 4.—*Editor Forest and Stream:* Inclosed please find four votes on the 'Camp Fire Flickerings.' For fear that you will think I am trying to vote more than once (a common trick here in Lowell), I will explain who my voters are: Mrs. — is my wife. — is a watchman in our employ who always goes a hunting with me, and — is an errand boy here in our office. I have loaned my paper to several persons, who said they would vote direct. Mrs. — and myself have of course selected different stories; neither of us are willing to compromise in order to make our vote stronger, but we have left it to our two-year old boy, and he says mine are the best. I tell you this that you may count mine twice in case I should tie Mrs. —. We have had considerable fun over the 'Flickerings' and we shall wait patiently for the returns."

"MORNING SUN, Iowa.—*Dear Forest and Stream:* Last night wife and I found enjoyment in looking over the 'Flickerings,' and I inclose our vote. My boy, eight years old, is interested, and if he gets his vote made up in time will send it, too."

"BRIDGEPORT, Jan. 10.—*Editor Forest and Stream:* I inclose herewith two votes on the 'Flickerings,' one for self and one for my wife, who is as great a lover of FOREST AND STREAM as myself, and who, of course, is certain of winning."

"BLUFFTON, O., Dec. 26.—*Editor Forest and Stream:* Find inclosed three ballots on the 'Camp-Fire Flickerings,' one my own, another of my little girl, who has heard me read them,

and the other a brother sportsman here. Please deposit them in the ballot-box and give us a fair count. We confidently expect prizes; but if we don't get them the consequences will not be serious. We have already had lots of pleasure in reading them and laughing over them."

"FORD DU LAC, Wis., Jan. 12.—Your scheme has merit in it so far as it places the poor readers on equal terms with the poor authors, and they ought 'some of them' to have an award. The vote of the 'Bashful Hunter' was put up with some misgivings, but as her opinions on sports of the field and flood are orthodox, we have prevailed on her to record preference."

"Do husbands and wives ever vote alike?" asked the Visitor.

"Not in a single instance; and we have a score or two of pairs. I might regret having provoked all these family dissensions, but possibly the FOREST AND STREAM may be accomplishing a great domestic, social and political mission by this practical test of giving our wives and mothers and sisters-in-law the privilege of voting. I am keeping all these letters," explained the editor, "and when Congress appoints a Woman's Suffrage Committee I propose to lay the documents before them, and show just what a sweet world of domestic discord this great and glorious republic would become if husbands and wives should fall to discussing politics and betting on elections. Why, the system would convert every family circle into a parabolic spiral, and then where would you be?"

"Yes, but politics and 'Flickerings' are two different things; and to decide the merits of Presidential candidates is comparatively simple compared with the task of selecting the best ten out of ninety-six good stories. It is not easy for any one to do that, even though he be not only a gentleman and a scholar, but a sportsman as well."

"You are right. Here are some comments that express just that":

"CINCINNATI, Ohio, Jan. 10.—*Dear Forest and Stream:* Enclosed please find ten numbers of 'Flickerings,' which I trust will knock at least one persimmon. I won't say anything about their being placed in their order of merit, and I expect I have missed some of the best ones, but will 'set both eyes' and turn 'em loose on you, with a hope that a stray pellet may reach a vital spot. I read them over twice, and after selecting about twenty numbers, picked out the inclosed ten, at 'memorandum,' same as old Dave Edwards loaded and shot at the enemy, at the fight at Richmond, Ky. By the way, 'that reminds me,' and at some future time, I may give you Dave's experience in that little 'bresh of arms,' in the shape of a 'Flickering.'—KINGFISHER."

"HARTFORD CITY, Ind.—*Editor Forest and Stream:* I herewith inclose you my vote on the 'Camp-Fire Flickerings.' I consider them all very good, and when I select one as the best I see something in another as good, so that I am in the fix of the duck shooter told about in No. 22, who did not shoot the bird because so many other ducks got in his way. I only hope there will be as many more stories in the coming year."

"I can appreciate how difficult it is to decide on ten. By the way, here is my vote. It was easy enough to write down the best one, you see it is the story for whose merits I have been contending all this time. But the other nine bothered me. Ninety-six are a good many. It's fortunate there were no more."

"There might have been," replied the editor. "See these," and he handed over two notes which read:

"BINGHAMTON, N. Y., Dec. 29.—*Editor Forest and Stream:* Below is my list. If I had only known of your intention I could have written the awfullest funny 'Flickering' that ever was; would have surely taken the prize."

"WASHINGTON.—*Editor Forest and Stream:* I am looking forward with much curiosity for that vote on 'Flickerings.' That was a good and novel scheme, and will be interesting and entertaining. It is a fair and impartial method of settlement; but the stories are all good, and I am sorry I did not have something in them of my own."

"To use a familiar expression, those fellows 'got left.' Is it too late for them? Won't you have more 'Flickerings'?"

"Oh yes. No. 97 will be printed next week, and I have several stories on hand."

"Good!" exclaimed the visitor; "and a man told me one the other day, which he promised to write out. If he does I'll betcher it will take the first prize next winter."

"There you go again," said the Editor. "Hold on, your fish is not in the beat yet. Just wait until this voting is decided, and see whether the story you have been carrying at the head of the procession squeezes into the first seven."

"If it don't I'll give it a prize myself; it's the best one of the whole ninety—"

"Here, read that, and give me your valuable advice," interrupted the editor, handing over a letter from an Iowa man, who inclosed with his ballot "a little incident that happened out there." Would you use that?"

After the visitor had read the story he replied: "I'd throw it into the fire and burn it up; that's about what it is good for."

"You would, eh?" retorted the editor. "Nice editor you would make. Have a little conflagration here all by yourself every time a good joke came in. Might as well set fire to the building and burn the whole thing up at once. That's what it would amount to in the end."

"Go on," returned the other. "You are only demonstrating just what I have contended all the time, that when it comes right down to humor, you are as myopic as a mole. My remark was figurative, jocular, and in dead earnest. I

meant that I would put that story into the FOREST AND STREAM Camp-Fire and let 'er flicker. As to my success as an editor, that, of course, is problematical; but I flatter myself I would know enough to keep out of the kind of box you are in now."

"What's that?" asked the other.

"Figuring up those votes. Do you propose to do it alone?"

"Not much. I have engaged the services of a New York Herald man who has had large experience in computing election returns."

"Do you expect to get a prize yourself?"

"On what?"

"That dismal bone joke in your 'Familiar Talk' advertisement."

"No, that is not a 'Flickering,' although it was intended to 'remind' you of something."

"Thanks, I saw the mercenary moral of the talk, and have a receipted bill for \$4 in my pocket. Why don't you write a report of my call to-day and end up by advertising a dog paper as you did before?"

The editor accepted the suggestion, and now repeats that ballots must be sent in so as to reach this office on or before next Friday, Feb. 1, and as the editor of the *American Kennel Register* so often says, "none can be received later."

The polls are open.

SHE HAS VOTED.

Editor Forest and Stream:

Well, now you have done it! Of course it is hard to have to find fault with an old and tried friend, particularly one so valued and necessary as the FOREST AND STREAM; but have you not taken advantage of your position, of the fact that we can't do without you, to destroy the peace of thousands of once happy homes?"

Yes, it is the 'Flickerings,' and the domestic blazes they have started. I have not, certainly, I have not read each as it appeared, gave the usual chuckle, and "That's good," smiled the mental "That reminds me," perused that deceptive editorial, said "Capital idea," re-read all the pleasant stories without the slightest intention of voting; felt a little sorry that that funny occurrence in the spring of '78 had not been sent on, because you know it was just a shade better than all the other 'Flickerings,' and would undoubtedly have "laid all the rest," if one had only taken the time to write it up, and so on, in the usual modest strain of thought that we of the non-contributing staff indulge in when entertained by the bright thoughts of our more worthy contributing brothers, but which I fear has its foundation in a feeling of envy at their skill as raconteurs. Then a growing desire to show our excellent literary taste and skill in selection, a little more seductive reflection, then, "Well, I might as well vote." Happy thought. "How surprised the editor will be when he sees my card. He will say, 'By Jove, boys, just see how this fellow has hit it; we must get him to contribute to the next issue.' The first poison has done its work; 'vanity of vanities, all is vanity.'"

The pipe is laid down and with knitted brow and severe expression the amateur critic proceeds to consider, and inwardly digest the pleasant labors of his more unselfish friends. Behold him now, severe and judicial in his tastes; no grave and spectacled faculty deciding on the merits of would-be graduates could be more self-satisfied. The eye that could so quickly mark the coming duck now more keenly searches the list of gamy anecdotes to single out and bring to bag the coveted "ten," and one feels as if the rule awarding but one prize to each was quite absurd, for never was one more confident of his ability to "score a double" if the right were only granted. Alas! it was thus felt. Now in my sore straits and hard afflictions I do confess my fault and atone to them for my harsh judgment of the unselected eighty-six. I will in my poor halting words tell the story of my fall.

Like all true sportsmen I have a wife (of my own), and (like all true sportsmen's wives) she takes a gentle yet distant interest in my hunting tastes, lets my gun closet and hunting gear alone, does not cut up my fishing line for strings, nor use my split bamboo to hold the windows up, nor my landing net for a clothes bag. She once took out my oil can to lubricate the sewing machine, and I found myself in a driving rain on a pass twenty miles from home, out for a week's hunt, and no oil; but that is past, and she is in general a very estimable person.

Well, having made my selection, of course I could not "keep down," says I, "A very good idea this, of the FOREST AND STREAM."

"Oh yes, that hunting paper you are so fond of; I don't see what they can find in shooting to write so much about. I am sure you don't look so well in those big boots and that yellow coat, with the dogs jumping all over you, parading around in the mud after a little duck. I wouldn't like to have even a duck see me in such a rig; but men are so queer. What is in the old paper now?"

"Oh, nothing; only they have collected all the good stories published for some time past, and the subscribers are to select the best ten, and the best story gets a prize, and the one that picks out the best gets a prize."

"What, a prize just for picking out the best stories? Why any one could do that; are you going to try? What's the prize? Do you think they will really give it? Isn't it funny? I know I could pick it out better than you, let me see." And away goes the paper, and Madame gravely proceeds to assimilate the yachting columns; then resumes: "Why there is nothing about it here; why this is all about 'lead on the keel,' 'displacement,' 'yaw-rig,' 'cutters vs. sharpies,' 'is that a new kind of sleigh? I didn't know there was anything about sleighs in this paper, I thought it would be all about hunting. Do they hunt in sleighs? Was it that you were talking about to Stone the other night when you said you were 'slaying' the ducks last fall? Oh, dear! where is the old article on my way?"

When I came to, I showed it to her and fled. On my return I found her sitting alone, a sheet of paper, pens and ink before her, covered with those occult female characters beside which a hieroglyph is the Roman alphabet in large print, and there was the FOREST AND STREAM in a very crushed and crumpled condition on the floor by her side.

"Well, you are a nice man; why didn't you tell me any one could do it? I don't say so in the paper. Of course, you didn't want me to see it because you knew I could beat you and

you wanted the prize; but I will vote, and I have picked out twenty nice stories so I can get two prizes."

"But you can only select ten," I ventured. "Well, but there are more than ten good ones; a great deal more than twenty, but I just thought I would take twenty to give some for the rest. I don't see why, if they want us to pick out ten good ones there are twenty just as good, why can't I pick them out just as well. I could have picked out thirty, but you went on and picked out ten before I did, and, of course, I didn't pick out that ten because they might think you told me, and you ought to have given me the first chance; it was very selfish for you not to; I can tell what is good better than you can. I will get the prize, too, so if I don't, I don't think they will truly give a prize." I don't believe they will. Well, I have voted anyway. Oh! do you think they will put my name in the paper? I would die if they did and any one saw it. They would think I wanted the prize, and I don't care a bit for it; I only did it for fun and to show you that I can enjoy a good story just as well as you can, and the stories are all very good. I think I will read that paper now when it comes. Is it really long to wait until February to have it decided? and why don't you write some of those absurd things you tell about when you go hunting? I am sure they are just as funny as any of those old "Flickerings."

She has voted. And, as I have before remarked, "you have done it." MARK NORTH.

St. Paul, Minn., Jan. 7.

The Sportsman Tourist.

LIFE AMONG THE BLACKFEET.

By J. WILLARD SCHULTZ.

Ninth Paper.

IN each tribe of the nation are two painted lodges, one colored red, the other white. The owners of them, like the Bear-men, are supposed to be favorites of the gods, and able to cure sickness. The value of one of these lodges is about equal to fifteen heads of horses, and they are frequently bought and sold. The tradition regarding them is this:

Long ago, the three tribes of the Nation were camped on Bow River. One day two young men were sitting by the river making arrow shafts. Directly beneath them where the water ran swiftly against a cut bank, was a large whirlpool. One of the young men happening to look down, saw a large lodge in the bottom of the whirlpool, and he said to his companion, "Oh look! See that beautiful lodge down there," and his friend looked but could see nothing but the water ever whirling round and round. Then said the other, "I am going down into that lodge," and his companion tried to dissuade him saying, "Do not go, for the River people will grasp you and you will never return." But the young man was not afraid, and pulling off his clothes, he dived into the water.

When he had got to the bottom of the river, he came to the lodge, and it was painted red, and he went round to the doorway and entered it. Only one person sat in the lodge, an old man whose hair was very white and long. He did not speak or look up, but kept singing a strange song. Hearing this, on the inside of the lodge, were many buffalo robes, fine furs, and weapons, all of them painted red, and at the doorway hung a bunch of hoof bells also painted red. Now, after a long time, the old man raised his head and he said, "Who have you come in?" And the young man said, "On the bank of the river I was making arrows, and way down in the water I saw your lodge; and I wished to see the way you live. That is why I came." Then said the old man, "Your heart is brave, return to your people and make a lodge like mine; it shall be Nit-os-ee (of the sun) and the Sun will be glad."

When the young man returned to the bank he found his companion weeping and calling him by name, for he thought he was drowned, and he told him all that he had seen in the underwater lodge. As they stood looking down into the whirlpool the other young man saw a lodge at the bottom and quickly dived into the water. After a time he returned and told his companion of his adventure; the lodge which he found was painted white, and inside were white buffalo robes, and white furs, and white painted weapons, and there was an old man who had spoken just as the other old man had spoken to the first young man who went down. Then the young men hurried home and told what they had seen, and they each made a lodge like the ones they had found in the whirlpool.

Nearly all the different tribes of Western Indians with which the writer is acquainted, build "sweet lodges." The Blackfeet are not an exception, but it is very probable that their traditions regarding the origin of the "sweet lodge" and the purposes for which it is used are different from those of any other Indians. According to tradition, the Old Man first built a sweet lodge and told the people to do so that the sun would quickly hear their prayers.

A sweet-lodge consists of a framework of light willows, covered with cow skin. It is in the shape of a hemisphere, about three feet high and six or seven feet in diameter. In the center a small hole is dug in the ground, in which are placed red-hot rocks. Every thing being ready, those who are to take the sweat crawl inside, the cow skins are pulled tightly down, so as to exclude all circulation of air, and water is thrown on the hot rocks, causing a dense steam which makes the perspiration fairly drip from one's body. When the sweat is over (it generally lasts for an hour and a half), the cow skins are removed and the framework left for the sun, it never being used a second time. During the process of sweating, prayers are offered by the Bear-man or painted lodge man. If neither of these is present, the oldest warrior makes the prayer. Occasions for building a sweet-lodge are: To pray for the success of a war party; to pray for the recovery of persons from illness, and for a continuance of life. E-niiks-ii-p! e-niiks-ii-p! "Let me (be) old, let me (be) old," is the constant prayer of every Indian. Women never enter a sweet-lodge.

Mr. Joseph Kipp once told the writer that when the small-pox was raging among the Indians they would crowd into sweat lodges, take an unusually hard sweat, and then jump into the icy waters of the river. Many, he said, never reached the bank again; hundreds of them being chilled and powerless to combat the strong current, were swept away.

When a war party is made up, the one man noted for his bravery and successful chase of a leader. Before starting it is the duty of the leader to build a sweet-lodge for a Bear-

pipe-man and any others whom the Bear-pipe-man may invite. Prayers are offered for the success of the party, and beside the sweat-lodge the leader erects a pole on which is hung a valuable present for the sun. Each member of the war party, on his parting, has a sacrifice, and sometimes a sacrifice. This sacrifice consists in cutting off a long lock of hair or a piece of flesh, and sometimes a joint of a finger, and giving to the sun. Women also make these sacrifices, the reason for so doing being that if they give the sun a piece of their body he will be glad and preserve them and their relatives from death. Every day during the absence of a war party the Bear-pipe-man mounts his horse and, saddle in hand, rides all through the camp, calling out in a loud voice the names of the warriors. He also visits the lodges of the relatives of the absent war party and sings and prays that they may be successful, the women all joining in the songs. In the event of a war party returning with scalps of the enemy, a war dance or scalp dance is held. All the women wear the shields, weapons and flury of their husbands, and have their hair parted and their faces painted just like a man's. One or more women carry the scalp on slender poles, and have the lower half of their faces painted black. The men, most of them having drums, form into a line, and opposite them stand the women. All sing, and in time to the music the women gradually advance and come up to the men, then fall back, and again advance, and so on. When an enemy is killed near camp it is customary to bring in his feet and hands, which are shot at and kicked around by the women.

When a person dies, and as soon as life is pronounced extinct, the female relatives of the deceased securely wrap the body in cow skins and robes, and having built a stout scaffold between the branches of an adjacent tree, they fasten the corpse to it with innumerable thongs. Contrary to a statement by John Young, of the Piegau Agency, all persons—men, women and children—are buried in this manner. Sometimes, however, chiefs are buried in their own lodges. There are two ways of burying in lodges; one is to suspend the deceased on a post or high enough from the ground to prevent the wolves from reaching it; the other method, as described by Mr. Kipp, is to dig a grave directly under the accustomed sitting place of the chief. After the body has been laid in it a strong platform is built just above it and covered over with stones and dirt. The weapons of a dead person were always buried with him, and in the graves of women and children articles of housefury and toys were always placed with the body. The chief or his wife, for several horses were generally killed. At the burial lodge of a chief which the writer once found, were the skeletons of four horses. Mourning observances devolve chiefly upon the women. The wife or mother of a deceased person lacerates the calves of her legs, cuts off her hair and a joint of a finger to show her grief. The father or husband cuts off part of his hair and goes without leggins for a number of days.

For the first few days succeeding a person's death all the near relatives of the deceased spend the greater part of the time on the hills adjacent to the camp, where they sit and mourn, calling the name of the dead person over and over again, until they become so hoarse they cannot speak. After a short period the men give up mourning altogether. A wife or mother, however, mourns for a year or two, not daily, but at irregular periods.

BETWEEN THE LAKES.

First Paper.

SEARCHING FOR A CAMPING GROUND.

LAST June the Judge, the Greek Professor and the writer set out for a vacation tour in the Upper Peninsula of Michigan. The Judge had been in the country before, but to the Greek Professor and the writer was a veritable *terra incognita*, like most of our new territory. The Greek Professor had a "hump" camper-out, and his hobby is his tent. In the remote part he suffered from an ailment of some sort, and relief came to him in his tent, and he not only believes that the tent cured him, but that it will cure any ailment. No matter what the bodily complaint of a friend, he invariably prescribes "camp life in the woods." And to that prescription is due the fact that the Greek Professor and I went to the woods to pass summer. The Greek Professor has a "hump" in his throat," a veritable, old, hot, dyspeptic lump, more troublesome to eradicate than the worst Greek root he ever ran across; and I was dizzy-headed, so dizzy at times that I had to sit down right on the curbstone and wait for it to pass off, and I didn't feel comfortable over it at all, and the doctor's stuff didn't seem to do a bit of good either, and so when the Judge in his confident manner prescribed his sovereign remedy for us, we said, "Well, we will try your prescription if you will only show us the way; and thereupon he proposed a trouting expedition in the Upper Peninsula, and that is the way we came to go.

"The middle of June is too early by just one month," said the Judge, "to go into the pine woods. That is the height of the trouting season, it is true, but then at that very time the mosquitoes and the 'no-see-ems' are laying it all their own way. But," he added, "I know of a camping ground on Lake Superior where the insects seldom molest, and if we find them too hot for us in the interior, we will go there." And so we determined to set out on our journey as soon as Court and Commencement were done with, and we did so.

Before leaving, however, the Judge said that, in making up an outfit, there were three classes of things to be considered: First, things absolutely necessary; second, things convenient to have along; and, third, things that under no circumstances must be taken. We found a good many things enumerated in the third class by him which we would have put in the first; but we submitted to his dictation in all things, even as to the exact quantity of whisky to be taken, and that the Greek Professor, who was the only preacher in the party, should be burdened with the care of it.

At the appointed time we bid our respective families farewell and made for the nearest station on that great "Fishing Line," the Grand Rapids & Indiana Railroad, which carried us direct to Mackinaw City, whence we crossed over to St. Ignace, which has recently been started into a show of activity by the whistle of the locomotive. I have no interest in any railroad *per se*, and it is, therefore, immaterial to me what road gets the benefit of a sportsman's money, but I do have a "fellow feeling" with all men who go a-fishing, and I cannot help but advert to the fact that one can take a coach at Cincinnati and keep the same road, he so wishes, until he reaches Mackinaw City, the extreme northern point of the Lower Peninsula, provided that coach runs on the Grand Rapids line.

St. Ignace is a place of more historical interest than most people are aware. Indeed the entire region of the Straits is one brimful of historical matter attractive to the historian and the reader. From time immemorial the Ojibwas built their lodges at the Point, and it is said that the *Capitane de Bois* and Jesuit Missionaries as early as 1620, the very year the Pilgrim Fathers landed, visited here, but I do not find the saying verified by any credible historian. Twenty-one years after that date, however, the Pictured Rocks on the south shore of Lake Superior were visited, and forty-nine years after Father Marquette, the fearless priest and intrepid discoverer—the first of white men to look upon the Upper Peninsula—established a mission here and bestowed the name of St. Ignace upon it. It is also visited in the Roman calendar, and this is the date of its first settlement by white men. Six years after establishing his mission the good father died at the mouth of a little river on the east shore of Lake Michigan, not far south of the promontory called "Sleeping Bear," and which was long known by his name. He was there buried, and it is related that one of the two Frenchmen who were with him at the time of his death was so overcome with grief thereat that he had a mortal attack of colic, but ere the disease had done its worst, bethinking himself, he applied a handful of earth from the good priest's grave to the seat of the pain, and at once he was made well. Two years after his death the grateful Indians of the St. Ignace Mission unearthed his bones and carried them with great pomp to St. Ignace. Thirty canoes were in procession, each manned by a crew of painted warriors, and when the end of the journey was reached the sacred bones were received with solemn ceremony and buried beneath the floor of the little chapel of the mission. In 1877, just two hundred years after the burial, an excavation was made on the supposed site of the ancient chapel, and inclosed in fragments of a birch-bark collar, human bones, were found, supposed to have been the remains of the great discoverer.

A purpose has been expressed by the Michigan people of erecting at some safe point, a monumental stone in honor of the discoverer whose name is so honorably linked with that of their own State. While it may be safe to assume that that monument will never be built, yet it is pleasant to remember that the most delightfully situated of all the Lake Superior towns and one which is destined to ever stand high up in the scale of Lake Superior commerce, perpetuates in its name the memory of the discoverer. And after all how much better it is to have one's name perpetuated in a beautiful little city like Marquette, than in a shaft of iron and mortar.

At the hotel in St. Ignace we met a party of Pittsburgh gentlemen, from the woods. They were very boisterous and badly mosquito bitten. They piled each other with jokes, stupid jokes, very, in the breezy air of St. Ignace, but which may have sounded well enough around the camp-fire. I was a good deal astonished at the pertness of these fishermen, but I know that the only trout with them was that they did not know that a good camp-fire just loses much of its lustre when exhibited in a drawing room.

The Pittsburghers had evidently seen a hard time of it, and they drew heavily upon their vocabulary for adjectives and epithets in their vain effort to paint the tortures inflicted by mosquitoes and no-see-ems. No need for that, however, for their necks, ears, forehead, cheeks, chin, nose, hands, wrists, though quite worthless, told the story of their sufferings better than any speech. But speech, but speech, they caught about "fill there was no fun in it," they said, and as they sat around the bar-room stove that breezy June morning, it was plain to be seen that in the future the memory of the biting trout would be growing greener as the memory of the biting insects would be fading dimmer.

The Detroit, Mackinac and Marquette Railroad takes up the Grand Rapids and Indiana passenger at St. Ignace, and carries one hundred and fifty miles through the Upper Peninsula, and lands him at Marquette or Lake Superior. This is not only a new road, but it runs through a truly new country. When we remember that settlements of white men on the Upper Peninsula antedated like settlements by many years in Ohio, Indiana, Kentucky and Illinois, it seems strange that the interior of the region should have remained an unknown region to all save the hunter and trapper until within a very few years.

The early explorers kept to the water ways. Their missions and villages were established on the shores of lakes and banks of streams. There was nothing to lure men out into the pine and hardwood forests, into the marshy plains, and into the tamarac swamps, save the game and fur that there abounded, and so it happened that for over two hundred years after the first settlement was made, the interior remained a practically unexplored region. When the engineers came to run the new St. Ignace and Marquette line, they traversed the one hundred and fifty miles of plain and swamp and forest land intervening without passing the door of a single permanently inhabited cabin. It was a veritable wilderness then and it is not a great deal better yet. The map shows towns planted along the road at convenient distances from each other; but, with only three or four exceptions, these towns amount to no more than a single cabin in which a gang of seccing men are holed.

Such a country, when well stocked with deer and fish, as is the Upper Peninsula, must be a country supremely interesting to the sportsman, and if in this or any of the papers of this series which may follow, there should seem to any one to be a needless prolixity, I trust it will be remembered that the main purpose of the writer is to give information to brother sportsmen.

To cut my story short, we went out the railroad a hundred miles to Mousling Station, where we went down to Mousling Bay on Lake Superior, four miles from the railroad, and there we met Mr. Edward Cox, who generously loaned us the Sand Piper, which John Clark, an Indian preacher, sailed for us down to Miner's Creek, six miles east of the place of our embarkation, where we went into camp and spent a week, part of which was made miserable by the insects. As we were borne over the plains and through the swamps and up the hills between St. Ignace and Mousling, we took notice that the streams were bank full, and that all the low places were flooded. An unprecedented rainfall had visited the region all through the early summer, a circumstance by no means calculated to repress mosquitoes, gnats, and flies, as every sportsman knows, and now when we had made our camp near the lake shore, we found that even there we were so fiercely assailed that life was a burden, and more than that, the waters were so shallow that we could not get to the water in Miner's Creek, that the trout disdained to rise to fly, or nibble at a worm.

Our stay here, however, was not wholly devoid of incident. The Judge conceived of a plan whereby he hoped to circumvent our tormentors during the night time at least,

DOWN THE YUKON ON A RAFT.

BY LIEUT. FREDK SCHWATKA, U. S. ARMY.

Fourth Paper.

and he proceeded at once to carry it out by constructing a sort of curtain out of mosquito-bar with which he surrounded our bed. At the appointed time we went to bed, but it soon found the curtain was no protection. As many mosquitoes seemed to be on the inside as on the out. Thereupon the Judge declared that "there was nothing like gunpowder for mosquitoes anyhow," and at once he proceeded to clear the tent with the fumes from burnt powder. Without striking a light, he procured his powder and threw it off beneath the curtain, and as the fumes rose the mosquitoes fell from the bar and neatly up to the ridge-pole of the tent, where the Greek Professor lunged out to bed under the belief that the camp had blown up, and it was sometime before we could make him understand that nothing more serious had happened than the destruction of a dozen yards of mosquito-bar.

But the wind shifting from the south to the north during our stay here, thereafter we had no more trouble with the insects. But from another source came a disturber to our short our sleep. Hedgehogs are very numerous hereabouts, and if there is one thing in hedgehogdom to do better than crawl at a head during the night hours, we fail to discover it. No sooner had the insect nuisance abated than we began to observe the hedgehog, and the Judge, who is exceedingly nervous and easily disturbed of nights, soon had his teeth on edge at their persistent and exasperating gnawing. On more than one occasion he went out and whipped the brutes off, and finally he declared that at their next visit he intended to go out and kill them outright. The next visit was soon made, and out the Judge went, "hissling threatenings and slaughter." The Greek Professor and I were not so easily discomposed as the Judge, and we rather enjoyed his nocturnal raids, and never more so than this night. We heard him thrashing on the ground and beating on the logs in an endeavor to frighten them off, and finally we heard him say, "Darn you!" We knew then a crisis was about to come. The Judge never swears, but when greatly provoked he sometimes uses that meaningless "darn." The next visit was soon made, and then the Judge was momentarily roused. We could see and hear him as he was evidently getting into position, so as to hit something hard; after which came a swift, sharp "zweep," followed by such a clatter of a bounding kettle as brought us both to our feet.

"Merciful fathers!" exclaimed the Greek Professor, as he ran out of doors. "What is the matter?" "Darn it!" said the Judge; "I mistook the pot for a hedge hog."

And so we laughed ourselves to sleep that night. But we had not to be lulled to sleep, for the Judge was the only man whose acts brought merriment to our camp. The Greek Professor occasionally got in a little work which made sport for us. He and the Judge both were fishermen, and the latter had killed a deer, several of them in fact, but the former had not. He was, as might be expected, peculiarly anxious to add one to the list of his achievements, and had provided himself with a muzzle-loading squirrel rifle for that purpose. Hard by our camp was a blind within convenient distance of a "sign," which the Indians at some previous time had made, and which, judging from the "signs," was then frequently visited. The Greek Professor expressed himself as quite sure that if he could once get a lead on a big buck the buck was his, and when the Judge hinted that the buck game was apt to supervene at such critical moments the Greek Professor fairly "laughed him to scorn." Full of hope and confidence, the Greek Professor went forth early one cool morning to kill his first deer. Not long did he hunt, but he was soon back at camp. He had hoped and hoped to meet suddenly made its appearance at the root of the pine where the salt had been strewn. What a splendid mark! Less than fifty yards away and standing broad-side to him. Bang goes the Greek Professor's gun. The buck looks around a moment and then licks away at that precious salt. The Greek Professor is in a tree and the foolish buck never once thinks of looking up into a tree for a Greek Professor with a squirrel gun. The gun had gone off before the Greek Professor was quite ready to fire. In fact, it was the powder direct from the horn. Then he aimed a bullet down without a patch and dabbed on a cap, and this time he took aim. At least he thought he did, but when questioned and cross-questioned afterward about it, he had no recollection of seeing any but the forward sight. Anyhow "bang" went his gun the second time, after which the Greek Professor could tell no more. We heard three shots fired, but the Greek Professor was so far gone in the delirium that invariably follows a first attack of buck ague, that we cannot make him believe that he shot three times at that deer and then came with a bullet in his gun and no powder behind it!

In one time we procured a boatman to carry us further on our way. The Judge assured us that on a high point of land at Beaver Lake, about nineteen miles east of Moosling and beyond the eastern extremity of the Pictured Rocks, we would surely be exempt from the insects, and Captain Jim Kishkater coming for us by previous arrangement, we set off on our way, and by the middle of the afternoon had in the ornate language of Bancroft, the historian, "sailed by the cliffs of pictured sandstone, which for twelve miles rise three hundred feet in height, fretted by the violence of the chafing waves into arches and bastions, caverns and towering walls, heaps of prostrate ruins and erect columns, crowned with fantastic entablatures," and had landed at the mouth of the Ahmeek-we-se-pe or Beaver Creek, where we made our camp on a mud-swept promontory, and for three weeks made it our home. D. D. BANNA.

A KNOWING FISH.—A Philadelphia paper credits Rev. Dr. Wayland Hoyt with this: "I was in California. In San Francisco, near the water works, was a large tank, and in that tank was a fine large California trout. It was very tame and the clerks used to catch flies and hold them over or take the fly from their fingers. Well, one day an idle clerk, tired of the usual thing, placed a nice fat fly upon the hook of a bent pin. His troutship came up as usual and was caught. The clerk released him and enjoyed the joke. But would you believe it, after that day twenty hotel clerks could stand around that tank and that fish would take flies from every one except the man who played the loaded fly on him."

We left our raft alongside the beach of Lake Tahk'oo in the last article, and leaving it there for a short while a stroll along its shores showed a great number of well-trimmed logs that strongly resembled telegraph poles, and would have been sold for those necessary nuisances in a civilized country had they been there. They were finally made out to be the logs used by Indians in rafting down the stream, and well trimmed by constant attrition on the rocky beaches while held there by storms. Most of these were observed on the northern shores of the lakes where the current, slight as it is, coupled with the prevailing south wind, naturally drifts them. I afterward ascertained that rafting was quite a usual thing along the headwaters of the Yukon, and that we were not pioneers in this mode of travel by any manner of means, although we had thought so from the direct proposition of the natives, who were continually making us to our probable surprise their own. The "cottonwood" canoes already referred to are very scarce craft, there probably not existing over ten or twelve the whole length of the river to old Fort Selkirk, and many of their journeys up the stream are performed by the natives on foot, carrying their limited necessities on their backs, and when they return a small raft of two to six or eight logs is made and they float down with the current in the streams and pole and sail across the lakes. Comparing their logs with telegraph poles gives one a good idea of the usual size of the timber of these districts. The scarcity of good wooden canoes also is explained by this smallness of their size; while birch bark canoes are unknown in this part of the river until old Fort Selkirk is reached.

This same Lake Tahk'oo, or certainly one very near to it, had been reached by a Mr. Byrnes in the employ of the Western Union Telegraph Company. Many of the readers of the FOREST AND STREAM are probably not acquainted with the fact that the late Mr. Byrnes, who conceived the original plan of the telegraph line running by way of Behring Straits, and that a great deal of the preliminary surveys, and even a vast amount of the work had been completed when the success of the Atlantic cable put a stop to the project. The Yukon River had been examined from its mouth as far as old Fort Yukon (then a flourishing Hudson Bay post) some one thousand miles from the mouth of the river, and the route had been previously explored by the Russian and Hudson Bay trading companies. Mr. Byrnes, a practical miner from the Caribou mines of British Columbia, crossed the Tahko Pass, already cited, got on to one of the sources of the Yukon and descended it to the vicinity of the lake of which I am writing. Here it appears he was recalled by a courier sent on his trail and despatched by the telegraph company, who were now mournfully assisting in the jubilee of the cable's success, and he returned to his former occupation.

Whether he ever furnished a map of this journey, so that it could be called an exploration, I do not know, but from the books founded in part on that trip I should say not, considering their great error. One of these already noticed by its title said in a mournful way that, had Mr. Byrnes continued his trip only a day and a half further in the light birch bark canoes of the country, he would have reached old Fort Selkirk, and that although it has previously been known, had he reached Selkirk, he would have had that credit he recorded it, however rough his notes may have been, but he would never have done so in the light birch bark canoes of the country, for they do not exist, as already stated, and as to doing it in a day and a half, our measurements from this point to Selkirk show nearly 450 miles, and observations show that the Indians seldom exceed about six hours in their cramped canoes, and would have to go at the rate of a little over a mile and a half for each hour. At this canoe rate along the whole river, across Behring Sea and up the Annoor, the telegraph company need not have completed their line along this part, but just turned their dispatches over to these couriers and they would have only been a few hours behind the lightning, if it would have been worked as slow as it is now in the interest of the public.

We passed out of Tahk'oo Lake, some eighteen miles long, (forty-five by one authority, who never saw it a little after 2 in the afternoon, and who was on the shore of the lake) to a river that we had yet met on the trip, about nine miles long, and quit it at 5, which was quite an improvement in our lake gait even at the fastest. When on the lakes a high tree near the beach projected against the distant hill would creep along its outline like an application for a "six months' leave, and then suddenly cutting a swift outlet they would go buzzing along like an officer taking advantage of the leave. On the right hand bank we saw a tolerable "big white" salmon, and in the water above four canoes from the entrance. Near it in the water was a swamped Indian canoe, and one of our natives bailed it out, and in a manner as novel as it was effectual. Grasping it one side and near the center, a rocking motion, fore and aft, was kept up, the bailer waiting until the recurrent wave was just striking the particular end that he tipped down, and as this was repeated the canoe was slowly lifted until it stood at his waist, with not enough water in it to sink an oyster-camp, and in a space of time not much greater than it has taken to relate it. This house was deserted, but evidently for only a while, as we still dea of their material of the chase and fisheries were great to be seen hanging inside on the rafters. "There were also a great number of dried salmon in the house, one of the staples that now commence appearing on this part of the river, nearly 2,000 miles from its mouth. This salmon, when dried before putrefaction sets in, is bearable in its eating qualities, ranking somewhere between Linburger cheese and salted fish in the scale of delicacy. It is taken from the Indians as we floated by, we would use it as a lunch in homopathic quantities, until some of us got so that we really imagined we liked it.

Floating down the river and coming near any of the low points we were at once visited by myriads of small black gnats, whose pressing questions were very pointed, and which formed a handsome addition to the mosquitoes that did not diminish in the least as we descended the river. The only protection from them was in being well out from land and a good wind blowing, or when forced to camp on shore a heavy smoke would often reduce them to a bearable minimum. When we camped that evening on the new lake the signal smoke of the Tahk'oo Indians was still burning ahead of us some six or seven miles, which showed how much we had been mistaken in estimating the distance to it the day before. A tree has something definite in its size, and even a butte or a mountain peak has something tangible

on which a person can base a calculation for distance, even a cloud has a form which can be grasped by an average mind, but when one comes down to smoke I think the maximum of indefiniteness has been reached, especially when one wants to estimate how far away it may be, and it is not until one has been before the plain where it is still worse than in a hilly country, where one can at least say that it is beyond the hill back of which it rises, but when looking down a river valley often no such guides are to be had. I remember when traveling through the sand hills of Western Nebraska that a smoke that was estimated to be ten or fifteen and possibly twenty miles away took two days' long traveling in an army ambulance to reach the blackened district where it had been.

The new lake—which I named Lake Marsh after a well-known scientist of our country—was composed of clay stones, jumbled together in a rocky confusion, and where the water reached them and beat upon them it had reduced them to a sticky clay, not easy to walk through. This, accompanied with the vast amount of mud that the glacier streams had brought down, and which was distinguishable by its whiter color and impalpable character of its ingredients, nearly filled the new lake, at least for wide strips along the shores where it had been beaten up by the storms. The raft stuck several times, although drawing a little less than two feet of water, at distances from the shore of from fifty to a hundred yards, and the only alternative was to wade ashore in our rubber boots and tie the raft by a long line whenever we wanted to camp. One night, an inshore wind of no light character coming up, our raft, while unloaded, was gradually lifted by the high waves coming in, and brought a few inches higher each time, until a number of raft-boards had been made.

The next morning when loaded, the work to pry it off its easier to conceive than to describe, but it taught us a lesson that we took to heart, and thereafter a friendly pod or two was generally given at the ends of the cumbersome craft to keep it aloft as the load weighted it down. When the wind was blowing vigorously from some quarter—and it was only when this was blowing that we could set sail and make any progress—these shallow mud banks would tinge the water over them with a dirty color that was in striking contrast with the blue water over the deeper portions, and by catching this demarcation line closely when under sail, the most favorable points could be made out to reach the bank for camping purposes.

Going into camp on the lakes was generally quite an easy affair. Sailing until 9 or 10 o'clock in the evening if the wind was fair, it was still light enough to see from the raft where a probable camping place would be, and when we got close into the shore, if it did not suit us, we would creep along near by until we found one that did. There was always plenty of wood, and, of course, water, almost everywhere, so about all that was needed was a dry place large enough to pitch a couple of tents for the white people and a tent fly for the Indians, but simple as the latter seemed, it was very often quite difficult to obtain. It was really seldom that we found places where tent-pins could be driven in the ground, and when rocks large enough to do duty as pins, or fallen timber or brush for the same could not be had, we generally put the tent upon us, spread our blankets there, crawled in, and sticking our nose in the air (not from pride, but because we had to), we went to sleep—when the mosquitoes would let us. The greatest comfort in pitching the tent was in keeping out the mosquitoes, for then we could spread our bars with some show of success, although the constantly recurring light rains made us often regret that we had made a bivouac, not particularly on account of the slight wettings we got, but for the constant fear that it was going to be put on the shore to our discomfort, and that so we had to resort to sleep out with only a blanket or two over them, and have a great cloud sprinkle a drop or two of rain in their face and not imagine that the deluge was coming next. I have tried it for ten or twelve years, and have not got over the feeling yet. If, after camping, a storm threatened, a couple of skids fore and aft were placed under the beveled logs to prevent breaking it off. Both ends of the raft were, of course, secured by ropes. When the wind set in from ahead, it was possible of our gaining. The burgeon on the raft, like that in an army wagon or of a pack-train, in a few days so asserted itself that the part necessary for the night's camping was always the most handy, and but a few minutes was required after landing until the evening meal was ready.

So important was it to make the entire length of the river (over 2,000 miles) within the short time encompassed between the date we had started and the probable date of departure of the last vessel from St. Michaels, near the mouth of the river, for civilization, that but little time was left for rambling about the country, and that so we had to make a dash for inland, and most of all make an inspection of the nature of the country, I felt over my shoulders the constant fear that by so doing I might be compromising our chances of getting out of the country before winter would effectually veto it. Therefore, from the very start it was one constant fight against time to avoid such an unwished for contingency, and the readers of the FOREST AND STREAM must expect only such incidents as would arise from starting early, going all day, camping late at night, and reworking the programme from day to day. On the 28th of June a good fair breeze on Lake Marsh, continuing past sunset (which it seldom did), we kept on our way until well past midnight before it died out with us. So bright was it at midnight that type the size of FOREST AND STREAM could easily be read, and but one star in the blue unclouded sky made its appearance, and that was the brilliant Venus.

Lake Marsh was the first water that we could trust in which to take a bath, and even then—and for that fact the whole length of the river—it was only on still, warm, sunny days that we could do so. Below old Fort Selkirk on the Yukon, where the White (so called on account of its muddy waters) River comes in, bathing is almost undesirable on account of the large amount of sediment the water holds, its swift current and muddy banks allowing it to hold much more, and furnishing a ready base of supplies, therefore, than any river of the western slope that I know. Its temperature also seldom reaches that point that will allow one to plunge in all over with any comfort. One annoyance in bathing in Lake Marsh in the warm, muddy water on one day was the large number of "horse" flies—if they could be called such—that made it unsafe for a person to stop swinging a towel in the air, for if they did it was uncertain when a descent would be made by them and a piece bitten out that a few days later would look like a United States brand on a Government mule. One person's hand bitten by one of them was completely disabled for a week, and at the moment of fulfillment it was hard to comprehend that you were not

disabled for life. With "horse" flies, gnats and mosquitoes, and everything that can bite except mad dogs and "bunko" steers, the Yukon Valley is not held up as a paradise for future tourists.

The almost constant southern winds which had been blowing since we left Lake Lindeman, and which had been our salvation, we could see were constant companions of this country by the way the small spruce and pine trees invariably leaned to the north, especially where their isolated condition and exposure on flat, level tracts gave the wind full play to influence their upright positions. Near Lake Lindeman a dwarfed contorted pine was noticed that was not only twisted around its axis two or three times in its ascent of fifteen or twenty feet, but also its axis was twisted in a spiral that made two or three turns in its path, and then as if it had confusion to disorder, it was bent in a graceful sweep to the north to conform to the general leaning of all the trees similarly exposed. There was a general brash condition of all the wood which was very apparent when we started to make piers for binding the raft, while it was seldom that a log was found large enough to have been available for cutting for timber.

The little cove into which we put on the 19th of June, closed by a gale, by a singular streak of good fortune had just the logs we wanted, both in length and size, to repair our raft, and I do not think we saw such a good chance again on the upper waters of the Yukon. Further down every island—and the Yukon has probably nearly as many islands as any dozen of rivers of the same size in the world put together—has its upper end covered with enough timber to build all the rafts that a lively party could construct in a year. Lake Mark also had a few terraces showing on the hillsides, but not near so well marked as further back on some of the other lakes noticed. Along these, however, were pretty open prairies, covered with the dried yellow grass from last year, this summer's growth having evidently not yet forced its way through the dense mass, and more than one compared them, irregular as they seemed, with the stubble fields of oats or wheat in more civilized climes. I doubt not but that they furnish good grazing to mountain goats, caribou and moose, and would be sufficient for cattle could they keep on friendly terms with the mosquitoes. According to the general terms of the survival of the fittest and the growth of muscles the most used to the detriment of others, a band of cattle in the far future in this district would be all tall and no body, or the present status of mosquitoes would have to cease.

Natural History.

WINTER'S TALES.

THERE are goings on about us under cover of night, which are unknown to us and unsuspected when the ground is bare, but fully revealed when the earth is asleep under its white blanket, upon which the record is written so plainly that he who runs thereon may read it.

Who ever thought that wild shy Reynard came so near us of his own free will, till the prints in the snow informed us of his nightly visits? Now we see that he has been within gunshot of the house while we were asleep, and we can read every step of his devious course as clearly as we can read his tracks. Here he came to the footpath which leads to the barn, and made a full stop to take a suspicious sniff at it before he ventured to cross the tainted trail of his arch enemy. Then he tried the flavor of a fallen frozen apple, and found it not to his taste, for one small bite satisfied him. Then he heard the squeak of a field mouse and turned aside to unearth or unsnow a morsel more to his liking. A waft of the best mouse came to his nostrils here, and he recommitted that paradise at a safe distance. We can almost see his sharp, wistful nose turned toward it, itching with the tempting fragrance. But discretion got the better of his valor, and his stomach and he veered off. Perhaps the baying of the house dog quickened his pace, for he made some flying leaps before he again fell to printing leisurely footsteps, tending toward the hills. Doubtless he made the same rounds in spring, summer and fall night, but in the morning there was no sign of his recent presence perceptible to any but the hound.

We seldom see the weasel, for he has bargained with the seasons to hide him, yet these footprints, in regular pairs alongside the wall, only distinguishable by their smaller size from those of his larger cousin, the mink, show that he is one of our near neighbors. He ought hardly to be an unwelcome one, though he sometimes makes sad havoc among the poultry, for he wages constant warfare upon the hordes of meadow mice, and is an unrelenting foe of the rat, more terrible than the cat. He is braver than puss, and so sleeker that no rat hole is inaccessible to him; the liethest of our four-footed things.

In February and March we may read the record of the mink's journeys along the streams, and learn what a traveler he becomes when his heart is set on burning. No matter what the weather is, frost cannot cool his ardor nor rain quench his fire when he goes a-wooling, miles and miles away from his home burrow.

After a thawy night we see how near to our door the skunk has walked or cantered, deliberate in either pace. Taking his back track, we may find that he has been all winter so near us as the barn, keeping house under the hay-mow. We would have trod gingerly had we known that we were delving down toward such a Chinese bomb, when we were pitching out the fodder. He seems bent on our evil now, but waits patiently to get a breath of fresher air and to see something of the world again by starlight. It takes a lurch of the offal left from the butchering, or the carcass of a winter-killed sheep, but he flees not to visit the hen-roost.

We knew that Grimalpink was a night-walker, but now we have knowledge of where he has been and something of his doings while he was abroad, though it is hard to tell what took him to the woods at this season, when birds are scarce and their nests empty. He is nothing but a diminutive, fat-tailed panther at best, and it is likely that the wild part of him took the tamer half away for retribution in the forest shadows. On his way through the orchard he turned aside to make a spring at a low-hung vireo's nest, and its torn bottom shows that his leap was true. We think he was fooled jumping at a bird's nest in winter, till our friend, the bee-hunter, a cunning reader of the book of Nature, after looking a little, says: "Perhaps you are looking at a goldfinch after all. You are the honored litter of the nest that the wind was blowing right to him where he turned out of his

course to come here, and it carried to him the scent of something, probably a deer mouse, curled up for a nap in the old nest." He has been to the barn in the meadow to look after his stock of mice there; and if we come upon him in this green preserve of his, his old wildness will show itself in his skulking, sneaky modes, and will glare at us out of his green eyes, as he crouches in a dim corner, half at bay, half ready to turn tail, enough to send a shiver down one's back. Can this savage be the same mid-looking fellow that was purring so gently under the kitchen stove last evening?

These tracks, near the granary, beginning and ending so abruptly, are not those of some small plantigrade, as one might think, but the footprints of the bandsome as well as the most unpopular of our winter birds, the bluejay. He will steal where we cannot see him, and he is so beautiful, but his beauty and his presence here in winter should atone for many tricks and shortcomings. Now, he has only been picking up the scattered kernels that have fallen through the floor, and perhaps varying his scant fare with a few shreds of fat torn from the pig's plucks hanging against the crib.

Further afield where the tall weeds overtop the snow, it is in the tracks with the tracks of snow buntings, true birds of winter, wearing its liver of sea-leaf and snow, with voices like the creaking and linking of ice. They bring the far North down to us, and make us neighbors to the Esquimaux and Laps, whose nets and springes they have escaped. How lately have they seen those wild people and how were they getting on when last they hurried past their igloos and reindeer-skin tents?

In the fall we saw no signs of meadow mice, and hoped that adverse seasons had cut off their tribe, the snow now shows so many of their shafts, bored from below, round as auger holes, and so many little tracks radiating from them that we know how busily they are tunnelling next the earth, and that young apple trees are not likely to get unscathed by them, nor fox, owl, hawk or weasel to go hungry for lack of them. Yet, when the snow is very deep, they rarely come to the surface, but carry on their work unsuspected, till spring or a great thaw brings it to light.

Once in many winters, not in the depths of the ice season, but near the beginning or end, we see a puzzling track leading up some little brook, disappearing here and there, as he who made it found a way under the shell ice, always walking or rather waddling with broad webbed footprints, wide apart, and between them the narrow trail of something dragged behind. What was it, beast or bird? Any trapper will tell us that it was a muskrat who, lured by the smell of food and water, persecution of enemies, hatred of his kind or desire to see something of upland life, had forsaken the luts of the marshes and the adjacent burrows, and come exploring this world unknown to his people. Doubtless he saw much that was new to him, and suffered the hardships of cold, hunger and thirst, like many another explorer. The rudder that steered him so dry wintry waste, and doubtless here we saw his track some fox or great owl had made an end of it and him.

If we find no more tracks to read in the woods than in the fields, there are some we do not see in the meadows and pastures. Here the ruffed grouse has rayed the snow with his well-defined and unmistakable footprints, and left the mark of his pinions when he took flight to a tree. We know the very branch whereon he alighted by the clods of snow beneath it, left by the snow he kicked up in his flight, or by being snowed under. Here is the mould of his plump body where, by the signs left, he must have lain for days, warming himself under the snow quilt that the last snowfall spread over him. When he had become warm enough and hungry enough, he rent it asunder and went hurtling to the nearest birch to fill his crop with buds. He never leaves his couch on foot, but bursts from it as if he had suddenly felt an inward gnawing—or the danger of an outward one if Reynard's nose should sniff the secret of his hiding.

Here is the broad trail of our northern hare sunk but little below the surface of the lightest snow, for he has his snow shoes always with him. What has he been so busy about in the long winter nights to make so many tracks? One hare will make you think that a hundred had been here, if you will believe what he has set down; yet he is not a voter nor has the census taker anything to say to him. Winter as well as autumn he carries his brown coat, but his brown coat still he looks like a fluffy snow ball as he sits in his form under a snow-laden evergreen. Such faith has he in his disguise that he will let you almost lay your hand on him before he takes to his heels. But try to touch him and a little avalanche goes shooting over the snow, its course more to be seen than itself, by the sway and jar and sudden unloading of low branches.

The fox has his head on a rock and slept with ears and nose alert if not with an eye open, ready to start at the first sound or scent of danger. He has left some threads of his longest fur on his cold mattress to tantalize the hound who has worked his slow way hither on the old trail. And here is the track of the hound following both these others, and easily enough known from that of the wood chopper, who has gone straight to his work, only stopping to light his pipe, as we may see by the half burnt match and the stamp of his axe and binney pail close by the halted boot prints.

The gray squirrel has been out digging for food, and by the fragments he has left—here chips of a pine cone, there the empty shell of a nut—we see that in every place where he went down to the mold he found some morsel to help him in the stress of winter. What fine sense directed him? If you think it only chance, try how many times you will have to probe the unmarked, even whitens before you strike either cone or nut. But in any pleasant day, and in a little red squirrel lead from one tree to another, under foot, and there are lost, for they have gone homeward or a wandering by the air line of the branches. We seldom see the bigger of the two in our winter walks, for though we may hear him barking not a furlong away, if we attempt to approach him the crunching of our footsteps alarms him, and he puts a whole great tree trunk or the wall of a hollow one between himself and us. But in any pleasant day, and in a little red squirrel lead from one tree to another, under foot, and there are lost, for they have gone homeward or a wandering by the air line of the branches. Pacific District (Washington, Oregon, California, Nevada)—Supt., L. Belding, Stockton, Cal.

The home of each observer is called a station, and is recorded by number upon the books of the committee. The committee particularly requests that all persons who read his circular, and are willing to aid in the work, will immediately communicate with the superintendents of their respective districts. Those residing in districts whose superintendents have notes yet been named may address the chairman.

It is the duty of each superintendent to exert himself to the utmost to increase the number of observers in his district; to answer the questions they may put to him concerning the details of the work, etc., to collect at frequent intervals the product of their labors; to ascertain from these data the whereabouts of certain species in winter, and the times of leaving their winter homes; to determine if possible the number and extent of the chief avenues of migration within the limits of his district, and the average rate of speed at which the different species travel; to locate the breeding areas of the summer residents; and, finally, to submit the result of the season's work to the chairman of the committee. The chairman shall, in turn, arrange, condense and systematize the material received from the superintendents of the several districts, and shall present to the Union the fruits of the joint labors of all the winter hunters; to determine if possible the deductions or generalizations he may have made upon the same.

INSTRUCTIONS TO COLLABORATORS.

The data collected may conveniently be arranged in three general classes: a. Ornithological Phenomena. b. Meteorological Phenomena. c. Contemporary and Correlative Phenomena.

(a) Ornithological Phenomena.

Each observer is requested to prepare, at his earliest convenience, a complete list of the birds known to occur in the vicinity of his station, and to indicate (by the abbreviations enclosed in parentheses) to which of the following five categories each species pertains:

- 1. *Permanent Residents*, or those that are found regularly throughout the entire year (R).
- 2. *Winter Visitors*, or those that occur only during the winter season, passing North in the spring (WV).
- 3. *Transient Visitors*, or those that occur only during the migrations, in spring and fall (TV).
- 4. *Summer Residents*, or those that are known to breed, but which depart southward before winter (SR).
- 5. *Accidental Visitors*, or stragglers from remote districts (A).

It is desirable also to indicate the relative abundance of the different species, the terms to be employed for this purpose being: *Abundant, Common, Tolerably Common, Rare.*

In many species, especially in the case of the females, hence it is important to note the sex of the first couers, and the date at which the opposite sex is first seen.

In recording arrivals and departures it is highly important to distinguish between the movements of the great bulk of the species and those of the forerunners or advance guard. For this purpose two dates should be recorded for the incoming, and two for the outgoing of every non-resident species, as follows:

- 1. The first appearance of the species (F).
 - 2. The arrival of the bulk (BA).
 - 3. The departure of the bulk (BD).
 - 4. The last individual seen (L).
- In addition to the above, which may be regarded as essential data, there are other noteworthy details that bear more or less directly upon the complicated problems involved in the study of migration. Among such may be mentioned the bodily condition of the bird (whether fat or lean), the moult, and the periods of song. The time of mating, when observed, should always be recorded.

(b) Meteorological Phenomena.

Extended meteorological data are not required, though the observer would derive material assistance from a systematic weather record. The committee desires information upon:

- 1. The direction and force of the wind.
- 2. The direction, character and duration of storms.
- 3. The general conditions of the atmosphere, including rainfall.
- 4. The succession of marked warm and cold waves, including a record of all sudden changes of temperature.

(c) Contemporary and Correlative Phenomena.

The committee desires that the data under this head be as full and complete as possible, and requests exact information upon:

- 1. The date at which the first load is seen.
- 2. The date at which the first frog is heard.
- 3. The date at which the first tree-toad or "peeper" is heard.
- 4. The dates at which certain mammals and reptiles enter upon an increased low, or hibernation.
- 5. The dates at which various insects are first seen.
- 6. The dates of the flowering of various plants.
- 7. The dates of the leaping and falling of the leaves of various trees and shrubs.
- 8. The dates of the breaking up and disappearance of the ice in rivers and lakes in spring, and of the freezing over of the same in the fall.

C. HART MERRIAM,
Chairman of Committee on Migration,
Locust Grove, Lewis County, N. Y.

NAMES OF GAME BIRDS.

I HAVE been almost provoked into writing on the subject of the quail, the partridge, the grouse and the prairie chicken, or grouse again, if that be the name. These four distinct kinds of birds are so confounded by sportsmen in their writings, that one scarcely can tell what bird is meant unless the writer happens to state on what kind of ground or place the bird was found. The bird that announces himself as "Bob White" is the quail, and nothing else, the United States and Canada over. The bird that utters an energetic low, or ruck, or hoot, in a conspicuous place, and has a bunch of black feathers for emulcates, is the partridge the same territory over. The bird that crows and makes a row generally on the prairies of the Western States is the pinnated grouse, and the bird that inhabits the cold northern regions of Canada, and is almost unknown south of 45 degrees north latitude is the grouse.

I have never seen a grouse south of the Ottawa River. This bird I am sure the majority of your readers know very little about. In these cold winter storms that occur in that section this bird becomes very stupid—some call it tame—so that a man on snow-shoes can hunt them successfully with a stick or pole, knocking them out of the trees while they are feeding on the buds. The male bird is very dark, almost black, and the female gray or lighter in color. They become very poor toward the spring of the year.

I give these peculiarities to identify these four birds. I have shot my share of them, and have seen them shot by better marksmen than I, but I don't like to hear a sportsman say that he has shot a quail and a partridge in a row, and I dislike still more to hear one say, that he killed a pheasant, a partridge and a ruffed grouse, all with one .44 caliber bullet out of his rifle; and I don't like to hear a sportsman talk about killing grouse who never was worth of Mason and Dixon's line.

I may be liking the line too exactly, but I want to be cor-

rected if I do, and I want the FOREST AND STREAM, to whom we look for authority, to set us all right on this subject.

ALDERSON, W. Va.

[We publish the above letter, because it shows very clearly one phase of the misapprehension which exists among some of our readers about the names of our very commonest birds and mammals. Our correspondent dislikes to have names misspelled, yet his letter shows that he is ignorant of the zoological relations of the birds about which he writes. We may tell him that the birds which he defines, and calls partridge, pinnated grouse and grouse, are all of them grouse. The first is the ruffed, the second the pinnated, and the third the spruce grouse, and any one of them may properly be called grouse. "Bob White" is commonly called quail in the North, but throughout the South he is usually, and more correctly, called "partridge," which name in the New England States is invariably applied to the ruffed grouse. The ruffed grouse is also called pheasant in Pennsylvania, Minnesota and the South, very incorrectly, of course. Strictly speaking, we have no true quail or partridge indigenous to this country, but "Bob White" and his Southwestern cousins belong to the partridge family (*Perdix*), and are so closely related to the true partridges that it is not a misuse of terms to give them that name.]

TWO HERONS.—East Onondaga, N. Y., Jan. 12.—*Editor Forest and Stream.*—More trouble. Your statement that my strange bird is very common has led me to think that the authority I swear by—the only work I possess—is indefinite and vague. We have a bird that is very common, nesting on the bank of Onondaga Creek, belonging to the family of waders, which I have long supposed to be the least bittern (*Ardeola cristis*), but since the strange bird (to us) is the least bittern, what is the bird by its styled least bittern? I send you the head and wing of both, please name them and oblige not only myself, but several in this locality interested in the study of animated nature. We also have the bittern (*Botaurus lentiginosus*). [The specimens sent are the head and wing of a green heron (*Butorides virescens*) and those of a least bittern (*Ardeola cristis*). The smaller specimen is the least bittern. We did not say that the least bittern was a very common bird, but that it was not very uncommon.]

COLONG SPARROWS.—Cleveland, O., Jan. 14.—While out collecting Jan. 12 with a friend we came upon a flock of tree sparrows, and out of five birds which we secured, three proved to be song sparrows. These birds are occasionally found to winter here in small numbers during mild open winters, but this has been anything but a mild winter, as the thermometer has stood at zero and below for days at a time.—S. R. INGERSOLL.

LATE SNIPPE.—Cleveland, O., Jan. 14.—On the 33d of December a specimen of Wilson's snippe was brought to me by a person who said he had shot it the day before. This is the latest that I have ever known it to have been taken in this locality, and we have had quite cold weather already.—S. R. INGERSOLL.

Game Bag and Gun.

SHOOTING IN CUBA.

A DAY AMONG THE GUINEA FOWLS.

IT WAS 4:30 A. M. when the policeman of our street rapped in a lively way upon our outer door, as he had been pre-instructed to do. I turned out of bed, partook of the smoking hot coffee and milk, which is always the first thing to do in Cuba after rising, and wended my way to the railroad station.

My canine companion capered and relped for exuberance of joy as we crossed the park, well knowing the significance of this early rising. At the station she took her accustomed place beside my equipments while I procured the necessary tickets for myself and her, and on my return eagerly led the way to the train, which she knew so well. Several other sportsmen were among the bustling crowd of passengers, which was a motley one of various colors, but very orderly and proper in behavior.

At 5:30 o'clock the whistle shrieked out its warning "all aboard," and the train slowly drew out of the station on its way to La Union and intermediate stations, to be followed by the Matanzas express at 5:40 (the express goes after the way train in this country).

The hour is a very charming one, and when clear of the city the air was redolent of vegetable odors, and musical with the sounds of reawakening life. Even the dog jumped upon frequently putting his paws upon the window-sill and projecting his nose outside to sniff in its morning fragrance. Luxuriant fields in richest verdure fled past in continued procession, and the royal palm trees in stately rows, looking for all the world like long lines of feather-capped warriors, rushed past us as we sped along. A belt of lurid sky to the height of fifteen degrees along the eastern horizon, against which these trees and the cocotera palms stood out in bold relief, furnishing a most bewitching landscape scenery peculiar to inter-tropical regions.

At 8 o'clock the color of the eastern sky gradually lightened to orange, while northeast and southeast it was fading toward the blue, till at 6:30 a deep golden hue entered in and radiated from the east, steadily rising like a golden crown over the inimitable display of nature's handiwork. I gazed enraptured on this absorbing scene, while broad-brimmed platters returning from town gossiped unmoved on the possibilities of the gathering crops, and the high prices of labor and its limited supply, interspersed with scenes for the formation of emigration, which are here interchangeable, and thus far confined to words, words barren of results.

We reached the station of our destination at 7:15 A. M., where two darky boys were waiting for me, from the plantation of my friend and companion in the day's sport. Arrived at the house I donned my shooting suit and took a short turn among the quail while waiting for breakfast, after which we took horses about three miles to a cattle farm owned by a sportsman who has several bands (flocks) of wild guinea fowls had their habitat.

Joined there by the Mayoral and two of the colored boys who knew something of the habits of the birds, we started for the fields about noon. The hacienda consists of about two thousand acres, not much wooded, but with many fields of tall grass divided by wide hedges of bromelia (*piña de*

paton) interspersed with century plants and small trees, furnishing excellent cover and an impetrate retreat for the birds when they became fully aware of what was going on.

This combination of circumstances made the work too heavy for the dog, so we determined to keep her to heel, using her only for retrieving, and to work the fields over with our horses until we located the birds.

The first half hour was drawn blank as we re-united for consultation. During this conference we heard a subdued call of guineas in the distance, and well knowing the intelligence of this wily fowl we moved cautiously forward till we felt sure the birds were not far away, then dismounting, left our horses in charge of the servants to follow at a few yards behind. The game was to windward, and the dog, with head erect and nose pointing directly up the wind, begged for orders to move on. Keeping her well in hand, and waiting till my companion got well forward to the side, we followed her lead but a short distance when, with a thundering whirr, a band of more than fifty flushed wild.

Although we had approached with great caution, some cunning old cock had been stationed with his ears open, or perhaps with his eyes above the grass, and giving his fellows warning of the approaching danger led them in rapid flight far away over the fields toward the cover of the hedges. But not all of them, for wild as they flushed I could not resist the temptation to feel out for them with my choke barrel. Drawing my head on the ground I saw one of my companions by my seven-pound Parker, and almost to my surprise she turned quickly over and "tumbled to my racket," a victim to my winning ways. Another flew within reach of my partner, who brought her also to bag.

Marking down the rest the best we could, we saw that some of them did not go into the cedar, but scattered in the high grass and weeds on opposite sides of them. This gave promise of good sport with single birds, so remounting we quietly pursued most of the distance lost by our men, and again left the horses to the servants, and separating somewhat, we and the dogs covered the ground pretty well over as we skirted the hedges where we had marked the birds down, though indefinitely, owing to our distance at the time of marking. The grass was so high and thick that it was very difficult for the dog to get through it, and the guineas lie so very close in such cover, choosing not to run the gauntlet of two guns, or perhaps they had run into the hedges after the guineas, suggesting the Mayoral, who now came riding up with the markies, when sudden whirr, whirr, went up two birds from the ground we had just passed over. My friend was ahead, and bang-bang went my two barrels in quick succession, scoring a clean miss with my right, but my left dropped its bird, a heavy old cock, with a solid tumble into the next field.

Here we called a halt while the Mayoral made a wide detour to a gateway through the impetrate hedge and returned with the game; then we proceeded scarcely more than fifty yards when, with a startling whirr, up jumped another, making direct for the same field. He was so near the hedge that why he got up at all, or why he did not run into or pitch into it after he flushed, is a puzzle to me; but the fact is he did get up and intended to go over it, but tumbled to my right barrel, into the very middle of that bristling and impetrate thorn hedge. Well, I suppose it was not the first time an astute bird has committed an error of judgment that proved his ruin. We still stepped forward until the whirr was over, and the birds were still uttering their movement worked his way down through that worse than bramble to its very breast, and through some of its crevices the feathers on his breast were visible; but what ingenuity of mortal or canine could ever hope to retrieve him from that inaccessible place?

Reader, have you any conception of a Cuban rat pine hedge? (*Coro de piña de ratón*.) Let me attempt a description, because I wish to relate as ingenious a piece of retrieving as I have seen in many a day.

The piña de ratón, of which Cuban hedges are formed, is the *Sibbilla pinguin*—Sant., of the order *Bromeliaceae*, a mono cotyledonous plant that sends out from its stubby sheath an almost endless succession of its prickly blades four to six feet long, which sting like thistles and cut like Damascus blades. One row of these planted as a hedge will multiply till they occupy ground from one to two yards in width, presenting their thorned points and edges like a million bayonets to an animal large enough to hit with its quarters, which cleck feathered coats of mail. Numerous small trees grow up in them and overshadow their tops, thus making them still more attractive to the hiding birds.

In this hedge both quail and guinea well know they are quite secure from all intrusion on the part of either man or dog, and I know of no way of flushing them out of it, so only those outside of the hedges are available as game. But my dog saw the guinea fall into the hedge and appeared very much unwilling that ourselves to leave without it. But how to get it? I could not ask her to retrieve it, but her perseverance attracted the attention of the whole party.

Carefully she inspected the hedge inch by inch for several yards opposite to where it lay, about a yard within, then selecting a spot near to the game she clawed and excavated a space large enough to introduce her head under the matted, thorny and cutting blades. She crouched and thrust forward her paws with her head between them, and in that position worked her body along the ground, now and again yelping at the sharp thorns gored her, until she reached the dog's head, and backed out again, even with more difficulty, but depositing her prize in my hand with an air that told plain that words of her full consciousness of having deserved especial caresses for a difficult performance.

Remounting we made a detour to gain the other field, where we had marked down a part of the scattered birds and spread our lines to beat the field parallel with the hedge we had skirted on the other side, but we drew a blank and turned away toward the other side. The grass was thick and we kept our eyes above the grass, with our kerky bow wide behind. Near the middle of the field a sudden whirr started directly beneath my horse's feet. Even my horse was startled by its suddenness and vigor; the surprised guinea rose on my right like a flash, and as my friend was far to my left she was not in much danger, though I instinctively rose in my stirrups, and twisting my body to my utmost I fired both barrels in succession and scored a double miss.

The report of my gun two others rose very near and made good their escape. Quickly dismounting and placing fresh cartridges in my gun, I advanced but a few yards when whirr! whirr! two more rose before me, and I fully redeemed my double miss with a right and left that counted me two very dead guineas, the Mayoral applauding with enthusiasm. At the sound of the firing another pair flushed; while

renewing my cartridges without moving from my tracks, and as I closed the open breach, still another rose with a flurrying whirr and essayed to follow its fleeing mates. I bring a trifle demoralized by so much whirring in rapid succession about my ears, again scored a miss with my right, which I quickly redeemed with my left barrel, winning an enthusiastic bravo from the Mayoral, who was hunting without a gun.

Quickly renewing my cartridges the bitch was ordered to retrieve the three dead birds, which she accomplished in about ten minutes of laborious search through the high, thick and matted grass, four of us, all of whom thought we could go directly to where they fell, trying in vain to assist her, because being tenacious of life, the beating of their wings in their death throes sent them through the grass down to its very roots, where they became stilled one may pass directly over them without finding.

Patently we worked the rest of the field over, my companion flushing several more guineas and bringing one to bag. We now had eight heavy birds, a very fair bag, even the darkey boys manifesting their enjoyment of the sport by a liberal display of their ivories and insisted upon a division of the load instead of tying them to the saddles. On our way home we flushed a heavy cove of quail and bagged two of them, and as the darkness was rapidly approaching we hurried onward. We had proceeded nearly a quarter of a mile when it was discovered that the bitch was not with us and we knew at once that she had stopped on another point, and having forgotten to call her in after shooting the quail. Returning, there sure enough she was, representing the role of patience in a statue, just in the edge of a cane-field by the side of the road.

We, too, tarried in the full enjoyment of that artistic pose until the quail aroused us with his flurrying dog night as he quickly disappeared into the depths of the cane-field. These let him rest, for he had afforded us nearly as much enjoyment as if we had brought him to bag, performing well his part in an artistic exhibition which he, too, may have appreciated. If so he well deserved to live and I propagate and teach to his progeny what I consider a prime virtue in *Oryx capensis*. NEMO (of Cuba).

HAVANA, Dec. 24, 1883.

A TEXAS THANKSGIVING.

THERE was just a faint indication of approaching dawn, as G. and I left the city bound down the island for our annual snoot.

For fully two weeks we had been planning and arranging matters, and as we had everything in order, it was arranged with a Parker—no computation in many and many such expeditions—and a belt full of cartridges, while the pockets of my shooting coat held even as many as my belt. G. carried a light Baker, and to judge from the amount of ammunition he had, extermination was his object, not pleasure. To speak out, I am afraid, had we fired every shot we had, and killed each time, there would have been very little use in gunners going in the vicinity we intended visiting for some time; however, we wanted to have a good time, and, as we intended making a day of it, we left fully prepared.

Indications were favorable. It was cool and pleasant. The north wind came across the bay with just force enough to cause a gentle whispering in the weeds that lined the roadway on either side.

As we crossed Mud Bridge a faint flush of pink in the east warned us that it would be well for us to move a little faster if we intended to arrive at our destination by sunrise. We took the hint and gently giving our "nog" a reminder with the whip, we were soon jogging along at a considerably increased rate of speed.

I may as well say a few words in regard to our horse, for he merits it. He was ordinary in color, height, and speed, but was not as pleasing to look upon as some; still he possessed these qualities, he could keep the same gait for hours, was not the least gun-silly, and could be as long as a person desired in the middle of a prairie without being tired. Three things that are the most difficult to find, and most desired by the gunner.

By a little before sunrise we had arrived at the neck of a small marsh where, a few days before, I had bagged some dozen snipe. Leaving Charlie to graze, we proceeded to beat this marsh, but without any success, one snipe only getting up. I killed this fellow, and in getting over a fence to get him, I found it would be well to be a little more careful in future, for, although "barbed wire" above a fence rail is almost invisible, it scratches nevertheless.

One snipe was rather discouraging, but we went to our next ground, Big Marsh, full of hope. Big Marsh well deserves its name, for it is big. It extends for fully two miles, from Snyder's Bayou to Sweetwater Lake, and is the rendezvous for all the snipe on the island; at least I had judged so from the numbers I had always found there. This time, however, and I were doomed to disappointment. We had beaten the marsh thoroughly, looked into every little nook and corner that seemed likely to harbor one of these skulking little rascals, and as a reward we had three between us.

G. looked at me and I looked at G. Our eyes expressed how we felt, and we turned toward the buggy, two disgusted "shootists."

Who understands the habits of this game bird? I don't, I must confess, although I have been thrown with them year after year for quite a period, their habits are shrouded in a veil of mystery, too thick for me to penetrate.

I had visited this same Big Marsh the Tuesday before Thanksgiving, and had found snipe plenty; yet on the morning of the second day after a visit to the same locality was fruitless. I learned later that a party had bagged thirty odd there the day after Thanksgiving. Where were the birds Thanksgiving? This is the question.

After returning to the buggy G. and I drowned our disgust by eating a glorious lunch that fair fingers had put up for us the night before. We did this justice at any rate. After finishing we felt in better humor, and as game seemed scarce, we concluded to go on our expedition further down solely for fun.

On the way to the main road G. killed a stray black duck, that probably, as I tell him, had been wounded in the first place.

We were driving by the edge of the lake, not thinking of anything particular, when suddenly I saw two snipe pitch down in its very center. This puzzled me, but upon walking through the reeds I found that last summer's drouth had absorbed the water, leaving nothing but a boggy marsh. I entered slowly, and had hardly advanced a dozen feet before up jumped a snipe, rapidly followed by three more. I took advantage of my opportunity, scoring a right and left,

but four at a time was more than I could attend to, so I waited for G. Together, by exercising a little patience, and going through a great deal of manual labor, we managed to get seven birds, which added to the four bagged before, made eleven. This was certainly more than we expected after leaving Big Marsh. We killed nothing else except time, but the pleasure derived from the drive alone was more than reward us for our trouble. NEMO (of Texas).

GALVESTON, Texas, January, 1884.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Custom has made it quite the proper thing for writers upon this subject to preface their opinions and arguments with a statement as to their experience with the rifle, therefore I will say I have had quite an extended experience with this weapon in the field on large and small game, and at the target over ranges between 100 and 1,500 yards. However, I do not expect nor wish this fact to give additional weight to any statement I may make.

Facts, hard bare facts, are trumps in this discussion, whether stated by the tyro or the professional. Argument is ever sufficed to consideration only to the extent that it elucidates.

Accuracy, flat trajectory at hunting ranges, rapidity and durability are the prime requisites of a hunting rifle. This is an axiom. If the arm is to be used on large or dangerous animals, it should possess in addition to the above, great killing power.

Let us take a rifle which will represent the highest development of the arm, for use on large game, at the present time. We will take the 40-90 Winchester, for instance. How can we improve this rifle for such work? In seeking such improvement, we must bear in mind the fact that other things being equal, the killing power of a firearm is in exact proportion to the area of its bore.

Now if we reduce the caliber of this rifle to .40, we reduce its killing power about one-fifth. If we increase the charge to 90-500, we will get about the same initial velocity and trajectory at short hunting ranges, a slightly flatter trajectory at long hunting ranges, i. e., 300 yards, and greatly increased penetration at all ranges. I state the above as facts, proven to be such by actual experiments with a Remington match rifle and a Winchester .45-60-300. The former is a .40-50 and was loaded at the muzzle with 90 grains Hazard F. G. powder and Winchester-500 grain bullet. The latter used shells loaded with 60 grains same powder and 300-grain bullet. The trajectory of the Winchester at 300 yards varied in diameter, as follows: Between ten and eleven inches. The trajectory of the Remington, loaded as above, was more uniform, viz., about ten inches. Now I ask, does not the larger bore of the .45-60 about offset the increased penetration of the 40-90?

I also experimented with another rifle (side by side with shot barrel) built to my order by the American Arms Co. This rifle was 28-inch barrel, chambered for .45-100 shell, loaded with shell of 100 grains Hazard F. G. powder and 300-grain Winchester bullet. The cartridge measures 25 inches. The trajectory of this rifle at 200 yards is seven inches, with penetration sufficient to crush the biggest bones and make two holes in the hide of any grizzly.

I say this after using this rifle several seasons on large game. I regard this cartridge, .45-100-300, as greatly the superior to the 40-90-500 for shooting at dangerous animals, because of its flat trajectory at all hunting ranges, greater diameter of bullet and consequent killing power. It is also greatly the superior to the .45-60-300 cartridge by reason of its flatter trajectory and increased penetration.

Right here I will indulge in a growl at our manufacturers of sporting ammunition. The greatest proportion of powder to lead in any rifle cartridge of which I have any knowledge is one to five. This is all wrong.

What we want most, and with accuracy in a hunting rifle, is flat trajectory at hunting ranges, and this we can only get by using large powder charges in proportion to the amount of lead used. One to three is about the correct proportion, and if some manufacturer will put a 200 or 225 grain .45 bullet in the market, I will assure him one steady customer. However, the .45-100-300 cartridge is not the one I would recommend for use on *Ursus horribilis*. Still greater killing power is desirable when we are not on a mountain.

Let me describe what my experiments with hunting rifles and my experience in shooting at large game leads me to believe would be the best weapon for such shooting. A lever repeater of .50-caliber and 32-inch barrel, chambered for .50-150-400 cartridge. This rifle, by reason of its larger caliber, higher velocity of its projectile and equal penetration at hunting ranges, would undoubtedly possess the greatest killing power. The length of the cartridge would be about three inches, necessitating a frame one-fourth longer and a weight somewhat greater than that of the .45-60 Winchester.

Notwithstanding the strictures of "W. N. B." in your issue of Jan. 10, I regard the repeater as immeasurably the superior of the single-loader for hunting purposes. His article simply proves that even in America there are men who are entitled to a medal for stupidity. But these stupidity of the lot he was alluded to, those magazine rifles became clogged must have been exceptional, else, having discovered the legitimate result of their ignorance or carelessness, they would also have discovered that their rifles could still have been used as single-loaders as effectively as the Sharps or the metamorphosed Springfield musket.

The reasons for my choice of the rifle briefly described above, may be summed up as follows: Accuracy, to enable us to strike the spot aimed at. This implies the use of a bullet long enough in proportion to its diameter to give it steadiness. Next we want flat trajectory at hunting ranges, i. e., at all distances up to 200 yards, to eliminate as far as possible the necessity of estimating distances. This implies a powder charge large in proportion to amount of lead used. If the rifle is to be used on dangerous animals, we want it to possess great killing power, and be capable of rapid hunting ranges, combined with bullet heavy enough to pulverize the biggest bones and go through the carcass of the animals on which it is to be used. Manufacturers of express bullets have sought to attain the effect of large calibers by making the point of the bullet hollow, but have failed in a large measure, because the points of these bullets were in striking bones or tough muscle were a tendency to split in splashes as far back as the hollow extends, leaving them too light to give necessary penetration.

As to rapidly, we want a weapon with which we can deliver ten shots before a grizzly could possibly reach us from a distance of one hundred yards, the blow from each of which would be like a stroke of lightning.

My vote is against bottleneck shells every time. Have used them in both long-range and off-hand rifles, and find them so much more liable to expand and stick in the chamber and burst at the head than the straight shell. My theory is, that much of the force of the explosion is caught on the shoulder of these shells, and action and re-action being equal, this subjects not only the head of the shell, but also the action of the arm to a much greater strain than is the case when the same charge is used in a straight shell. JOS. W. SHURTEN.

GANSEVOORT, Jan. 15.

Editor Forest and Stream:

If in the discussion now going on in the FOREST AND STREAM we omit all consideration of repeater vs. single-shot rifle, we shall find that the question is one of improvement in the ammunition, rather than in the existing arms. The great essentials of a successful hunting ammunition are:

First—Accuracy.

Second—Force (not necessarily great penetration).

Third—A flat trajectory.

As matters of minor importance, we may add compactness, portability, and as light a recoil as is compatible with the fulfillment of the essentials.

"D. M. B." proposes a 40-90-500-grain cartridge. This would certainly fall in the third essential, and quite probably in the first, also.

Your correspondent, "Penabody-Martini," has pointed out that an excessive rotation is necessary to keep this 300-grain projectile (probably four calibers long) point on.

His statement is confirmed by the experiments of our own and foreign ordnance boards, and also by those of gunmakers, notably Whitworth.

Nor does this .40-90-500 ammunition fulfill our minor conditions. It would be clumsy, heavy, and give an excessive recoil. Thus it would not have its great penetration to recommend it. But will a bullet that will pass through the body of a grizzly and still possess reserve force be any more effective than one that will pass through the body and lodge in the skin on the opposite side?

"C. D." proposes a 40-90-300 cartridge, which ought to fulfill all the conditions much better.

On the other side of the question we have the large bore express, giving a flat trajectory with sufficient accuracy or short-range work, and a not too excessive recoil, but it is conspicuously lacking in penetration.

For the special purpose of hunting grizzlies, Mr. Litchfield advocates a 12-bore double rifle, shooting a round ball with 120 grains of powder, and advances seemingly sound reasons for the faith that is in him. But as the range of this arm is limited, and as the round ball is used, would not a heavy 12-gauge cylinder smooth-bore answer his purpose? Such a gun could be used for shot, and probably would be much cheaper than the rifle.

These calibers, .40 and .75, may be regarded as the extremes. The intermediate calibers, .45 and .50, have many earnest partisans, who have put their favorite weapons to the severest practical tests, and have not found them wanting.

My own preference is for a .45-caliber rifle, 28-inch round barrel, chambered for the Government ammunition. Examined by the Ordnance Department, we have shown that 28-inch barrel possesses no advantage for accuracy over a 26-inch, even at 800 yards. The longer barrel would probably impart a higher velocity to the bullet, as the powder would be more thoroughly consumed, and the powder gas would act on the bullet through a greater space. But this advantage would, to my mind, be more than counterbalanced by the superior portability and lightness of the shorter arm. My style of loading is quite similar to that adopted by "Big Lujin." By carefully filling the Government shell, 85 grains of F. G. powder can readily be accommodated. On this a hard, grooved and lubricated, 300-grain bullet is placed, and the shell crimped around it.

This gives a cheap, compact and waterproof cartridge, that will stand any amount of rough handling.

The trajectory will be very flat, within hunting ranges, and the accuracy and penetration good, and the recoil manageable at any time the supply of ammunition should run out, and the means of reloading not be at hand, the Government cartridge, purchasable everywhere, may be used with good effect.

If thought desirable this gun can be readily converted into a very efficient express rifle by chambering for the 2.6-inch shell, taking 110 grains of powder and a 325-grain bullet. This is exactly the charge used in the Hoadly .45-bore double express, the winning gun in the London Field trials.

This gun weighed 8 pounds 4 ounces, and with an initial velocity of 1776 f. s. gave a velocity of 4.68 inches at 80 yards in a range of 150 yards. The accuracy (a string of 14.49-inches in ten shots at 150 yards) which they considered very good will not, I think, strike your readers as anything phenomenal. The recoil was not greatly in excess of that of the Springfield rifle using the service ammunition. Of course the high-velocity bullets are not suited to the heavier kind of game, but that can hardly be said to be the fault of the rifles, which can use solid projectiles, with very great penetrative power, equally well, preserving all the advantages of their very flat trajectory. Simple penetration, however, though desirable in many ways, does not always prove an effectual in immediately killing an animal if no vital part is struck. Penetration can be combined, when desirable, with the explosive effect of the ordinary hollow-fronted express bullet by making the projectile of hardened lead with a smaller hollow in its front, leaving a good solid cylinder in the rear end of the bullet, so that, though the front part of the bullet expands on striking and gets into mushroom shape and splinters, the solid base end goes straight on penetrating and smashing everything in its course. Of course, the advantage claimed for the ordinary express bullet is in tying to pieces after passing through the skin so that these pieces may wound a vital part. This, of course, a bullet cannot do if its force is expended entirely on the surface of a heavy animal's body and before it has penetrated

Editor Forest and Stream:

"D. M. B.," in your issue of Dec. 13, complains of the want of killing power of English express rifles on account of the small penetrative power of their projectiles. Of course the high-velocity bullets are not suited to the heavier kind of game, but that can hardly be said to be the fault of the rifles, which can use solid projectiles, with very great penetrative power, equally well, preserving all the advantages of their very flat trajectory. Simple penetration, however, though desirable in many ways, does not always prove an effectual in immediately killing an animal if no vital part is struck. Penetration can be combined, when desirable, with the explosive effect of the ordinary hollow-fronted express bullet by making the projectile of hardened lead with a smaller hollow in its front, leaving a good solid cylinder in the rear end of the bullet, so that, though the front part of the bullet expands on striking and gets into mushroom shape and splinters, the solid base end goes straight on penetrating and smashing everything in its course. Of course, the advantage claimed for the ordinary express bullet is in tying to pieces after passing through the skin so that these pieces may wound a vital part. This, of course, a bullet cannot do if its force is expended entirely on the surface of a heavy animal's body and before it has penetrated

sufficiently to reach any of its vital parts. English express rifles are made light, as most sportsmen who use them like them to handle as much like a shotgun as possible, and as rifles of light weight are in great demand in India, to which country a very large number are sent; but there is nothing to prevent a rifle, double or single, being made of any weight required.

The ordinary hollow express ball has a fair amount of killing power when used against game to which it is suited. In '83 a friend of mine killed four tigers with only five shots. His rifle was a .50 double express by Tolley, powder 116 grains, the bullets Eley's ordinary express, weighing 340 grains.

With regard to the .40-90 repeater, the cartridge could be made much shorter by being made bottle-shaped. I do not know that there is any particular objection to the bottle-shape as compared to the straight one, perhaps a little more so. I think there is no doubt that the .40-90, when it is introduced into countries besides the States, will be a great favorite in those countries besides the States. In India, the .40-caliber is beginning to come into use for small game, as an express. I hardly think that the bullet need be as heavy as 500 grains. The English government experimental .40-85-400 rifle has been found to have very great penetration with nearly 1,600 feet muzzle velocity; for sporting purposes it would do to have an express bullet much lighter, say 250 grains, with more weight when penetration is required.

BENGAL SEPOY.

LONDON, ENGLAND.

COLD DAYS IN MISSISSIPPI.

"Oh the snow, the beautiful snow," It's very pretty on paper, you know.

THE weather is hyperborean in temperature here at this writing—scoted a goose egg here Friday night—but I see by the press that you got out 0 and went to —25 or —30. Well, I don't see how you stand it. A man here could not tell by his feelings whether he had on his pants or was walking around without them, so far as the sensation of cold was concerned.

A gentleman going down town to catch the early train had the car on the windward side of his head frozen as stiff as an icicle while he was walking half a mile. You could have snitten it off with a sickle as easily as a Peter snook off the man's car while it was in this latitude before. Yesterday at 7 A. M. it began to snow, and now there are seven inches on the ground, so dry and solidly crystallized that it might be barreled out sold for sugar—"A" with any number of Xs behind it—"coffee."

The "boys," old and young, are out in masses after rabbits. Those that have come in report that Mr. Lepus can't leap worth a cent, but butts up under the snow and lies there until he is picked out. Saw one this week with four, all he found, and he killed them with sticks.

If the snow remains long on the ground I fear that the quails will suffer, and that many of them will perish from cold and hunger. In 1876 snow remained two weeks, and hundreds of birds of all sorts and kinds died. The quails in some places were found dead in beavies, just as they had roosted.

The sun is shining brightly to-day, and we hope the snow will soon melt.

On a recent day the black wolf was killed ten or twelve miles east of this place last week. It was the only one that has been seen here within fifteen years. It was killed at a deer stand, as it tried to slip out ahead of the bounds.

The quail crop was fairly good, and we have had some splendid shooting.

I lost my best dog early in the season, and have been dependent on my friends for dogs ever since, as I have only one trained dog. Write Belton in my kennel. There are some fine field dogs here, notably Mr. Field's Texas, one of the finest pointers I ever saw. He has also a kind of nondescript setter that comes to the euphonious name of Gopher that is a rattling field dog. Besides these he has Baldy, a Llewellyn (Belton II.—rhébe III.).

Dr. A. J. Bourrou has two good dogs, one a Llewellyn, a grandson of the illustrious Gladstone; the other a grandson of that grand dog, Joe, Jr.

Then Friend Jim G. has a pointer, old Don, from the strain of the name. He is a celebrated dog, that could once get away with almost anybody's dog, but he, like his illustrious master, is "growing old, Maggie." Then James has another, a Llewellyn, a thing of beauty, and therefore a joy forever to his handsome master, named for Guy on, Doctor.

He is a grand representative of the lordly Llewellyns, and should have three or four big L's, and five or six little ones in the name when it is spelled for him.

Then Dr. Sanford has a good and steady old pointer, Hurricane, now named down to a mild zephyr, bred by the writer and trained by that emperor of sportsmen, Col. Gordon. He has also a half Laverack, Leila, that is fast, staunch and stylish. Mr. Will Thompson has a fine pointer, and owned a magnificent Irish red setter. He had the misfortune to have the setter killed by a passing train a few days ago.

Mr. A. Reitz has a good pointer. Mr. Hardy Green has a splendid setter, a native, given him by the writer. This dog, Larry, is one of the sort that will hold a point for half a day. On one occasion his master was shooting with a doctor from New Orleans. Larry was missed and could not be found. The doctor sat on a fence half a mile from the others. Green yelled to him:

- "Doc., do you see anything of Larry over there?"
- "Yes, here he is."
- "What is he doing?"
- "Nothing but standing here like a fool in the grass."
- "May he be pointing?"
- "Pointing, thunder, he is just standing still."
- "Send him on then."
- "High low, Larry! He won't go."

Then the doctor walked up to him, and about twenty quail whirled up from under his feet. The last dogs to be mentioned are those that belong to the writer. Nellie Belton, a rattling little lady, fast, staunch, steady and a stayer, prettily marked, standing on her points with all the grace, or willing to them with all the deadly coolness of her illustrious grand sire, the incorruptible Gladstone.

Then there is the little boy dog Guyon's Kove (Pembroke—Gilt), that is as smart as a puppy can be, and well grown to his age and handsome to boot.

Last year I could have added Guyon's Rock, one of the very best field dogs I ever shot over—now, gone, alas to the everlasting hunting grounds. The best blood of the best Llewellyns flowed in his veins, and he was the dog to win

the love of any man. In the prime of life he has passed away and "his like I ne'er shall look upon again."

Everybody was prophesying a mild winter. Christmas Day was bright and sunny, with not a speck of cloud, and a south wind mild as the breath of May. The mocking birds sang, but for the bare and leafless trees you might have thought it an Indian summer day. We rode in the dog-cart with the girls, and sailed boats on the big carp pond.

New Year's night a roaring wind came down from the north and almost chilled the marrow in our bones, and it has not let up to this writing.

If the wind gets around to the south it will take it about a week to blow back the breath of Boreas that has already gone down that way, and make it warm again.

We hope for a little relaxation in old winter's grip before long, and then if all the birds come out safe we will go afield.

"I hold it best what'er befall,
I feel it when I esrow most.
This better to have quail on toast
Than not to have a quail at all."

CORINTH, Miss., Jan. 8.

PHILADELPHIA NOTES.

AN unusual number of Canada geese are stopping in the Delaware River this winter. This would indicate an open January and February, which has not been the case thus far. Snow upon snow has come upon us, and as I write we are having a storm which will add to the covering with which our State has been liberally presented, and cause more distress among the ground game of Pennsylvania.

It is said by the game dealers of Philadelphia that no quail are being sold since the 15th of this month, but a run through the market shows the contrary. Our law says in Sec. 32: "Any person may sell or have in possession any pinated grouse, commonly called prairie chicken, ruffed grouse, commonly called pheasant, quail or Virginia partridge, and woodcock for a period of fifteen days after the time limited for killing the same has expired, and shall not be liable to any penalty under this act." Jan. 15 was the last day of the limit, and yet I can purchase at any stand in Philadelphia all the quail I want at \$3.50 per dozen. We miss the work of the Philadelphia Sportsmen's Club. Such open violations of the game law were not dared when the organization had its eyes upon the dealers.

The sportsmen of Harrisburg, Pa., are much pleased with the new clause relative to duck shooting in the Pennsylvania game law, which allows this sport only on Mondays, Wednesdays and Fridays of each week. This will greatly benefit the waters of the Susquehanna in the neighborhood of this city, and attract many feet from below. At one time the best of duck shooting could be had in this section, but the sailing on them with tugs and boats of all sorts (which is now also illegal) and the continual harassing of them by night and day has almost ruined the sport.

HOMO.

THE PERFORMANCE OF SHOTGUNS.

I SHOULD like some of your correspondents of a practical run, to let us know through your columns what we may expect in performance of a fair breechloading shotgun. Some three years ago I disposed of a most excellent muzzle-loader, 10-gauge, on the performance of which I would risk heavy odds, and replaced it with a breechloader, same gauge, made by an American maker of considerable prominence. Although I have handled this arm considerably since, as well as other breechloaders of high pretensions, I am disappointed as to their performance. I think they lack in force and closeness of distribution. At least, that is the result of my experience. Notwithstanding, we load them with charges that would be considered rather steep in the old muzzle-loader.

Choke-boring I consider an abomination, the gun I speak of above was choke-bored; I had the choke taken out of it by a competent gunsmith; it improved its shooting fifty per cent., and that not from a few chance trials, but heavy work at both game and a crucial test at the target. "That may have suited the peculiarities of that particular gun," say the savants. Granted, but the reverse of the proposition may also be true—choke-boring may suit particular guns—when we have so many high sounding titles for modern systems and so-called improvements in the breechloader, we naturally look for corresponding excellence of performance in the field.

In these remarks, I confine myself strictly to the shooting qualities of the arm. The ease and rapidity of manipulation and many other advantages of the breechloader must be conceded.

There are hundreds who are better posted than I am. Let us have a fair, square record of performance, practical, not theoretical, and oblige some sportsmen in the BACKWOODS.

WEST VIRGINIA.

WHITE-BREASTED BEARS.

IN FOREST AND STREAM of Jan. 10, allusion is made to a black bear with white spots on breast, as having grizzly proclivities, and being more ferocious than others of the black race; and the editor remarks that the Indians of the Northwest Coast believe them to be more dangerous.

I have killed almost a hundred black bears, and have never seen but one with a white breast. I will tell the circumstances, and you can judge about his ferocity.

It was the beginning of the fall hunt, and I was looking up new grounds to set my traps. I had been out from home more than a week in the mountains alone, and had spotted a line into this new region many miles from my regular hunting grounds.

I was near some small ponds on the top of a mountain, and was trying to follow down their outlet which ran under ground a part of the way. The day was cloudy and drizzly, and as it was past noon and I had taken my breakfast quite early, I felt quite hungry and looked around for a suitable chance to kindle a fire to cook tea and a partridge, which I had shot just before. A very large birch tree being just where I prepared my partridge, and after kindling my fire I sat down in front of it, with my back against the big tree, and commenced roasting my bird while my tea was boiling. My gun stood against the tree, with the case on it, as it rained a little. While broiling the bird I basted it with a little butter which I had left, thinking how much better it was than the Indians, for they could not have butter to baste with or salt either. While cogitating thusly, I heard a small twig snap behind

the tree. Supposing it to be a rabbit, I said to myself, "There's a rabbit, and if I had you here I would roast and baste you," but I did not look around, I cared so little about it. Just then a large stick snapped, making a noise like a small gun. This startled me. I knew some large animal must be there, and on the impulse I dropped my partridge and jumped into the air and turned around before touching the ground; and there was a bear within four feet of me, and the next look I noticed the white spot in his breast, and for the life of me I could not tell which was the most frightened, the bear or myself. A few heavy leaps and he disappeared in the thick woods, even before I could get the case off the gun, and my appetite followed the bear off.

I had a steel bear trap with me and set it beside that tree, and the next time I came to tend my traps I had him; I knew him by the white spot.

He probably smelled the roasting meat and did not see me until I jumped up; but the savage part of that bear I never discovered. J. G. R.

BETHEL, MAINE.

REBOUNDING LOCKS.

Editor Forest and Stream:

"Sinkboat's" letter about rebounding locks interested me very much, as it treats of a question I have for four years been experimenting to solve. During that time I have tried the locks of every gun that I could get hold of, to see if a cap could be exploded by raising the hammer as far as it will go without catching on full cock and letting it go without touching the trigger. I regret very much that I did not keep a record of the guns so tried. However, the result was all one way, so a record could have added little to the value of my experiments. I suppose that few men outside of the gun trade handle as many guns as I do in the course of a year, and as I improved all opportunities to make the test the number of guns must have been considerable. I will not attempt to say how many, but am sure it includes specimens from all the well-known makers, except Duggal. Various kinds of primers were also tried.

In one case the hammer was raised and let fall from five to ten times on the same cap, yet I have never been able to explode a single one, though all were slightly indented by the striker. The guns ranged from the cheapest and meanest to the very best of American, English and German makers. As to exploding a cap by a blow on the hammer, I agree with "Sinkboat" that it can be done; but the blow must be a severe one, such as is little likely to happen by accident. After exploding a few caps and breaking a hammer I abandoned this particular line of investigation as too liable to injure the gun. I would like to know if others have made similar experiments. My experience may have been in the nature of a "run of luck," as such occur in scientific experiments as well as in card playing.

It has, however, been sufficient to satisfy me that the rebounding lock makes a shooting iron as safe as it can be unless we reduce it to the condition of the proverbial one that had neither lock, stock nor barrel, yet was still considered dangerous. J. M. TRACY.

GREENWICH, CONN.

THE TRESPASS LAW.—Senator Otis's bill introduced into the Senate at Albany, Jan. 17, amends Section 10 of the Laws of 1879 (of New York) so as to read as follows: "Any person who shall trespass upon cultivated or inclosed lands for the purpose of shooting or hunting any game protected by this act, or shall take any fish from private ponds or private streams not stocked in whole or in part by the state, or shall take any game or fish from any land occupied by any person or corporation leasing or hiring from the owner thereof the exclusive right to shoot, fish and hunt over said lands, as provided in the next section, shall be liable to such owner, occupant or person or corporation leasing or hiring from the owner thereof the exclusive right to shoot, hunt or fish thereon—in addition to the actual damage sustained—exemplary damages to an amount not exceeding \$25." Section 17 of said act is amended so as to read as follows: "The notice referred to in the preceding section shall be given by personally serving upon any person a written notice not to trespass upon said lands for said purposes, or by erecting and maintaining sign-boards at least one foot square, upon every fifty acres of land, upon the lot lines thereof, or upon the shores or bank of any lake, stream or pond in at least two conspicuous places on the premises. Such notices to have appended thereto the name of the owner, or occupant, or person, or corporation leasing or hiring the exclusive right to shoot, hunt or fish thereon. And any person who shall tear down or in any way deface, or remove any such sign-board, not having the right to do so, shall be guilty of a misdemeanor, and in addition thereto shall be liable to a penalty of \$25." The act is to take effect immediately.

GEORGIA GAME.—Macon, Jan. 2.—In our section, our game birds, more particularly quail, have been in goodly numbers. Owing to pot-hunters, however, the supply has been greatly reduced, and in many places coveys are small and very wild. I have hunted but little this season, and had poor sport. I went last week part of three days and bagged forty quail. Unfortunately for our best sportsmen, we have a large number of hunters who kill indiscriminately everything they can, and at this rate our game birds will soon be exhausted. I thank the FOREST AND STREAM for good views on the subject, and wish you had two hundred more subscribers in our county. Ducks have been found in small numbers owing to warm weather and low streams. Squirrels and other small game in fair numbers. A negro man took alive a gray eagle near the city recently. The bird measured seven feet from tip to tip, was eating a pig when first on by the man, and being only slightly wounded attacked the negro's dog, severely wounding him, from which he afterward died.—J. H. J.

SPYSLANT, Mich., Jan. 10.—At the annual meeting of the Ypsilanti Rod and Gun Club, held Jan. 8, the following officers were elected: President, Prof. James H. Shepard; Vice-President, James C. Martin; Secretary, Don C. Phillips; Treasurer, Guy Davis; Executive Committee, D. F. Shuler, P. C. Sherwood, David Dodge, H. C. Haines, William Mallon, Dan Galt; Scorer, S. P. Hutchinson. Our gun club is in a most prosperous condition, numbering fifty members.—DON C. PHILLIPS, Secretary.

MONTGOMERY, Ala.—Our market is full of live and dead quail. The shooting never was better. Ducking on the river very poor this year, owing to the lowness of the river. ONLY.

FELLS DOMESTICUS AGAIN.—The story of "Reignolds" in your issue of Jan. 10, about *Pellis domesticus* reminds me of one which was told me many years ago by a gentleman in Philadelphia. Tom was a handsome large yellow specimen of the genus above named, valuable as a mouser, but unfortunately possessed of some traits that made my friend determine to rid of him. Having the fear of the "coops" before his eyes he deemed it inadvisable to shoot the cat, and so attacked poor Tom with a spade, and after some trouble killed him. During the performance a misdirected blow of the spade cut the cat's tail off. My friend carried away the dead body, and Tom, in a somewhat distant open lot, and put Tom away to stay, as he supposed. Imagine his surprise when upon going into the back yard one morning some ten days later, he saw Tom alive and well, just as though nothing had happened to him, apparently glad to be back again, and with his tail fully restored.—M.

WHO WILL PURCHISE QUAIL for stocking a piece of land in New Jersey? This is the question asked by a correspondent, who offers to take care of the birds for the man who puts them out. Letters prepaid and addressed to "Quail," care this office, will be forwarded.

Sea and River Fishing.

TROUTING ON THE BIGOSH.

LAKE RANOLS.

AFTER dinner the Colonel prepared to fish with the Doctor and give him his first experience with lake trout. "I tell you," said he to the latter, "there is some sport in taking lakies on a rod, if there is not too much lead used on the line. Of course they do not bite as low and vigorously as the brook trout, but for a change it is pleasant. We do not troll a spoon loaded heavily to keep it down, and trolling a spoon from a boat is lazy business anyway, but we take them on the rod and reel them in, and feel every struggle made. You may change your opinion of it after you have tried it." The Doctor made no reply to this, and after a pause the Colonel asked him: "How about finding this baited spot of yours in the middle of the lake? I don't see how a man is to tell when he is within a hundred feet of a certain place which may be only twenty feet in diameter."

"I will give you the ranges," I replied. "The ranges! And what will I do with them? We will probably range all over the lake before we find the little spot that Jack and you have baited. If there was a buoy there I might find it, but I doubt any man's ability to go twice over the same spot on a lake as large as this without some guide."

"Nonsense, Colonel," said the Doctor; "all fishermen make use of what are called ranges, in order to find choice fishing spots, and if the ranges are accurately taken there is no trouble."

"Here are the ranges for the place baited yesterday. In a general direction it lies northeast from camp about three-quarters of a mile. Row 'off' there until you are in a direct line between the black pine stub, which you will see near the edge of the lake, just beyond the big pine, and the big rock on the south shore. This will give you the range north and south. Shift your position on this line until you bring that white birch on the eastern shore into the middle of the notch in the hill beyond it. Drop your anchor and verify your ranges, and—fish."

"And you pretend to say that you can strike the same spot every time by these means?" asked the Colonel. "Every time," answered I, "and if the ranges are correctly observed a boy of ten years old can drop his anchor within five feet of the same place every time. No man who fishes on a lake and finds a good spot neglects to take the ranges of it, else how would he find it?"

"I don't know, never thought of it," answered the Colonel. "Some years ago," said I, "a party of us used to fish for lakies on Cayuga Lake and we had a few good spots, the ranges of which were not generally known outside of a few native fishermen and a few occasional visitors, and we often took many fine fish there. One summer we noticed a new comer at the lake who seemed much interested in our daily catch and for several evenings he met us as we landed and inspected the fish. The young man was one of the very knowing kind and talked learnedly about fishing, and among other things declared that he could take more lake trout than any one that he had ever met. If he only knew the spots, I disliked the fellow for his brag and his indurated cheek, and thought with Hotspur, 'He made me mad to hear him talk so like a waiting gentleman.' One day he met me alone near the water and the following conversation occurred:

"I say, now," said he, "what are the ranges of that place where you fished yesterday? I want to go out and take some big trout, for I'm tired of fishing for perch and sunfish. Can't you let me out with you to-day?"

"Our boats are full enough," I answered, "and our party is complete. You can hire a boatman here who may put you on a good spot."

"Confound the boatman," he said, "they may put me in a good place and may not. I had rather go by myself, anyway. Just give me the ranges, won't you?"

Now to ask a man for the ranges of a spot when he evidently doesn't care to give them, puts one in a position where he must refuse, politely, blank, tell the about them, or find an excuse for refusal. I said: "The ranges belong to others, as well as to me, and I have no right to give them. Pardon me, I see our party coming with the boat and I must join them. Good morning." I left him, and getting into the boat told my friends of the occurrence as soon as we were out of hearing.

About an hour after we had anchored, we saw this fellow in a boat near the eastern shore nearly abreast of us. Soon after this one of the party noticed him working to the north and said that he was trying to steal our ranges. We lifted the anchor and drifted out near the middle of the lake, and staid there until the man went back. At evening he met us and accused us of drifting out so that he could not get our ranges, and a smile on each face was all the reply made. A week later we were packing up to go home when down he came again, and after a while said that as we were going away we might as well give him our ranges.

Said I, "Will you promise not to tell if I give them to you?"

He promised.

"Then," said I, "You see this stake out here in the lake?"

"Yes."

"Row out and get that in line with the north chimney of the University. Then you see a blade of dead grass with the black top on the northern end of Canoga Marsh."

"No, how can I see a blade of grass across the lake, three miles or more?"

"Well, the grass is there, as you can tell by rowing across the lake. Then you see that forty-acre lot above the marsh, where that old white mare is feeding?"

"Yes."

"Then, after getting on your first line, you row out until you get that blade of dead grass with the black top in exact range with the old white tail. Good morning."

And we left him with an arrow in his eye, which might be searching for the grass on the edge of Canoga Marsh, or might be resting on the tail of the old white mare. We could not say.

FRED MATIER.

A FISHING OUTFIT.

I READ with pleasure "Rednasy's" article on the above topic, and also his complaint that writers who touched upon this matter at all, did not go into detail. This complaint is a just one, and I think you will agree with me when I say that most correspondents of the FOREST AND STREAM are not amateurs, and forget that there are others who are younger and would profit by minuteness of description and detail. Now here is "Rednasy," who is eager to learn the necessities of a fishing outfit, though he, too, is indefinite as to what kind of fishing he proposes to follow, where he intends "to turn his footsteps," and especially whether he goes by canoe, yacht or otherwise. I have a faint intuition that this "Rednasy" (pretty name isn't it) has had more experience in "outings" than he would have us think, however, willingly will I give him the benefit of my experience in fishing outfits.

When about sixteen years of age, I spent part of my summer vacation on the shores of Lake Ontario. This can hardly be called a fishing excursion, as our camp was permanently located, though by means of a yacht and rowboat we were able to go anywhere we wished. Our party consisted of four big hearted, noisy boys, not a drone among us. We had two tents, a common army tent, called the wall tent, and a pretty affair called a lawn tent. The latter we used for sleeping purposes, and just here let me say that it has served in many subsequent campaigns and has proved itself worth many of the military tents. The wall tent was used as a storeroom, and said to relate did not prove water-proof.

The first thing to be done when one is a member of a fishing party like the above, is to divide the work and responsibility equally among the members. I have found it best to meet once or twice and discuss matters fully, so as not to be obliged to start off hurriedly and with insufficient preparations.

As committee on supplies, I procured the following: 1 can salmon, lobster, chicken and 3 of pressed corned beef, 3 dozen eggs, 4 quart beans, small bag of dried peaches, same of apples, good supply of Boston crackers, 6 loaves bread, both wheat and "Boston brown," pepper and salt in convenient boxes, 1 piece salt pork, small pail of butter and 10 lb of lard. Now as to the necessary cooking utensils, they consisted of one frying pan, a small kettle (both with covers), coffee pot, with long handle, two square pie pans, old-fashioned, for Johnny cake, and a bean pot.

Now for the stove, which we dubbed "the range." First and foremost, two lengths of pipe are necessary. Now collect an abundant supply of smooth, flat stones, which are found near all lakes and rivers. The general form of the stone both lengths should be securely fastened to adjoining trees by means of wire. Cover the stove with two flat stones, which act as covers, and if care is taken you have a permanent and convenient range. I built one on the St. Lawrence on which we could easily cook meat and fish and have our pot of coffee boiling at the same time. We were never troubled with burned fingers or smoke.

The table is a simple affair, and our party insisted upon having it at quite a distance from the tent. This, too, is a good plan, for as the stove and table must be near one another, the danger from sparks flying into the tents (as has often happened) is avoided. A small hole dug in the ground in some shady place acts as a good refrigerator for the butter, lard, etc. Cover with a flat stone.

You will say I am not speaking of the fishing outfit proper at all. Well, I am great on details as you may have concluded. First and foremost I think every angler should own two rods. A fly-rod and one for bait-fishing. Have heard that the two can be combined in one, and by aid of an extra tip or two save the additional expense. My experience proves to me that a fly-rod must be a fly-rod and a bait rod one for bait only. Take a good supply of flies, the choice of which must be governed by the locality in which you are to fish. I will remember that two of our party had a continual bone of contention in regard to the color of hackles; not a fish was taken by this bait during our stay. For minnow fishing we all agreed that Abbie & Imbric's "Kinney No. 11" was the best hook. Buss find it a sufficient time to free themselves from this hook when well handled. A small seine is necessary for obtaining minnows in any locality, and with this and a light scoop net our outfit is about finished.

I dread the "editorial shears" or would mention many other things that I deem necessary where one goes into permanent camp. One thing I must recommend, whether one fishes by canoe, boat, rowboat or yacht, and that is the lawn tent. This, though intended as an ornament originally, has been adopted very extensively by sportsmen. It can be folded up and put in a rubber bag, so that the whole thing occupies a space 36x18 inches. Do not know its weight. The pole is made in two sections, each five or six feet long, and they are joined by a neat brass ferrule. This tent is twelve feet square, and two active men can put it up in ten minutes. Mine has been used for eight seasons and practically is as good as ever.

I hope "Rednasy" will derive some benefit from what I have so carelessly written. He will find that it will apply to the permanent camper or to one who cruises by yacht. I go in for comfort, and so my outfit may seem too elaborate. Every one of our party had a splendid time, and I heard no complaint of too much truck. We caught a great many fish

as we were located on one of the best grounds for bass in the United States.

Let "Rednasy" go into a camp on one of these magnificent rivers of the United States for a month, and follow my suggestions as to how and where to fish, and if he does not have a good time, why I know nothing of the business. G. W. S.

TO HOLEB FALLS.

[CONTINUED FROM PAGE 491.]

THE tents were struck at sunrise, Sept. 21, the blankets folded and provisions packed and loaded into the boats for a start up the river. The upper carry was soon reached, and the boats and luggage "toted" by the Falls to the smooth water above; but not without considerable labor and sweat. The crew was soft and green and not used to hard knocks. They were all good robust fellows, and with some experience in sporting matters, but not one had performed any manual labor for years. But they found this business of going up an uninhabited river, with no guides, soaking their traps and hauling their boats over carries, very much like row labor. Yet they went at it right merrily. A four mile tow up river brought them to the "Three Streams," where they met three gentlemen from Skowhegan on their way home. They were in good spirits, and spoke enthusiastically of the shooting and fishing about Holeb Falls. After a half hour's rest and a mutual exchange of good fellowship, the parties separated and went on their respective ways.

Five miles up stream, with dense forests on both sides, brought the party to Spencer Falls, a single pitch of about ten feet over a pile of rocks. A halt was made here long enough to carry by and get dinner; then came the race to Holeb Falls. Cony got his boat loaded first and made a rapid push for Holeb, which was five miles away. As he pulled out into the stream with strong oar strokes, having several minutes the start, there was a look of defiance and triumph on his Roman countenance which said plainer than words can speak, "Holeb or bust." Martin accepted the challenge, and from that moment it was a trial of skill and strength between the crews of those two boats for all the win there was in them. Martin said to his crew, "Boys, this is a death struggle for Holeb. We have the best boat, but it is mainly a question of pluck and muscle; take a long stroke, for every cent you lose a mile against some current, and we will win the race." The boat was loaded on an even keel and the race began in earnest. The river was crooked and it was some time before Cony's boat was seen. He continued to maintain the lead for three or four miles, but Martin was continually lessening the distance. Now the race became exciting as the boats came nearer together. Hunt was pulling his level best and Martin was paddling for every cent he was worth. When within less than a mile of Holeb they passed Cony. The grand old man with hat off was pulling like a Trojan; great beads of perspiration were standing on his bald head, and the veins on his neck stood out like those of a race horse, while Walker was paddling like a steam engine. From this point to the close Martin kept the lead, but still they followed in hot pursuit, hoping to regain their lost ground, but useless endeavor, for every minute the distance between them was lessening.

At 3 P. M. Martin's boat touched Holeb landing, at the foot of the falls, and the race was won. The contestants were badly used up; Walker was *hors de combat*, and the plucky Cony was not much better. Martin was lame all over, and Hunt's hands were covered with blisters. Colcord and Potter did not enter into the race with as much enthusiasm as the others, and consequently came out in a little better condition. From the landing on the west side of Echo Basin, four or five rods from the lower pitch or rapids. Passing up the rapids some fifteen rods in a northerly direction the Holeb Pool is reached; here the river takes a course at right angles toward the east. Going up the rapids some fifteen rods further the foot of the main falls is reached, above which the river again runs north.

From Holeb Falls, in an easterly direction, to where Moosehead Lake, into Moosehead Lake, opposite Mount Kineo, in an air line it is thirty five miles, but to follow the windings of the river it is sixty miles. It is twenty-seven miles from the falls to Moose River Bridge, and about twelve miles from the falls in a westerly direction to the Canada line. The source of this river is near the source of the Chaudiere River, that flows north into the St. Lawrence.

It is hard to find a better camping ground than this. The place selected was on a plateau, about twenty rods from the landing, which was on an old "tote" road that leads by the falls. Facing the falls was a huge granite boulder, about twelve or fifteen feet high, with a perpendicular face, against which a fire was built; and on the other side of the road, in a clear, level space, the tents were pitched, the road running between tents and fire. There was plenty of hard wood for fires all round the camp, and only a few steps down a path, at Holeb Pool, excellent water was obtained. Cedar splits were procured and a table made, twelve feet long and four feet wide, on the left of the tents by the roadside. A deck chair was made by the tables, twelve feet long, sufficient to seat the whole party. There were abundance of cedar and fir boughs to make a good bed, better than can be found in some hotels.

Not far in front of the camp, Holeb Falls, the most picturesque sight of water in Maine, came pouring down over a rocky and fishy ledge, some seventy-five feet; and Holeb Mountain rears his ragged summit in the background. The scenery is wild and romantic enough to make the most exacting and fastidious sportsman happy. It was rest, delicious rest, to lie down on such a fragrant bough bed and be lulled to sleep by the roar of Holeb Falls.

The second day was spent in recuperating, in viewing the grand scenery around them, and, with the effort, killing birds and fish enough to supply the wants of the party. Tracks of caribou and deer were frequently seen, but the noble game kept well out of sight.

Below the last pitch of Holeb is a large basin of water, circular in form, whose diameter is more than three times the width of the river. A large granite promontory hides the main falls from the basin and obscures the roar. This is remarkable for its echo. The best place to get it distinctly is a little ways below the landing, facing the mountain, which you would stand here and talk to the mountain, which would send the echo back with great distinctness. Colcord's red Irish setter Rex would listen, his glossy coat glistening in the sun, and his intelligent eye looking intently for the man in the mountain who was talking back.

The morning of Sept. 23, was cloudy with indications of rain, which began to fall in the afternoon. About 8 A. M., Cony, Hunt and Martin started for the south branch rap-

some two miles above the falls, where they found trout of fair size very plenty. In the course of two hours' time they caught forty-eight fine fish. Believing that they had enough and more than enough to last the party two days, and not wishing to catch more than could be disposed of, they decided to return to camp which they reached before dinner time. Cony had caught the best lot of fish, not in number, but in size. He had just a dozen beauties, nearly all of one size, averaging about six pounds each, which he caught in a pool and partly under a jam of logs near the foot of the rapids. It was conceded by all hands that he had a magnificent string of trout. This made the old gentleman take his place at the head of the class with a good deal of pride and dignity.

When it was time to return to camp, Martin found himself on the east side of the rapids opposite to Cony, thus were Saul and Jonathan divided. However, they never failed to enjoy a good point on each other. A few days before at Attean, Cony had fallen sprawling among the granite boulders and spilled his fish in the falls, greatly to his friend's amusement. Now, Martin undertook to show his superior spryness by jumping across the stream from stone to stone, some of which were two or three inches under water, covered with moss and slippery as an eel. He got on very well until he came to the last and longest leap, when forgetting that old age was creeping on; that he was still from the race to Holeb and thinking in his wild young days, he used to be vent into their, but now having the wings of Rascals to sustain him even in the water, he fortunately fell on his belly across a rock, his feet dangling in the swift current, with a broken rod. Cony had his laugh this time.

Between 3 and 4 P. M., Colcord arrived in camp, the hero of the expedition. No Indian warrior with his wampum belt, decorated with the scalp of a deadly foe, ever returned from the warpath in greater triumph! Prior to this very day, Jo's luck had been hard. He was back on the fourth neck. He had started for Spencer Falls, five miles below, in the morning, alone and downhearted, and came back in the afternoon with his contribution to the day's sport, consisting of six ruffed grouse and sixteen trout. The sixteen trout weighed fifty pounds. When laid side by side, touching each other, they measured five feet six inches across, and when laid end to end they measured twenty-three feet. Two hours before, Cony had the "big Injun" of the party. He took his fish to the magnificent fish before him, he exclaimed "that is a magnificent specimen." "Farewell, a long farewell, to all my greatness," then went down to Holeb Pond and washed off his war paint.

Walker had remained in camp and Potter caught eight good trout about the falls; Hunt had shot six birds the day before, so with the trout left over the larger contained over one hundred fine fish and twelve birds. The party thought they had found "the promised land, overflowing with milk and honey," but wishing to kill game for the mere sport, when their wants were more than supplied, for two days they rested in camp. They salted down seventy-five pounds of trout and waxed fat in eating the others, and enjoyed themselves in various ways.

The evening entertainments were well worth attending. Potter, aided by Colcord and sometimes by Hunt and Cony, would give a concert. They would sing war songs, negro melodies, but, best of all, those grand old ballads that have held their place in the popular heart for generations. When they were "up to the concert pitch," these songs rang out on the still evening air, and were a source of wonder to the tenants of forest and stream; for assuredly the deer was listening in the depths of the wood; the partridge on his fir branch and the fox within his hole; the muskrat left his clam half opened; the otter, on his side, left the fish half eaten; the beaver stopped work on his dam, and the mink canted his head and listened. Near the camp and in the sombre foliage of the woods, came the great grey eyes of a wise old owl, apparently unmoved, and charmed by the harmony of song; for every now and then he would join in the chorus.

After spending a week in this paradise for sportsmen, the party very reluctantly struck their tents and turned their faces down river. Just as the boats were leaving Echo Basin, Martin took a last look behind and exclaimed: "Good bye, Holeb! thou art a thing of beauty and a joy forever." After a year, grown old and brown, his face showing his regret at leaving, sang:

"Still around me 'twill hover,
In grief or in glee,
Thy life's dream is o'er,
Sweet memories of thee."

The boats floated slowly down stream with the current, the occupants taking the listless ease and comfort only known to hunters drifting down a beautiful river, overhung by the branches of great trees. There was no inclination to race now. All were contented and happy. Spencer Falls was reached about noon, where dinner was eaten. There being a gentle breeze the party caught several large trout above the falls, the largest weighing 4½ pounds. This is the best fishing place for large trout in the fall, to be found on the river. They rise readily to a black alder fly or a brown hackle.

Spencer Falls is where Amel True, when on a trip to Moose River, in 1877, with Cony, Martin and Morton, caught his famous string of trout. The year following he was drowned in Carrying Place Pond. His canvas boat was upset while he was in the net of firing at ducks that were passing by, and he went down in thirty feet of water. He was a most prudent man in use of his shooting costs, yet when he got into his boat he forgot, for the first time in his life, to take off his shooting vest, which carried seventy-five loaded metallic shells weighing about ten pounds. It was this fatal weight that carried him to the bottom.

The party left Spencer and continued their journey down the river. They camped that night at a barn just above Three Streams. There is a clearing here where timbermen cut their first work in the logging camp. This is a good location for duck shooting as they fly up and down stream, night and evening. Colcord, with the same gun that went down with his friend True when he was drowned, gave a good exhibition of duck shooting at the barn; cutting them down right and left until his game bag was full to overflowing.

The next morning the sportsmen went on their way most satisfied with the line sport, which they had enjoyed so heartily the first week in the logging camp. They counted their fish and birds. Like Livingston, when wandering among the equatorial lakes in Africa, some of the party began to lose the day of the week and month. However, none lost their appetite for trout, grouse and ducks. During the fore-

noon Attean was reached and the long upper carry passed much easier than on the way up. The men had become stronger and harder. Even the sickly Potter would tackle a boat and tug away like a young Samson.

Their friends, Gen. J. Manchester Haynes and Judge Wm. Penn Whitehouse, went over the same route this year, when they left Attean. Gen. H. was very much out of health, in fact hardly able to leave his bed. His physician advised him to try Holeb water, and fitted him out with a lot of medicine. The General said he would try and get as far as the Parlin Pond house and rest. He got there and the bracing air of Northern Maine made him feel better; got out his gun and went on to Moose River; shot birds on the road; got a boat and went up river; felt better every hour; threw his medicine into Attean Pond and climbed Attean Mountain, singing:

"Here the invalid seeks rest,
Seeks the softened nerves to harden,
Sucking from each braving breast,
Iron milk from out Katahdin."

Went over to Holeb Pond and round by the way of the falls. He lived on trout and birds, and came home in two weeks feeling like a fighting cock; jumped up, knocked his heels together twice, and discharged his dog. Judge Whitehouse, who accompanied him, and who is a learned and upright judge, as well as a good sportsman, enjoyed the trip immensely. It is whispered in court circles that since his return he has ruled, "that Holeb is the best place in Maine to brace a man up and find good trout fishing." Try it invalid, and if you don't come back feeling like a new man, the writer will give you his old necktie.

The camp was at the head of lower Attean Falls. After a good hearty supper on fried trout, broiled ruffed grouse and roast duck, while all hands were smoking and resting from the sports of the day and watching the approaching twilight, and listening to the music made by the roar of the falls, Jo. Colcord took his rod, which was leaning against a tent, and stepping out on a great rock just above the pit, commenced casting his flies, as though giving an exhibition of his superior skill in trout fishing. He first cast twenty feet up river, his flies falling on the limpid stream, and as this failed, he still further out on the smooth, unbroken water near the falls; still further up stream his mist-colored leader with its black alder and brown hackle flies, and still, with lengthened line, he casts till full seventy-five feet away his flies fall as gently as a snowflake near a log that lays across a huge old boulder on the very brink of the falls. But see that gleam on the smooth surface; the little whirlpool made in the water; the nervous twist in the fisherman's wrist, and a lusty trout is hooked. He makes an arrowy rush up stream for deeper water, he is a gamey fish and is fighting hard for life. How he makes the reel sing as he takes out the line. Now he darts for the further shore, but the springy rod checks his headlong career and turns him toward the angler, and as he takes a diagonal course across the stream, allowing him to reel in line, now there is a moment's pause in the conflict, during which time this "king of sporting fishes," takes breath and recovers his strength for the final struggle. Then with all his might he darts straight down the stream for the hole. But he is cool as a cucumber, which he is, and prepared for the final charge; and gives the trout "the butt" of his rod. See how it bends like a horse-shoe curved. Will it break? Jo. shows no signs of fear, for the rod is his own make. Every piece of lancewood he carefully selected and tested its strength. The fish is brought to a halt on the very brink of the falls. Once in his gallant struggle to free himself from the fatal steel he leaps clear of the water, and slips in under the log. Gradually he is drawn away from the falls, and makes a large arch, and then another, and another; each time ten in diameter. The last bold spur is telling on him, and each lessening circle brings him nearer to the surface, until at last he turns on his speckled side exhausted, with his head out of water; seemingly the better to catch in his dying ear the silver music of the falls as they go joyously dancing down toward the great lake. Hunt takes the landing net and jumps down to the water's edge and slips in under the log, as Jo. standing on the great rock where he made his first cast, strikes an iron outline clear and distinct against the blue of the western sky, swings him in, and a three and a half pound trout is landed. The fight lasted half an hour. All hands applaud heartily, and Walker more than all the others; saying it was the finest feat in sportsmanship that he ever saw.

After the last trout was landed and the pipes smoked out, the sportsmen unjoined their rods and carefully put them away in their cases, not to be used again until another year. Although it takes three days to the legal close time, Oct. 1, to them the fishing season was ended.

The question naturally comes to the mind of the close observer, How long will such magnificent fishing as this party enjoyed last? It is undoubtedly true that the great forests of Northern Maine, so abounding in lakes and streams, will be one of the few last places on this continent to give up its trout. But few people conceive the vast extent of this great unknown wilderness. It has been said that "Massachusetts might be lost in Maine's woods, so that you would need a compass to find it." Seventy-five years ago just as good trout were found in Kennebec country, but now all this splendid trout fishing is gone, never to return. It can only be found in out-of-the-way and in inaccessible places where few have the courage and hardihood to go. As civilization advances these places will become accessible, and before many generations the beautiful trout will disappear. To compensate sportsmen for his loss, the black bass fishing is growing better every year. Charles Haddock very graciously bids good bye to the departing trout, and welcomes his successor thus:

"No doubt the bass is the appointed successor of the trout; not through heritage nor selection, nor by interloping, but by foreclosure. Truly, it is sad to contemplate, in the not distant future, the extinction of a beautiful race of creatures, whose attributes have been sung by all the poets; but we regard the inevitable with the same calm philosophy with which the astronomer watches the burning out of a world, knowing that it will be succeeded by a new creation. As we mark the soft, vari-tinted flush of the trout disappear in the eventide, behold the sparkle of the coming glory! We hardly know which to admire the most, the velvet livery and charming graces of the departing courier, or the flash of the armor plates on the advancing warrior. No doubt the bass will prove himself a worthy substitute for his predecessor, and a candidate for a full legacy of honors."

Thus the trout and the black bass fishing, the ten years were struck, and without further delay the boats were loaded and moved gliding down stream toward Attean Pond. As morning advanced a stiff northwest wind came up that made the pond quite rough, but the many islands along the route

afford some protection, so it was got over without much discomfort, and the "thoroughfare" was reached when the water was again smooth. The "Moose Horns" were soon repassd, and the sportsmen again came out into the world.

"With the odors of the forest,
With the dew and damp of meadow,
And the curling smoke of wigwams."

still clinging to their garments. They went on to Wood Pond, which was very rough, for the wind was blowing hard, and in crossing the boats took in considerable water, especially Cony's, which was loaded too heavily astern.

The boats arrived at Moose River bridge about noon, and the luggage was carried up the bank by the roadside. The horses were washed out and hauled up; the horses were harnessed to the wagon, the boats loaded, the luggage put aboard, and the crews jumped to their seats. The horses, glad to be on the road again, bounded away right merrily, and the singers catching the "spirit," struck up a lively air, and all were "as happy as clams at high water."

A jolly ride of thirty miles through the woods brought them to the forks of the Kennebec, where they camped for the night. Here they met Mr. King, a gentleman from Connecticut, on his way to Holeb for shooting. He goes there in June and October. He said that he caught at Attean Falls in one day, last June, one hundred and fifty pounds of trout.

The best way for the public to reach Moose River is to go to Skowhegan and take the stage from there to the bridge, eighty-five miles. Information in relation to boats and guides can be obtained by writing to Joseph Clark, "The Forks Plantation," or Cyrus Newton or N. Colby, "Moose River Plantation," Me.

Bright and early the next morning they were on the road again. The weather was delightful, and the party was in high feather. As the horses went spunking along over good roads and amid grand scenery they frequently crossed a rushing brook as it went dancing down to the river.

"I chatter, chatter, as I flow
To join the brimming river;
For men may come, and men may go,
But I go on forever."

The Kennebec Valley is renowned for its beautiful and picturesque scenery. No finer visions can be obtained on the historic Potomac or romantic Hudson. Whoever rides from the Forks to Norridgewock Falls must be impressed with the grandeur of the beautiful river, winding among the surrounding hills; especially if it be when the foliage wears that beautiful golden hue peculiar to Maine forests in autumn. Such grand and romantic scenery will make the eye of the landscape painter flash with delight.

At Bingham, sixty miles from Augusta, the sportsmen found the first telegraph office and sent home their first message: "We are coming," and then went dashing after it. A long and merry ride brought them, about sunset, to "Old Indian Path," at Norridgewock Falls. Here they erected their wigwams and camped at the old Indian village, where once the Indian warrior wooed his dusky mate. Their sleep was sweet and undisturbed by the glare of the tomahawk, or war whoop of the red man; for generations ago the Norridgewocks had paddled their birch canoes over the river to the happy hunting grounds. All that remains of this once powerful tribe is now and then a stone hatchet or arrow-head turned up by the ploughshare of the white man; and the marks left, not far from the old Indian mounds' tents, which mark the site of this old Indian village.

The rising sun ushered in a glorious autumn morning, a genuine Indian summer day, and the hunters were soon on their journey, bound for home with the same happy exuberant feeling that had been with them throughout the whole trip.

Just as the sun was sinking behind the western hills, lighting them up with a blaze of glory, the horses galloped into Augusta and landed the sportsmen where they usually stopped, and better for their recreation, and that their lines had, indeed, been cast in pleasant places.

The next day, with browner cheeks and a new stock of energy and nerve force, they went about their several vocations with cheerful looks and merry hearts. Long will they remember and talk about this trip to Holeb Falls as an oasis in the pathway of life. PISCATOR.

FISHING NEAR BALTIMORE.

The fishing in this vicinity past season has been exceptionally good. Rock bass, especially, were unusually abundant, and I never knew of such fine catches of this splendid fish as were made during September and October in nearly all of the rivers accessible to our city. I went down the Gunpowder, off Maxwell's Point, and to other locations on that river many times during the summer and fall, and on nearly all occasions caught great numbers of blue rock and white and yellow perch. The rock all ran about the same size and weighed from a pound and a half to two pounds.

On one occasion a friend and myself went down to the stone pile at the mouth of the river to fish for white perch. We left the bridge at 3 A. M., and had a fine breeze down. We made such good time that when we were within a mile of the stones I took in all sail and let the boat drift for fear I would overrun the bearings. The place is very hard to find, being simply the wrecks of two canal boats that were loaded with stones, and have fallen to pieces, and the stones have fallen down. The white perch congregated there in great numbers, and of the biggest kind. As soon as it was light enough to get the bearing I got on the place, and we soon had our rods and lines adjusted and hooks baited with "preler." For five hours we had all we wanted to do.

They were there, and we took them in out of the wet. The wind died out about 11 o'clock, and as the fish stopped biting we made track for home, rowing the eight miles without any great fatigue. On arriving at the bridge we caught out of the boat over three hundred fine large white perch.

My boat is a daisy. She is 18 feet long on top, built of white cedar, sharp at both ends, late rigged, and has the Atwood centerboard and Lyman's bow-facing gear. I must say for the latter that it is splendid.

Not all of my trips, however, were as successful as the one told of above. One day in November, I started down the river to Maxwell's Point with a friend. We had a fine whopper about the size of a muskellunge, and were soon tied up to one of the stakes. After we had been there for half an hour the wind hulled, and suddenly came out from the northwest. It blew harder and harder, until it increased to a gale. I

and said she would fix that. So she went out with the old woman, picked a few tomatoes and put them in her basket, when Gipsy considered it was no further concern of hers, and the old woman went to another patch and began to pick beans. Gipsy required her to produce fresh evidence of her authority, and the proceeding had to be gone over again. I suppose I could give you fifty such instances.

I must admit that I have never had a ruff quite Gipsy's age, yet they were not so much as to find my place, wagging his tail, kicking his hands, but will immediately smell him if he picks up anything, and if he considers it a case demanding his attention, he will growl and stop all further movements, except toward the gate, and if the matter is boring, he will just kick him down. By the way, this knocking down must be a common trick of mastiffs, as four of mine do it, and M. B. Wynn, Esq., of England, says the same of some of the dogs he owned. Gipsy merely walks up on a hard-looking stump, and takes a good piece of one, and I have had trouble in keeping him down when such cases came about. Off my place he had no attention to be shown to strangers, unless they point fingers or sticks at him, when he will make a few springs toward them and bark and bark for further developments. The other mastiffs I own are not equal to either Gipsy or Tny, but all have one trait in common, that they will always give abundant warning before they will attack, and even then attack with seeming reluctance. I have often known them determine to get into my place by the coat tail, generally with bad results for the coat. Mr. Deland's Bayard will not let a stranger go out of the room where his master has been until his master returns. Dr. Alson's Boadicea is another rare white bitch, and was once in a pen at the same place that Mr. Graham kept his dogs, but she considered the rest as of no account, and constituted herself inspector of the premises. How she arrived at her conclusions as to who had business there and who had not, I never could determine. She did, and never made a mistake. She was perfectly tolerant of visitors, but had no use for mere idle curiosity-seekers. Anything like sparring or rough play in her neighborhood met with her instant veto.

There is an odd trick; if he sees a stranger taking anything from his master's place he will endeavor to take the thing away instead of taking hold of the person. Mr. Du Verne's Lion has no chance as a guard, as he is kept at the Currier's in Boston, where he has rights and who has not, but his keeper says he is around at night, and I will warrant him a genuine mastiff watch from one trick I saw him do. He will tumble a dog over that is big enough to be worth a notice, and stand by until he has got the dog out of his pen if he is afraid for "pulling" I would say something about this dog. Another peculiarity I have noticed in most mastiffs is that they do not seem to understand being "set out." You may hiss or "sick" and you are bound to get into a quarrel with them, but they do not seem to care. He considers worthy of his attention, then he needs no urging from anybody. Of course I speak of the mastiff when raised around a house in company with people and left to his natural development. If bred in a kennel, accustomed to company, he will not know his business, or if regularly trained he may develop almost anything.

Now, if FOREST AND STREAM will spare the space, I call on other lovers of the breed to give their experience, but before I do I would say that the stuff one sometimes sees, that had a tempered mastiff must be a mongrel, is all "rot." Gipsy and her offspring are all perfect in temper, and she is by Marquis, who was by Green's Monarch ex Duchess (2,365) a sister of Mrs. Rawlinson's Countess, and her mother's name is Countess; all her offspring will be as savage as a devil, perfectly unmanageable, will kill sheep and hold his grip like a bulldog, and lighter breeding than his is not to be found in mastiff pedigrees. The truth seems to be that while gentleness is the one quality that will make a mastiff, you will occasionally get a coward, a savage, or a fool. W. WADE.

Pittsburgh, Jan. 15.

A CHALLENGE TO LARGE POINTERS.

Under the above heading there appeared two weeks ago in a contemporary a challenge from Mr. Geo. W. Fisher, who thinks that he owns the best looking large size pointer in America, and that he will give a challenge to any other pointer in the country to enter the arena, and if it can then be settled which dog is the "litest model for an artist's brush or a sculptor's chisel."

The judges I shall require a thorough practical man, who has had a large experience both as breeder and exhibitor, and whose integrity has never been questioned.

It will be a great pleasure to me, as an old breeder of pointers, to see so perfect a specimen of the breed, and according to description so faultless. Such dogs are indeed rare, and it has not heretofore been my good fortune to have either seen or heard of one. CHARLES H. MARSH.

New York, Jan. 21.

A WELL DESERVED COMPLIMENT.

A NUMBER of gentlemen who took an active part in the late bench show held in this city, and other prominent dog fanciers, assembled at the London House, for the purpose of acknowledging the services of Mr. John Pudcombe, the secretary, in a suitable manner. There were present at the supper Messrs. T. H. Smallman, A. G. Chisholm, S. Turner, W. Humphrey, Dr. Niven and others. Dr. Niven occupied the chair, and presented Mr. Pudcombe, on behalf of the guarantors, with a magnificent silver water pitcher, and the following address:

To Mr. John Pudcombe:

We have met here to night to express to you publicly what we all think of the manner in which you have performed the very tedious, unglorious and unenviable duty of secretary of the late bench show held in London, and to thank you collectively as well as individually for your attention to our interests. Without your very able and unremitting assistance there is not a shadow of doubt in our minds that instead of being a mere failure, the show would have been a very large deficit to grow over; as it is, we, the guarantors are jubilant, and it affords us very much pleasure indeed to be able, in some slight manner, to express to you our admiration of your exceedingly courteous and unobtrusive manner of secretary to you this water pitcher. It is our earnest hope that you, Mr. Pudcombe, and your family, may long be permitted to engage among us at this festive season which we are just celebrating. We are all yours and all your party kindness and hoping we may count on your technical as well as assistance should London again give a bench show we remain always your indebted friends, the guarantors of the fund. L. B. S.

The following resolution, moved by T. H. Smallman, seconded by A. G. Chisholm, was unanimously carried.

That the best thanks of the committee of the late bench show held in London, are due to Mr. John Pudcombe, Secretary of the show, for the very able and successful manner in which he conducted the show.

Toasts were then proposed and drunk to Supt. Lincoln, Secretary C. A. Stone, Treasurer D. S. King, and to the ladies in general, after which the party broke up—

Canadian Sportsman.

CINCINNATI DOG SHOW.

Editor Forest and Stream:

It has now been happily decided to give a show of dogs in the Queen City of the West, on March 4, 5, 6 and 7. The locality selected is Melodion Hall, a capital place for the purpose, and as this is the first show ever held in Cincinnati, there is no doubt of its being a grand success, especially as it is well supported by the prominent gentlemen in Cincinnati, including many members of the famous Currier Club, who will assist by all in their power to make it a success. The prizes are all guaranteed to be paid in full. The railroad arrangements will be very satisfactory to all exhibitors. It is to be hoped that the owners of dogs will send their best dogs, so as to make this the first show, a great success. What Cincinnati wants is a first-class bench show, and none other will suit them. To insure this object, the non-sporting dogs must be well represented, and as Cincinnati is so centrally located, the show of those dogs from all parts of the country should be good.

The premium lists will be ready next week, and can be obtained by addressing me, care of B. Kittridge & Co., Box 1445, Cincinnati, Ohio.

The judges are Major J. M. Taylor, of Lexington, Ky., who will judge all classes of setters and pointers, and Mr. James Mortimer, of New York city, who will judge mastiffs, Newfoundlands, greyhounds, beagles, fox-terriers, and all other non-sporting dogs. Fox-terriers, and all other dogs well represented throughout, the judging in this lot being very difficult. Mr. Hazen's dog was elected, being truly honored.

CHAS. LINCOLN, Supt.

ST. JOHN DOG SHOW.

THIS show opened successfully on Wednesday, the 16th inst., with a fair complement of dogs in their different varieties, the quality naturally not being up to the standard of bench shows in the larger cities. The attendance was more than gratifying. The arrangement of the stalls in the halls set apart can be highly praised, and from the financial record it would seem fair to bid the future success of the enterprising association.

In the mastiff class, though small, there was a fine, handsome, imported dog, the rest being of little account. St. Bernards were represented by a nice one in Mr. F. N. Daniels' lot, and a very nice one in Mr. S. B. Newland's. The latter were well represented throughout, the judging in this lot being very difficult. Mr. Hazen's dog was elected, being truly honored.

The greyhounds were scarce, only one being entered, a very superior dog lately imported from the States, but all good, and up well although a small class. Dr. Berrymann carried the award, which was well deserved, the others were also good. Pointers certainly should have been better; Holstead's was a good representative, but too highly spoken of. The judge placed him on a par with Sensation, in which I cannot by a "jug full" agree. English setters were nothing outside of Almon and Inman's half Laveracks, which took first and second respectively. Abby, also owned by the latter, setting her deers as the best bitch. Foxhounds were poor, and need no comment. Irish, represented by Sturdee in dogs and Engon of Halifax in bitches were only fair specimens.

In retrieving spaniels there were two good ones from superior stock; had it not been from Alabama's being debarsly first awarded. In class 15, Cumber, we had Eagan's prize winner from New York, besides other dogs from his stock, which, of course, made the class a superior one. Field spaniels were comparatively few, but the one in this class could hardly be called satisfactory, but I doubt not that Armstrong's was properly first, the other honors being placed wrong. Morrisie's cockers were well deserving of what they got, the dog and pup being specially good; the class was well represented throughout. In the terrier class, the dogs comprise the favorite sporting dogs of this section, it would not be wrong to say that they contain the pure breed and good blood essential. Foxhounds, only two and poor. Beagles, one, and not up to the standard. Dog collies, one. Mr. McLaren's girl getting best bitch and special for the class. Thorne's, as a dog, was a good one. Collies were certainly up to standard both in smooth and rough coats. Kay's bitch and Dan's dog were very good. Bull-terriers, Col. Blaine's lot of dogs, bitches and puppies, certainly are beautiful; he has made his reputation, but I should like to see them entered in the States. The small terriers and fancy dogs, though in some numbers, are not of the same quality as in former times. The cat show in connection with above, though not wonderful in numbers, comprised all kinds, good, bad and indifferent, but added considerably to the receipts and success of the all-round pleasing exhibition. The following are the awards and specials:

AWARDS.

- Class 1—Mastiff dog, J. Murray Kay, 1st; do puppy, A. C. Fairweather, 1st; A. McLean for 2d; do bitch puppy, H. Wilson, 2d.
- Class 2—St. Bernard dog, W. H. Howe, 2d; do bitch, W. R. Purchase, 2d; (smooth-coat dog), F. W. Daniel, 1st; do puppy, H. S. McLaughlin, 1st; John Thompson, 2d.
- Class 3—Yorkshire Terrier dog, W. H. Reynolds, 1st; Gen. Warner, 2d; Do bitches—Thos. Cullinan, 1st; William Holman, 2d; Robert Blackall, 3d; do dog puppy, H. S. Miller, 1st; H. R. McLean, 2d.
- Class 6—Greyhounds—dogs, A. Shirley Benn, 1st; (very fine).
- Class 7—Deerhounds—bitch, J. Berrymann, M. D., 1st; A. W. Magee, 2d; do dog puppy, J. Berrymann, M. D., 1st; do bitch puppy, J. Berrymann, M. D., 1st.
- Class 8—Pointers—Dog, A. E. Holstead, 1st; L. T. McFoy, 2d; do bitch, J. C. Johnston, 1st; W. H. Howe, 2d.
- Class 9—English Setter—Dog, J. Almon, 1st; H. H. Homan, 2d; do bitch, H. Homan, 1st; do dog puppy, H. E. Howard, 1st; E. J. Harrison, 2d.
- Class 10—Gordon Setter—Dog, F. O'Shaughnessy, 1st; do bitch, J. H. Pullen, 1st; do bitch puppy, R. M. Gibson, 1st; Gen. Warner, 2d.
- Class 11—Irish Setter Dogs—H. L. Sturdee, 1st; E. F. H. Ford, 2d; do bitch, W. H. Howe, 1st; H. H. Homan, 1st; Robert Blackall, 2d; do bitch puppy, Robert Blackall, 1st.
- Class 13—Irish Water Spaniel Dog—George Hatt, Jr., 1st (excellent); Miss Dunn, 2d.
- Class 14—Retrieving Spaniel Dog—R. R. Patenell, 1st; do bitch, James Sullivan, 2d.
- Class 15—Retrieving Spaniels—William Ellis, St. Martins, 1st; bitch, Thomas J. Egan, Halifax, 1st; A. O. Earle, 2d.
- Class 16—Cockers—C. D. Morrisie, 1st; W. F. Danaher, recommended special; do bitch, W. H. Howe, 2d; do bitch puppy, J. M. C. Morrison, 1st; E. LeROI Willis, 2d; dog puppies, C. D. Morrisie, 1st; bitch puppies, F. McGuire, 1st.
- Class 17—Fox-terriers—John R. Armstrong, 1st; H. L. Sturdee, 2d; bitch, Geo. Emery, 1st.
- Class 18—Foxhound—A. E. Holstead, Moneton, 1st for bitch; Wm. McCreary, 2d.
- Class 19—Beagles—M. A. Dinsmore, 1st for bitch.
- Class 20—Dachshund—L. B. Busby, 1st.
- Class 22—Terriers—W. H. Thorne, 1st; W. Carnall, 2d; bitch; J. S. Maclean, 1st.
- Class 23—Collies—John Danory, 1st; T. W. Magee, 2d; A. S. Benn, 3d; bitch, F. W. Kay, 1st; do bitch puppy, Frank McGuire, 2d; do bitch puppy, wrong class, recommended for diploma; dog puppies, Joseph Hayes, 1st; E. Willis, 2d; bitch puppies, Joseph Hayes, 1st; A. S. Magee, 2d.
- Class 24—Danaton Dog—David H. King, 1st.
- Class 25—Pug Dog—James Griffith, 1st; F. P. Magee, 2d; do bitch, Frank McGuire, 1st; F. H. Jones, 2d; do dog puppy, Frank McGuire, 1st; do bitch puppy, J. F. F. Jones, 1st.
- Class 26—Bull Terriers—Col. Blaine, 1st; J. Williams, 2d; bitch, Col. Blaine, 1st; A. F. F. Jones, 2d.
- Class 27—Pug Dog—Pricker-geed, Geo. Sanderson, of Moncton, 1st; Henry Hart, 2d; dog bitch, Alfred Morrisie, 1st.
- Class 28—Scott Terriers—H. Thorne, 1st; bitch, Geo. Rowald, 1st.
- Class 29—Black and Tan—A. S. Benn, 1st; do bitch, W. H. Wilson, 1st; J. Armstrong, 2d.
- Class 32—Yorkshire terrier dogs—Chas. Bustin, 1st; do dog puppy, H. W. Wilson, 1st.

- Class 33—Toy terrier dogs—Thos. McBrien, 1st; do bitch, E. C. Wells, 1st; do bitch puppy, I. D. Damesy, 1st.
- Class 34—Miscellaneous—Herman Ahlborn, Spanish pointer, 1st; C. D. Morrisie, 1st; A. Dowdy, 2d; English pointer, 1st and 2d; Wm. Barclay, Japanese pug, 1st; Chas. Poo, Scotch terrier, 1st and 2d; John Ryan, Irish terrier, 2d; Wm. Campbell, Irish terrier, 1st; J. C. Poo, Hally, English retriever, 1st.
- Class 35—Japanese Spaniel—E. McLean, 1st.
- Class 36—Italian Greyhound—Samuel Haine, 1st.
- Class 37—Toscani Pupae—A. Downs, Halifax, 1st and 2d, for dog and bitch.

SPECIAL PRIZES.

- Best Mastiff—Jas. Murray (Kry).
- Best Bull Terrier—A. Blaine.
- Best St. Bernard—F. B. Hazen.
- Best Greyhound—A. S. Benn.
- Best Deerhound—John Berrymann, M. D.
- Best Pointer—A. E. Holstead.
- Best English Setter—J. J. Almon.
- Best Gordon Setter—E. O'Shaughnessy.
- Best Irish Setter—H. L. Sturdee.
- Best Water Spaniel—Geo. Hatt, Jr.
- Best Champion Spaniel—F. J. Cazaux.
- Best Dog—Wm. H. Howe.
- Best Field Spaniel—J. R. Armstrong.
- Best Foxhound—A. R. Holstead.
- Best Cocker—Wm. H. Howe.
- Best Pug Terrier—J. S. Maclean.
- Best Collie—John Danory.
- Best Bull Terrier—A. Blaine.
- Best Skye Terrier—George Sanderson.
- Best Skye Terrier (drop eared)—Alfred Morrisie.
- Best Dog and Toy Terrier—Wm. Barclay.
- Best Yorkshire Terrier—Chas. Bustin.
- Best Toy Terrier—E. LeROI Willis.
- Best Italian Greyhound—S. Blaine.
- Best Pug—Jas. Griffiths.
- Best in the miscellaneous class—W. Campbell.
- Best Litter Puppies—A. Blaine.
- Best dog in the largest class—A. Blaine, bull-terrier.
- Best dog, bitch, dog or bitch puppy (any variety) in the exhibition—A. S. Benn, English greyhound.

CANADIAN KENNEL CLUB.

We have received a brief dispatch from Toronto, announcing that the show of the Dominion Kennel Club will surely be held there at the end of March. The Toronto Mail a few days ago, said Mr. C. Greville Harston, who has promised to undertake the work of secretary, in connection with the coming bench show in Toronto, of the Dominion Kennel Club, has been offered the pavilion in the Horticultural Gardens for the show for three days for \$300. The dates offered are March 25, 27 and 28. A meeting will shortly be called in the city to open a guarantee fund, as the Kennel Club is not in a position to take any risk, and while Mr. Harston has gone to Ottawa to consult the executive of the club. There seems to be fears that the figure named by the managers of the Horticultural Gardens is too high. Of course, the Kennel Club know their own business, and they hope that they will see their way clear to taking the pavilion, and it is the opinion of a good many people interested in the show that it will pay the club better to give \$300 for the pavilion than to take any other place in Toronto for nothing. [The Horticultural Gardens building is admirably adapted for the purpose, and is in an excellent location.]

NEW HAVEN BENCH SHOW.

New Haven Conn., Jan. 19.—The first annual bench show of the New Haven Kennel Club will be held in this city, in the Second Regiment Armory, on Meadow street, March 12, 13 and 14. The armory is one of the largest halls in the country, is on the ground floor, and is well ventilated. A good party of dogs is attached to give a chance to exercise dogs. For entry blanks and preliminary catalogue of classes, prizes, judges, etc., address Edward S. Porter, Secretary, post-office box 657.

ABSENCE.—Owing to the continued absence of the kennel editor, who is confined to the house by sickness, several communications remain unattended to. We beg the indulgence of our friends, and assure all that their wants shall be attended to at the earliest possible moment.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of each animal:

1. Color.
2. Breed.
3. Name and residence of owner.
4. Age or sex.
5. Buyer or seller.
6. Date of birth.
7. Size, with his sire and dam.
8. Age or sex.
9. Owner of dam.
10. Date of last breeding or of dam, with her sire and dam.

All names must be plainly written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

- 757—See instructions at head of this column.
- Do and Do—By Mr. S. S. Hildreth, of Lancaster, Pa., for lemon and white liver and white cocker spaniel dogs, whelped Nov. 8, 1883, by Colonel Stubbs out of Beauty.
- 758—By Mr. Luke White, Bridgeport, Ct., for lemon and white bitch whelped Aug. 19, 1883, by champion Trump out of champion Grace.
- 759—By Mr. Luke White, Bridgeport, Ct., for lemon and white bitch whelped Aug. 19, 1883, by champion Trump out of champion Grace.
- 760—By Mr. Luke White, Bridgeport, Ct., for lemon and white bitch whelped Aug. 19, 1883, by champion Trump out of champion Grace.
- 761—By Mr. Luke White, Bridgeport, Ct., for red Irish setter bitch whelped Aug. 22, 1883, by Kilarney out of Lili Hill.
- 762—By Chequesset Kennels, Lancaster, Mass., for smooth-coated orange fawn, perfect white markings, six toes on each hind foot, St. Bernard dog whelped Nov. 29, 1883, by Alp H. (A.K.R. 43) out of Breamer (A.K.R. 70).
- 763—By Mr. J. A. Hoffer, Washington, D. C., for lemon and white bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 764—By Mr. J. W. Trumbull, Middletown, Ct., for red Irish setter bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 765—By Mr. J. H. W. Poplar, Germantown, Md., for black and white fox-terrier dog whelped July 19, 1883, by Brokenhurst Joe out of Featherbed (A.K.R. 26).
- 766—By Mr. Henry Strecker, Harms, O., for white, black and tan tickle beagle bitch whelped Aug. 2, 1883, by Spottie (Lee-Maud) out of Spottie (Weller-Fran).
- 767—By Mr. C. P. Williams, New Preston, Ct., for Irish setter dog whelped Feb. 2, 1883, by Chief (A.K.R. 231) out of Biddy (Dash-Bell).
- 768—By Mr. Frank P. Allen, Weymouth, N. J., for black and white cocker dog whelped Oct. 14, 1883, by imported Garry out of Flossie (Ladlow).
- 769—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 770—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 771—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 772—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 773—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 774—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 775—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 776—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 777—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 778—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 779—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 780—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 781—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 782—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 783—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 784—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 785—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 786—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 787—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 788—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 789—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 790—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 791—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 792—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 793—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 794—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 795—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 796—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 797—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 798—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 799—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 800—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).

BRED.

- 750—See instructions at head of this column.
- 751—Young Toby. The Chequesset Kennel's (Lancaster, Mass.) imported rough-coated fawn bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 752—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 753—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 754—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 755—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 756—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 757—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 758—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 759—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 760—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 761—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 762—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 763—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 764—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 765—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 766—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 767—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 768—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 769—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 770—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 771—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 772—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 773—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 774—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 775—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 776—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 777—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 778—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19, 1883, by champion Grace out of Hurch's Victoria (Warwick-Belle).
- 779—By Mr. J. W. Poplar, Germantown, Md., for rough-coated fawn, white markings, St. Bernard bitch whelped Aug. 19

A MODERN YACHT.

PROMINENT building yards are fairly swarming with new cutters. One-half of these, it is true, are of the heavy sort, quite up to the limit of width cutting them to be classed as beam cutters. But the beam will regulate itself according to experience, it can be safely left to the future to disclose the most acceptable proportion. The main issue between cutter and beam cutter is represented in the depth, keel weights and rig of one class as opposed to the stonk hold with flat floor, high ballast, center-board and single jib of the other. Broadly considered, the two types can be described as follows: Each with seamanlike rigs on the one hand, and nursery toys with clumsy and unhandy division of sail carried far in excess of what real work would justify, on the other. If it can be shown that three or four half beams can be incorporated in a deep sea-going form equally as well as four or five beams, there can be no possible harm in retaining the largest beam feasible, if you can choose to put up with the increase of sail demanded without any gain of value in other respects. Beam will always be susceptible to the influence of the measurement rule of the day, and it is natural enough that those who lay no stress upon the economy of form in relation to area of sail will insist upon all the law and experience allows. With this no reasonable person is disposed to quarrel, so long as the boat is not butchered in other respects with the sole object of obtaining great beam at the expense of much more vital considerations.

Should it be demonstrated that cutters of about three beams are fast and good vessels, many will give to their admirer who might denounce the supposed shortcomings of narrower forms. The evidence concerning cutters of the "medium" class is so meagre and conflicting at this day that we will not venture a hasty opinion one way or the other, being content to allow a question of no very great moment to settle itself from actual tests in the future, as long as sufficient depth and low keel weight are recognized as indispensable to credible design, essentials now almost universally conceded. Some beamy cutters have given a gratifying exhibition of speed and sea-going qualities of late, but the tests have not been sufficient to enable any broad deductions to be drawn. We are inclined to think that three beams, coupled with enough depth, will be found productive of too much displacement and too much form for the best around performance, and that three and a half beams to leadline is the limit in breadth to which a well-shaped yacht can aspire, while even less is to be preferred for the open water racing and cruising for which the public is fast exhibiting a growing partiality.

In large yachts, beam of course will diminish with increase of size in cutters just as in the coal boats of the age-hoer classing. But beam is always to be taken in a relative sense, for what would be excessive in one shape might be quite admissible in another. Moreover a true conception of a yacht's beam cannot be derived from a tape line measure at its maximum, but rather from an average estimate up and down and fore and aft as well. Thus a vessel with low bilge and convex frame could not be driven as well with the same waterline measure as another having the bilge proper to a hollow floor or flare. Similarly a boat in which the breadth is preserved well fore and aft rather full and short ends would suffer with an amount of beam another boat of long lines and short middle body might find actually necessary. In general, then, while counseling moderation in beam as an economic attribute unaccompanied by any serious drawbacks, it is to be maintained that the maximum will be quickly demonstrated in experience by the clogging up of deep boats which are too broad as well as by their "bouncy" behavior at sea, that the corrective will be so investigated by every investigator to render superfluous further concern on our part. There are many cutters of three beams now in hand. Others which have come before have not given a very good account of themselves as violators. Instances can be found in last year's racing where the contrary was true. Additional trials will give a positive answer next season. It is enough to know that the agitation carried on so long in these columns has brought about the general adoption of depth, liberal displacement, low weight and double head sail. As no retrogression in those respects need be feared, beam can be allowed to find out for itself to just what exuberance it may flourish.

In perfect accord with the foregoing is the new cutter now building by Briscolt at Greenport, N. Y. The lines of the four beam craft are produced herewith as a very good example of the modern yacht combining all the best points commendable for general yachting purposes. Safety, ability, accommodations, comfort, dry decks and good cabin are characteristics self-evident from the plans. As to her speed, experience can be cited by the cargo to show that there is nothing in her general proportions to interfere with the highest rate attainable in her class. Whether or not this yacht will ever be depended therefore solely on the excellence of the lines in themselves, her mechanical ballasting and rig, and the man at the helm in command.

Length over all	49ft.
Length leadline	32ft.
Beam extreme	8ft. 6in.
Draft extreme	6ft. 3in.
Least freeboard to planksheer	2ft. 6in.
Displacement, long tons	25.8 tons.
Lead on keel, long tons	7.3 tons.
Lead inside, long tons	0.25 tons.
Ratio ballast to displacement	0.25
Area wet surface, no rudder	366sq. ft.
Area three lower sails	1092 sq. ft.
Sail per sq. ft. of wet surface	63.63 sq. ft.
Mast, deck to cap.	31ft. 9in.
Topmast	25ft. 6in.
Boom	31ft. 6in.
Gaff	23ft. 3in.
Bowsprit outboard	18ft. 4in.

CRUISE OF THE MABEL.

GOt under way Aug. 7 from Clayton, N. Y., and stood up the St. Lawrence river to Club Island, where we anchored for about half an hour to take on necessities for a cruise around Lake Ontario. Made sail again at 11 A. M., and worked up the river under mainmast and jib with a fresh breeze from the S.E. About meridian we single-reefed our mainsail to steady the yacht, as the cook claimed there was too much heel on the mackerel which he intended keeping the pots on the stove. Had dinner late when off Carlton Island. The cook said he would go without dinner, as he did not feel very well. He then cleared off the table and kept every thing standing in the galley, including the corn which had capsized off the stove into the middle of the galley floor, and crawled on deck, laid out with sea-sickness. He laid flat on his face, on top of the cabin, all the afternoon. Joe says that his father went recognize him when he gets home, it made him so flat-chested, and asked the captain to order him off the cabin before he got so flat that he would blow away. One of our crew, Henry, is also disabled and below, sick from eating too many cherries. We made Cape Vincent about 5, and Tibbet's Point a couple of hours later, and then stood for Galloo Island Light with a heavy dead sea running, but the wind dying down. Walter turned in about 10:20 P. M., and the captain at 11:45 P. M., we then being a little over three miles west of Galloo Island Light. At 1:30 A. M. Capt. Stebbins came on deck, and the wind still holding steady, and H. J. Fresher than it was at sunset, we shook out the reef in the mainsail which we had kept in until then. W. H. now turned in, Walter taking his place, and the yacht was kept off S. 83° W. for Oswego. At 6 A. M. Joe went below and came on deck again in an hour, Oswego Light then being in sight, and Galloo Light having been out, dropped for about two hours. At 9:30 W. H. relieved Walter at the wheel and stayed on deck till 5 o'clock. Had a heavy head sea and light wind when about two miles from Oswego Light. At 6 A. M. Joe turned the cook out, and he was sadly sick, but recovered enough to get breakfast. Ran into Oswego harbor and let go at the anchorage of the Oswego Y. C. about 6:30 A. M., Aug. 8.

Aug. 8.—Had a call from Commodore Lot of the Cricket. Took off our bobsays, and sent them to ship chandler to be fitted with turnbuckles. Also sent our flying jib to sailmaker to be stitched with grommets on the luff, in order that we might set it standing. Took dinner on board, and in the evening went ashore. Weather warm, and no wind. Our sick men recovered, and were up today again. In the afternoon, about 6 o'clock, Commodore Lot called us to a sail with him in the Cricket. Captain S. and W. H. accepted, but left Walter asleep below. The wind was so light that we did not go outside the breakwater.

Aug. 9.—Weather hot and calm. Cast off the flying jibstay and rove it through the grommets on the flying jib. Got the turnbuckles in the afternoon, and fitted the bobsays to suit. Had calls from several members of the O. Y. C., and among others the measurer of the club, Mr. Fitzgerald, who took her dimensions as per club rules.

Aug. 10.—Got under way at 7:30 A. M. with light breeze from the N., which improved later on, so we shaped our course S. 35. W. for Big Sodus. On reaching Big Sodus we put in for the night, as the wind had nearly left us, and came to an anchor inside the point near the hotel about 5 P. M. Went ashore in the evening and played pool. During the day we had carried all sail, and even then hardly managed to reach our destination.

Aug. 11.—Got under way a little before 7 A. M. with hardly enough air stirring to move us, and worked out of the bay, which took us over an hour to accomplish. The breeze improved as we got clear of the breakwater, and we headed her straight for Onondago under all sail. About 1 P. M., when off Onondago Bay, the steamer City of Rochester ran out toward us and saluted with her

LINES OF FOUR-BEAM CUTTER.
